Example: The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargetes SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
          <document targetdoc="MailUserGuide"
            baseuri="userguide.html">
            &ugtargetes;
          </document>
        </dir>
        <dir name="mailadmin">
          <document targetdoc="MailAdminGuide">
            &agtargetes;
          </document>
        </dir>
      </dir>
    <dir name="reference">
      <dir name="mailref">
        <document targetdoc="MailReference">
          &reftargetes;
        </document>
      </dir>
    </dir>
  </sitemap>
</targetset>
```

```

        </document>
    </dir>
</dir>
</dir>
</sitemap>
</targetset>

```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

Example: An example of a `target.db` file:

```

<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xrefext>How to administer user accounts</xrefext>
  <div element="part" href="#d5e4" number="I">
    <ttl>First Part</ttl>
    <xrefext>Part I, "First Part"</xrefext>
    <div element="chapter" href="#d5e6" number="1">
      <ttl>Chapter Title</ttl>
      <xrefext>Chapter 1, Chapter Title</xrefext>
      <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
        <ttl>Section1 Title</ttl>
        <xrefext>xreflabel_here</xrefext>
      </div>
    </div>
  </div>
</div>

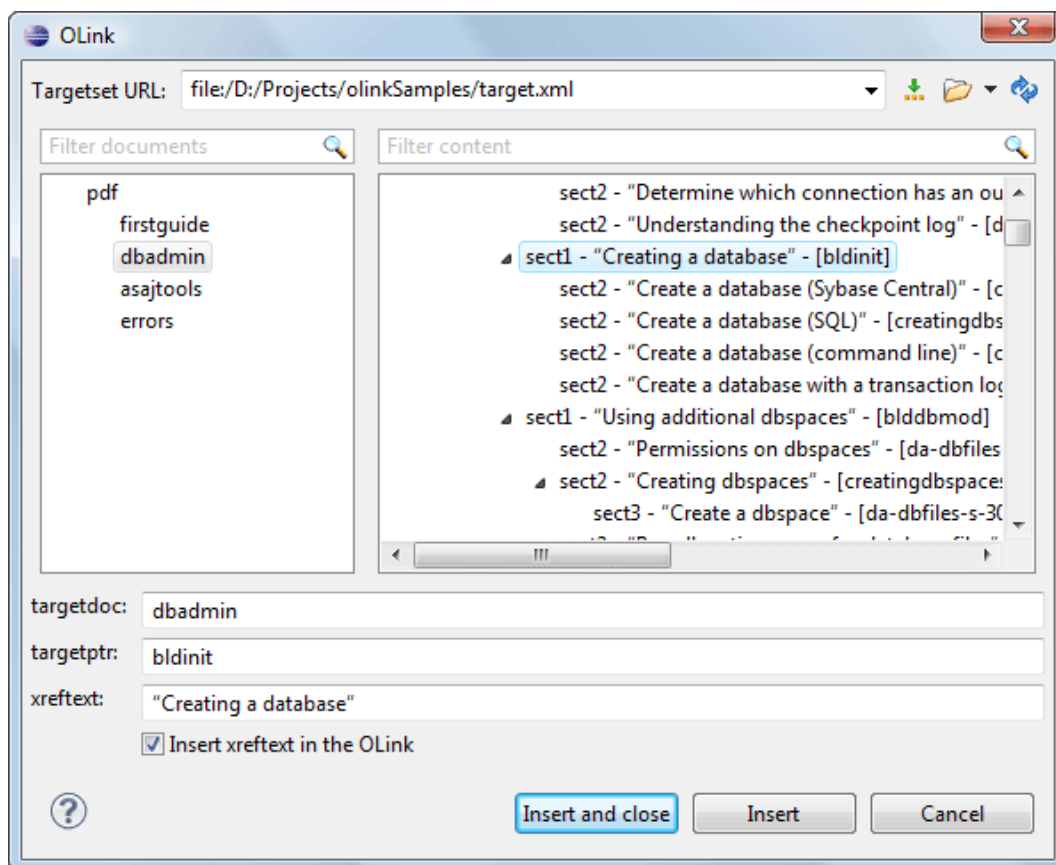

```

5. Insert `<olink>` elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the  **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `<olink>` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed, allowing you to easily identify the appropriate `@targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `@targetdoc` and `@targetptr` attributes, you can insert them directly in the corresponding fields.

Example: In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`@targetdoc`), and `bdinit` is selected as the value for the `@targetptr` attribute. Notice that you can also add XREF text into the `<olink>` by using the `xrefext` field.

Figure 402. Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
 - a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
 - b. Apply the transformation scenario.

DocBook 5 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a DocBook 5 document when the namespace is `http://docbook.org/ns/docbook`.

Default Document Templates

There are a variety of default *DocBook 5* templates available when creating [new documents from templates](#) (on page 253) and they can be found in: **Framework Templates > DocBook 5 > DocBook 5.0** and **Framework Templates > DocBook 5 > DocBook 5.1**.

New document templates for both DocBook 5 documents are located in the

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.0` folder.

New document templates for both DocBook 5.1 documents are located in the

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored

in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.0/rng/` (or for DocBook 5.1 in

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`). Other types of schemas for various DocBook versions are also located in various folders inside the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/` directory.

Default CSS

The default CSS files used for rendering DocBook content in **Author** mode is stored in

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 5 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor Eclipse plugin also includes a DocBook 5.1 transformation scenario for *Assembly documents (on page 1073)*. All of them are listed in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box (*on page 1300*).

For more information, see the [DocBook Transformation Scenarios \(on page 1200\)](#) section.

DocBook 5 Author Mode Actions

A variety of actions are available for DocBook 5 documents in the **DocBook5** menu, toolbar, contextual menu, and the *Content Completion Assistant (on page 2677)*.

DocBook 5 Toolbar Actions

The following default actions are available on the DocBook toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook5** menu and in various submenus of the contextual menu):

B Bold

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

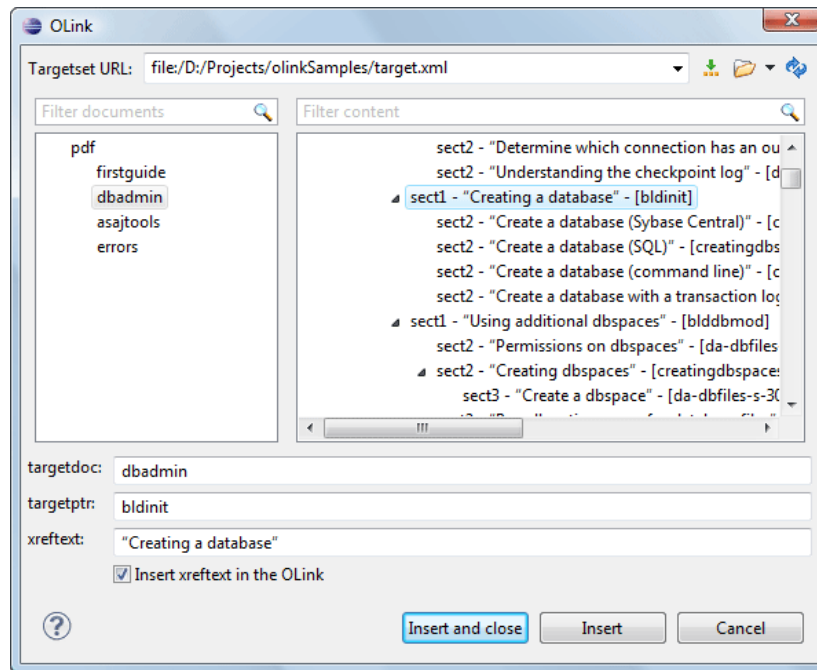

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the values of the `@targetdoc` and `@targetptr` attributes that are present in a **Targetset (on page 1075)** file.

Figure 403. Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed allowing you to easily identify the `@targetptr` for the `<olink>` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `<olink>` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `<olink>`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Edit OLink

Opens a dialog box that allows you edit an existing *OLink*. See the **Insert OLink** action for more information.

Insert Image

Opens a dialog box that allows you to select the path of an **image to insert at the cursor position** (*on page 491*). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a **Choose Media** dialog box (*on page 519*) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

§ ▾ **Section Drop-Down Menu**

The following actions are available from this menu:

§ **Insert Section**

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `<sect1>`, then a `<sect2>` is inserted. By default, this action also inserts a `<para>` element as a child node. The `<para>` element can be deleted if it is not needed.

← **Promote Section (Ctrl + Alt + LeftArrow (Command + Option + LeftArrow on macOS))**

Promotes the current node as a sibling of the parent node.

→ **Demote Section (Ctrl + Alt + RightArrow (Command + Option + RightArrow on macOS))**

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Σ **Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations (on page 521)*.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook `<procedure>` element. A `<step>` child element is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook5 Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DocBook5** menu at the top of the interface):

Edit Attributes

Displays an *in-place attributes editor* (*on page 407*) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the *profiling attributes* (*on page 442*) defined on all selected elements.

Cut (**Ctrl + X** (**Command + X** on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (**Ctrl + C** (**Command + C** on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (**Ctrl + V** (**Command + V** on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions:

Paste As XInclude

Allows you to create an `<xi:include>` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `<link>` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `<xref>` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image**

Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions that are specific to the DocBook *framework*:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Image

Inserts an *image reference (on page 491)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Media Resource

Opens a **Choose Media** dialog box (*on page 519*) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations (on page 521)*.

Insert Paragraph

Inserts a new *paragraph* element at current cursor position.

Insert Section

Inserts a new *section* element in the document, depending on the current context.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e.g. #65
- &#<decimal value> - e.g. A
- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. A

Style submenu

This submenu includes the following text styling actions:

B Bold

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

T₂ Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

T² Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

§ Section submenu

The following actions are available in this submenu:

← Promote Section (**Ctrl + Alt + LeftArrow** (**Command + Option + LeftArrow** on macOS))

Promotes the current node as a sibling of the parent node.

→ Demote Section (**Ctrl + Alt + RightArrow** (**Command + Option + RightArrow** on macOS))

Demotes the current node a child of the previous node.

Link submenu

The following actions are available in this submenu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

Inserts a cross reference to other parts of the document.

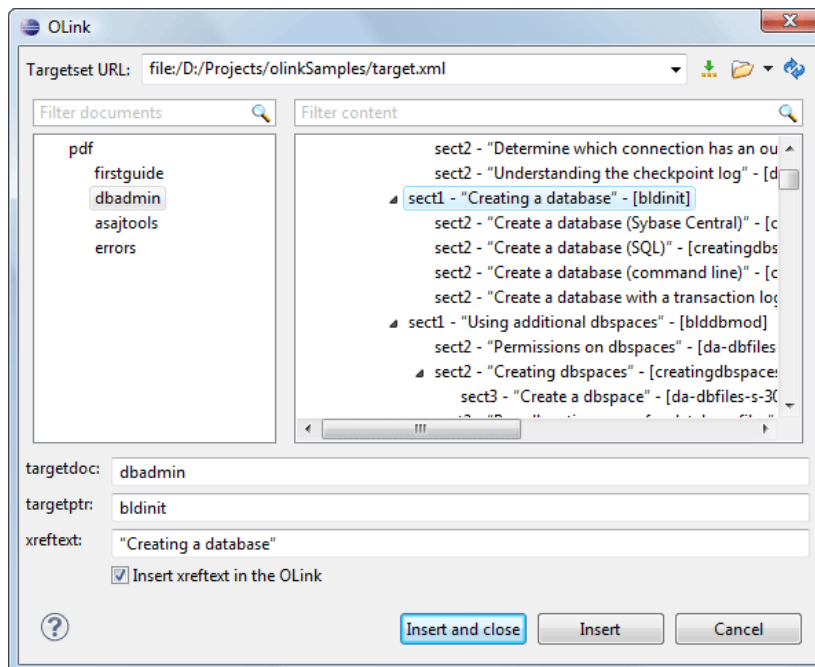

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the values of the `@targetdoc` and `@targetptr` attributes that are present in a **Targetset** (on page 1075) file.

Figure 404. Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed allowing you to easily identify the `@targetptr` for the `<olink>` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `<olink>` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `<olink>`, enter the text in the **xref** field and make sure the **Insert xref text in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Edit OLink

Opens a dialog box that allows you edit an existing *OLink*. See the **Insert OLink** action for more information.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

Note:

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ⓔ`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

→! Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

⌘ Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 120) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 120) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when

hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

About Element >  **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the **CSS Inspector view** ([on page 414](#)) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page](#) ([on page 136](#)) where you can configure various options with regard to the **Author** editing mode.

Floating Contextual Toolbar for DocBook

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 405. DocBook Floating Contextual Toolbar

The *floating contextual toolbar* is automatically displayed when editing DocBook documents in the following situations:

- When a `<para>` or `<listitem>` element has a selection inside, the floating toolbar includes actions such as **B Bold**, **I Italic**, **U Underline**, **T₂ Subscript**, and **T² Superscript**.
- When an `<imagedata>` or `<videodata>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When an `<olink>` element is selected, the floating toolbar includes an **Edit OLink** action.
- When a `<link>` or `<include>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When a `<programlisting>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@language` attribute.
- When an `<itemizedlist>`, `<orderlist>`, `<variablelist>`, or `<procedure>` element is selected, the floating toolbar includes actions for converting it to a different type of list or sorting the list.
- When a `<listitem>`, `<varlistentry>`, or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<tr>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).

- When an `<entry>` or `<td>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
- When a `<table>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

DocBook 5 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project Explorer** view (on page 269) and dropping it into a DocBook 5 document that is edited in **Author** mode, creates a link to the dragged file (the `<link>` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project Explorer** view (on page 269) and drop them into a DocBook 5 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `<imageobject>` DocBook element with an `<imagedata>` child element and a `@fileref` attribute).

Tip:

For information about customizing **Author** mode actions for a particular *framework* (on page 2679) (document type), see the *Customizing the Author Mode Editing Experience for a Framework* (on page 1955) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework \(on page 1955\)](#)

Inserting an Olink in DocBook Documents

The `<olink>` element is used for linking to resources outside the current DocBook document. The `@targetdoc` attribute is used for the document ID that contains the target element and the `@targetptr` attribute for the ID of the target element (the value of an `@id` or `@xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.
A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `@id` (or `@xml:id` for DocBook5) attribute to the root element of the document.
2. Decide on your output hierarchy.
For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.
3. Create the target database document.
Each collection of documents has a main target database document that is used to resolve all *olinks* from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

Tip:

Oxygen XML Editor Eclipse plugin includes a built-in new document template called **DocBook Targetset Map** available in the **New from templates wizard** (on page 253) that will help you get started.

Example: The following is an example of a target database document. It structures a collection of documents in a `<sitemap>` element that provides the relative locations of the outputs (HTML in this example). Then it pulls in the individual target data using system entity references to target data files that will be created in the next step.

```
<?xml version="1.0" encoding="utf-8"?>
<!DOCTYPE targetset [
<!ENTITY ugtargets SYSTEM "file:///doc/userguide/target.db">
<!ENTITY agtargetes SYSTEM "file:///doc/adminguide/target.db">
<!ENTITY reftargets SYSTEM "file:///doc/man/target.db">
]>
<targetset>
  <targetsetinfo>
    Description of this target database document,
    which is for the examples in olink doc.
  </targetsetinfo>

  <!-- Site map for generating relative paths between documents -->
  <sitemap>
    <dir name="documentation">
      <dir name="guides">
        <dir name="mailuser">
```

```

<document targetdoc="MailUserGuide"
          baseuri="userguide.html">
  &ugtargets;
</document>
</dir>
<dir name="mailadmin">
  <document targetdoc="MailAdminGuide">
    &agtargets;
  </document>
</dir>
</dir>
<dir name="reference">
  <dir name="mailref">
    <document targetdoc="MailReference">
      &reftargets;
    </document>
  </dir>
</dir>
</dir>
</sitemap>
</targetset>

```

4. Generate the target data files by executing a DocBook transformation scenario.

Before applying the transformation, you need to edit the transformation scenario, go to the **Parameters** tab, and make sure the value of the `collect.xref.targets` parameter is set to `yes`. The default name of a target data file is `target.db`, but it can be changed by setting an absolute file path in the `targets.filename` parameter.

Example: An example of a `target.db` file:

```

<div element="book" href="#MailAdminGuide" number="1" targetptr="user_accounts">
  <ttl>Administering User Accounts</ttl>
  <xrefext>How to administer user accounts</xrefext>
  <div element="part" href="#d5e4" number="I">
    <ttl>First Part</ttl>
    <xrefext>Part I, "First Part"</xrefext>
    <div element="chapter" href="#d5e6" number="1">
      <ttl>Chapter Title</ttl>
      <xrefext>Chapter 1, Chapter Title</xrefext>
      <div element="sect1" href="#src_chapter" number="1" targetptr="src_chapter">
        <ttl>Section1 Title</ttl>
        <xrefext>xreflabel_here</xrefext>
      </div>
    </div>
  </div>

```

```
</div>
</div>
```

5. Insert `<olink>` elements in the DocBook documents.

When editing a DocBook XML document in **Author** mode, the **Insert OLink** action is available in the  **Link** drop-down menu from the toolbar. This action opens the **Insert OLink** dialog box that allows you to select the target of an `<olink>` from the list of all possible targets from a specified target database document (specified in the **Targetset URL** field). Once a **Targetset URL** is selected, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed, allowing you to easily identify the appropriate `@targetptr`. You can also use the search fields to quickly identify a target. If you already know the values for the `@targetdoc` and `@targetptr` attributes, you can insert them directly in the corresponding fields.

Example: In the following image, the target database document is called `target.xml`, `dbadmin` is selected for the target document (`@targetdoc`), and `bldinit` is selected as the value for the `@targetptr` attribute. Notice that you can also add XREF text into the `<olink>` by using the `xreftext` field.

Figure 406. Insert OLink Dialog Box

6. Process a DocBook transformation for each document to generate the output.
 - a. Edit the transformation scenario and set the value of the `target.database.document` parameter to be the URL of the target database document.
 - b. Apply the transformation scenario.

DocBook Assembly (5.1 and Later)

The DocBook *Assembly* document type was introduced with DocBook 5.1 and it is used to define the hierarchy and relationships for a collection of resources. It is especially helpful for topic-oriented authoring scenarios since it assembles a set of resources (such as [DocBook 5.1 topics \(on page 1074\)](#)) to form a hierarchical structure for a larger publication.

An *Assembly* document usually has four major parts:

- **Resources** - Identifies a collection of resources (such as topics). An *Assembly* may identify one or more collections.
- **Structure** - Identifies an artifact to be assembled. A document in this case is the particular collection of resources (such as topics) that forms the documentation. Within the `<structure>` element, an `<output>` element can be used to identify the type of output to be generated and `<module>` elements can be used to identify the resources to be included. An *Assembly* may identify one or more *structures*.
- **Relationships** - Identifies relationships between resources. These relationships may be manifested in any number of *structures* during assembly. An *Assembly* may identify any number of relationships.
- **Transformations** - Identifies transformations that can be applied during assembly. An *Assembly* may identify any number of transformations.

For detailed information about the DocBook *Assembly* document type, see [The Definitive Guide - DocBook Assemblies](#).

File Definition

A file is considered to be an *Assembly* when the root name is `assembly`.

Default Document Templates

A default **Assembly** document template is available when creating [new documents from templates \(on page 253\)](#) and it can be found in: **Framework Templates > DocBook 5 > DocBook 5.1**.

The default template for DocBook Assembly documents is located in the

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in

`[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that can be applied on an *Assembly* file to generate an *assembled* (merged) DocBook file. The scenario is called **DocBook Assembly** and is found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1300\)](#).

Resources

- [The Definitive Guide - DocBook Assemblies](#)
- [DocBook Specifications](#)
- Sample files: `[OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/`

DocBook Topic (5.1 and Later)

The DocBook *Topic* document type was introduced with DocBook 5.1 and it is used as a modular unit of documentation. It is similar to the concept of the DITA *Topic* and can be used as modular resources in conjunction with *DocBook Assembly* ([on page 1073](#)) documents.

For detailed information about the DocBook *Topic* document type, see [The Definitive Guide - DocBook Topic](#).

File Definition

A DocBook file is considered to be a *Topic* when the root name is `topic`.

Default Document Templates

A default **Topic** document template is available when creating [new documents from templates](#) ([on page 253](#)) and it can be found in: **Framework Templates > DocBook 5 > DocBook 5.1**.

The default template for DocBook Assembly documents is located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook5.1` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `docbookxi.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/5.1/rng/`.

Transformation Scenarios

Since DocBook *Topics* are modular resources, they are *assembled* and transformed in the **DocBook Assembly transformation process** ([on page 1073](#)). You can also use any of the built-in DocBook transformation scenarios to transform individual DocBook Topics to a variety of outputs, such as PDF, HTML, EPUB, and more. They are found in the **DocBook 5** section in the **Configure Transformation Scenario(s)** dialog box ([on page 1300](#)).

Resources

- [The Definitive Guide - DocBook Topic](#)
- [DocBook Specifications](#)
- Sample files: `[OXYGEN_INSTALL_DIR]/samples/docbook/v5/assembly/`

Related Information:

[DocBook Assembly \(5.1 and Later\)](#) ([on page 1073](#))

DocBook Targetset Document Type (Framework)

DocBook *Targetset* documents are used to resolve cross references with the DocBook *Olink*.

File Definition

A file is considered to be a *Targetset* when the root name is `targetset`.

Default Document Templates

A default **DocBook Targetset Map** document template is available when creating [new documents from templates \(on page 253\)](#) and it can be found in: **Framework Templates > DocBook Targetset**.

The default template for DocBook Targetset documents is located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Targetset` folder.

Default Schema for Validation and Content Completion

The default schema, `targetdatabase.dtd`, for this type of document is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/xsl/common/`.

[DocBook Specifications](#)

DITA Topics Document Type (Framework)

The Darwin Information Typing Architecture (DITA) is an XML-based architecture for authoring, producing, and delivering technical information. It divides content into small, self-contained topics that you can reuse in various deliverables. The extensibility of DITA permits organizations to define specific information structures while still using standard tools to work with them. DITA content is created as topics, each an individual XML file. Typically, each topic has a defined primary objective and structure, and DITA also includes several specialized topic types (*task*, *concept*, *reference*, *glossary entry*).

For much more detailed information, resources, and instructions, see the [DITA Authoring \(on page 2327\)](#) chapter.

File Definition

A file is considered to be a DITA topic document when one of the following conditions are true:

- The root element name is one of the following: `<concept>`, `<task>`, `<reference>`, `<dita>`, or `<topic>`.
- The PUBLIC ID of the document is a PUBLIC ID for the elements listed above.
- The root element of the file has a `@DITAArchVersion` attribute for the “`http://dita.oasis-open.org/architecture/2005/`” namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option (on page 89) is selected from the **Document Type Association** preferences page (on page 88).

Default Document Templates

There are a variety of default *DITA topic* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in various folders inside: **Framework Templates > DITA**.

The default templates for DITA topic documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/templates/topic` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the DITA documents are stored in the various folders inside `DITA-OT-DIR/dtd/` or `DITA-OT-DIR/schema/`.

Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalogs

The default *XML Catalogs (on page 2683)* for the DITA topic document type are as follows:

- `DITA-OT-DIR/catalog-dita.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/plugin/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/dita/styleguide/catalog.xml`

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1300\)](#).

DITA Topic Author Mode Actions

A variety of actions are available for DITA documents that can be found in **DITA** menu, toolbar, contextual menu, and the *Content Completion Assistant (on page 2677)*.

DITA Toolbar Actions

The following default actions are available on the DITA toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

B Bold

Surrounds the selected text with a `` tag. You can use this action on multiple non-contiguous selections.

I Italic

Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

U Underline

Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box (*on page 2515*) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map (on page 2678)* structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see *Linking in DITA Topics (on page 2515)*.

File Reference

Opens the **File Reference** dialog box (*on page 2516*) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see *Linking in DITA Topics (on page 2515)*.

Web Link

Opens the **Web Link** dialog box (*on page 2516*) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see *Linking in DITA Topics (on page 2515)*.

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box (on page 2516) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

**Tip:**

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens the **File Reference** dialog box (on page 2517) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Related Link to Web Page

Opens the **Web Link** dialog box (on page 2517) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Insert Image

Opens the **Insert Image** dialog box (on page 2416) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the **Insert Media** dialog box (on page 2419) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in **Author** mode so that it can be played directly from there.

§ ▾ Insert Section Drop-Down Menu

The following insert actions are available from this menu:

Insert Section

Inserts a new `<section>` element in the document, depending on the current context.

Insert Concept

Inserts a new `<concept>` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

Insert Task

Inserts a new `<task>` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

Insert Topic

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference

Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Note

Inserts a new `<note>` element, depending on the current context.

Insert Codeblock

Inserts a new `<codeblock>` element, depending on the current context.

Insert Intent Question

Inserts a new special `<data>` element that contains a question or intent. The intent can be used to [generate Google Structured data \(on page 1477\)](#) content in WebHelp Responsive output.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box (on page 2488)** that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include [content references \(@conref\) \(on page 2489\)](#), [content key references \(@conkeyref\) \(on page 2491\)](#), or [key references to metadata \(@keyref\) \(on page 2494\)](#).

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

Edit Attributes

Displays an *in-place attributes editor* (*on page 407*) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the *profiling attributes* (*on page 442*) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA *framework*:

Paste as content reference

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions

from *DITA maps (on page 2678)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA *framework*:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Image**

Inserts an image reference ([on page 491](#)) at the cursor position. Depending on the current location, an image-type element is inserted.

**Insert Media Resource**

Opens a **Choose Media** dialog box ([on page 519](#)) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

**Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#) ([on page 521](#)).

**Insert Note**

Inserts a new `<note>` element at the current cursor position.

**Insert Code Block**

Inserts a new `<codeblock>` element at current cursor position.

**Insert Menu Cascade**

Inserts a new `<menucascade>` element at current cursor position.

Insert Label

Inserts a special label keyword in the prolog. The label is helpful for searching WebHelp Responsive output for similar topics with the same label.

**Insert Paragraph**

Inserts a new `<p>` (paragraph) element at current cursor position.

**Insert Section**

Inserts a new `<section>` element in the document, depending on the current context.

**Insert Topic**

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. A
- `<x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. A

Style submenu

This submenu includes the following text styling actions:

B Bold

Emphasizes the selected text by surrounding it with a `` (bold) tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an `<i>` (italic) tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with a `<u>` (*underline*) tag. You can use this action on multiple non-contiguous selections.

T₂ Subscript

Surrounds the selected text with a `<sub>` (subscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

T² Superscript

Surrounds the selected text with a `<sup>` (superscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

{ } Code

Surrounds the selected text with a `<codeph>` tag.

UI Control

Surrounds the selected text with a `<uicontrol>` tag, used to mark up names of buttons, entry fields, menu items, or other interface objects.

../ Filepath

Surrounds the selected text with a `<filepath>` tag, used to indicate the name, and optionally the location of a referenced file. You can specify the directory that contains the file and other directories that may precede it in the system hierarchy.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

A variety of table editing actions are available in the contextual menu when it is invoked on a table (depending on the context, the table-related actions are promoted to the top level of the contextual menu and the **Other Actions** submenu provides access to the other actions):

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box (on page 2515) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* (on page 2678) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see [Linking in DITA Topics](#) (on page 2515).

File Reference

Opens the **File Reference** dialog box (on page 2516) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics](#) (on page 2515).

Web Link

Opens the **Web Link** dialog box (on page 2516) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics](#) (on page 2515).

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box (on page 2516) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) (on page 2515).

Tip:

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens the **File Reference** dialog box (on page 2517) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not

already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Related Link to Web Page

Opens the **Web Link dialog box (on page 2517)** that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

Note:

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box (on page 2488)** that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include **content references (@conref) (on page 2489)**, **content key references (@conkeyref) (on page 2491)**, or **key references to metadata (@keyref) (on page 2494)**.

Push Current Element

Opens the **Push current element dialog box (on page 2497)** that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `@conref` or `@conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`@conref/@conkeyref` and `@conrefend` attributes). For more information, see [Reuse Content Dialog Box \(on page 2488\)](#).

Replace Reference with Content

Replaces the referenced fragment (`@conref` or `@conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

Replace All References with Content

Replaces all referenced fragments (`@keyref`, `@conref`, or `@conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

For *keyrefs* inside `<xref>` or `<link>` elements, the `@keyref` attribute is changed to an `@href` attribute, while the rest of the content for the *keyref* is replaced with its source content.

If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (`@conref` or `@conkeyref`) inside the element at the cursor position.

Create Reusable Component

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the **Replace selection with content reference** option is selected in the dialog box, the selection will be replaced with a content reference (`@conref`). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (`@conref` and `@conrefend`). For more information, see [Creating a Reusable Content Component \(on page 2500\)](#).

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see [Inserting a Reusable Content Component \(on page 2501\)](#).

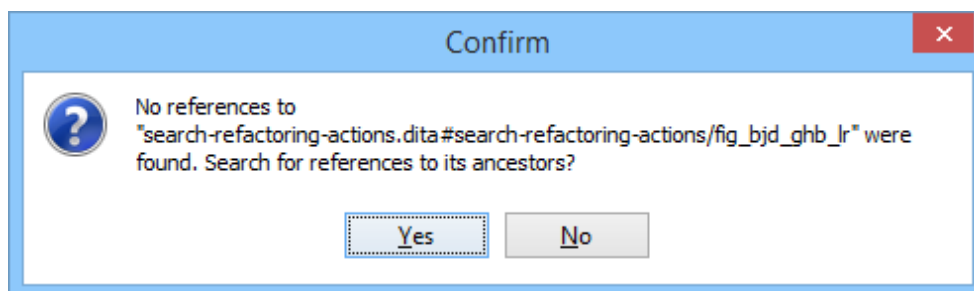

Extract Topic From Selection

Creates a new DITA topic from a selection of content in the current topic.

Search References (Ctrl + Shift + G (Command + Shift + G on macOS))

Finds the references to the `@id` attribute value for the element at the current cursor position, in all the topics contained in the current *DITA map (on page 2678)* (opened in the **DITA Maps Manager view (on page 2337)**). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure 407. Search References to Ancestors Dialog Box

Tip:

If you are invoking the action on an image, see [Searching for References to Images \(on page 2419\)](#) for details about what will be reported.

Find Similar Topics

Opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements. It is helpful for quickly finding related topics that can be added as related links.

Show Key Definition

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the *DITA map (on page 2678)* that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant (on page 2677)*.

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (**Ctrl + Shift + H** (**Command + Shift + H** on **macOS**))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ě`
- `0X0125` to `ĥ`
- `265` to `ı`
- `2190` to `–`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 120) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 120) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

 **Track Changes**

Enables or disables the *Track Changes (on page 2683)* support for the current document.

 **Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

 **Accept All Changes**

Accepts all *Tracked Changes (on page 2683)* in the current document.

 **Reject Change(s) and Move to Next**

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

 **Reject All Changes**

Rejects all *Tracked Changes (on page 2683)* in the current document.

 **Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

 **Highlight**

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

 **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

 **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

 **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

 **Manage Reviews**

Opens the *Review view (on page 438)*.

Manage IDs submenu

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** (*on page 600*) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** (*on page 600*).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

Inspect Styles

Opens the **CSS Inspector view** (*on page 414*) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the **Author mode preferences page** (*on page 136*) where you can configure various options with regard to the **Author** editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 408. DITA Floating Contextual Toolbar

The *floating contextual toolbar* is automatically displayed when editing DITA documents in various situations, including:

- When a `<p>`, ``, or `<shortdesc>` element has a selection inside, the floating toolbar includes actions such as **B Bold**, **I Italic**, **U Underline**, a **Link** submenu, and more.
- When an `<image>` or `<xref>` element is selected:
 - If the element has an `@href` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
 - If the element has a `@keyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an `<object>` element is selected:
 - If the element has a `@data` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
 - If the element has a `@datakeyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an element with a `@conref` attribute is selected, the floating toolbar includes actions for editing, removing, or replacing content references.
- When a `<codeblock>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@outputclass` attribute.
- When a `` element is selected, the floating toolbar includes actions for converting it to an ordered list or sorting the list.
- When an `` element is selected, the floating toolbar includes actions for converting it to an unordered list or sorting the list.
- When an `` or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<strow>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
- When an `<entry>` or `<stentry>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
- When a `<table>` or `<simpletable>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project Explorer** view ([on page 269](#)) or **DITA Maps Manager** view ([on page 2337](#)) and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `<xref>` DITA element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project Explorer** view ([on page 269](#)) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `<image>` element with an `@href` attribute).

Tip:

For information about customizing **Author** mode actions for a particular *framework* ([on page 2679](#)) (document type), see the [Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#)) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#))

DITA Map Document Type (Framework)

DITA maps ([on page 2678](#)) are documents that collect and organize references to DITA topics to indicate the relationships between the topics. They can be used as a container for topics used to transform a collection of content into a publication and they offer a sequence and structure to the topics. They can also serve as outlines or tables of contents for DITA deliverables and as build manifests for DITA projects. *DITA maps* allow scalable reuse of content across multiple contexts. Maps can reference topics or other maps, and can contain a variety of content types and metadata.

For much more detailed information, resources, and instructions, see the [DITA Authoring](#) ([on page 2327](#)) chapter.

File Definition

A file is considered to be a *DITA map* document when one of the following conditions are true:

- The root element name is one of the following: `<map>`, `<bookmap>`.
- The public ID of the document is `-//OASIS//DTD DITA Map` or `-//OASIS//DTD DITA BookMap`.
- The root element of the file has a `@class` attribute that contains the value `map/map` and a `@DITAArchVersion` attribute from the <http://dita.oasis-open.org/architecture/2005/> namespace. This enhanced case of matching is only applied when the **Enable DTD/XML Schema processing in document type detection** option ([on page 89](#)) from the **Document Type Association** preferences page ([on page 88](#)) is selected.

Default Document Templates

There are a variety of default *DITA map* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in various folders inside: **Framework Templates > DITA Map**.

The default templates for *DITA map* documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/sita/templates/map` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the *DITA map* document are stored in the various folders inside `DITA-OT-DIR/dtd/` or `DITA-OT-DIR/schema/`.

Default CSS

The default CSS files used for rendering DITA content in **Author** mode are stored in the various folders inside: `[OXYGEN_INSTALL_DIR]/frameworks/dita/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalogs

The default *XML Catalogs (on page 2683)* for the *DITA map* document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/dita/catalog.xml`
- `DITA-OT-DIR/catalog-dita.xml`

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes numerous built-in transformation scenarios that allow you to transform *DITA maps* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, and CHM. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1300\)](#).

For more information, see the [DITA Map Transformation Scenarios \(on page 2525\)](#) section.

DITA Map Author Mode Actions

A variety of actions are available for DITA map documents that can be found in **DITA** menu, toolbar, contextual menu, and the *Content Completion Assistant* (on page 2677).

DITA Map Toolbar and Menu Actions

When a *DITA map* is opened in **Author** mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

Insert New DITA Resource

Opens a **New DITA file dialog box** (on page 2402) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

Insert Topic Reference

Opens the **Insert Reference dialog box** (on page 2363) where you can configure a topic reference and inserts it at the current position within the map.

Insert Key Definition with Keyword

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

Reuse Content

Opens the **Reuse Content dialog box** (on page 2488) that allows you to insert and configure a content reference (`@conref`), or a content key reference (`@conkeyref`) at the cursor position.

Insert Topic Heading

Opens the **Insert Reference dialog box** (on page 2363) that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the **Insert Reference dialog box** (on page 2363) that allows you to insert a topic group at the cursor position.

Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Relationship Table Properties

Allows you to change the properties of rows in relationship tables.

 **Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

 **Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

 **Delete Relationship Column**

Deletes the table column where the cursor is located.

 **Delete Relationship Row**

Deletes the table row where the cursor is located.

 **Move Up**

Moves the selected node up one position on its same level.

 **Move Down**

Moves the selected node down one position on its same level.

 **Promote**

Moves the selected node up one level to the level of its parent node.

 **Demote**

Moves the selected node down one level to the level of its child nodes.

DITA Map Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

 **Edit Properties**

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box \(on page 2373\)](#).

 **Cut (Ctrl + X (Command + X on macOS))**

Removes the currently selected content from the document and places it in the clipboard.

 **Copy (Ctrl + C (Command + C on macOS))**

Places a copy of the currently selected content in the clipboard.

 **Paste (Ctrl + V (Command + V on macOS))**

Inserts the current clipboard content into the document at the cursor position.

 **Paste special submenu**

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 2678)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA Map *framework*:

Insert New DITA Resource

Opens a **New DITA file dialog box** ([on page 2402](#)) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

Insert Topic Reference

Opens the **Insert Reference dialog box** ([on page 2363](#)) where you can configure a topic reference and inserts it at the current position within the map.

Insert Key Definition with Keyword

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

Reuse Content

Opens the **Reuse Content dialog box** ([on page 2488](#)) that allows you to insert and configure a content reference (`@conref`), or a content key reference (`@conkeyref`) at the cursor position.

Insert Topic Heading

Opens the **Insert Reference dialog box** ([on page 2363](#)) that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the **Insert Reference dialog box** ([on page 2363](#)) that allows you to insert a topic group at the cursor position.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. `#65`
- `&#<decimal value>` - e.g. `A`
- `#x<hexadecimal value>` - e.g. `#x41`
- `&#x<hexadecimal value>` - e.g. `A`

Relationship Table > Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

Note:

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Search References

Finds the references to the `@href` or `@keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current *DITA map* (opened in the **DITA Maps Manager view** (on page 2337)). The current topic/map reference element must have an `@href` or `@keys` attribute defined to complete the search.

Show Key Definition

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the *DITA map* (on page 2678) that contains the definition of the key with the element that defines that key selected.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `É`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

→! Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

 **Split Element**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

 **Join Elements**

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

 **Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 120) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 120) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

 **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

 **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

 **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

 **Track Changes**

Enables or disables the *Track Changes (on page 2683)* support for the current document.

 **Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

 **Accept All Changes**

Accepts all *Tracked Changes (on page 2683)* in the current document.

 **Reject Change(s) and Move to Next**

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

 **Reject All Changes**

Rejects all *Tracked Changes (on page 2683)* in the current document.

 **Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

 **Highlight**

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

 **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

 **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

 **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

 **Manage Reviews**

Opens the **Review view (on page 438)**.

Folding submenu

This submenu includes the following actions:

 **Toggle Fold**

Toggles the state of the current fold.

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the **CSS Inspector view** ([on page 414](#)) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page](#) ([on page 136](#)) where you can configure various options with regard to the **Author** editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The *floating contextual toolbar* is automatically displayed when editing DITA map documents when a `<topicref>` element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).

DITA Map Drag/Drop Actions

Dragging a file from the **Project Explorer view** ([on page 269](#)) or **DITA Maps Manager view** ([on page 2337](#)) and dropping it into a *DITA map* document that is edited in **Author** mode creates a link to the dragged file (a `<topicref>` element, `<chapter>`, `<part>`, etc.) at the drop location.

Opening a Topic from a DITA Map in Author Mode

If a *DITA map* is open in the **Author** visual editing mode, you can open a referenced topic by clicking the   icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.

Tip:

For information about customizing **Author** mode actions for a particular *framework* ([on page 2679](#)) (document type), see the [Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#)) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework \(on page 1955\)](#)

XHTML Document Type (Framework)

The Extensible HyperText Markup Language (XHTML), is a markup language that has the same depth of expression as HTML, but also conforms to XML syntax.

File Definition

A file is considered to be an XHTML document when the root element is `<html>`.

Default Document Templates

There are a variety of default XHTML templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in: **Framework Templates > XHTML**.

The default templates for XHTML documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the XHTML file are stored in the following locations:

- XHTML 1.0 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/nvdl/`.
- XHTML 1.1 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/` or `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/schema/`.
- XHTML 5 - `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/xhtml5 (epub3)/`.

Default CSS

The default CSS files used for rendering XHTML content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalogs

The default *XML Catalogs* ([on page 2683](#)) for the XHTML document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml/dtd/xhtmlcatalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/relaxng/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/nvdl/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/xhtml11/dtd/xhtmlcatalog.xml`

- [\[OXYGEN_INSTALL_DIR\]/frameworks/xhtml11/schema/xhtmlcatalog.xml](#)
- [\[OXYGEN_INSTALL_DIR\]/xhtml5 \(epub3\)/catalog-compat.xml](#)

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform XHTML documents to several types of DITA document types (topic, task, concept, reference). They can be found in the **XHTML** section in the **Configure Transformation Scenario(s)** dialog box ([on page 1300](#)).

Related information

- [Editing XML Documents in Text Mode \(on page 307\)](#)
- [Editing XML Documents in Author Mode \(on page 367\)](#)
- [Adding Tables in XHTML Documents \(on page 482\)](#)
- [XHTML Specifications](#)

XHTML Validation

XHTML documents can be validated in Oxygen XML Editor Eclipse plugin using the same validation features as with any other XML document. In addition, Oxygen XML Editor Eclipse plugin includes a built-in validator engine (**W3C XHTML Validator**) based upon the [W3C Nu HTML Checker](#) that can be used to validate HTML or XHTML documents.

To use the **W3C XHTML Validator** engine:

1. Create or edit a validation scenario (e.g. select the  **Configure Validation Scenario(s)** from the toolbar).
2. Change the **File type** column to *XML Document* and select *W3C XHTML Validator* in the **Validation engine** column.
3. Click **OK** and **Apply Associated** to run the validation.

XHTML Author Mode Actions

A variety of actions are available for XHTML documents that can be found in **XHTML** menu, toolbar, contextual menu, and the [Content Completion Assistant \(on page 2677\)](#).

XHTML Toolbar Actions

The following default actions are available on the XHTML toolbar when editing in **Author** mode (by default, they are also available in the **XHTML** menu and some of them are in various submenus of the contextual menu):

B Bold

Changes the style of the selected text to *bold* by surrounding it with the `` tag. You can use this action on multiple non-contiguous selections.

I Italic

Changes the style of the selected text to *italic* by surrounding it with `<i>` tag. You can use this action on multiple non-contiguous selections.

U Underline

Changes the style of the selected text to *underline* by surrounding it with `<u>` tag. You can use this action on multiple non-contiguous selections.

 **Link**

Inserts an `<a>` element with an `@href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the  **Browse** drop-down menu.

 **Insert Image**

Inserts a graphic object at the cursor position. This is done by inserting an `` element regardless of the current context. The following graphical formats are supported: GIF, JPG, JPEG, BMP, PNG, SVG.

 **Insert Media Resource**

Opens a **Choose Media** dialog box (*on page 519*) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

H ▾ Headings Drop-down Menu

A drop-down menu that includes actions for inserting `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>` elements.

 **Insert Paragraph**

Insert a new paragraph element at current cursor position.

Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations (on page 521)*.

 **Insert List Item**

Inserts a list item in the current list type.

 **Insert Unordered List**

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Definition List

Inserts a definition list (`<dl>` element) with one list item (a `<dt>` child element and a `<dd>` child element). You can also use this action to convert selected paragraphs or other types of lists to a definition list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Insert Row Above

Inserts a new table row with empty cells above the current row. This action is available when the cursor is positioned inside a table.

Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Insert Cell

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

XHTML Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **XHTML** menu at the top of the interface):

Edit Attributes

Displays an [in-place attributes editor \(on page 407\)](#) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the [profiling attributes \(on page 442\)](#) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and

decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Link

Inserts an `<a>` element with an `@href` attribute at the cursor position. You can type the URL of the reference you want to insert or use the browsing actions in the

 **Browse** drop-down menu.

Insert Image

Inserts an *image reference (on page 491)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Media Resource

Opens a **Choose Media dialog box (on page 519)** that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations (on page 521)*.

Insert Paragraph

Inserts a new *paragraph* element at current cursor position.

H ▾ Headings Drop-down Menu

A drop-down menu that includes actions for inserting `<h1>`, `<h2>`, `<h3>`, `<h4>`, `<h5>`, `<h6>` elements.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. `#65`
- `&#<decimal value>` - e.g. `A`

- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. A

Style submenu

This submenu includes the following text styling actions:

B Bold

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

T₂ Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

T² Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

→! Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements* ([on page 2676](#)) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (**Alt + Shift + E**)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option ([on page 120](#)) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option ([on page 120](#)) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (**Alt + Shift + ForwardSlash**)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when

hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

About Element >  **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the **CSS Inspector view** ([on page 414](#)) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page](#) ([on page 136](#)) where you can configure various options with regard to the **Author** editing mode.

XHTML Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project Explorer view** ([on page 269](#)) and dropping it into an XHTML document that is edited in **Author** mode, creates a link to the dragged file (the `<a>` element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project Explorer view** ([on page 269](#)) and drop them into an XHTML document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `` element with the `@src` attribute).

 **Tip:**

For information about customizing **Author** mode actions for a particular [framework](#) ([on page 2679](#)) (document type), see the [Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#)) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#))

TEI P5 Document Type (Framework)

The *TEI (Text Encoding Initiative)* document type is an international and interdisciplinary standard that enables libraries, museums, publishers, and individual scholars to represent a variety of literary and linguistic texts for online research, teaching, and preservation.

File Definition

A file is considered to be a TEI P5 document when one of the following conditions are true:

- The document namespace is <http://www.tei-c.org/ns/1.0>.
- The public ID of the document is `-//TEI P5`.

Default Document Templates

There are a variety of default *TEI P5* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in: **Framework Templates > TEI P5**.

The default templates for TEI P5 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI P5` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI P5 document is `tei_all.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalogs

The default *XML Catalogs* ([on page 2683](#)) for the TEI P5 document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform TEI P5 documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, and ODT. They can be found in the **TEI P5** section in the **Configure Transformation Scenario(s)** dialog box ([on page 1300](#)).

Resources

- [Oxygen Video Tutorial: Editing TEI Documents in Author Mode](#)
- [TEI: P5 Guidelines](#)

Related Information:

[Editing XML Documents in Author Mode \(on page 367\)](#)

[Editing XML Documents in Text Mode \(on page 307\)](#)

[Adding Tables in TEI Documents \(on page 485\)](#)

TEI P5 Author Mode Actions

A variety of actions are available for TEI P5 documents that can be found in **TEI P5** menu, toolbar, contextual menu, and the *Content Completion Assistant* (on page 2677).

TEI P5 Toolbar Actions

The following default actions are available on the TEI P5 toolbar when editing in **Author** mode (by default, they are also available in the **TEI P5** menu and some of them are in various submenus of the contextual menu):

B Bold

Changes the style of the selected text to *bold* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *bold*. You can use this action on multiple non-contiguous selections.

I Italic

Changes the style of the selected text to *italic* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *italic*. You can use this action on multiple non-contiguous selections.

U Underline

Changes the style of the selected text to *underline* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *ul*. You can use this action on multiple non-contiguous selections.

§ Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

¶ Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Image

Inserts an [image reference](#) (on page 491) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

 **Sort**

Sorts cells or list items in a table.

 **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

 **Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

 **Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

 **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

 **Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

 **Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

 **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

 **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **TEI P5** menu at the top of the interface):

Edit Attributes

Displays an [in-place attributes editor \(on page 407\)](#) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the [profiling attributes \(on page 442\)](#) defined on all selected elements.

Cut (**Ctrl + X (Command + X on macOS)**)

Removes the currently selected content from the document and places it in the clipboard.

Copy (**Ctrl + C (Command + C on macOS)**)

Places a copy of the currently selected content in the clipboard.

Paste (**Ctrl + V (Command + V on macOS)**)

Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a [block element \(on page 2676\)](#)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

 **Insert Image**

Inserts an image reference (*on page 491*) at the cursor position. Depending on the current location, an image-type element is inserted.

 **Insert Paragraph**

Inserts a new *paragraph* element at current cursor position.

 **Insert Section**

Inserts a new *section* element in the document, depending on the current context.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e.g. #65
- &#<decimal value> - e.g. A
- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. A

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

**Note:**

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an @id attribute.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

 **Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

 **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

 **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

 **Sort**

Sorts cells or list items in a table.

 **Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

→! Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

 **Split Element**

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

 **Join Elements**

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

 **Surround with Tags (Alt + Shift + E)**

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 120) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 120) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

 **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

 **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

 **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

 **Track Changes**

Enables or disables the *Track Changes (on page 2683)* support for the current document.

 **Accept Change(s) and Move to Next**

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

 **Accept All Changes**

Accepts all *Tracked Changes (on page 2683)* in the current document.

 **Reject Change(s) and Move to Next**

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

 **Reject All Changes**

Rejects all *Tracked Changes (on page 2683)* in the current document.

 **Comment Change**

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

 **Highlight**

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

 **Add Comment**

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

 **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

 **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

 **Manage Reviews**

Opens the **Review view (on page 438)**.

Folding submenu

This submenu includes the following actions:

 **Toggle Fold**

Toggles the state of the current fold.

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the **CSS Inspector view** ([on page 414](#)) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page](#) ([on page 136](#)) where you can configure various options with regard to the **Author** editing mode.

TEI P5 Drag/Drop Actions

Dragging a file from the **Project Explorer view** ([on page 269](#)) and dropping it into a TEI P5 document that is edited in **Author** mode, creates a link to the dragged file (the `<ptr>` element with the `@target` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on macOS, for example) and dropping it into a TEI P5 document inserts a graphic element (the `<graphic>` element with the `@url` attribute) at the drop location, similar to the  **Insert Image** toolbar action.

Tip:

For information about customizing **Author** mode actions for a particular [framework](#) ([on page 2679](#)) (document type), see the [Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#)) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#))

How to Install a TEI Framework with the Latest Schema and Stylesheets

The TEI framework that is bundled in Oxygen XML Editor Eclipse plugin has the TEI schema and stylesheets that were available at the time of its release. When the *TEI Consortium* releases a new TEI version (Schema and Stylesheets), they also release a new version of the Oxygen XML Editor Eclipse plugin TEI framework with them.

**Warning:**

TEI Consortium, who maintains these releases, chose to keep them compatible with Oxygen XML Editor Eclipse plugin version 18.1. This means that some features or improvements that were developed in later versions of Oxygen XML Editor Eclipse plugin might be missing from these frameworks.

The following procedure describes how to install a release of the TEI framework done by *TEI Consortium* that has a newer version of the TEI Schema and TEI XSL <https://github.com/TEIC/oxygen-tei/blob/master/oxygen-tei-plugin.md>

1. Go to **Help > Install new add-ons**.
2. Enter or paste **<https://www.tei-c.org/release/oxygen/updateSite.oxygen>** in the **Show add-ons from** field.
3. Choose the TEI framework that you want to install and click **Next**.
4. Read the end-user license agreement. Then select the **I accept all terms of the end-user license agreement** option and click **Finish**.
5. Restart the application.

TEI ODD Document Type (Framework)

The *TEI ODD (Text Encoding Initiative - One Document Does it all)* document type is a TEI XML-conformant specification format that allows you to create a custom TEI P5 schema in a literate programming fashion. A system of XSLT stylesheets called [Roma](#) was created by the TEI Consortium for manipulating the ODD files.

File Definition

A file is considered to be a TEI ODD document when the following conditions are true:

- The file extension is `.odd`.
- The document namespace is `http://www.tei-c.org/ns/1.0`.

Default Document Templates

There is a default *TEI ODD* document template available when creating [new documents from templates \(on page 253\)](#) and they can be found in: **Framework Templates > TEI ODD**.

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI ODD` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the TEI ODD document is `tei_odds.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS files used for rendering TEI ODD content in **Author** mode are stored in

`[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalogs

The default *XML Catalogs* (on page 2683) for the TEI ODD document type are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/catalog.xml`

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform TEI ODD documents to a variety of outputs, such as PDF, XHTML, EPUB, DOCX, ODT, RNG, DTD, and XML Schema. They can be found in the **TEI ODD** section in the [Configure Transformation Scenario\(s\)](#) dialog box (on page 1300).

TEI ODD Author Mode Actions

A variety of actions are available for TEI ODD documents that can be found in **TEI ODD** menu, toolbar, contextual menu, and the *Content Completion Assistant* (on page 2677).

TEI ODD Toolbar Actions

The following default actions are available on the TEI ODD toolbar when editing in **Author** mode (by default, they are also available in the **TEI ODD** menu and some of them are in various submenus of the contextual menu):

B Bold

Changes the style of the selected text to *bold* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *bold*. You can use this action on multiple non-contiguous selections.

I Italic

Changes the style of the selected text to *italic* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *italic*. You can use this action on multiple non-contiguous selections.

Underline

Changes the style of the selected text to *underline* by surrounding it with the `<hi>` tag and setting the `@rend` attribute to *ul*. You can use this action on multiple non-contiguous selections.

Insert Section

Inserts a new section or subsection, depending on the current context. For example, if the current context is `div1`, then a `div2` is inserted. By default, this action also inserts a paragraph element as a child node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Image

Inserts an image reference ([on page 491](#)) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a [block element \(on page 2676\)](#)) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

 **Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

 **Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

 **Insert Cell**

Inserts a new empty cell depending on the current context. If the cursor is positioned between two cells, Oxygen XML Editor Eclipse plugin a new cell at the cursor position. If the cursor is inside a cell, the new cell is created after the current cell.

 **Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

 **Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

 **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

 **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

TEI Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **TEI ODD** menu at the top of the interface):

 **Edit Attributes**

Displays an [in-place attributes editor \(on page 407\)](#) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the [profiling attributes \(on page 442\)](#) defined on all selected elements.

 **Cut (Ctrl + X (Command + X on macOS))**

Removes the currently selected content from the document and places it in the clipboard.

 **Copy (Ctrl + C (Command + C on macOS))**

Places a copy of the currently selected content in the clipboard.

 **Paste (Ctrl + V (Command + V on macOS))**

Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions that are specific to the DocBook *framework*:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Image

Inserts an *image reference (on page 491)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Paragraph

Inserts a new *paragraph* element at current cursor position.

Insert Section

Inserts a new *section* element in the document, depending on the current context.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e.g. #65
- &#<decimal value> - e.g. A
- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. A

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

Note:

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with *change tracking (on page 2683)* is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character](#) (on page 299). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ě`
- `0X0125` to `ĥ`
- `265` to `ı`
- `2190` to `–`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent](#) (on page 301).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 120*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 120*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the [CSS Inspector view \(on page 414\)](#) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page \(on page 136\)](#) where you can configure various options with regard to the **Author** editing mode.

TEI ODD Drag/Drop Actions

Dragging a file from the **Project Explorer** view ([on page 269](#)) and dropping it into a TEI ODD document that is edited in **Author** mode, creates a link to the dragged file (the `<ptr>` element with the `@target` attribute) at the drop location.

Tip:

For information about customizing **Author** mode actions for a particular *framework* ([on page 2679](#)) (document type), see the [Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#)) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#))

jTEI Document Type (Framework)

The *jTEI* (*Journal of the Text Encoding Initiative*) document type is a highly restrictive customization (only about 80 elements are included) of the TEI P5 *framework*.

File Definition

A file is considered to be a *jTEI* document when the root element is named *TEI*, it is in the namespace `http://www.tei-c.org/ns/1.0`, and the `@rend` attribute is set to `"jTEI"`.

Default Document Templates

There is a default **jTEI Article** template available when creating [new documents from templates](#) ([on page 253](#)) and they can be found in: **Framework Templates > TEI JTEI**.

The default template is located in the `[OXYGEN_INSTALL_DIR]/frameworks/tei/templates/TEI jTEI` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected is `tei_jtei.rng` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/relaxng/`.

Default CSS

The default CSS file (`jtei.css`) that is used for rendering *jTEI* in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework](#) ([on page 1955](#)).

Default XML Catalogs

The default *XML Catalogs* (on page 2683) for *jTEI* are as follows:

- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/custom/schema/dtd/catalog.xml`
- `[OXYGEN_INSTALL_DIR]/frameworks/tei/xml/tei/stylesheet/catalog.xml`

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform *jTEI* documents to PDF and ODT. They can be found in the **TEI JTEI** section in the **Configure Transformation Scenario(s)** dialog box (on page 1300).

[Editing XML Documents in Text Mode \(on page 307\)](#)

[Adding Tables in TEI Documents \(on page 485\)](#)

JATS Document Type (Framework)

The *JATS (NISO Journal Article Tag Suite)* document type is a technical standard that defines an XML format for scientific literature.

File Definition

A file is considered to be a JATS document when the PUBLIC ID of the document contains the string `-//NLM//DTD.`

Default Document Templates

There are some default *JATS* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in: **Framework Templates > JATSKit - NISO JATS and NLM BITS**

The default templates for JATS documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/jats/templates/` folder.

Default Schema for Validation and Content Completion

Default schemas that are used if one is not detected in the JATS document are stored in `[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

Default CSS

The default CSS files used for rendering JATS content in **Author** mode are stored in

`[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/author-css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalog

The default *XML Catalog* (on page 2683), `jatskit-catalog.xml`, is stored in

`[OXYGEN_INSTALL_DIR]/frameworks/jats/lib/schemas/`.

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios that allow you to transform JATS documents to a variety of outputs, such as PDF, HTML, and EPUB. They can be found in the **JATSKit** section in the [Configure Transformation Scenario\(s\)](#) dialog box (on page 1300).

JATS Author Mode Actions

A variety of actions are available for JATS documents that can be found in **JATS** menu, toolbar, contextual menu, and the [Content Completion Assistant \(on page 2677\)](#).

JATS Toolbar Actions

The following default actions are available on the JATS toolbar when editing in **Author** mode (by default, they are also available in the **JATS** menu and in various submenus of the contextual menu):

Paragraph Level Drop-Down Menu

Insert Paragraph

Insert a new paragraph element at current cursor position.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

 **Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

 **Boxed Text**

Inserts or wraps content in a box with a shaded background.

 **Code**

Inserts or wraps content in a `<code>` element.

 **Display Quote**

Inserts or wraps content in a `<disp-quote>` element.

Figure

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

Graphic Figure

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element), and a `<graphic>` element. A dialog box is displayed that allows you to enter the title for the figure, followed by a dialog box that allows you to select the URL of the graphic to be inserted.

B Bold

Surrounds the selected text with a `<bold>` tag. You can use this action on multiple non-contiguous selections.

I Italic

Surrounds the selected text with an `<italic>` tag. You can use this action on multiple non-contiguous selections.

 **Underline**

Surrounds the selected text with an `<underline>` tag. You can use this action on multiple non-contiguous selections.

 **Monospace**

Inserts or wraps content with a `<monospace>` element.

 **Insert Table**

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table,

with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Insert Image

Inserts an [image reference \(on page 491\)](#) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert List Item

Inserts a list item in the current list type.

Insert MathML

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations \(on page 521\)](#).

Subscript

Surrounds the selected text with a *subscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a *superscript* tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

JATS Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **JATS** menu at the top of the interface):

Edit Attributes

Displays an *in-place attributes editor* (*on page 407*) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the *profiling attributes* (*on page 442*) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Boxed Text

Inserts or wraps content in a box with a shaded background.

Insert submenu

This submenu includes the following insert actions:

Figure

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element). This action opens a dialog box that allows you to enter the text for the title for the figure.

Graphic Figure

Inserts a `<fig>` element with a `<title>` (inside a `<caption>` element), and a `<graphic>` element. A dialog box is displayed that allows you to enter the title for the figure,

followed by a dialog box that allows you to select the URL of the graphic to be inserted.

»» Display Quote

Inserts or wraps content in a `<disp-quote>` element.

¶ Insert Paragraph

Inserts a new *paragraph* element at current cursor position.

Insert Image

Inserts an [image reference \(on page 491\)](#) at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. `#65`
- `&#<decimal value>` - e.g. `A`
- `#x<hexadecimal value>` - e.g. `#x41`
- `&#x<hexadecimal value>` - e.g. `A`

Style submenu

This submenu includes the following text styling actions:

Monospace

Inserts or wraps content with a `<monospace>` element.

B Bold

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

List > Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

 **List >  Insert Ordered List**

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

 **Code**

Inserts or wraps content in a `<code>` element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ě`
- `0X0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

→! Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

⌘ Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

⌘ Join Elements

Joins two adjacent *block elements (on page 2676)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or

Backspace keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 120*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 120*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

About Element > **Go to Definition**

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the [CSS Inspector view \(on page 414\)](#) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page \(on page 136\)](#) where you can configure various options with regard to the **Author** editing mode.

JATS Drag/Drop Actions

Dragging a file from the **Project Explorer** view [\(on page 269\)](#) and dropping it into a JATS document that is edited in **Author** mode, creates a link to the dragged file (the `<ext-link>` element with the `@xlink:href` attribute) at the drop location. Dragging an image file from the default file system application (Windows Explorer on Windows or Finder on macOS, for example) and dropping it into a JATS document inserts an image element (the `<inline-graphic>` element with the `@xlink:href` attribute) at the drop location, similar to the **Insert Image** toolbar action.

Tip:

For information about customizing **Author** mode actions for a particular [framework \(on page 2679\)](#) (document type), see the [Customizing the Author Mode Editing Experience for a Framework \(on page 1955\)](#) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework \(on page 1955\)](#)

EPUB Document Type (Framework)

EPUB is an e-book file format that is a ZIP archive and can be downloaded and read on devices such as phones, tablets, computers, or e-readers. You can [view the contents and structure of this type of file \(on page 1825\)](#) in the **Project Explorer** view or main editing pane.

Three distinct [frameworks \(on page 2679\)](#) are supported for the EPUB document type:

- **NCX** - A declarative global navigation definition.
- **OCF** - The Open Container Format (OCF) defines a mechanism by which all components of an Open Publication Structure (OPS) can be combined into a single file system entity.
- **OPF** - The Open Packaging Format (OPF) defines the mechanism by which all components of a published work that conforms to the Open Publication Structure (OPS) standard (including metadata, reading order, and navigational information) are packaged in an OPS Publication.

Note:

Oxygen XML Editor Eclipse plugin supports OPF 2.0, OPF 3.0, and OPF 3.1.

File Definition

A file is considered to be an *EPUB* document if it has a file extension of `.epub`.

Default Document Templates

There are a variety of default *EPUB* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found the following folders in **Framework Templates: NCX, OCF, OPF 2.0, OPF 3.0, and OPF 3.1**.

- The default templates for the **NCX** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ncx/templates` folder.
- The default templates for the **OCF** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ocf/templates` folder.
- The default template for the **OPF 2.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/2.0` folder.
- The default template for the **OPF 3.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/3.0` folder.
- The default template for the **OPF 3.1** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/templates/3.1` folder.

Default Schema

The default schema files for the various types of EPUB document types are located in the following directories:

- The default schema files for the **NCX** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ncx/schemas` folder.
- The default schema files for the **OCF** document types are located in the `[OXYGEN_INSTALL_DIR]/frameworks/ocf/schemas` folder.
- The default schema files for the **OPF 2.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/schemas/2.0` folder.
- The default schema files for the **OPF 3.0** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/schemas/3.0` folder.
- The default schema files for the **OPF 3.1** document type is located in the `[OXYGEN_INSTALL_DIR]/frameworks/opf/schemas/3.1` folder.

Related Information:

[Working with Archive Files \(on page 1827\)](#)

OpenAPI (Swagger) Document Type (Framework)

OpenAPI specification, previously known as Swagger specification, is a specification that defines a standard, programming language-agnostic interface description for HTTP APIs, which allows both humans and computers to discover and understand the capabilities of a service without requiring access to source code, additional documentation, or inspection of network traffic. Use cases for machine-readable API definition documents include interactive documentation, code generation for documentation, automation of test cases,

and more. OpenAPI documents describe an API's services and are represented in either YAML or JSON format.

Oxygen XML Editor Eclipse plugin includes three OpenAPI frameworks:

- OpenAPI 2.0
- OpenAPI 3.0
- OpenAPI 3.1

Editing OpenAPI Documents

You can edit OpenAPI files in **Text** mode and you have access to all the usual text editing actions and you can also edit them in the visual **Author** editing mode and you have access to the various features and actions that are available when [editing XML documents in Author mode \(on page 367\)](#).

When opening a detected OpenAPI document in **Author** mode, you have access to some form controls, collapsible sections, descriptions can be edited inline in a text area that features syntax highlighting, and other features to help you visualize and edit these documents. Also, when editing OpenAPI files in **Author** mode, a **+ Markdown Syntax Highlight** CSS style can be selected from the **Styles** drop-down menu (available on the toolbar) to visualize descriptions with Markdown style syntax highlights.

Tip:

There is an OpenAPI sample document named `petsore.json` located in `[OXYGEN-INSTALL-DIR]/samples/json/openapi` that you can use to see how these documents are rendered in Oxygen XML Editor Eclipse plugin.

Validation and Content Completion

Validation and content completion is supported in Oxygen XML Editor Eclipse plugin for OpenAPI documents (version 2.0, 3.0, 3.1). The validation and content completion in OpenAPI documents are driven by schemas according to the OpenAPI version in the document. Each of the three frameworks (OpenAPI 2.0, OpenAPI 3.0, and OpenAPI 3.1) have a unique schema specified for content completion and validation. When opening an OpenAPI document (in JSON or YAML format), Oxygen XML Editor Eclipse plugin automatically associates the corresponding schema based on the OpenAPI version of the document.

Resources

- For more details about the *OpenAPI Specification*, along with example documents, go to <https://spec.openapis.org/oas/latest.html>.
- Video: [OpenAPI Document Editing in Oxygen XML Editor](#)
- Webinar: [OpenAPI Editing, Testing, and Documenting](#)
- Webinar: [OpenAPI/AsyncAPI Support in Oxygen](#)

OpenAPI Test Scenario Document Type (Framework)

Oxygen XML Editor Eclipse plugin includes a specialized framework for working with OpenAPI test scenario files. It includes the usual text editing actions, a visual editing interface, content completion, and automatic validation.

Author Mode Editing

You can edit OpenAPI test scenario files in the visual **Author** editing mode and you have access to the various features and actions that are available when [editing XML documents in Author mode \(on page 367\)](#).

Default Document Template

There is a default scenario file template available when creating [new documents from templates \(on page 253\)](#) and they can be found in the **Framework Templates > OpenAPI Test Scenario**.

Content Completion

Oxygen XML Editor Eclipse plugin helps you edit OpenAPI test scenario files through the [Content Completion Assistant \(on page 2677\)](#), offering proposals for properties and values that can be inserted at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

Validation

Oxygen XML Editor Eclipse plugin includes built-in validation for OpenAPI test scenario documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document.

Resources

- For more details about the *OpenAPI Specification*, along with example documents, go to <https://spec.openapis.org/oas/latest.html>.
- Video: [OpenAPI Document Editing in Oxygen XML Editor](#)
- Webinar: [OpenAPI Editing, Testing, and Documenting](#)
- Webinar: [OpenAPI/AsyncAPI Support in Oxygen](#)

AsyncAPI Document Type (Framework)

Oxygen XML Editor Eclipse plugin includes a specialized framework for working with AsyncAPI files. The application supports the following AsyncAPI versions: [1.0.0](#), [1.1.0](#), [1.2.0](#), [2.0.0](#), [2.1.0](#), [2.2.0](#), [2.3.0](#), [2.4.0](#).

Editing AsyncAPI Documents

You can edit AsyncAPI files in **Text** mode and you have access to all the usual text editing actions and you can also edit them in the visual **Author** editing mode and you have access to the various features and actions that are available when [editing XML documents in Author mode \(on page 367\)](#). When editing AsyncAPI files

in **Author** mode, a **+ Markdown Syntax Highlight** CSS style can be selected from the **Styles** drop-down menu (available on the toolbar) to make it easier to visualize descriptions with Markdown style syntax highlights.

Default Document Templates

There are some default AsyncAPI templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in the **Framework Templates > AsyncAPI 1.x** and **Framework Templates > AsyncAPI 2.x** folders. Each of those folders contain a default new document template for a JSON version and a YAML version. Some other useful examples can be found at [public AsyncAPI GitHub project](#).

Content Completion

Oxygen XML Editor Eclipse plugin helps you edit AsyncAPI files through the *Content Completion Assistant (on page 2677)*, offering proposals for properties and values that can be inserted at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

Validation

Oxygen XML Editor Eclipse plugin includes built-in validation for AsyncAPI documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document.

Resources

- For details about the *AsyncAPI Specification*, go to <https://www.asyncapi.com/docs/reference/specification/v2.0.0>.
- Webinar: [OpenAPI/AsyncAPI Support in Oxygen](#)

JSON-LD Document Type (Framework)

Oxygen XML Editor Eclipse plugin includes a specialized framework for working with **JSON-LD** files. *JSON-LD* (JavaScript Object Notation for Linked Data) consists of multi-dimensional arrays and is considered an easy-to-use lightweight *Linked Data* format.

Editing JSON-LD Documents

You can edit JSON-LD files in the [specialized JSON text mode editor \(on page 858\)](#) and you have access to its various features and actions. You can also edit JSON-LD files in the **Author** visual editing mode [\(on page 859\)](#) with access to the usual visual editing features for normal JSON documents.

Default Document Template

There are some default *JSON-LD* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in: **Framework Templates > JSON-LD**. Some other useful examples can be found at [public JSON-LD GitHub project](#).

Content Completion

Oxygen XML Editor Eclipse plugin includes an intelligent [Content Completion Assistant \(on page 2677\)](#) that offers proposals for inserting JSON structures that are valid at the current editing location. For more details, see [Content Completion Assistant in JSON \(on page 870\)](#).

Validation

Oxygen XML Editor Eclipse plugin includes built-in validation for JSON-LD documents to help you keep them well-formed. The documents are validated automatically as you type against the schema specified in the framework and problems are highlighted within the document. For more details, see [Validating JSON Documents \(on page 863\)](#).

10.

Additional XML Editing Frameworks (Document Types)

Oxygen XML Editor Eclipse plugin supports custom frameworks (document types) contributed by the XML community (for example, the [S1000D framework \(on page 1169\)](#)). They provide support for additional functionality and XML vocabularies.

Similar to the built-in [frameworks \(on page 2679\)](#), the additional frameworks may define:

- A default grammar used for validation and content completion in both **Author** mode and **Text** mode.
- CSS stylesheets for rendering XML documents in **Author** mode.
- User actions invoked from toolbars or menus in **Author** mode.
- Built-in transformation scenarios used for publishing XML documents.
- [XML Catalogs \(on page 2683\)](#) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in **Author** mode.

S1000D Document Type (Framework)

S1000D is an international specification for the procurement and production of technical publications (mainly used in aerospace and aviation industries). It is an XML-based specification for preparing, managing, and using equipment maintenance and operations information.

S1000D is articulated based on three main notions:

- **Data Module** - It is an XML file that defines a standalone information unit.
- **Data Module Structure** - It defines how a *Data Module* is divided:
 - The *Identification* and *Status* part that identifies the *Data Module* within the CSDB structure.
 - The *Content* part that is the detailed information of the *Data Module*.
- **Common Source DataBase (CSDB)** - It defines how the *Data Modules* are arranged inside a publication.

Oxygen XML Editor Eclipse plugin does not have default built-in support for **S1000D**, but a company called Amplexor has developed a framework that can be installed in Oxygen XML Editor Eclipse plugin to add support for S1000D documents.

To install the framework in Oxygen XML Editor Eclipse plugin, follow these steps:

1. Download or clone the framework on [GitHub](#) and install it as an [additional framework](#) (*on page 90*).
2. Download the S1000D specifications package that contains samples and schemas at [S1000D Downloads](#).
3. Copy the XML Schema files from `[ZIP]\XML Schema Package\xml_schema_flat` into the corresponding version of the `xml_schema_flat` folder.

If you want more advanced **S1000D** editing features, you can ask some of [our partners](#).

11.

Publishing

XML documents can be transformed into a variety of user-friendly output formats that can be viewed by end-users. This process is known as a *transformation*.

Oxygen XML Editor Eclipse plugin includes numerous built-in transformation possibilities to publish XML content in various output formats (such as WebHelp, PDF, CHM, EPUB, JavaHelp, Eclipse Help, XHTML, etc.)

For transformations that are not included in your installed version of Oxygen XML Editor Eclipse plugin, simply install the tool chain required to perform the specific transformation and process the files in accordance with the processor instructions. A multitude of target formats are possible. The basic condition for a transformation to any format is that your source document is well-formed.

Warning:

Keep in mind that there could be instances where there are differences between what you see in **Author** mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain complex referencing.

Transformation Scenarios

A transformation scenario is a set of complex operations and settings that gives you the possibility to obtain outputs of multiple types (XML, HTML, PDF, EPUB, etc.) from the same source of XML files and stylesheets.

Note:

You need to use the appropriate stylesheet according to the source definition and the desired output. For example, if you want to transform into an HTML format using a DocBook stylesheet, your source XML document should conform with the DocBook DTD.

Executing a transformation scenario implies multiple actions, such as:

- Validating the input file.
- Obtaining intermediate output files (for example, formatting objects for the XML to PDF transformation).
- Using transformation engines to produce the output.

Before transforming an XML document in Oxygen XML Editor Eclipse plugin, you need to define a transformation scenario to apply to that document. A scenario is a set of values for various parameters that define a transformation. It is not related to a particular document, but rather to a document type. Oxygen XML

Editor Eclipse plugin includes [preconfigured built-in transformation scenarios \(on page 1173\)](#), but you can also [create new transformation scenarios \(on page 1206\)](#).

When creating new transformation scenarios, the types that are available include:

- **Scenarios that Apply to XML Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited XML document, as well as other transformation parameters. For more information, see [XML Transformation with XSLT \(on page 1206\)](#) and [XML Transformation with XQuery \(on page 1223\)](#).
- **Scenarios that Apply to XSLT Files** - This type of scenario contains the location of an XML document that the edited XSLT stylesheet is applied to, as well as other transform parameters. For more information, see [XSLT Transformation on XML \(on page 1258\)](#).
- **Scenarios that Apply to XQuery Files** - This type of scenario contains the location of an XML source, that the edited XQuery file is applied to, as well as other transform parameters. When the XML source is a native XML database, the XML source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the XML input field of the scenario. For more information, see [XQuery Transformation \(on page 1288\)](#).
- **Scenarios that Apply to JSON Files** - This type of scenario contains the location of an XSLT stylesheet that is applied on the edited JSON document, as well as other transformation parameters. For more information, see [JSON Transformation with XSLT \(on page 1252\)](#) and [XSLT Transformation on JSON \(on page 1277\)](#).
- **Scenarios that Apply to SQL Files** - This type of scenario specifies a database connection for the database server that runs the SQL file that is associated with the scenario. The data processed by the SQL script is located in the database.
- **Scenarios that Apply to XProc Files** - This type of scenario contains the location of an XProc script, as well as other transform parameters. For more information, see [SQL Transformation \(on page 1296\)](#).
- **DITA-OT Scenarios** - This type of scenario provides the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, although you can also set other versions in the scenario. For more information, see [DITA-OT Transformation \(on page 1233\)](#).
- **ANT Scenarios** - This type of scenario contains the location of an Ant build script, as well as other transform parameters. For more information, see [Ant Transformation \(on page 1248\)](#).

**Note:**

Status messages generated during the transformation process are displayed in the **Console view (on page 304)** (the **Enable Oxygen consoles** option [\(on page 180\)](#) must be selected in the **View preferences page (on page 180)).**

Built-in Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes preconfigured built-in transformation scenarios that are used for common transformations. They can be found in the various sections in the **Configure Transformation Scenario(s)** dialog box (*on page 1300*) or **Transformation Scenarios** view (*on page 1306*). All the built-in *document types (frameworks)* (*on page 2679*) that are included in Oxygen XML Editor Eclipse plugin have various transformation scenarios in their specific sections, including the most popular *frameworks*, such as DITA, DocBook, TEI, XHTML, JATS, OOXML, and more.

To obtain the desired output, use one of the following actions from the toolbar or **Transform** submenu in the contextual menu of the **Project Explorer** view (*on page 269*):

-  **Apply Transformation Scenario(s)** (**Alt + Shift + T, T (Command + Option + T, T on macOS)**) - If you have associated transformation scenarios for the current document, this action will simply **apply the association** (*on page 1299*) and begin the transformation process. If an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box (*on page 1300*) where you can choose the scenarios you want to apply.
-  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C (Command + Option + T, C on macOS)**) - This action will open the **Configure Transformation Scenario(s)** dialog box (*on page 1300*) where you can choose the scenarios you want to apply.

Note:

- You can apply a transformation even if the current document is not associated with a transformation scenario.
- If the document contains an `xml-stylesheet` processing instruction that references an XSLT stylesheet (commonly used to display the document in web browsers), Oxygen XML Editor Eclipse plugin prompts you to associate the document with a built-in transformation scenario.
- The default transformation scenario is suggested based on the processing instruction from the edited document.

Related Information:

- [Applying Associated Transformation Scenarios](#) (*on page 1299*)
- [Transformation Scenarios View](#) (*on page 1306*)

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform *DITA maps* (*on page 2678*) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor Eclipse plugin also

includes a special **Integrate/Install DITA-OT Plugins** ([on page 1197](#)) that can be used to integrate a DITA-OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box ([on page 1300](#)).

A variety of transformations scenarios are available for *DITA maps* ([on page 2678](#)):

- Built-in transformation scenarios allow you to transform a *DITA map* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, Metrics Report, and MS Word.
- **Integrate/Install DITA-OT Plugins** ([on page 1197](#)) - Use this transformation scenario if you want to integrate a DITA-OT plugin ([on page 2611](#)). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

Related Information:

[Editing a Transformation Scenario](#) ([on page 1297](#))

[Configure Transformation Scenario\(s\) Dialog Box](#) ([on page 1300](#))

[Applying Associated Transformation Scenarios](#) ([on page 1299](#))

[DITA Topic Transformation Scenarios](#) ([on page 2549](#))

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The [WebHelp Responsive layout and features](#) ([on page 1311](#)) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for [customizing the WebHelp Responsive output](#) ([on page 1395](#)).

WebHelp Responsive Transformation Scenario

To publish a *DITA map* ([on page 2678](#)) as **WebHelp Responsive** output, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** ([on page 2337](#)) toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- [Templates Tab](#) ([on page 2552](#)) - This tab contains a set of built-in [publishing templates](#) ([on page 1356](#)) that you can use for the layout of your WebHelp system output. You can also [create your own publishing templates or edit existing ones](#) ([on page 1395](#)).
- [Parameters Tab](#) ([on page 2558](#)) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the [Parameters section](#) ([on page 1175](#)) below for details about the most commonly used parameters for WebHelp Responsive transformations.

- [Feedback Tab \(on page 2559\)](#) - This tab is for those who want to add the **Oxygen Feedback** comments component at the bottom of each WebHelp page so that you can interact with your readers.
- [Filters Tab \(on page 2560\)](#) - This tab allows you to filter certain content elements from the generated output.
- [Advanced Tab \(on page 2561\)](#) - This tab allows you to specify some advanced options for the transformation scenario.
- [Output Tab \(on page 2564\)](#) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

Result: When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

General Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

editlink.remote.ditamap.url

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

editlink.web.author.url

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the

`editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.csh.disable.topicID.fallback

Specifies whether or not topic ID *fallbacks* are enabled when computing the mapping of context sensitive help and `resourceid` information is not available. Possible values are **false** (default) and **true**.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as `*` (matches zero or more characters) or `?` (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be **UTF8**.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.sitemap.base.url

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the *DITA map*, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

Parameters Specific to Oxygen WebHelp Responsive

webhelp.fragment.feedback

You can integrate **Oxygen Feedback** with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an **Oxygen Feedback site configuration**, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.enable.html.fragments.cleanup

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to **true** (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to **false**, the transformation will fail if at least one HTML fragment is not well-formed.

webhelp.enable.scroll.to.search.term

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are **no** (default) and **true**.

webhelp.fragment.after.body

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.main.page

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.topic.page

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.search.page

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.terms.page

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.logo_and_title

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

webhelp.fragment.before.search.input.main.page

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

**Important:**

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.search.page

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.terms.page

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.feedback

This parameter can be used to display a given XHTML fragment before the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.feedback

This parameter can be used to display a given XHTML fragment after the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.search.default.operator

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to `or` and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is `yes` (meaning the index terms icon is displayed). If set to `false`, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is `yes`. The `webhelp.merge.nested.topics.related.links` parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.skip.main.page.generation

If set to `true`, the default main page is not generated in the output. The default value is `false`.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to `yes`), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can

click outside the menu or press **ESC** to hide the menu. When set to `no` (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Editor Eclipse plugin includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a *DITA-OT CSS-based PDF Publishing plugin* that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xs:fo* customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor Eclipse plugin. For more information, see the [Oxygen PDF Chemistry User Guide](#). This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

How to Create the Transformation Scenario

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** (*on page 2337*) toolbar.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (on page 2552) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

Figure 409. DITA Map to PDF Templates

- **Parameters Tab** (on page 2558) - This tab includes numerous parameters that can be set to customize the transformation.
 - **Filters Tab** (on page 2560) - This tab allows you to filter certain content elements from the generated output.
 - **Advanced Tab** (on page 2561) - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output Tab** (on page 2564) - This tab allows you to configure options that are related to the location where the output is generated.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
 - **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
 - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If

this parameter is not set, the transformation will use the processor specified in the [CSS-based Processors preferences page \(on page 187\)](#).

- **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is `no`.
- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

Customizing the Output

For information about customizing the output, see [CSS-based DITA to PDF Customization \(on page 1537\)](#).

Related Information:

[Editing a Transformation Scenario \(on page 1297\)](#)

[CSS-based DITA to PDF Customization \(on page 1537\)](#)

DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps* ([on page 2678](#)) to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a *DITA Map PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the [DITA Maps Manager \(on page 2337\)](#) toolbar.
2. Select **DITA Map PDF - based on XSL-FO** and click the **Edit** button (or use the **Duplicate** button if your *framework* ([on page 2679](#)) is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:

- `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
- `customization.dir` - Specifies the path to a customization directory.
- `editlink.present.only.path.to.topic` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Related Information:

[XSL FO-based DITA to PDF Customization \(on page 1803\)](#)

DITA Map MS Office Word Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario that allows you to convert *DITA maps* (on page 2678) to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This *plugin* contains a Word document named **Normal.docx** (located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

Tip:

You can make general modifications to the **Normal.docx** template file to alter the published output. The Word application used to edit the **Normal.docx** should be configured with English locale as the style names for each Word element must be in English.

Configuring the Transformation Scenario

To configure a **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager** (on page 2337).
2. Click the  **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** (on page 2337) toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
 - **dotx.file** - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
 - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
 - **core.xsl** - Specifies the path to a core metadata stylesheet.
 - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
 - **document.xsl** - Specifies the path to a main document stylesheet.
 - **comments.xsl** - Specifies the path to a comments stylesheet.
 - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.

- **footnotes.xsl** - Specifies the path to a footnote stylesheet.
- **document.xml.xsl** - Specifies the path to a document relations metadata stylesheet.
- **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click **OK** and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

Related Information:

[Editing a Transformation Scenario \(on page 1297\)](#)

[Configure Transformation Scenario\(s\) Dialog Box \(on page 1300\)](#)

[Migrating MS Office Documents to DITA \(on page 2634\)](#)

DITA Map Markdown Transformation

Using the **Configure Transformation Scenarios** toolbar button, you can create a new transformation scenario of the type **DITA-OT transformation** and then choose one of the Markdown-specific output types:

- **GitHub-flavored Markdown**
- **Markdown**
- **GitBook**

More information about the Markdown output types is available in the DITA-OT documentation: <https://www.dita-ot.org/dev/topics/dita2markdown.html>.

The generated Markdown content can be used with a static web site generator (such as **MKDocs**) to build a web site: https://blog.oxygenxml.com/topics/publishing_dita_content_using_a_markdown_static_web_site_generator.html.

DITA Map CHM (Compiled HTML Help) Transformation

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor Eclipse plugin needs **Microsoft HTML Help Workshop** to be installed on your computer. Oxygen XML Editor Eclipse plugin automatically detects if **HTML Help Workshop** is installed and uses it.

Note:

HTML Help Workshop might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the *.hhp* and *.hhc* files. If the transformation fails to produce the CHM output but the *.hhp* (HTML Help Project) file is already generated, you can manually try to build the CHM output using **HTML Help Workshop**.

Changing the Output Encoding

Oxygen XML Editor Eclipse plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor Eclipse plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on **macOS**)) action from the toolbar or the **XML** menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

Note:

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the `ISO 639-1` standard and the country codes are contained in the `ISO 3166-1` standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
 1. Create the custom CSS.
 2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
 3. In the **Parameter** tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to **yes** to instruct the transformation to copy the custom CSS to the output folder.
 4. Run the transformation.
- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
 - `map2hhcimpl.xsl` - This file is used to compile the table of contents.
 - `map2hhpimpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the *HTML Help Workshop* when creating the output.

DITA Map Kindle Transformation

To produce Kindle books from DITA XML content, follow these steps:

1. Start Oxygen XML Editor Eclipse plugin and open a *DITA map* in the **DITA Maps Manager** view ([on page 2337](#)).
2. Click the  **Configure Transformation Scenario(s)** button.
3. Select the **DITA Map EPUB** transformation and click the **Edit** button to edit it.
4. Run the transformation scenario and produce the EPUB.
5. Install the Amazon [Kindle Previewer](#) utility and use it to produce a Kindle book from the EPUB.

DITA Map Metrics Report Transformation

A **DITA Map Metrics Report** action is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** main menu. It generates an overview report that contains useful statistics for a DITA map.

As an alternate approach, to create a metrics report from a *DITA map* ([on page 2678](#)) using a transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** ([on page 2337](#)) toolbar.
2. Select the **DITA Map Metrics Report** scenario from the **DITA Map** section.
3. Run the transformation.

The generated HTML report contains information such as:

- The number of processed maps and topics.
- The number of `map/bookmap/topic/task/concept/reference` types in the DITA map.
- Content reuse percentage.
- Number of elements and attributes of different types used in the entire *DITA map* structure.
- Number of words and characters used in the entire *DITA map* structure.
- DITA conditional processing attributes used in the *DITA maps*.
- Processing instructions.
- External links.
- All `@outputclass` attribute values gathered from the DITA project.

Important:

If you have cross references that point to content outside the scope of the DITA map, that referenced content is not counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

The metrics report can also be obtained in XML format, making it possible to construct a [metrics report evolution](#) between multiple versions of the same DITA project.

DITA Map Zendesk Publishing

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the [Zendesk Help Center](#).

**Attention:**

This feature is only available in the **Enterprise** edition of Oxygen XML Editor Eclipse plugin.

To run the transformation, follow these steps:

1. Start Oxygen XML Editor Eclipse plugin and open a *DITA map* in the **DITA Maps Manager view** (on page 2337).
2. Click the  **Configure Transformation Scenario(s)** button.
3. Create a new **DITA-OT** transformation scenario and choose the **Zendesk Help Center** transformation type.
4. Go to **Parameters** tab and set the following parameters:

Host

The URL reference to the *Zendesk Help Center* (for example, `https://your-domain.zendesk.com`).

Username

The username (e-mail address) for the account used to upload the content.

API Token

An API token, generated in the *Zendesk* admin pages, necessary for authentication to the server: <https://support.zendesk.com/hc/en-us/articles/226022787-Generating-a-new-API-token>.

Article category

The name of the category where the articles are uploaded. The category needs to be created in the *Zendesk* admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_tl4_kk.

Article section

The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the *Zendesk* admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_zz.

**Note:**

When publishing to a subsection, a path of section names separated by '///' can be passed (for example: `Main section///Subsection 1///Subsection 1.1`).

Create article draft

This setting controls whether the articles should be published (if the value is `false`) or saved as drafts (if the value is `true`). The default value is `false`.

Permission group name

The name of the Zendesk permission group that controls who edits and publishes articles: <https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups>.

5. Save the changes and run the transformation.

**Important:**

There may be cases when the publishing breaks, presenting an error related to **HTTPS** certificates, similar to this one:

```
Error: org.zendesk.client.v2.ZendeskException: java.net.ConnectException: PKIX path
  building failed:
sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid
  certification path
  to requested target
```

This usually occurs if an HTTPS proxy server is installed in your company's network. In this case, if running on Windows, you can edit the transformation scenario you are using to publish **DITA to Zendesk** and in the **Advanced** tab, go to the **JVM Arguments** field and set this value:

```
-Djavax.net.ssl.trustStoreType=Windows-ROOT -Djavax.net.ssl.trustStore=C:\\Windows\\win.ini
```

Resources

For more information about publishing content to the Zendesk Help Center, watch the following video demonstration:

https://www.youtube.com/embed/QZ_9Fk_L0k8

Integrate/Install DITA-OT Plugins Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT *plugins* (on page 2681). These DITA-OT *plugins* are used for various customizations. It is called **Integrate/Install DITA-OT Plugins** and is found in the **DITA Map** section of the  **Configure Transformation Scenario(s)** dialog box (on page 1300).

**Attention:**

The integration will be performed on the DITA-OT version specified in the **DITA Open Toolkit** section of the **DITA preferences page** (on page 81).

**CAUTION:**

Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins.

If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Running the Transformation Scenario

To integrate a DITA-OT *plugin*, follow these steps:

1. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
2. Select the  **Apply Transformation Scenario(s)** or  **Configure Transformation Scenario(s)** (*on page 1300*) action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view (*on page 1306*)).
3. Select the **Integrate/Install DITA-OT Plugins** transformation scenario. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. *Apply the scenario* (*on page 1299*).
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

Related Information:

[Configure Transformation Scenario\(s\) Dialog Box](#) (*on page 1300*)

[Installing a DITA-OT Plugin](#) (*on page 2611*)

[Integrating a DITA Specialization](#) (*on page 2623*)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. *Validate the DITA map* (*on page 2382*) by using the  **Validate and Check for Completeness** action that is available on the **DITA Maps Manager** (*on page 2337*) toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. *Run the DITA transformation scenario* (*on page 1233*).
4. If the transformation results in errors or warnings, they are displayed in the **Results panel** (*on page 335*) at the bottom of the editor. The following information is presented to help you troubleshoot the problems:

- **Severity** - The first column displays the following icons that indicate the severity of the problem:
 - **Informational** - The transformation encountered a condition of which you should be aware.
 -  **Warning** - The transformation encountered a problem that should be corrected.
 -  **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
 - **Info** - Click the  **See More** icon to open a web page that contains more details about DITA-OT error messages.
 - **Description** - A description of the problem.
 - **Resource** - The name of the transformation resource.
 - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
 6. If you need to contact the *Oxygen* technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:
 - a. Go to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
 - b. Execute the transformation scenario again. The console output messages are displayed in the **DITA-OT** view.
 - c. Copy the entire log, save it in a text file, then send it to the *Oxygen* technical support team.
 - d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **When build fails**.

Related Information:

[Troubleshooting DITA Transformation Problems \(on page 2573\)](#)

DITA Topic Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box (on page 1300).

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. Another advantage of this transformation scenario is that you can use the same [customization CSS \(on page 1567\)](#) or [publishing template \(on page 1555\)](#) that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected [context DITA map \(root map\) \(on page 2341\)](#) so that keys and references are properly resolved (the detected context map is set as the value of the `args.root.map` parameter (this can be changed in the **Parameters** tab). It also automatically detects the currently [applied profiling condition set \(on page 2588\)](#) to be used as the default filtering option in the transformation scenario (this can be changed in the **Filters** tab).

The transformation scenario also supports a parameter named `args.enable.root.map.key.processing` that can be used to specify whether or not the values for `@keyref` and `@conkeyref` attributes within the transformed topics are resolved. The possible values are:

- **no** - This means that the values for all `@keyref` and `@conkeyref` attributes are ignored in the transformation. This results in lower processing times.
- **yes** - This means that the values for any `@keyref` and `@conkeyref` attributes found in the transformed topic are processed and resolved using the value of the `args.root.map` parameter.
- **auto** - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.
- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an *xsl:fo* processor.

Related Information:

[Editing a Transformation Scenario \(on page 1297\)](#)

[Applying Associated Transformation Scenarios \(on page 1299\)](#)

[DITA Map Transformation Scenarios \(on page 2525\)](#)

DocBook Transformation Scenarios

Built-in transformation scenarios allow you to transform DocBook documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. Oxygen XML Editor Eclipse plugin also includes a DocBook 5.1 transformation scenario for *Assembly* documents. All of them are listed in the **DocBook 4** and **DocBook 5** sections in the [Configure Transformation Scenario\(s\) dialog box \(on page 1300\)](#).

Related Information:

DocBook to WebHelp Classic Transformation (Deprecated)

DocBook documents can be transformed into several types of WebHelp systems (with or without a feedback section). The [WebHelp Classic layout and features \(on page 1503\)](#) are designed for desktop systems and include a familiar classical style. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for [customizing the WebHelp Classic output \(on page 1511\)](#).

WebHelp Classic Transformation Scenario (Deprecated)

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the **DocBook WebHelp Classic (Deprecated)** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

Result: When the transformation is complete, the output is automatically opened in your default browser.

Customizing DocBook WebHelp Transformation Scenarios

To customize a DocBook WebHelp transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

l10n.gentext.default.language

This parameter is used to identify the correct stemmer that differs from language to language. For example, for English the value of this parameter is `en` or for French it is `fr`, and so on.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.copyright

Adds a small copyright text that appears at the end of the **Table of Contents** pane.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.footer.file

Path to an XML file that includes the footer content for your WebHelp output pages. You can use this parameter to integrate social media features such as widgets for Facebook™, X™ (formerly known as Twitter), Google Analytics, or Google+™. The file must be well-formed, each widget must be in separate `<div>` or `` element, and the code for each `<script>` element is included in an XML comment (also, the start and end tags for the XML comment must be on a separate line). The following code excerpt is an example for adding a Facebook™ widget:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!-- (function(d, s, id) { var js, fjs = d.getElementsByTagName(s)[0];
      if (d.getElementById(id)) return;
      js = d.createElement(s); js.id = id;
      js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
      fjs.parentNode.insertBefore(js, fjs); }
      (document, 'script', 'facebook-jssdk')); -->
  </script>
  <div data-share="true" data-show-faces="true" data-action="like"
    data-layout="standard" class="fb-like"/>
</div>
```

webhelp.footer.include

Specifies whether or not to include footer in each WebHelp page. Possible values: `yes`, `no`. If set to `no`, no footer is added to the WebHelp pages. If set to `yes` and the `webhelp.footer.file` parameter has a value, then the content of that file is used as footer. If the `webhelp.footer.file` has no value then a default **Oxygen** footer is inserted in each WebHelp page.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.product.id (available only for Feedback-enabled systems)

This parameter specifies a short name for the documentation target, or product (for example, `mobile-phone-user-guide`, `hvac-installation-guide`).

Note:

You can deploy documentation for multiple products on the same server.

**Restriction:**

The following characters are not allowed in the value of this parameter: `< > / \ ' ()`
`{ } = ; * % + &.`

webhelp.product.version (available only for Feedback-enabled systems)

Specifies the documentation version number (for example, 1.0, 2.5, etc.). New user comments are bound to this version.

**Note:**

Multiple documentation versions can be deployed on the same server.

**Restriction:**

The following characters are not allowed in the value of this parameter: `< > / \ ' ()`
`{ } = ; * % + &.`

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.skin.css

Path to a CSS file that sets the style theme in the WebHelp Classic output. It can be one of the built-in skin CSS from the `OXYGEN_INSTALL_DIR\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\predefined-skins` directory, or it can be a custom skin CSS generated with the [Oxygen Skin Builder](#) web application.

For more information about all the DocBook transformation parameters, go to <http://docbook.sourceforge.net/release/xsl/current/doc/fo/index.html>.

DocBook to DITA Transformation

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to DITA. This transformation scenario is based upon a DITA Open Toolkit plugin that is available at sourceforge.net.

To convert a DocBook document to DITA, follow these steps:

1. Use one of the following two methods to begin the transformation process:
 - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Option + T, T on macOS))** action from the toolbar or the **XML** menu.
 - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** action from the toolbar or the **XML** menu.
2. Select the **DocBook to DITA** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

Step Result: The transformation will convert as many of the DocBook elements into equivalent DITA elements as it can recognize in its mapping process. For elements that cannot be mapped, the transformation will insert XML comments so that you can see which elements could not be converted.

4. Adjust the resulting DITA composite to suit your needs. You may have to remove comments, fix validation errors, adjust certain attributes, or split the content into individual topics.

Related Information:

[Editing a Transformation Scenario \(on page 1297\)](#)

[Configure Transformation Scenario\(s\) Dialog Box \(on page 1300\)](#)

DocBook to PDF Transformation

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to PDF.

To convert a DocBook document to PDF, follow these steps:

1. Use one of the following two methods to begin the transformation process:
 - To apply the transformation scenario to a newly opened file, use the  **Apply Transformation Scenario(s) (Alt + Shift + T, T (Command + Option + T, T on macOS))** action from the toolbar or the **XML** menu.
 - To customize the transformation or change the scenario that is associated with the document, use the  **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** action from the toolbar or the **XML** menu.
2. Select the **DocBook PDF** transformation scenario in the **DocBook 4** or **DocBook 5** section.
3. Click the **Apply associated** button to run the transformation.

For information about customizing the PDF output for DocBook content, see [DocBook to PDF Output Customization \(on page 1815\)](#).

Related Information:

[Editing a Transformation Scenario \(on page 1297\)](#)

[Configure Transformation Scenario\(s\) Dialog Box \(on page 1300\)](#)

[DocBook to PDF Output Customization \(on page 1815\)](#)

DocBook to EPUB Transformation

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to convert DocBook content to EPUB. The EPUB specification recommends the use of *OpenType* fonts (recognized by their `.otf` file extension) whenever possible. To use a specific font, follow these steps:

1. Declare it in your CSS file, as in the following example:

```
@font-face {
  font-family: "MyFont";
  font-weight: bold;
  font-style: normal;
  src: url(fonts/MyFont.otf);
}
```

2. In the CSS, specify where this font is used. To set it as default for `<h1>` elements, use the `font-family` rule, as in the following example:

```
h1 {
  font-size: 20pt;
  margin-bottom: 20px;
  font-weight: bold;
  font-family: "MyFont";
  text-align: center;
}
```

3. Open the **Configure Transformation Scenario(s)** dialog box (on page 1300), select the **DocBook EPUB** transformation scenario in the **DocBook 4** or **DocBook 5** section, and click **Edit**.
4. In the **Parameters** tab, set the `epub.embedded.fonts` parameter to `fonts/MyFont.otf`. If you need to provide more files, use commas to separate their file paths.

**Note:**

The `html.stylesheet` parameter allows you to include a custom CSS in the output EPUB.

5. Run the transformation scenario.

DocBook PDF (Show Change Tracking and Comments)

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that is designed to show tracked changes and comment in DocBook to PDF output.

To include comments and *tracked changes* (stored within your DocBook 5 documents) in the PDF output, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button.
2. Select **DocBook PDF (Show Change Tracking and Comments)** in the **DocBook 5** section.
3. If you need to configure the transformation, click the **Edit** ([on page 1297](#)) or **Duplicate** ([on page 1299](#)) button, make your changes to the scenario, and click **OK**.
4. Click the **Apply Associated** button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Creating New Transformation Scenarios

Defining a transformation scenario is the first step in the process of transforming a document. This section includes information on the types of new scenarios that are available in Oxygen XML Editor Eclipse plugin and how to create each type of transformation.

XML Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited XML document. This scenario is useful when you develop an XML document and the XSLT document is in its final form.

To create an **XML transformation with XSLT** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C (Command + Option + T, C on macOS)**) action from the toolbar or the **XML** menu. Then click the **New** button and select **XML transformation with XSLT**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **XML transformation with XSLT**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note:

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page](#) ([on page 212](#)), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template](#) ([on page 1207](#)) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can also be empty if you use [external XSLT processors](#) ([on page 1222](#)). Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page](#) ([on page 199](#)). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine](#) ([on page 1210](#)) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page](#) ([on page 210](#)). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box (*on page 1208*) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for **additional XSLT stylesheets** (*on page 1208*). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a **dialog box for configuring the XSLT extension JARS or classes** (*on page 1209*) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a **dialog box for adding XSLT stylesheets** (*on page 1210*) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all **additional stylesheets** (*on page 1210*), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or **editor variables** (*on page 218*) (such as **\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 218\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the [JARS \(on page 2679\)](#) and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip:

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the  **Move up** or  **Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable \(on page 218\)](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page \(on page 210\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a [configuration file \(on page 1211\)](#), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a [configuration file \(on page 1211\)](#), the value in this option takes precedence.

**Tip:**

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Editor Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the *XSLT Debugger* (on page 1931) to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

Note:

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version** option [\(on page 195\)](#).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via

a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called [Integrated Extension Functions](#)) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                throws XPathException {
                long v0 = ((IntegerValue)arguments[0].next()).longValue();
                long v1 = ((IntegerValue)arguments[1].next()).longValue();
                long result = v0<<v1;
                return Value.asIterator(Int64Value.makeIntegerValue(result));
            }
        };
    }
}
```

2. Compile the class and add it to a JAR file.

3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

**Note:**

To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (*on page 95*).
- In a *validation scenario (on page 558)*, you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (*on page 1208*) to open a dialog box where you can add libraries.

FO Processor Tab (XSLT Transformations)

When you *create a new transformation scenario (on page 1206)* or *edit an existing one (on page 1297)*, a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an *external processor (on page 183)*.

Output Tab (XSLT Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 176\)](#).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  [Insert Editor Variables \(on page 218\)](#) button, or the  **Browse** button.

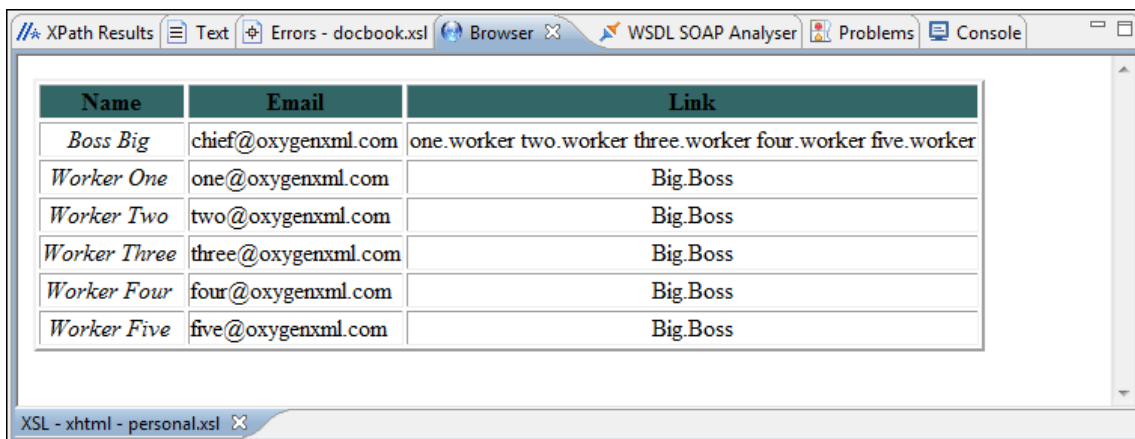

**Attention:**

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

Oxygen XML Editor Eclipse plugin Browser View

The Oxygen XML Editor Eclipse plugin Browser view is automatically displayed in the views pane of the Eclipse window to display HTML output from XSLT transformations. It contains a tab for each file with HTML results displayed in the view.

Figure 410. Browser View

Oxygen XML Editor Eclipse plugin Text View

The Oxygen XML Editor Eclipse plugin **Text** view is automatically displayed in the views pane of the Eclipse window to display text output from XSLT transformations, FO processor info, warnings, and error messages. It contains a tab for each file with text results displayed in the view.

Figure 411. Text View

Text View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Clear

Removes all content from the view.

Copy

Copies the selected content to the clipboard.

Select All

Selects all content in the view.

Format and Indent

Formats (*pretty-prints (on page 2681)*) the content in this view.

Find/Replace

Allows you to perform search and replace operations.

Save Results

Saves the content in the view to a file in text format.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor Eclipse plugin.

Supported XSLT Processors

Oxygen XML Editor Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2** (Deprecated) - [Xalan-Java](#) is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - [Saxon 6.5.5](#) is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 12.3 Home Edition (HE), Professional Edition (PE)** - [Saxon-HE/PE](#) implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 12.3 Enterprise Edition (EE)** - [Saxon EE](#) is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be [configured in Preferences \(on page 195\)](#).

Note:

Oxygen XML Editor Eclipse plugin implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon configuration**. Both of these templates support content completion, element annotation, and attribute annotation.

Note:

Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

1. Download Saxon 12.3 Professional Edition (PE) or Enterprise Edition (EE) from <http://www.saxonica.com>.
2. Unpack the downloaded archive.

3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor Eclipse plugin.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor Eclipse plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

**Note:**

A specific template, named **Saxon-CE stylesheet**, is available in the [New from Templates wizard \(on page 253\)](#).

- **Xsltproc (libxslt)** (Deprecated) - **Libxslt** is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Editor Eclipse plugin uses **Libxslt** through its command-line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from <http://xmlsoft.org/XSLT/downloads.html> and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

**Tip:**

As an example, a Windows installation of the Xsltproc engine would follow these steps:

1. Go to <http://ftp.zlatkovic.com/libxml.en.html> and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
2. Unzip all of them into the same folder of your choice.

3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:

4. Restart Oxygen XML Editor Eclipse plugin.

Result: You can now use the `xsltproc` processor as an XSLT engine in the XSLT transformation scenario.

Note:

The Xsltproc processor can be configured from the [XSLTPROC options page \(on page 213\)](#).

CAUTION:

There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in [XML Catalog \(on page 2683\)](#) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for [transformation \(on page 1206\)](#) and [validation of XSLT stylesheets \(on page 656\)](#).

Oxygen XML Editor Eclipse plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for [transformation \(on page 1206\)](#) and [validation of XSLT stylesheets \(on page 656\)](#).

Oxygen XML Editor Eclipse plugin performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (*System.Xml.Xsl.XslTransform* class) through the **nxslt** command-line utility. The **nxslt** version included in Oxygen XML Editor Eclipse plugin is 1.6.

You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

- **.NET 1.0 (Legacy)** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

You can get the .NET *Framework* version 1.0 from the [Microsoft website](#).

- **.NET 2.0 (Legacy)** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.`

You can get the .NET *Framework* version 2.0 from the [Microsoft website](#).

Configuring Custom XSLT Processors

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*) and go to **XML > XSLT-XQuery > Custom Engines**.
2. Click the **+ New** button at the bottom of the dialog box.
3. Configure the [parameters for the custom engine \(on page 199\)](#).
4. Click **OK**.

Note:

You can not use these custom engines in [the Debugger perspective \(on page 1913\)](#).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows [the format of an Oxygen XML Editor Eclipse plugin linked message \(on page 555\)](#), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:[Custom Engines Preferences \(on page 199\)](#)

Configuring the XSLT Processor Extensions Paths

The Saxon and Xalan processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan (Deprecated)** - <http://xml.apache.org/xalan-j/extensions.html>
- **Saxon 6.5.5** - <http://saxon.sourceforge.net/saxon6.5.5/extensions.html>
- **Saxon 12.3** - <http://www.saxonica.com/documentation9.5/index.html#!extensibility>

To set an XSLT processor extension (a directory or a `jar` file), use the **Extensions** button (on page 1208) in the **Edit scenario** dialog box.

XML Transformation with XQuery

This type of transformation specifies the transform parameters and location of an XQuery file that is applied to the edited XML document.

Use the **XML transformation with XQuery** scenario to apply a transformation to have an XQuery file query an XML file for the output results.

To create an **XML transformation with XQuery** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **XML transformation with XQuery**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **XML transformation with XQuery**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you [create a new transformation scenario \(on page 1206\)](#) or edit an existing one [\(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 218\)](#) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note:

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page \(on page 212\)](#), the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 218\)](#) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 199\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1226\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 210\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the [Configure parameters dialog box \(on page 1225\)](#) for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual

menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension JARS or classes \(on page 1226\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or [editor variables \(on page 218\)](#) (such as **\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables**

button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 218\)](#)

XQuery Extensions

The **Extensions** button is used to specify the *JAR (on page 2679)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 204\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:

The profiling support works only if the **Present as a sequence transformation option** ([on page 1229](#)) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 183\)](#).

Output Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 218\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#) (on page 176).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

XML to PDF Transformation with CSS

This type of transformation uses the **Oxygen PDF Chemistry** processing engine to obtain PDF output by applying CSS styling to the edited XML document. This scenario is useful for those who are familiar with CSS and want to obtain PDF output as its final form.

To create an **XML to PDF transformation with CSS** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on macOS)) action from the toolbar or the **XML** menu. Then click the **New** button and select **XML to PDF transformation with CSS**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view](#) (on page 1306). Click the  **New Scenario** drop-down menu button and select **XML to PDF transformation with CSS**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

For more information about the **Oxygen PDF Chemistry** processing engine and numerous tips for customizing the output, see the [Oxygen Chemistry User Guide](#).

CSS Tab (XML to PDF Transformation with CSS)

When you [create a new transformation scenario](#) (on page 1206) or [edit an existing one](#) (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **CSS** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

CSS URL

Optionally, you can use this option to specify the location of a custom CSS file to be applied to the transformation. If this option is left blank, only the CSS referenced directly from the document will be applied. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Apply CSS stylesheets set in the current framework

If selected, CSS stylesheets that are specified in the framework (in the [Document Type configuration CSS subtab \(on page 96\)](#)) are applied to the transformation in addition to any CSS referenced directly in the document or specified in the [CSS URL field \(on page 1231\)](#).

Note:

If CSS files are specified in multiple ways, the transformation applies the CSS in the following order (from lowest priority to highest):

- CSS files that are specified in the framework (in the [Document Type configuration CSS subtab \(on page 96\)](#)).
- CSS files referenced directly in the document.
- CSS files specified in the [CSS URL field \(on page 1231\)](#).

Processor options link

Opens the [CSS-based Processors preferences page \(on page 187\)](#) where you can configure some options for generating PDF output.

Output Tab (XML to PDF Transformation with CSS)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Output File section

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the PDF file type (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Debugging section

Dump the intermediate annotated XML

Select this option to include (dump) the intermediate, annotated XML file in the same location as the output file. This can be used for debugging purposes.

Dump the FO file

Select this option to include (dump) the FO file (before it is converted to PDF) in the same location as the output file. This can be used for debugging purposes.

Console options link

Opens the [CSS-based Processors preferences page \(on page 187\)](#) where you can configure some options for generating PDF output.

DITA-OT Transformation

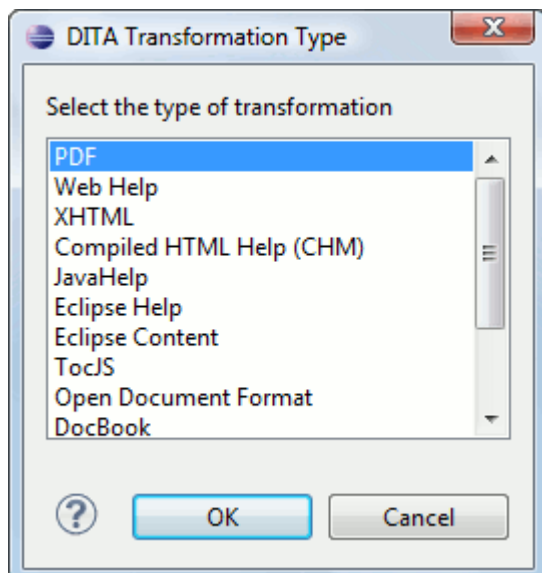

This type of transformation specifies the parameters for an Ant transformation that executes a DITA-OT build script. Oxygen XML Editor Eclipse plugin includes a built-in version of Ant and a built-in version of DITA-OT, but other versions can be set in the scenario.

To create a **DITA-OT Transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu. Then click the **New** button and select **DITA-OT Transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **DITA-OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

Figure 412. DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

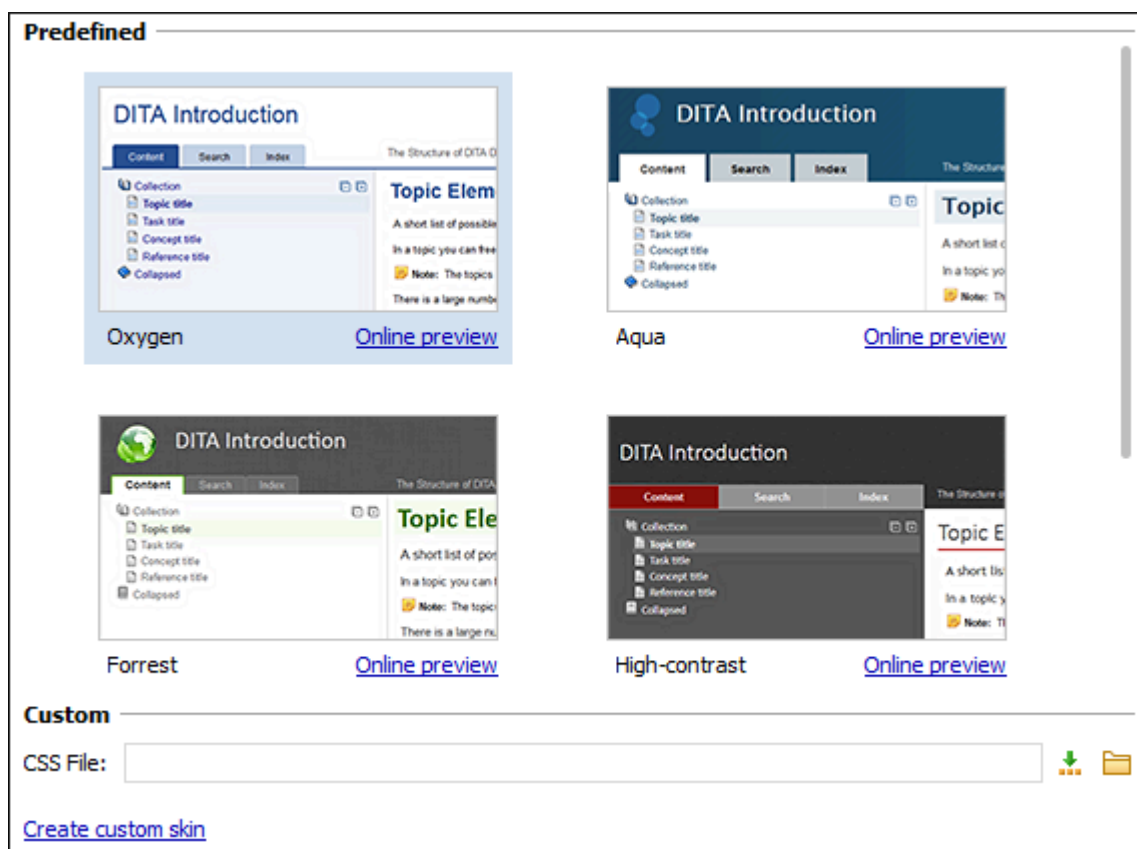

Skins Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Skins** tab is available for DITA-OT transformations with the **WebHelp Classic** output type and it provides a set of built-in skins that you can use as a base for your WebHelp system output.

A *skin* is a collection of CSS properties that can alter the look of the output by changing colors, font types, borders, margins, and paddings. This allows you to rapidly adapt the look and feel of your output.

Figure 413. Skins Tab

The **Skins** tab includes the following sections:

Built-in Skins

This section presents the built-in skins that are included in Oxygen XML Editor Eclipse plugin. The built-in skins cover a wide range of chromatic themes, ranging from a very light one to a high-contrast variant. To see how the *skin* looks when applied on a sample documentation

project that is stored on the Oxygen XML Editor Eclipse plugin website, click the **Online preview** link.

Custom Skins

You can use this section to customize the look of the output.

CSS File

You can set this field to point to a custom CSS stylesheet or customized skin. A custom CSS file will overwrite a skin selection.

Note:

The output can also be styled by setting the `args.css` parameter in the **Parameters tab**. The properties taken from the stylesheet referenced in this parameter take precedence over the properties declared in the skin set in the **Skins tab**.

Create custom skin

Use this link to open the [WebHelp Skin Builder \(on page 1511\)](#) tool.

Templates Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA-OT transformations with **WebHelp Responsive** or **PDF - based on HTML5 & CSS** output types and it provides a set of built-in [publishing templates \(on page 1356\)](#). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 414. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an  **Online preview** icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
 - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
 - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor Eclipse plugin scans the locations specified in the [DITA > Publishing preferences page \(on page 86\)](#) to find custom templates to display in the dialog box. You can access that preferences page directly from the **Template** tab by clicking on the **Configure Publishing Templates Gallery** link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also [add your custom templates \(on page 1399\)](#) to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the **DITA > Publishing preferences page (on page 86)** where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template \(on page 1562\)](#). Clicking this button will open a [template package configuration dialog box \(on page 2554\)](#) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

A rectangular box with a thin border containing an error icon (a red circle with a white exclamation mark) on the left, followed by the text "Some templates could not be loaded." and a blue underlined link "More details" on the right.

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing (on page 86)** and add that new folder to the list.
3. Switch the option at the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Resources

For more information about customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWXwO8>

Related Information:

[Publishing Templates \(on page 1356\)](#)

[Publishing Template Package Contents for PDF Customizations \(on page 1556\)](#)

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template \(on page 1562\)](#). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

Name

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

Description

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

Parameter Table

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

Note:

Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

Include WebHelp Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations ([DITA Map](#)

WebHelp Responsive (on page 1174) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1188)). This option specifies that the custom template will include a WebHelp Responsive customization.

Include HTML Page Layout Files

For **WebHelp Responsive** customizations, select this option if you want to copy the default *HTML Page Layout Files* (on page 1375) into your template package. They are helpful if you want to change the structure of the generated HTML pages.

Include PDF Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** (on page 1174) or **DITA Map to PDF - based on HTML5 & CSS** (on page 1188)). This option specifies that the custom template will include a PDF customization.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

[Publishing Template Package Contents for WebHelp Responsive Customizations](#) (on page 1359)

FO Processor Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 416. FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor Eclipse plugin.

XEP

The [RenderX](#) XEP processor. If XEP is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the **FO Processors** option page (on page 183).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor Eclipse plugin installation directory.

Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor Eclipse plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab ([on page 2558](#)).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related information

[FO Processors Preferences](#) ([on page 183](#))

[XSL-FO \(Apache FOP\) Processor for Generating PDF Output](#) ([on page 1273](#))

Parameters Tab (DITA-OT Transformations)

When you [create a new transformation scenario](#) ([on page 1206](#)) or [edit an existing one](#) ([on page 1297](#)), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA-OT Documentation](#). You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) ([on page 218](#)) selector to simplify setting a file path as the value of a parameter.

Note:

To input parameter values at runtime, use the [ask editor variable](#) ([on page 219](#)) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  **Insert Editor Variables** (*on page 218*) button or the  **Browse** button.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an *Oxygen Publishing Template* (*on page 1555*) descriptor file are displayed in italics. After [creating a publishing template](#) (*on page 1562*) and [adding it to the templates gallery](#) (*on page 1399*), when you select the template in the **Templates** tab (*on page 2552*), the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

[DITA Open Toolkit Documentation](#)

Feedback Tab (DITA-OT Transformations)

When you [create a new transformation scenario](#) (*on page 1206*) or [edit an existing one](#) (*on page 1297*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use **Oxygen Feedback** to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the **Oxygen Feedback** administration interface, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an **Oxygen Publishing Template** (*on page 1555*), either as an [HTML fragment extension](#)

point (on page 1366) or as a transformation parameter (on page 1364) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

Figure 417. Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA map* (on page 2678), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing

actions in the  **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the [DITA Documentation](#).

Note:

If a filter file is specified in the `args.filter` parameter (in [the Parameters tab \(on page 2558\)](#)), the filters are combined (neither file takes precedence over the other).

Use profiling condition set

Sets the [profiling condition set \(on page 2588\)](#) that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the  **New**,  **Edit**, or  **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

Note:

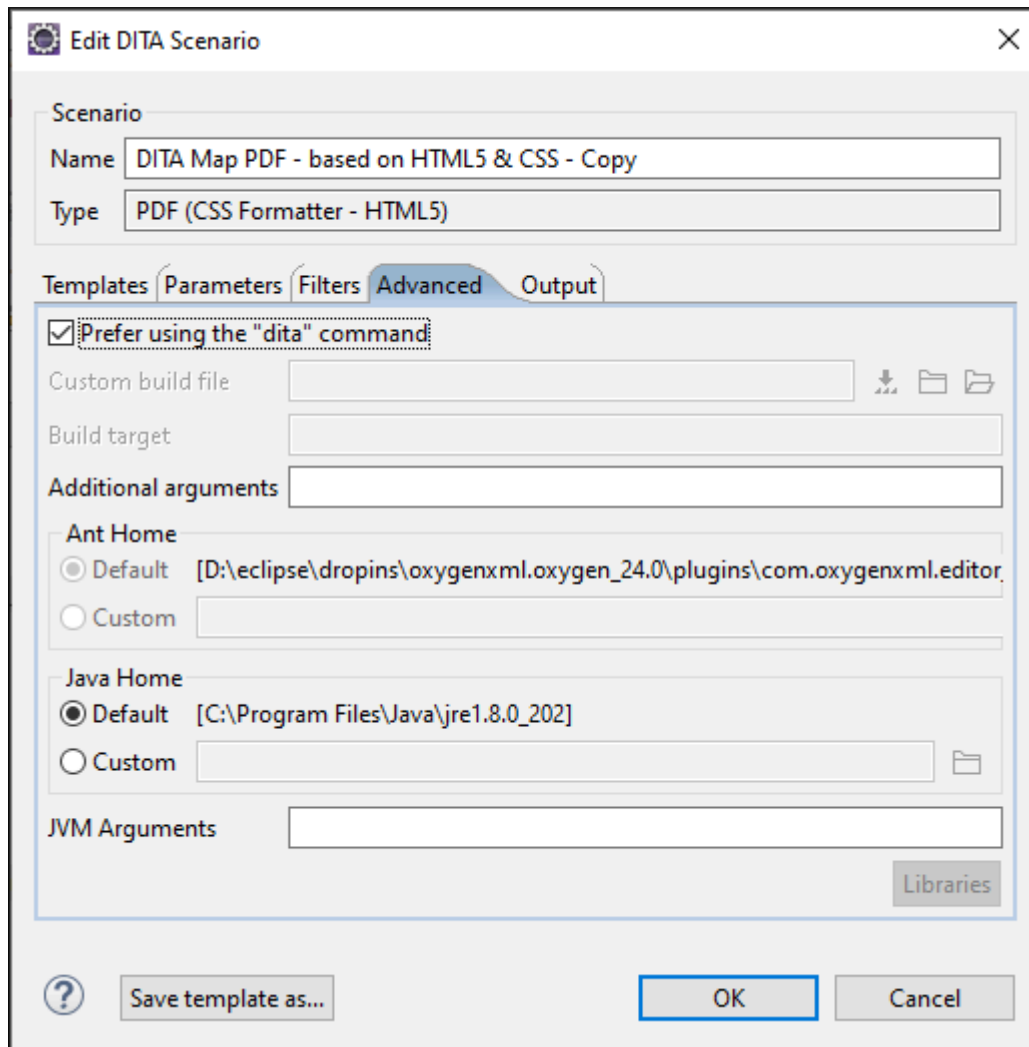

The [colors and styles of the profiled content \(on page 2593\)](#) settings are used for rendering it in **Author** mode but are not applied in the output.

Advanced Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

Figure 418. Advanced Settings Tab

You can specify the following options:

Prefer using the "dita" command

When selected, Oxygen XML Editor Eclipse plugin will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected, other options (**Custom build file**, **Build target**, **Ant Home**) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

Note:

Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the **Parameters** tab, the transformation is started as an ANT process instead of using the executable.

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters tab** (on page 2558) is used. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional Ant arguments

You can specify additional **Ant-specific** command-line arguments (such as `-diagnostics`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

Note:

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. If you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

Libraries

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* (on page 2679) files or additional class paths) to be used by the transformer.

Tip:

You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure 419. Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Note:

If the *DITA map* (on page 2678) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Ant Transformation

This type of transformation allows you to configure the options and parameters of an Ant build script.

An Ant transformation scenario is usually associated with an Ant build script. Oxygen XML Editor Eclipse plugin runs an Ant transformation scenario as an external process that executes the Ant build script with the

built-in Ant distribution (*Apache Ant (on page 2676)* version 1.9.8) that is included with the application, or optionally with a custom Ant distribution configured in the scenario.

Tip:

Certain Ant tasks require additional JAR libraries (for example, Ant *mail* tasks). The additional libraries can be added by editing the Ant transformation scenario, and in the **Output** tab, click the **Libraries** button (*on page 1249*) in the bottom right corner. This opens a dialog box where you can add JAR libraries. For a list of library dependencies, see <https://ant.apache.org/manual/install.html#librarydependencies>.

To create an Ant transformation scenario, use one of the following methods:

- Use the **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **ANT transformation**.
- Go to **Window > Show View** and select **Transformation Scenarios** to display *this view (on page 1306)*. Click the **New Scenario** drop-down menu button and select **ANT transformation**.

Both methods open the transformation configuration dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Options Tab (Ant Transformations)

When you create a new transformation scenario (*on page 1206*) or edit an existing one (*on page 1297*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Options** tab allows you to specify the following options:

Working directory

The path of the current directory of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** (*on page 218*) button, or the **Browse** button.

Build file

The Ant script file that is the input of the Ant external process. You can specify the path by using the text field, the **Insert Editor Variables** (*on page 218*) button, or the **Browse** button.

Build target

Optionally, you can specify a build target for the Ant script file. If no target is specified, the Ant target that is specified as the default in the Ant script file is used.

Additional Ant arguments

You can specify additional [Ant-specific](#) command-line arguments (such as `-diagnostics`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

Libraries

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR (on page 2679)* files or additional class paths) to be used by the transformer.

**Tip:**

You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Parameters Tab (Ant Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters that are accessible as Ant properties in the Ant build script.

The table displays all the parameters that are available in the Ant build script, along with their description and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable \(on page 218\)](#) selector to simplify setting a file path as the value of a parameter.

**Note:**

To input parameter values at runtime, use the [ask editor variable \(on page 219\)](#) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  **Insert Editor Variables (on page 218)** button or the  **Browse** button.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Output Tab (Ant Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Open

Allows you to specify the file to open automatically when the transformation is finished. This is usually the output file of the Ant process. You can specify the path by using the text field, the  **Insert Editor Variables (on page 218)** button, or the  **Browse** button.

- **In System Application** - The file specified in the **Open** text box is opened in the system application that is set in the operating system as the default application for that type of file (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).
- **In Editor** - The file specified in the **Open** text box is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

JSON Transformation with XSLT

This type of transformation specifies the transformation parameters and location of an XSLT stylesheet that is applied to the edited JSON document. This scenario is useful when you develop a JSON document and the XSLT document is in its final form.

To create a **JSON transformation with XSLT** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **JSON transformation with XSLT**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **JSON transformation with XSLT**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

JSON URL

Specifies the source JSON file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog

resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1210\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 210\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters** dialog box [\(on page 1208\)](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1253\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XSLT extension JARS or classes \(on page 1209\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a [dialog box for adding XSLT stylesheets \(on page 1210\)](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1210\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or *editor variables* (*on page 218*) (such as **#{cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable* (*on page 218*) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable* (*on page 218*) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:[Editor Variables \(on page 218\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS (on page 2679)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:**

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable \(on page 218\)](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

FO Processor Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 183\)](#).

Output Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 218\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#) (on page 176).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

**Attention:**

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

XSLT Transformation on XML

This type of transformation specifies the parameters and location of an XML document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the XML document is in its final form.

To create an **XSLT transformation on XML** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **XSLT transformation on XML**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **XSLT transformation on XML**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

**Note:**

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page \(on page 212\)](#), the XML input of the transformation is passed to that URI resolver. If the transformer engine is one of the built-in XSLT 2.0 / 3.0 engines and [the name of an initial template \(on page 1259\)](#) is specified in the scenario, the **XML URL** field can be empty. The **XML URL** field can

also be empty if you use [external XSLT processors \(on page 1222\)](#). Otherwise, a value is mandatory in this field.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 218\)](#) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Use "xml-stylesheet" declaration

If selected, the scenario applies the stylesheet specified explicitly in the XML document with the `xml-stylesheet` processing instruction. By default, this option is deselected and the transformation applies the XSLT stylesheet that is specified in the **XSL URL** field.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 199\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1210\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 210\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a [Configure parameters dialog box \(on page 1208\)](#) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1259\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XSLT extension JARS or classes \(on page 1209\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a [dialog box for adding XSLT stylesheets \(on page 1210\)](#) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1210\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or [editor variables \(on page 218\)](#) (such as **#{cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 218\)](#) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 218\)](#) can be inserted in the text box using the **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 218\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS (on page 2679)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

**Tip:**

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an [editor variable \(on page 218\)](#) in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

Advanced Saxon HE/PE/EE XSLT Transformation Options

The XSLT transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page \(on page 210\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Mode ("-im")

A Saxon-specific option that sets the initial mode for the transformation. If this value is also specified in a [configuration file \(on page 1262\)](#), the value in this option takes precedence.

Template ("-it")

A Saxon-specific option that sets the name of the initial XSLT template to be executed. If this value is also specified in a [configuration file \(on page 1262\)](#), the value in this option takes precedence.

Tip:

If your stylesheet includes `<xsl:template name="xsl:initial-template">`, Oxygen XML Editor Eclipse plugin will automatically detect and use it as the initial template, so this option is not needed in this case.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the [XSLT Debugger \(on page 1931\)](#) to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important,

optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

Note:

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a stylesheet is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

Note:

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

XML Schema version

Use this option to change the default XML Schema version for this transformation. To change the default XML Schema version globally, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Parser > XML Schema** and use the **Default XML Schema version** option [\(on page 195\)](#).

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable streaming mode

Selecting this option will allow an XSLT to run in streaming mode. It is not selected by default. However, in certain instances, the Saxon XSLT processor may auto detect and use streaming even if this option is not selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called [Integrated Extension Functions](#)) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
```

```

    return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
}

@Override
public SequenceType[] getArgumentTypes() {
    return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
}

@Override
public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
    return SequenceType.SINGLE_INTEGER;
}

@Override
public ExtensionFunctionCall makeCallExpression() {
    return new ExtensionFunctionCall() {
        public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
            throws XPathException {
            long v0 = ((IntegerValue)arguments[0].next()).longValue();
            long v1 = ((IntegerValue)arguments[1].next()).longValue();
            long result = v0<<v1;
            return Value.asIterator(Int64Value.makeIntegerValue(result));
        }
    };
}
}

```

2. Compile the class and add it to a JAR file.
3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

**Note:**

To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (on page 95).
- In a **validation scenario** (on page 558), you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (on page 1208) to open a dialog box where you can add libraries.

FO Processor Tab (XSLT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 183\)](#).

Output Tab (XSLT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** [\(on page 218\)](#) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

**Note:**

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#) (on page 176).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

**Important:**

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Attention:

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

Configuring an XSLT Processor for Generating Output

This section explains how to configure an XSLT processor and extensions for such a processor in Oxygen XML Editor Eclipse plugin.

Supported XSLT Processors

Oxygen XML Editor Eclipse plugin includes the following XSLT processors:

- **Xalan 2.7.2** (Deprecated) - **Xalan-Java** is an XSLT processor for transforming XML documents into HTML, text, or other XML document types. It implements XSL Transformations (XSLT) Version 1.0 and XML Path Language (XPath) Version 1.0.
- **Saxon 6.5.5** - **Saxon 6.5.5** is an XSLT processor that implements the Version 1.0 XSLT and XPath with a number of powerful extensions. This version of Saxon also includes many of the new features that were first defined in the XSLT 1.1 working draft, but for conformance and portability reasons these are not available if the stylesheet header specifies `version="1.0"`.
- **Saxon 12.3 Home Edition (HE), Professional Edition (PE)** - **Saxon-HE/PE** implements the basic conformance level for XSLT 2.0 / 3.0 and XQuery 1.0. The term *basic XSLT 2.0 / 3.0 processor* is defined in the draft XSLT 2.0 / 3.0 specifications. It is a conformance level that requires support for all features of the language other than those that involve schema processing. The HE product remains open source, but removes some of the more advanced features that are present in Saxon-PE.
- **Saxon 12.3 Enterprise Edition (EE)** - **Saxon EE** is the schema-aware edition of Saxon and it is one of the built-in processors included in Oxygen XML Editor Eclipse plugin. Saxon EE includes an XML Schema processor, and schema-aware XSLT, XQuery, and XPath processors.

The validation in schema aware transformations is done according to the XML Schema 1.0 or 1.1. This can be [configured in Preferences](#) (on page 195).

Note:

Oxygen XML Editor Eclipse plugin implements a Saxon *framework* that allows you to create Saxon configuration files. Two templates are available: **Saxon collection catalog** and **Saxon**

configuration. Both of these templates support content completion, element annotation, and attribute annotation.

**Note:**

Saxon can use the *ICU-J localization library* (`saxon9-icu.jar`) to add support for sorting and date/number formatting in a wide variety of languages. This library is not included in the Oxygen XML Editor Eclipse plugin installation kit. However, Saxon will use the default collation and localization support available in the currently used JRE. To enable this capability, follow these steps:

1. Download Saxon 12.3 Professional Edition (PE) or Enterprise Edition (EE) from <http://www.saxonica.com>.
2. Unpack the downloaded archive.
3. Create a new XSLT transformation scenario (or edit an existing one). In the **XSLT** tab, click the **Extensions** button to open the list of additional libraries used by the transformation process.
4. Click **Add** and browse to the folder where you unpacked the downloaded archive and choose the `saxon9-icu.jar` file.

Note that the `saxon9-icu.jar` should NOT be added to the application library folder because it will conflict with another version of the ICU-J library that comes bundled with Oxygen XML Editor Eclipse plugin.

- **Saxon-CE (Client Edition)** is Saxonica's implementation of XSLT 2.0 for use on web browsers. Oxygen XML Editor Eclipse plugin provides support for editing stylesheets that contain Saxon-CE extension functions and instructions. This support improves the validation, content completion, and syntax highlighting.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

**Note:**

A specific template, named **Saxon-CE stylesheet**, is available in the [New from Templates wizard](#) (*on page 253*).

- **Xsltproc (libxslt)** (Deprecated) - [Libxslt](#) is the XSLT C library developed for the Gnome project. **Libxslt** is based on *libxml2*, the XML C library developed for the Gnome project. It also implements most of the EXSLT set of processor-portable extensions, functions, and some of Saxon's evaluate and expression extensions.

Oxygen XML Editor Eclipse plugin uses **Libxslt** through its command-line tool (*Xsltproc*). Depending on your operating system, you must download the Libxslt libraries on your machine from <http://xmlsoft.org/XSLT/downloads.html> and place them in a local folder. Then you need to update the `PATH` environmental variable to contain the parent folder where the `xsltproc` executable is located.

 **Tip:**

As an example, a Windows installation of the Xsltproc engine would follow these steps:

1. Go to <http://ftp.zlatkovic.com/libxml.en.html> and download the following ZIP files: **iconv-1.9.2.win32.zip**, **libxml2-2.7.8.win32.zip**, **libxslt-1.1.26.win32.zip**, **zlib-1.2.5.win32.zip**.
2. Unzip all of them into the same folder of your choice.
3. Edit the `PATH` environment variable and add the `bin` folder for all four archives:

4. Restart Oxygen XML Editor Eclipse plugin.

Result: You can now use the **xsltproc** processor as an XSLT engine in the XSLT transformation scenario.

 **Note:**

The Xsltproc processor can be configured from the [XSLTPROC options page \(on page 213\)](#).

 **CAUTION:**

There is a known problem where file paths that contain spaces are not handled correctly in the LIBXML processor. For example, the built-in *XML Catalog (on page 2683)* files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled properly by LIBXML if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (C:\Program Files). This is because the built-in *XML catalog* files are stored in the `[OXYGEN_INSTALL_DIR]/frameworks` subdirectory of the installation directory, and in this case it contains a space character.

- **MSXML 4.0 (Legacy)** - MSXML 4.0 is available only on Windows platforms. It can be used for [transformation \(on page 1206\)](#) and [validation of XSLT stylesheets \(on page 656\)](#).

Oxygen XML Editor Eclipse plugin uses the Microsoft XML parser through its command-line tool `msxsl.exe`.

Since `msxsl.exe` is only a wrapper, Microsoft Core XML Services (MSXML) must be installed on the computer. Otherwise, you will get a corresponding warning. You can get the latest Microsoft XML parser from Microsoft web-site.

- **MSXML .NET (Legacy)** - MSXML .NET is available only on Windows platforms. It can be used for [transformation \(on page 1206\)](#) and [validation of XSLT stylesheets \(on page 656\)](#).

Oxygen XML Editor Eclipse plugin performs XSLT transformations and validations using the .NET *Framework* XSLT implementation (`System.Xml.Xsl.XsltTransform` class) through the `nxslt` command-line utility. The `nxslt` version included in Oxygen XML Editor Eclipse plugin is 1.6.

You should have the .NET *Framework* version 1.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

- **.NET 1.0 (Legacy)** - A transformer based on the **System.Xml** 1.0 library available in the .NET 1.0 and .NET 1.1 *frameworks* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 1.0 or 1.1 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 1.0 to be installed. Exit code: 128.`

You can get the .NET *Framework* version 1.0 from the [Microsoft website](#).

- **.NET 2.0 (Legacy)** - A transformer based on the **System.Xml** 2.0 library available in the .NET 2.0 *Framework* from Microsoft. It is available only on Windows.

You should have the .NET *Framework* version 2.0 already installed on your system. Otherwise, you will get the following warning: `MSXML.NET requires .NET Framework version 2.0 to be installed. Exit code: 128.`

You can get the .NET *Framework* version 2.0 from the [Microsoft website](#).

Configuring Custom XSLT Processors

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

To add a new custom processor, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **XML > XSLT-XQuery > Custom Engines**.
2. Click the **+ New** button at the bottom of the dialog box.

3. Configure the [parameters for the custom engine \(on page 199\)](#).
4. Click **OK**.

**Note:**

You can not use these custom engines in [the Debugger perspective \(on page 1913\)](#).

The output messages of a custom processor are displayed in an output view at the bottom of the application window. If an output message follows [the format of an Oxygen XML Editor Eclipse plugin linked message \(on page 555\)](#), clicking it highlights the location of the message in an editor panel containing the file referenced in the message.

Related Information:

[Custom Engines Preferences \(on page 199\)](#)

Configuring the XSLT Processor Extensions Paths

The Saxon and Xalan processors support the use of extension elements and extension functions. Unlike a literal result element, which the stylesheet simply transfers to the result tree, an extension element performs an action. The extension is usually used because the XSLT stylesheet fails in providing adequate functions for accomplishing a more complex task.

For more information about how to use extensions, see the following links:

- **Xalan (Deprecated)** - <http://xml.apache.org/xalan-j/extensions.html>
- **Saxon 6.5.5** - <http://saxon.sourceforge.net/saxon6.5.5/extensions.html>
- **Saxon 12.3** - <http://www.saxonica.com/documentation9.5/index.html#!extensibility>

To set an XSLT processor extension (a directory or a `jar` file), use [the Extensions button \(on page 1208\)](#) in the **Edit scenario** dialog box.

XSL-FO (Apache FOP) Processor for Generating PDF Output

The Oxygen XML Editor Eclipse plugin installation package is distributed with the [Apache FOP](#) that is a Formatting Objects processor for transforming your XML documents to PDF. *FOP* is a print and output independent formatter driven by XSL Formatting Objects. *FOP* is implemented as a Java application that reads a formatting object tree and renders the resulting pages to a specified output.

To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

Other FO processors can be configured in the [FO Processors preferences page \(on page 183\)](#).

Add a Font to the Built-in FO Processor - Simple Version

If the font that must be set to Apache FOP is one of the fonts that are installed in the operating system you should follow the next steps for creating and setting a FOP configuration file that looks for the font that it needs in the system fonts. It is a simplified version of [the procedure for setting a custom font in Apache FOP \(on page 1275\)](#).

1. Register the font in FOP configuration. (This is not necessary for DITA PDF transformations, skip to the next step)
 - a. Create a FOP configuration file that specifies that FOP should look for fonts in the installed fonts of the operating system.

```
<fop version="1.0">
  <renderers>
    <renderer mime="application/pdf">
      <fonts>
        <auto-detect/>
      </fonts>
    </renderer>
  </renderers>
</fop>
```

- b. Open the **Preferences** dialog box ([on page 70](#)), go to **XML > PDF Output > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

2. Set the font on the document content.

This is done usually with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

- For DocBook documents you can start with the built-in scenario called **DocBook PDF**, [edit the XSLT parameters \(on page 1206\)](#) and set the font name (for example, **Arial Unicode MS**) to the `body.font.family` and `title.font.family` parameters.
- For TEI documents you can start with the built-in scenario called **TEI PDF**, [edit the XSLT parameters \(on page 1206\)](#) and set the font name (for example, **Arial Unicode MS**) to the `bodyFont` and `sansFont` parameters.
- For DITA transformations to PDF using DITA-OT you should modify the following two files:
 - `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `<font-face>` element included in each `<physical-font>` element that has the `char-set="default"` attribute must contain the name of the font (for example, **Arial Unicode MS**)
 - `DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf` - An `<auto-detect>` element must be inserted in the `<fonts>` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute:

```
<renderer mime="application/pdf">
  . . .
```

```

<font>
  <auto-detect/>
</font>
. . .
</renderer>

```

Add a Font to the Built-in FO Processor - Advanced Version

If an XML document is transformed to PDF using the built-in Apache FOP processor but it contains some Unicode characters that cannot be rendered by the default PDF fonts, then a special font that is capable to render these characters must be configured and embedded in the PDF result.

Important:

On Windows, fonts are located into the `C:\Windows\Fonts` directory. On macOS, they are placed in `/Library/Fonts`. To install a new font on your system, it is enough to copy it in the `Fonts` directory. If a special font is installed in the operating system, there is a simple way of telling FOP to look for it. See [the simplified procedure for adding a font to FOP \(on page 1274\)](#).

1. Locate the font.

First, find out the name of a font that has the glyphs for the special characters you used. One font that covers most characters, including Japanese, Cyrillic, and Greek, is Arial Unicode MS.

2. Register the font in the FOP configuration.

Note:

DITA PDF transformations have their own `fop.xconf` (`DITA-OT-DIR/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`). If the font is not installed in the system, it needs to be referenced in the `fop.xconf`.

a. For information about registering the font in the FOP Configuration, see: <https://xmlgraphics.apache.org/fop/2.3/fonts.html>.

b. Open the **Preferences** dialog box ([on page 70](#)), go to **XML > PDF Output > FO Processors**, and enter the path of the FOP configuration file in the **Configuration file** text field.

3. Set the font on the document content.

This is usually done with XSLT stylesheet parameters and depends on the document type processed by the stylesheet.

DocBook Example: For DocBook documents, you can start with the built-in scenario called **DocBook PDF**, [edit the XSLT parameters \(on page 1206\)](#), and set the font name (for example, *Arialuni*) to the `body.font.family` and `title.font.family` parameters.

TEI Example: For TEI documents, you can start with the built-in scenario called **TEI PDF**, [edit the XSLT parameters \(on page 1206\)](#), and set the font name (for example, *Arialuni*) to the `bodyFont` and `sansFont` parameters.

DITA Example: For DITA to PDF transformations using DITA-OT modify the following two files:

- `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` - The `<font-face>` element included in each `<physical-font>` element that has the `char-set="default"` attribute must contain the name of the font.
- `DITA-OT-DIR/plugins/org.dita.pdf2/fop/conf/fop.xconf` - A `` element must be inserted in the `` element, which is inside the `<renderer>` element that has the `mime="application/pdf"` attribute.

For more information, see: <https://xmlgraphics.apache.org/fop/2.1/fonts.html>.

Adding Libraries to the Built-in FO Processor (XML with XSLT and FO)

Starting with Oxygen XML Editor Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in Apache FO processor. For older version of Oxygen XML Editor Eclipse plugin, use the following procedures to enable such support.

Adding Hyphenation Support for XML with XSLT Transformation Scenarios

If you want to add newer hyphenation libraries or you are using an older version of Oxygen XML Editor Eclipse plugin, follow this procedure:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the compiled *JAR* (on page 2679) from OFFO.
3. Copy the `fop-hyph.jar` file into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Editor Eclipse plugin.

Adding Support for PDF Images

To add support for PDF images in an older version of Oxygen XML Editor Eclipse plugin, follow these steps:

1. Create a folder called `fop` in the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Download the *fop-pdf-images* JAR libraries.
3. Copy the libraries into the `[OXYGEN_INSTALL_DIR]/lib/fop` folder.
4. Restart Oxygen XML Editor Eclipse plugin.

How to Enable Debugging for FO Processor Transformations

If you encounter errors when running PDF transformations that use an FO processor, it is possible to enable debugging/logging to help you identify the problem. To enable debugging/logging for FO processing, follow this procedure:

1. Locate and edit the following configuration file: `[OXYGEN_INSTALL_DIR]/tools/config/logback.xml`.

**Note:**

You need write access to this folder, so if you do not have administrator permissions, you might first need to copy the file to another location where you have write access.

2. Edit the `<root>` element (inside the `<configuration>` element), change its level to **debug**, and save the file.
3. Restart Oxygen XML Editor Eclipse plugin and re-run the transformation.

**Tip:**

To make it easier to analyze the data in the logs, it is recommended that you use a small input file when trying to reproduce the problem.

4. Once you are finished with the debugging session, remember to edit the `logback.xml` file and change the `<root>` element back to its original value. Otherwise, performance could be affected.

XSLT Transformation on JSON

This type of transformation specifies the parameters and location of a JSON document that the edited XSLT stylesheet is applied on. This scenario is useful when you develop an XSLT document and the JSON document is in its final form.

To create an **XSLT transformation on JSON** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **XSLT transformation on JSON**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **XSLT transformation on JSON**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XSLT Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XSLT** tab contains the following options:

JSON URL

Specifies the source JSON file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  ▾ **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

XSL URL

Specifies the source XSL file that the transformation will use. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  ▾ **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1210\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 210\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens a **Configure parameters dialog box** ([on page 1208](#)) that allows you to configure the XSLT parameters used in the current transformation. In this dialog box, you can also configure the parameters for [additional XSLT stylesheets \(on page 1278\)](#). If the XSLT transformation engine is custom-defined, you cannot use this dialog box to configure the parameters sent to the custom engine. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XSLT engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a **dialog box for configuring the XSLT extension JARS or classes** ([on page 1209](#)) that define extension Java functions or extension XSLT elements used in the transformation.

Additional XSLT stylesheets

Opens a **dialog box for adding XSLT stylesheets** ([on page 1210](#)) that are applied on the main stylesheet specified in the **XSL URL** field. This is useful when a chain of XSLT stylesheets must be applied to the input XML document.

XSLT Parameters

The global parameters of the XSLT stylesheet used in a transformation scenario can be configured by using the **Parameters** button in the **XSLT** tab of a new or edited transformation scenario dialog box.

The resulting dialog box includes a table that displays all the parameters of the current XSLT stylesheet, all imported and included stylesheets, and all [additional stylesheets \(on page 1210\)](#), along with their descriptions and current values. You can also add, edit, and remove parameters, and you can use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XSLT transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

Note:

1. The **doc** function solves the argument relative to the XSL stylesheet location. You can use full paths or [editor variables \(on page 218\)](#) (such as **\${cfdu}** [current file directory]) to specify other locations: `doc('${cfdu}/test.xml')//*`
2. You cannot use XSLT Functions. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 218\)](#)

XSLT Extensions

The **Extensions** button opens a dialog box that allows you to specify the *JARS (on page 2679)* and classes that contain extension functions called from the XSLT file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

Tip:

You can specify the path to the resources using wildcards (for example, `${oxygenHome}/lib/*.jar`).

An extension function called from the XSLT file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Additional XSLT Stylesheets

Use the **Additional XSLT Stylesheets** button in the **XSLT** tab to display a list of additional XSLT stylesheets to be used in the transformation and you can add files to the list or edit existing entries. The following actions are available:

Add

Adds a stylesheet in the **Additional XSLT stylesheets** list using a file browser dialog box. You can type an *editor variable (on page 218)* in the file name field of the browser dialog box. The name of the stylesheet will be added in the list after the current selection.

Remove

Deletes the selected stylesheet from the **Additional XSLT stylesheets** list.

Up

Moves the selected stylesheet up in the list.

Down

Moves the selected stylesheet down in the list.

FO Processor Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XSLT result as input** - The FO processor is applied to the result of the XSLT transformation that is defined in the **XSLT** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 183\)](#).

Output Tab (JSON Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables (on page 218)** button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting](#) (on page 176).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

**Attention:**

If your input XSLT contains `<xsl:result-document>` elements, then the secondary results will be saved to the specified URIs while the principal result is specified in this **Output** tab. For more information, see: <https://www.w3.org/TR/xslt-30/#element-result-document>.

XProc Transformation

This type of transformation specifies the parameters and location of an XProc script.

A sequence of transformations described by an XProc script can be executed with an XProc transformation scenario. To create an **XProc transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C on macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **XProc transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **XProc transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Related Information:

[Integrating an External XProc Engine \(on page 1287\)](#)

[Editing XProc Scripts \(on page 939\)](#)

XProc Tab

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XProc** tab contains the following options:

XProc URL

Specify the source XProc file to be used by the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the

browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Processor

Allows you to select the XProc engine to be used for the transformation. You can select the *Add-on for Calabash XProc engine* or a custom engine that is [configured in the XProc Preferences page \(on page 197\)](#).

Inputs Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Inputs** tab contains a list with the ports that the XProc script uses to read input data. Use the **Filter** text box to search for a specific term in the entire ports collection.

Each input port has an assigned name in the XProc script. The XProc engine reads data from the URL specified in the **URL** column.

The following actions are available for managing the input ports:

New

Opens an **Edit** dialog box that allows you to add a new port and its URL. The [built-in editor variables \(on page 218\)](#) and [custom editor variables \(on page 227\)](#) can be used to specify the URL.

Edit

Opens an **Edit** dialog box that allows you to modify the selected port and its URL. The [built-in editor variables \(on page 218\)](#) and [custom editor variables \(on page 227\)](#) can be used to specify the URL.

Delete

Removes the selected port from the list. It is available only for new ports that have been added to the list.

Parameters Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab presents a list of ports and parameters collected from the XProc script. The tab is divided into three sections:

List of Ports

In this section, you can use the **New** and **Delete** buttons to add or remove ports.

List of Parameters

This section presents a list of parameters for each port and includes columns for the parameter name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire parameters collection. You can use the **New** and **Delete** buttons to add or remove parameters. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers.

Editor Variable Information

The [built-in editor variables \(on page 218\)](#) and [custom editor variables \(on page 227\)](#) can be used for specifying the URI. The message pane at the bottom of the dialog box provides more information about the editor variables that can be used.

Outputs Tab (XProc Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Outputs** tab displays a list of output ports (along with the URL) collected from the XProc script. Use the **Filter** text box to search for a specific term in the entire ports collection. You can also sort the columns by clicking the column headers.

The following actions are available for managing the output ports:

New

Opens an **Edit** dialog box that allows you to add a new output port and its URL. An [editor variable \(on page 218\)](#) can be inserted for the URL by using the  **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output [Results view \(on page 335\)](#).

Edit

Opens an **Edit** dialog box that allows you to edit an existing output port and its URL. An [editor variable \(on page 218\)](#) can be inserted for the URL by using the  **Insert Editor Variables** button. There is also a **Show in transformation results view** option that allows you to select whether or not the results will be displayed in the output [Results view \(on page 335\)](#).

Delete

Removes the selected output port from the list. It is available only for new ports that have been added to the list.

Additional options that are available at the bottom of this tab include:

Open in Editor

If this option is selected, the XProc transformation result is automatically opened in an editor panel.

Open in Browser/System Application

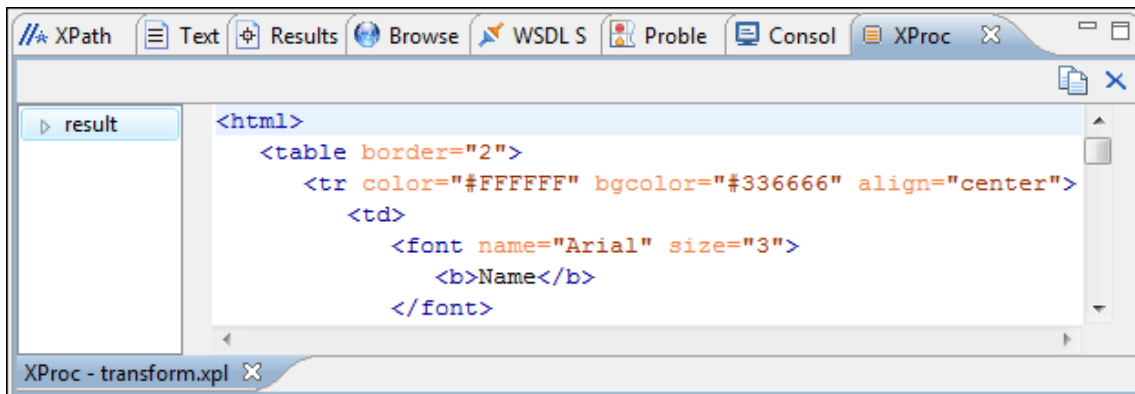

If this option is selected, you can specify a file to be opened at the end of the XProc transformation in the browser or system application that is associated with the file type. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Results

The result of the XProc transformation can be displayed as a sequence in an output view with two sections:

- A list with the output ports on the left side.
- The content that correspond to the selected output port on the right side.

Figure 420. XProc Transformation Results View

Options Tab (XProc Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Options** tab displays a list of the options collected from the XProc script. The tab is divided into two sections:

List of Options

This section presents a list of options and includes columns for the option name, namespace URI, and its value. Use the **Filter** text box to search for a specific term in the entire options collection. You can use the **New** and **Delete** buttons to add or remove options. You can edit the value of each cell in this table by double-clicking the cell. You can also sort the parameters by clicking the column headers. The names of edited options are displayed in bold.

Editor Variable Information

The built-in editor variables ([on page 218](#)) and custom editor variables ([on page 227](#)) can be used for specifying the URI. This section provides more information about the editor variables that can be used.

Calabash XProc Processor for Generating PDF Output

To generate PDF output from your XProc pipeline (when using the Calabash XProc processor), follow these steps:

1. Open the `[OXYGEN_INSTALL_DIR]/lib/xproc/calabash/engine.xml` file.
2. Uncomment the `<system-property name="com.xmlcalabash.fo-processor" value="com.xmlcalabash.util.FoXEP" />` system property.
3. Uncomment the `<system-property name="com.renderx.xep.CONFIG" file="../../tools/xep/xep.xml" />` system property. Edit the `@file` attribute to point to the configuration file that is usually located in the XEP installation folder.
4. Uncomment the references to the XEP libraries. Edit them to point to the matching library names from the XEP installation directory.
5. Restart Oxygen XML Editor Eclipse plugin.

Integrating an External XProc Engine

Oxygen XML Editor Eclipse plugin includes a bundled version of the *Calabash* XProc engine that can be used for XProc transformations and validation, but you can also integrate other external XProc engines. When you edit an XProc transformation scenario, there is a **Processor** drop-down menu where you can select the XProc engine to be used for the transformation.

If you do not need the external XProc engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can simply add the external engine by using the [XProc preferences page \(on page 197\)](#). Otherwise, if the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to integrate it using the plugin extension procedure below.

For example, there is a public project on GitHub that is an implementation for integrating *Morgana* XProc with Oxygen XML Editor Eclipse plugin: <https://github.com/xml-project/support-for-xmleditor>. Also, the Javadoc documentation of the XProc API is available for download from the application website as a zip file: [xprocAPI.zip](#).

To create an XProc integration project, follow these steps:

1. Move the `oxygen.jar` file from `[OXYGEN_INSTALL_DIR]/lib` to the `lib` folder of your project.
2. Implement the `ro.sync.xml.transformer.xproc.api.XProcTransformerInterface` interface.
3. Create a *Java archive (JAR)* ([on page 2679](#)) from the classes you created.
4. Create an `engine.xml` file according to the `engine.dtd` file. The attributes of the `<engine>` element are as follows:
 - a. **name** - The name of the XProc engine.
 - b. **description** - A short description of the XProc engine.

- c. **class** - The complete name of the class that implements *ro.sync.xml.transformer.xproc.api.XProcTransformerInterface*.
- d. **version** - The version of the integration.
- e. **engineVersion** - The version of the integrated engine.
- f. **vendor** - The name of the vendor / implementer.
- g. **supportsValidation** - **true** if the engine supports validation (otherwise, **false**).

The `<engine>` element has only one child, `<runtime>`. The `<runtime>` element contains several `<library>` elements with the `@name` attribute containing the relative or absolute location of the libraries necessary to run this integration.

5. Create a new folder (for example, named `MyXprocEngine`) and place the `engine.xml` and all the libraries necessary to run the new integration in that folder.
6. Place that new folder (e.g. `MyXprocEngine`) inside a new plugin folder. This new plugin folder should also contain a `plugin.xml` file that points to the new engine folder (e.g. `MyXprocEngine`).

The `plugin.xml` file would look like this:

```
<plugin
  id="morgana.xproc.addon"
  name="Contribute Morgana XProc"
  description="Contribute Morgana XProc"
  version="1.0"
  vendor="Syncro Soft"
  class="ro.sync.exml.plugin.Plugin"
  classLoaderType="preferReferencedResources">
  <extension type="AdditionalXProcEngine" path="MyXprocEngine/"></extension>
</plugin>
```

Related Information:

[Editing XProc Scripts \(on page 939\)](#)

[Creating an XProc Transformation Scenario \(on page 1283\)](#)

XQuery Transformation

This type of transformation specifies the parameters and location of an XML source that the edited XQuery file is applied on.

Note:

When the XML source is a native XML database, the source field of the scenario is empty because the XML data is read with XQuery-specific functions, such as `document()`. When the XML source is a local XML file, the URL of the file is specified in the input field of the scenario.

To create an **XQuery transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on **macOS**)) action from the toolbar or the **XML** menu. Then click the **New** button and select **XQuery transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **XQuery transformation**.

Both methods open the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

XQuery Tab

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **XQuery** tab contains the following options:

XML URL

Specifies the source XML file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, then the file is used directly from its remote location.

Note:

If the transformer engine is Saxon 9.x and a custom URI resolver is configured in the [advanced Saxon preferences page \(on page 212\)](#), the XML input of the transformation is passed to that URI resolver.

XQuery URL

Specifies the source XQuery file to be used for the transformation. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list. This URL is resolved through the catalog resolver. If the catalog does not have a mapping for the URL, the file is used directly from its remote location.

Transformer

This drop-down menu presents all the transformation engines available to Oxygen XML Editor Eclipse plugin for performing a transformation. These include the built-in engines and [the external engines defined in the Custom Engines preferences page \(on page 199\)](#). The engine you choose is used as the default transformation engine. Also, if an XSLT or XQuery document does

not have an associated validation scenario, this transformation engine is used in the validation process (if it provides validation support).

Advanced options

Allows you to configure the [advanced options of the Saxon HE/PE/EE engine \(on page 1226\)](#) for the current transformation scenario. To configure the same options globally, go to the [Saxon-HE/PE/EE preferences page \(on page 210\)](#). For the current transformation scenario, these **Advanced options** override the options configured in that preferences page.

Parameters

Opens the **Configure parameters dialog box (on page 1225)** for configuring the XQuery parameters. You can use the buttons in this dialog box to add, edit, or remove parameters. If the XQuery transformation engine is custom-defined, you can not use this dialog box to set parameters. Instead, you can copy all parameters from the dialog box using contextual menu actions and edit the custom XQuery engine to include the necessary parameters in the command line that starts the transformation process.

Extensions

Opens a [dialog box for configuring the XQuery extension JARS or classes \(on page 1226\)](#) that define extension Java functions or extension XSLT elements used in the transformation.

XQuery Parameters

The global parameters of the XQuery file used in a transformation scenario can be configured by using the **Parameters** button in the **XQuery** tab.

The resulting dialog box includes a table that displays all the parameters of the current XQuery file, along with their descriptions and current values. You can also add, edit, and remove parameters, and use the **Filter** text box to search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

If the **XPath** column is selected, the parameter value is evaluated as an XPath expression before starting the XQuery transformation.

Example:

For example, you can use expressions such as:

```
doc('test.xml')//entry
//person[@atr='val']
```

**Note:**

1. The **doc** function solves the argument relative to the XQuery file location. You can use full paths or *editor variables (on page 218)* (such as **#{cfdu}** [current file directory]) to specify other locations: `doc('#{cfdu}/test.xml')//*`
2. Only XPath functions are allowed.

Below the table, the following actions are available for managing the parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. An *editor variable (on page 218)* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Edit

Opens the **Edit Parameter** dialog box that allows you to edit the selected parameter. An *editor variable (on page 218)* can be inserted in the text box using the  **Insert Editor Variables** button. If the **Evaluate as XPath** option is selected, the parameter will be evaluated as an XPath expression.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

The bottom panel presents the following:

- The default value of the parameter selected in the table.
- A description of the parameter, if available.
- The system ID of the stylesheet that declares it.

Related Information:

[Editor Variables \(on page 218\)](#)

XQuery Extensions

The **Extensions** button is used to specify the *JAR (on page 2679)* and classes that contain extension functions called from the XQuery file of the current transformation scenario. You can use the **Add**, **Edit**, and **Remove** buttons to configure the extensions.

An extension function called from the XQuery file of the current transformation scenario will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item to be moved and click the **↑ Move up** or **↓ Move down** buttons.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as those in the [Saxon HE/PE/EE preferences page \(on page 204\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

Note:

The profiling support works only if the [Present as a sequence transformation option \(on page 1229\)](#) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated.

This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

FO Processor Tab (XQuery Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab contains the following options:

Perform FO Processing

Specifies whether or not an FO processor is applied (either the built-in Apache FOP engine or an external engine defined in **Preferences**) during the transformation.

Input

Choose between the following options to specify which input file to use:

- **XQuery result as input** - The FO processor is applied to the result of the XQuery transformation that is defined in the **XQuery** tab.
- **XML URL as input** - The FO processor is applied to the input XML file.

Method

The output format of the FO processing. The available options depend on the selected processor type.

Processor

Specifies the FO processor to be used for the transformation. It can be the built-in Apache FOP processor or an [external processor \(on page 183\)](#).

Output Tab (XQuery Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab contains the following options:

Present as a sequence

Selecting this option will reduce the time necessary to fetch the full results, as it will only fetch the first chunk of the results.

Prompt for file

At the end of the transformation, a file browser dialog box is displayed for specifying the path and name of the file that stores the transformation result.

Save As

The path of the file where the result of the transformation is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Show in results view as

You can choose to view the results in one of the following:

- **XML** - If this is selected, Oxygen XML Editor Eclipse plugin displays the transformation result in an XML viewer panel at the bottom of the application window with [syntax highlighting \(on page 176\)](#).
- **XHTML** - This option is only available if **Open in Browser/System Application** is not selected. If selected, Oxygen XML Editor Eclipse plugin displays the transformation result in a built-in XHTML browser panel at the bottom of the application window.

Important:

When transforming very large documents, you should be aware that selecting this option may result in very long processing times. This drawback is due to the built-in Java XHTML browser implementation. To avoid delays for large documents, if you want to see the XHTML result of the transformation, you should use an external browser by selecting the **Open in Browser/System Application** option instead.

- **Image URLs are relative to** - If **Show in results view as XHTML** is selected, this option specifies the path used to resolve image paths contained in the transformation result. You can specify the path by using the text field, the  **Insert Editor Variables (on page 218)** button, or the  **Browse** button.

SQL Transformation

This type of transformation specifies a database connection for the database server that runs the SQL file associated with the scenario. The data processed by the SQL script is located in the database.

To create an **SQL transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** action from the toolbar or the **XML** menu. Then click the **New** button and select **SQL transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display [this view \(on page 1306\)](#). Click the  **New Scenario** drop-down menu button and select **SQL transformation**.

Both methods open the **New Scenario** dialog box. This dialog box allows you to configure the following options that control the transformation:

Name

The unique name of the SQL transformation scenario.

SQL URL

Allows you to specify the URL of the SQL script. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** ([on page 218](#)) button, or the browsing actions in the  **Browse** drop-down list.

Connection

Allows you to select a connection from a drop-down list. To configure a connection, use the  **Advanced options** button to open the **Data Source** preferences page ([on page 74](#)).

Parameters

Allows you to add or configure parameters for the transformation.

Editing a Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

Note:

Since transformation scenarios that are associated with built-in [frameworks](#) ([on page 2679](#)) are read-only, to edit one of these scenarios you will need to [duplicate it and edit the duplicated scenario](#) ([on page 1299](#)).

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on **macOS**)) action from the toolbar or the **XML** menu.

Step Result: The **Configure Transformation Scenario(s)** dialog box ([on page 1300](#)) is opened.

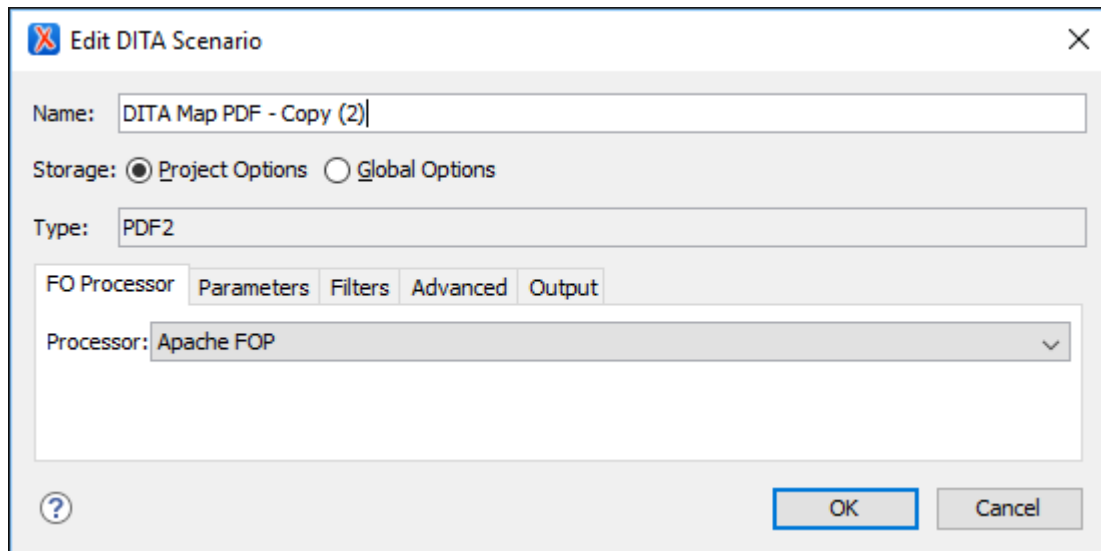

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

Tip:

You could also select the scenario and the  **Edit** button in the **Transformation Scenarios** view ([on page 1306](#)) to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected.

Figure 421. Edit Scenarios Configuration Dialog Box

Transformation Types

The **Configure Transformation Scenario(s)** dialog box ([on page 1300](#)) contains a **Type** column that shows you the transformation type for each of the listed scenarios. Each type of transformation contains some tabs with various configuration options.

The following is a list of the transformation types and their particular tabs (click the name of each tab below to see details about all the options that are available):

- **DITA-OT** - This type of transformation includes configurable options in the following tabs:
 - [Templates Tab \(on page 2552\)](#)
 - [FO Processor Tab \(on page 2556\)](#) (Available for PDF output)
 - [Parameters Tab \(on page 2558\)](#)
 - [Filters Tab \(on page 2560\)](#)
 - [Advanced Tab \(on page 2561\)](#)
 - [Output Tab \(on page 2564\)](#)
- **ANT** - This type of transformation includes configurable options in the following tabs:
 - [Options Tab \(on page 1249\)](#)
 - [Parameters Tab \(on page 1250\)](#)
 - [Output Tab \(on page 1251\)](#)
- **XSLT** - This type of transformation includes configurable options in the following tabs:
 - [XSLT Tab \(on page 1206\)](#)
 - [FO Processor Tab \(on page 1215\)](#)
 - [Output Tab \(on page 1216\)](#)
- **XProc** - This type of transformation includes configurable options in the following tabs:
 - [XProc Tab \(on page 1283\)](#)
 - [Inputs Tab \(on page 1284\)](#)
 - [Parameters Tab \(on page 1284\)](#)

- Outputs Tab *(on page 1285)*
- Options Tab *(on page 1286)*
- **XQuery** - This type of transformation includes configurable options in the following tabs:
 - XQuery Tab *(on page 1224)*
 - FO Processor Tab *(on page 1229)*
 - Output Tab *(on page 1229)*

Related Information:

[Creating New Transformation Scenarios *\(on page 1206\)*](#)

[Duplicating a Transformation Scenario *\(on page 1299\)*](#)

[Configure Transformation Scenario\(s\) Dialog Box *\(on page 1300\)*](#)

[Applying Associated Transformation Scenarios *\(on page 1299\)*](#)

Duplicating a Transformation Scenario

Duplicating a transformation scenario is useful for creating a scenario that is similar to an existing one or to edit a built-in transformation scenario.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on **macOS**)) action from the toolbar or the **XML** menu.

Step Result: The **Configure Transformation Scenario(s)** dialog box *(on page 1300)* is opened.

2. Select the particular transformation scenario and click the **Duplicate** button at the bottom of the dialog box or from the contextual menu.

Tip:

You could also select the scenario and the  **Duplicate** button in the **Transformation Scenarios** view *(on page 1306)* to achieve the same result.

Result: This will open an **Edit scenario** configuration dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types](#) section *(on page 1298)*.

Related Information:

[Creating New Transformation Scenarios *\(on page 1206\)*](#)

[Editing a Transformation Scenario *\(on page 1297\)*](#)

Applying Associated Transformation Scenarios

If you have associated transformation scenarios for the current document (in the **Configure Transformation Scenario(s)** dialog box *(on page 1300)* or **Transformation Scenarios** view *(on page 1306)*), Oxygen XML

Editor Eclipse plugin included an  **Apply Transformation Scenario(s)** action that allows you to quickly apply the associated transformation scenarios on the current document. Note that if an association is not detected, this action will open the **Configure Transformation Scenario(s)** dialog box (*on page 1300*) where you can choose the scenarios you want to apply.

The  **Apply Transformation Scenario(s)** action can be initiated from any of the following methods:

- Use the **Alt + Shift + T, T (Command + Option + T, T on macOS)** keyboard shortcut.
- Click the  **Apply Transformation Scenario(s)** button on the main toolbar.
- Click the  **Apply Transformation Scenario(s)** button on the toolbar in the **Transformation Scenarios** view (*on page 1306*).
- Right-click a file in the **Project Explorer** view (*on page 269*) and select **Transform >  Apply Transformation Scenario(s)**.
- Use the **Apply Associated** button in the **Configure Transformation Scenario(s)** dialog box (*on page 1300*).

[Editing a Transformation Scenario \(*on page 1297*\)](#)

[Configure Transformation Scenario\(s\) Dialog Box \(*on page 1300*\)](#)

[Transformation Scenarios View \(*on page 1306*\)](#)

Configure Transformation Scenario(s) Dialog Box

You can use the **Configure Transformation Scenarios(s)** dialog box for [editing existing transformation scenarios \(*on page 1297*\)](#) or [creating new ones \(*on page 1206*\)](#).

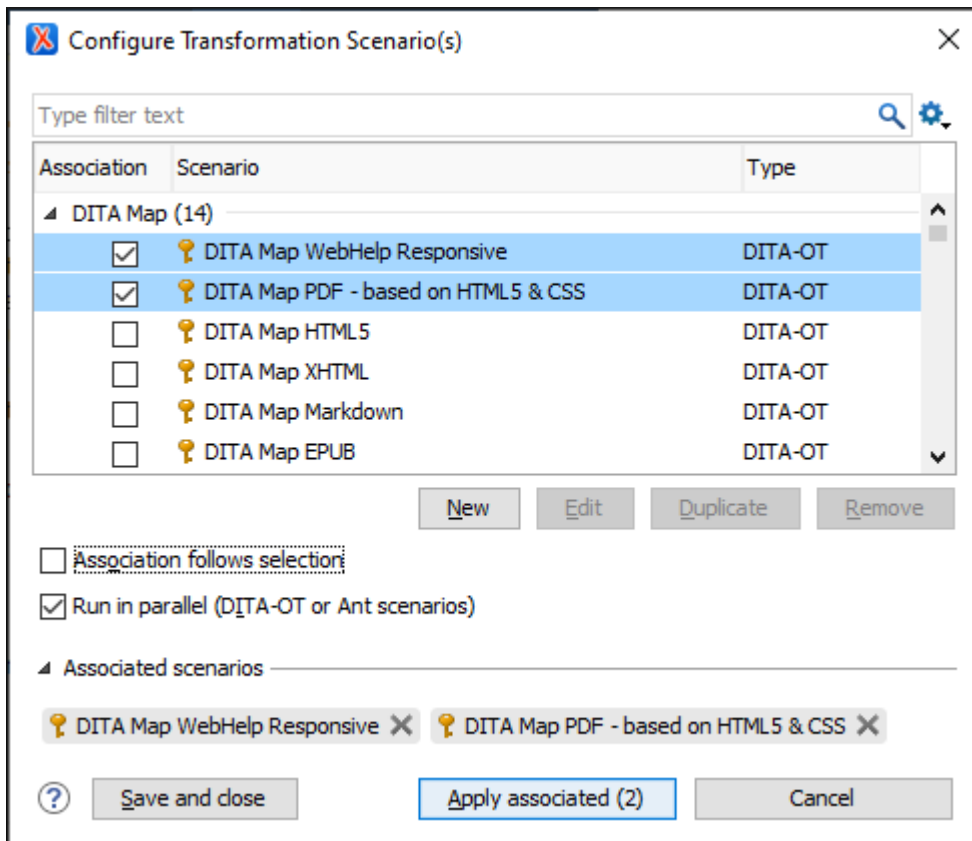

To open this dialog box, use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C (Command + Option + T, C on macOS)**) action from the toolbar or the **XML** menu.

Figure 422. Configure Transformation Scenario(s) Dialog Box

The dialog box includes the following options and features:

Search Filter Field

You can begin typing text in the search field at the top of the dialog box to filter the scenarios shown in the table below this field.

Settings

Use this drop-down to access the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds **imported** to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Scenarios Table Section

The middle section of the dialog box is a table that displays the scenarios that you can apply to the current document. The table includes following sortable columns:

- **Association** - The checkboxes in this column mark whether or not a transformation scenario is associated with the current document.
- **Scenario** - This column presents the names of the transformation scenarios.
- **Type** - If the **Show Type** contextual menu option is selected, this column displays the type of the transformation scenario. For further details about the types of transformation scenarios that are available in Oxygen XML Editor Eclipse plugin, see the [Transformation Types section \(on page 1298\)](#).

If you right-click in the header area, the following options are accessible:

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

If you right-click any particular transformation scenario, the following actions are accessible:

Edit

This button opens the **Edit Scenario** configuration dialog box (on page 1297) that allows you to configure the options of the transformations scenario.

Duplicate

Use this button to create a **duplicate transformation scenario** (on page 1299).

Remove

Use this button to remove custom transformation scenarios.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds **imported** to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Bottom Section

The bottom section of the dialog box contains the following actions and options:

New

This button allows you to **create a new transformation scenario** (on page 1206).

Edit

This button opens the **Edit Scenario** dialog box that allows you to configure the options of the transformations scenario. For information about all the specific options in the various tabs, see the [Transformation Types section \(on page 1298\)](#).

Note:

If you try to edit a transformation scenario associated with a defined document type, Oxygen XML Editor Eclipse plugin displays a warning message to inform you that this is not possible and gives you the option to create a [duplicate transformation scenario \(on page 1299\)](#) to edit instead.

Duplicate

Use this button to create a [duplicate transformation scenario \(on page 1299\)](#).

Remove

Use this button to remove transformation scenarios.

Note:

Removing scenarios associated with a defined document type is not allowed.

Association follows selection

Select this checkbox to automatically associate selected transformation scenarios with the current document. This option can also be used for multiple selections.

Note:

When this option is selected, the **Association** column is hidden.

Run in parallel (DITA-OT or Ant scenarios)

This option is available if you select multiple DITA-OT or Ant type scenarios. Selecting this option results in the transformations being done in parallel, instead of sequentially. It should help to reduce the amount of time it takes for the publishing to finish when transforming large projects.

Attention:

If multiple selected DITA-OT scenarios have the same output or temporary files folder, this option is not available since the process would need to read and write content to the same folder in this case.

Associated scenarios section

Displays the scenarios that are associated with the current document. Selecting a checkbox in the **Association** column in the list of scenarios will add that scenario to this section. To remove a scenario from being associated with the current document, simply click the remove icon () to the right of the scenario name.

Save and close

Saves the current configuration and closes the dialog box.

Apply associated

Use this button to apply the associated scenarios and run the transformation on the current document.

Cancel

Cancels any changes made in the dialog box and reverts to the previously saved association.

Tip:

Your selections in the **Configure Transformation Scenario(s)** dialog box are persistent so the configured associations for the current document will be remembered after the dialog box is closed.

Related Information:

[Sharing Transformation Scenarios \(on page 1306\)](#)

Batch Transformations

A transformation action can be applied on a batch of selected files [from the contextual menu of the Project Explorer view \(on page 273\)](#) without having to open the files involved in the transformation. You can apply the same scenario to a batch of files or multiple scenarios to a single file or batch of files.

1. Select the files you want to transform and from the contextual menu, select **Transform** >  **Configure Transformation Scenario(s)** to choose one or more transformation scenarios to be applied on all the files in the logical folder.
2. Use Oxygen XML Editor Eclipse plugin [editor variables \(on page 218\)](#) to specify the input and output files. This ensures that each file from the selected set of resources is processed and that the output is not overwritten by the subsequent processing.
 - a. Edit the transformation scenario to make sure the appropriate [editor variable \(on page 218\)](#) is assigned for the input file. For example, for a *DocBook PDF transformation*, make sure the **XML URL** input box is set to the ``${currentFileURL}` [editor variable \(on page 224\)](#). For a DITA PDF

transformation, make sure the `args.input` parameter is set to the `#{cf}` editor variable (on page 224).

- b. Edit the transformation scenario to make sure the appropriate editor variable is assigned for the output file. For example, for an **XML transformation with XSLT**, switch to the **Output** tab and set the path of the output file using a construct of [editor variables \(on page 218\)](#), such as `#{cfd}/#{cfn}.html`.
3. Now that the logical folder has been associated with one or more transformation scenarios, whenever you want to apply the same batch transformation, you can select **Transform** >  **Transform with** from the contextual menu and the same previously associated scenario(s) will be applied.
4. If you want a different type of transformation to be applied to each file inside the logical folder, associate individual scenarios for each file and select **Transform** >  **Apply Transformation Scenario(s)** from the contextual menu of the logical folder.

Related Information:

[Editor Variables \(on page 218\)](#)

Sharing Transformation Scenarios

The transformation scenarios and their settings can be shared with other users by [exporting them to a specialized scenarios file \(on page 217\)](#) that can then be imported.

Transformation Scenarios View

You can manage the transformation scenarios by using the **Transformation Scenarios** view. To open this view, select **Window** > **Show View** > **Transformation Scenarios**.

Figure 423. Transformation Scenarios view

Oxygen XML Editor Eclipse plugin supports multiple scenarios association. To associate multiple scenarios with a document, select the checkboxes in front of each scenario. You can also associate multiple scenarios with a document from the **Configure Transformation Scenario(s)** dialog box (*on page 1300*).

By default, Oxygen XML Editor Eclipse plugin presents the items in the following order:

1. Scenarios that match the current *framework* (*on page 2679*).
2. Scenarios that match the current project.
3. Scenarios that match other *frameworks*.

Toolbar/Contextual Menu Actions and Options

The following actions and options are available on the toolbar or in the contextual menu:

Apply selected scenarios

Select this option to run the current transformation scenario.

Debug selected scenario

Select this option to switch to the **Debugger perspective** ([on page 2680](#)) and initialize it with the parameters from the scenario (the XML, XSLT, or XQuery input, the transformation engine, the XSLT parameters).

New

This drop-down menu contains a list of the [scenarios that you can create](#) ([on page 1206](#)).

Oxygen XML Editor Eclipse plugin determines the most appropriate scenarios for the current type of file and displays them at the beginning of the list, followed by the rest of the scenarios.

Duplicate

Adds a new scenario to the list that is a duplicate of the current scenario. It is useful for creating a scenario that is similar to an existing one.

Edit

Opens the dialog box that allows you to configure various options in several tabs, depending on the type of transformation scenario that was selected. For information about all the specific options in the various tabs, see the [Transformation Types section](#) ([on page 1298](#)).

Remove

Removes the current scenario from the list. This action is also available by using the **Delete** key.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the [scenarios](#) file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds [imported](#) to the name of the imported scenario.

Export selected scenarios

Use this option to export transformation and validation scenarios individually. Oxygen XML Editor Eclipse plugin creates a [scenarios](#) file that contains the scenarios that you export.

Settings

This drop-down menu allows you to configure the following options (many of these options are also available if you right-click the name of a column):

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

Note:

When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds **imported** to the name of the imported scenario.

Export selected scenarios

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

Show Type

Use this option to display the transformation type of each scenario.

Show Storage

Use this option to display the storage location of the scenarios.

Group by Type

Select this option to group the scenarios by their type.

Group by Storage

Select this option to group the scenarios by their storage location.

Ungroup all

Select this option to ungroup all the scenarios.

Reset Layout

Select this option to restore the default settings of the layout.

Your selections in the **Transformation Scenarios** view are persistent so the configured associations for the current document will be remembered whenever the document is opened.

WebHelp Output Customization

Oxygen XML WebHelp provides the ability to generate two different types of output, **WebHelp Responsive** and **WebHelp Classic**. Each type has its own set of options and features. The **WebHelp Responsive** variant is available for DITA documents while the **WebHelp Classic** variants are available for DocBook.

Table 37. WebHelp System Feature Matrix

Features	WebHelp System Variants		
	Responsive	Classic w/ Feedback	Classic
Desktop Systems	✓	✓	✓
Mobile Devices	✓		
Built-in Skins	✓	✓	✓
Built-in Templates	✓		
Search Capabilities	✓	✓	✓
Modern Layout	✓		
Adaptable to Any Screen Size	✓		
Oxygen Feedback Commenting Platform	✓		
DITA Documents	✓		
DocBook Documents		✓	✓
Tri-Pane Frames or Frameless Version		✓	✓

WebHelp Responsive Output for DITA

WebHelp Responsive features a very flexible layout, is designed to adapt to any screen size to provide an optimal viewing and interaction experience. It is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

WebHelp Responsive output can be generated by using the [DITA Map WebHelp Responsive \(on page 1174\)](#) transformation scenario.

For an in-depth look at WebHelp Responsive features and the publishing process, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

Layout and Features

This section contains information about the layout and features of the WebHelp Responsive output.

Layout of the Responsive Page Types

You can select from several different styles of layouts (for example, by default, you can select either a *tiles* or *tree* style of layout). Furthermore, each layout includes a collection of skins that you can choose from, or you can customize your own.

Figure 424. WebHelp Responsive Output on a Normal Screen

Figure 425. WebHelp Responsive Output on a Narrow Screen

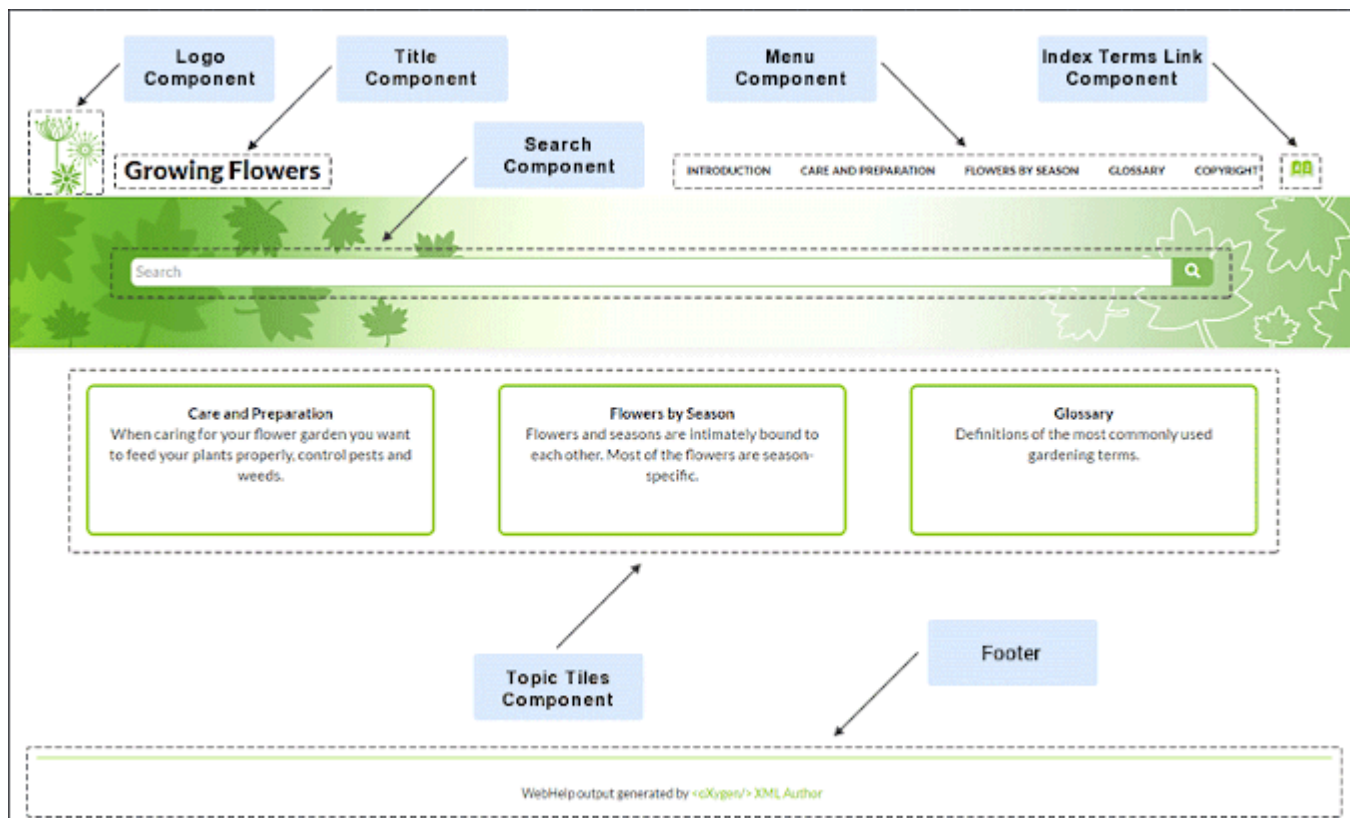

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The main page also consists of various other components, such as a logo, title, menu, search field, or index link.

Main Page - Tiles Layout

In the *tiles* presentation mode, a tile component is created for each chapter (first-level topic) in the publication. The tile presents a link to the topic and its short description.

Figure 426. Main Page - Tiles Layout

1. Logo Component (*on page 1314*)
2. Title Component (*on page 1314*)
3. Search Input Component (*on page 1315*)
4. Menu Component (*on page 1315*)
5. Index Terms Link Component (*on page 1315*)
6. Topic Tiles Component (*on page 1315*)
7. Footer Component (*on page 1315*)

Main Page - Tree Layout

In the *tree* presentation mode, links to the first and second level topics in the publication are displayed using a tree-like component.

Figure 427. Main Page - Tree Layout

1. Logo Component (on page 1314)
2. Title Component (on page 1314)
3. Search Input Component (on page 1315)
4. Menu Component (on page 1315)
5. Index Terms Link Component (on page 1315)
6. Table of Contents Component (on page 1315)
7. Footer Component (on page 1315)

Main Page Components

The layout components displayed in the main page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the [webhelp.logo.image](#) transformation parameter (*on page 1487*). For the target URL, use the [webhelp.logo.image.target.url](#) parameter (*on page 1487*).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu](#) (*on page 1416*) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the [webhelp.show.indexterms.link](#) parameter (*on page 1496*).

Search Input

An input text field where you can enter search queries.

Topic Tiles

A tile associated with a main topic. Each topic tile has three sections that correspond to the topic title, short description, and image.

Topic Tile Title

Presents the navigation title of the associated topic.

Topic Tile Short Description

Presents the [short description](#) of the topic. It may be collected either from the topic or from the DITA map topic meta.

Topic Tile Image

Presents an image associated with the topic. The [image association](#) (*on page 1416*) is done in the DITA map.

Tree Table of Contents

An area that contains first and second-level topic titles from your publication.

Page Footer

WebHelp Responsive output footer.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure 428. Topic Page

1. Logo Component (on page 1317)
2. Title Component (on page 1316)
3. Search Input Component (on page 1317)
4. Menu Component (on page 1317)
5. Index Terms Link Component (on page 1317)
6. Expand/Collapse All Sections Component (on page 1317)
7. Navigation Links Component (on page 1317)
8. Print Link Component (on page 1317)
9. Breadcrumb Component (on page 1317)
10. Publication Table of Contents Component (on page 1318)
11. Topic Content Component (on page 1317)
12. Topic Table of Contents Component (on page 1318)

Topic Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the `webhelp.logo.image` transformation parameter (on page 1487). For the target URL, use the `webhelp.logo.image.target.url` parameter (on page 1487).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu \(on page 1416\)](#) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the `webhelp.show.indexterms.link` parameter (on page 1496).

Search Input

An input text field where you can enter search queries.

Navigation Links

The navigation links ([← Previous](#) / [Next →](#) arrows) can be used to navigate to the previous or next topic. These navigation links are controlled by the `collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference, navigation links will be generated in the output for that topic and all of its child topics. You can also use the `webhelp.default.collection.type.sequence` parameter and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

Tip:

To hide the navigation links, you can edit the transformation scenario and set the value of the `webhelp.show.navigation.links` parameter to `no`.

Expand/Collapse Sections Button

Icon that expands or collapses sections listed in the side table of contents within a topic.

Print Link

A print icon that opens the print dialog box for your particular browser.

Breadcrumb

Presents the path of the current displayed DITA topic.

Topic Content

Presents the content of the associated DITA topic.

Publication Table of Contents

A Table of Content for the publication displayed in the left side of the screen. You can use the  button to collapse the table of contents (or the  button to expand it).

Topic Table of Contents (*On this page* links)

A table of contents for the topic displayed on the right side with a heading named **On this page** and it contains links to each section within the current topic and the section corresponding to the current scroll position is highlighted. This component is generated for any topic that contains at least two `<section>` elements and each `<section>` must have an `@id` attribute. You can use the  button to collapse the table of contents (or the  button to expand it).

Page Footer

WebHelp Responsive output footer.

Search Results Page

The *Search Page* presents search results in the WebHelp Responsive output. The HTML page consists of a search results component along with various other additional components, such as a title, menu, or index link.

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the  **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

Figure 429. Search Results Page

1. Logo Component (on page 1319)
2. Title Component (on page 1319)
3. Search Input Component (on page 1320)
4. Menu Component (on page 1320)
5. Index Terms Link Component (on page 1320)
6. Search Results Component (on page 1320)
7. Footer Component (on page 1320)

Search Results Page Components

The layout components displayed in the search page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the [webhelp.logo.image](#) transformation parameter (*on page 1487*). For the target URL, use the [webhelp.logo.image.target.url](#) parameter (*on page 1487*).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu](#) (*on page 1416*) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the [webhelp.show.indexterms.link](#) parameter (*on page 1496*).

Search Input

An input text field where you can enter search queries.

Search Results

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

Page Footer

WebHelp Responsive output footer.

Auto-complete Suggestions in the Search Input Field

When you are typing in the search input field, proposals are presented to help you to compute the search query. The information proposed when you are typing is collected from:

- The search queries from the history of the previous searches.
- The titles collected from your documentation.
- Documentation index terms and keywords. For example, in a DITA topic, the keywords and index terms are specified in the topic prolog section like this:

```
<prolog>
  <metadata>
    <keywords><indexterm>databases</indexterm></keywords>
    <keyword>installing</keyword>
    <keyword>uninstalling</keyword>
    <keyword>prerequisites</keyword>
  </metadata>
</prolog>
```

Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Related information

[WebHelp Responsive Search Engine \(on page 1322\)](#)

Index Terms Page

The *Index Terms Page* page consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section. The indexes are presented in multiple columns to make it easier to read this page.

Figure 430. Index Terms Page

1. Logo Component (on page 1322)
2. Title Component (on page 1322)
3. Menu Component (on page 1322)
4. Index Terms Link Component (on page 1322)
5. Index Terms Component (on page 1322)

6. [Alphabet Links Component \(on page 1322\)](#)

7. [Footer Component \(on page 1322\)](#)

Index Terms Page Components

The layout components displayed in this page are:

Publication Title

The title of the publication. It is usually taken from the DITA map title.

Logo

Displays a logo associated with the publication. Additionally, you can set a target URL that will be opened when you click on the logo image.

The logo image can be specified using the [webhelp.logo.image transformation parameter \(on page 1487\)](#). For the target URL, use the [webhelp.logo.image.target.url parameter \(on page 1487\)](#).

Menu

Helps you to navigate to your documentation. This component presents a set of links to all topics from your publication. For information about customizing the menu, see [How to Customize the Menu \(on page 1416\)](#) topic.

Index Terms Link

Presents a link to the index terms page. You can control if this component is displayed by using the [webhelp.show.indexterms.link parameter \(on page 1496\)](#).

Index Terms Alphabet

An alphabet that contains the first letter of index terms. Each letter represents a link to a specific indices section.

Index Terms

The first letter of the index along with the list of index terms.

Page Footer

WebHelp Responsive output footer.

Built-in JavaScript-based Search Engine

The client-side JavaScript-based search engine comes preconfigured in the WebHelp responsive plugin. It is enabled by default when you run the WebHelp Responsive transformation.

Search Index

The search index is created when you publish your documentation to WebHelp by traverses all HTML pages (for DITA topics) from output folder to gather information.

Search interface

This component is an interface between the user and the *search index*. It helps the user to search through the *search index* and displays results in the search page.

Search Field and Results Page

When you enter search terms in the **Search** field, the results are displayed in a results page. When you click on a result, the topic is opened in the main pane and the search results are highlighted. If you want to remove the colored highlights, click the  **Toggle Highlights** button at the top-right side of the page. The **Search** field also includes an *autocomplete* feature.

Each result includes the topic title that can be clicked to open that page. Under the title, a breadcrumb is displayed that shows the path of the topic and you can click any of the topics in the breadcrumb to open that particular page.

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Tip:

You can use the `searchQuery` URL parameter to perform a search operation when WebHelp is loaded. This opens the Search Results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [How to Change Element Scoring in Search Results \(on page 1428\)](#).

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.
- When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you may need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for 开始之前 (it translates as "before you begin" or "before start"), you have to enter 开始 之前 (notice the space between the second and third symbols) in the search field.

Note:

Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

Tip:

The `<indexterm>` and `<keywords>` DITA elements are an effective way to increase the ranking of a page (for example, content inside a *keywords* element weighs more than an *H1* HTML element).

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the *stop words* includes: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

Context-Sensitive Help System

Context-sensitive help systems assist users by providing specific informational topics for certain components of a user interface, such as a button or window. This mechanism works based on mappings between a unique ID defined in the topic and a corresponding HTML page.

Generating Context-Sensitive Help

When WebHelp Responsive output is generated, the transformation process produces an XML mapping file called `context-help-map.xml` and copies it to the output folder of the transformation. This XML file maps an ID to a corresponding HTML page through an `<appContext>` element, as in the following example:

```
<map productID="oxy-webhelp" productVersion="1.1">
  <appContext helpID="myapp-functionid1" path="tasks/app-help1.html" />
  <appContext helpID="myapp-functionid2" path="tasks/app-help1.html" />
  . . .
</map>
```

The possible attributes are as follows:

helpID

A Unique ID provided by a topic from two possible sources (`<resourceid>` element or `@id` attribute):

resourceid

The `<resourceid>` element is mapped into the `<appContext>` element and can be specified in either the `<topicref>` within a *DITA map* or in a `<prolog>` within a DITA topic. The `<resourceid>` element accepts the following attributes:

- **appname** - A name for the external application that references the topic. If this attribute is not specified, its value is considered to be empty ("").
- **appid** - An ID used by an application to identify the topic.
- **id** - Specifies a value that is used by a specific application to identify the topic, but this attribute is ignored if an `@appid` attribute is used.

Note:

Multiple `@appid` values can be associated with a single `appname` value (and multiple `@appname` values can be associated with a single `@appid` value), but the values for both attributes work in combination to specify a specific ID for a specific application, and therefore each combination of values for the `@appid` and `@appname` attributes should be unique within the context of a single *root map* (on page 2682). For example, suppose that you need two different functions of an application to both open the same WebHelp page.

Example: The `<resourceid>` Element Specified in a DITA Map

The `<resourceid>` element can be specified in a `<topicmeta>` element within a `<topicref>`.

```
<map title="App Help">
  <topicref href="app-help1.dita" type="task">
    <topicmeta>
      <resourceid appname="myapp" appid="functionid1" />
      <resourceid appname="myapp" appid="functionid2" />
    </topicmeta>
  </topicref>
</map>
```

Example: The `<resourceid>` Element Specified in a DITA Topic

The `<resourceid>` element can be specified in a `<prolog>` element within a DITA topic.

```
<task id="app-help1">
  <title>My App Help</title>
  <prolog>
    <resourceid appname="myapp" appid="functionid1" />
    <resourceid appname="myapp" appid="functionid2" />
  </prolog>
  ...
</task>
```

For more information about the `<resourceid>` element, see [DITA Specifications: `<resourceid>`](#).

id

If a `<resourceid>` element is not declared in the *DITA map* or DITA topic (as described above), the `@id` attribute that is set on the topic root element is mapped into the `<appContext>` element.

**Important:**

You should ensure that these defined IDs are unique in the context of the entire DITA project. If the IDs are not unique, the transformation scenario will display warning messages in the transformation console output and the help system will not work properly.

path

The path to a corresponding WebHelp page. This path is relative to the location of the `context-help-map.xml` mapping file.

There are two ways of implementing context-sensitive help in your system:

- The XML mapping file can be loaded by a PHP script on the server side. The script receives the `contextId` value and will look it up in the XML file.
- Invoke the `cshelp.html` WebHelp system file and pass the `contextId` parameter with a specific value. The WebHelp system will automatically open the help page associated with the value of the `contextId` parameter.

```
cshelp.html?contextId=myDITATopic
```

**Note:**

The `contextId` parameter is not case-sensitive.

**Attention:**

Prior to version 24.1, the method was to invoke the `index.html` file. The system still works using this method but it has been deprecated and its functionality will be removed in a future version.

Context-Sensitive Queries

You can use the URL field in your browser to search for topics in a context-sensitive WebHelp system with the assistance of the following parameters:

contextId

The WebHelp JavaScript engine will look for this value in the `context-help-map.xml` mapping file and load the corresponding help page.

**Note:**

You can use an [anchor \(on page 2676\)](#) in the `contextId` parameter to jump to a specific section in a document. For example, `contextId=topicID#anchor`.

appname

You can use this parameter in conjunction with `contextId` to search for this value in the corresponding `appname` attribute value in the mapping file.

```
http://localhost/webhelp/cshelp.html?contextId=topicID&appname=myApplication
```

**Tip:**

The `webhelp.csh.disable.topicID.fallback` [parameter \(on page 1487\)](#) can be set `true` to use a topic ID fallback when `resourceid` information is not available when computing the mapping for context sensitive help.

Accessibility

Oxygen XML WebHelp Responsive output is compliant with the Section 508 accessibility standard, making the output accessible for people with visual impairment and other disabilities. Documentation and interface components are considered accessible when they have support in place that allows those with disabilities to use assistive technologies to understand the content.

Generally speaking, the WebHelp Responsive output has two major parts: topic content and WebHelp Responsive-related components (publication TOC, breadcrumb, menu). While the WebHelp Responsive components are designed to comply with the accessibility rules, it is important to adhere to some rules when you write DITA topics so that the content is also accessible.

Related Information:

[DITA-OT Day 2017 Presentation: Accessibility in DITA-OT](#)

Writing Guidelines for Accessible Documentation

To create accessible content, good authoring practices involve following guidelines, such as marking table headers, using semantic elements where available, and using alternative text for images.

Accessible Images

Images must have text alternatives that describe the information or function represented by them.

Short Text Equivalents for Images

When using the `<image>` element, specify a short alternative text with the `<alt>` element.

```
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
</image>
```

Long Descriptions of Images

For complex images, when a short text equivalent does not suffice to adequately convey the function or role of an image, provide additional information in a file designated by the `<longdescref>` element.

```
<image href="puffin.jpg">
  <alt>Puffin figure</alt>
  <longdescref href="http://www.example.org/birds/puffin.html"
    scope="external"
    format="html" />
</image>
```

Related Information:

[Darwin Information Typing Architecture \(DITA\) Specification <image> element](#)
[Web Accessibility Tutorials: Alt Decision Tree](#)

Accessible Image Maps

For image maps, text alternatives are needed on both the `<image>` element itself (to describe the informative context) and on each of the `<area>` elements (to convey the link destination or the action that will be initiated if the link is followed). The `<xref>` content within the `<area>` element contains the intended alternative text or hover text for that image map area.

```
<imagemap id="gear_pump_map">
  <image href="../images/Gear_pump_exploded.png" id="gear_pump_exploded">
    <alt>Gear Pump</alt>
  </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref href="parts/bushings.dita#bushings_topic/bushings"
          format="dita">Bushings</xref>
  </area>
  <area>
    <shape>circle</shape>
    <coords>324, 210, 14</coords>
    <xref href="parts/ports.dita#ports_topic/suction_port" format="dita"
          >Suction Port</xref>
  </area>
</imagemap>
```

[Darwin Information Typing Architecture \(DITA\) Specification <imagemap> element](#)

Accessible Tables

Accessible HTML tables need markup that indicates header cells and data cells and defines their relationship. Header cells must be marked with `<th>`, and data cells with `<td>`, to make tables accessible. For more complex tables, explicit associations may be needed using `@scope`, `@id`, and `@headers` attributes.

When you implement the table, it is best to use the `<table>` element (CALs table or OASIS Table Exchange Model). The `<table>` element includes all that you need to make a fully accessible table.

Related Information:

[Darwin Information Typing Architecture \(DITA\) Specification <table> element](#)

Table with Header Cells in the Top Row Only

For this type of table, you have to embed the table rows in the `<thead>` element.

Table 38. Example: Oxygen Events

Event	Date	Location
Evolution of TC 2018	May 31 - June 1, 2018	Sofia, Bulgaria
Markup UK	June 9 - 10, 2018	London, United Kingdom
Balisage 2018 - The Markup Conference	July 31 - August 3, 2018	Rockville, Maryland, USA

```

<table colsep="1" rowsep="1" frame="all">
  <title>
    <b>Oxygen Events</b>
  </title>
  <tgroup cols="3">
    <colspec colname="COLSPEC0" colwidth="1*" />
    <colspec colname="COLSPEC1" colwidth="1.1*" />
    <colspec colname="newCol3" colwidth="1*" />
    <thead>
      <row>
        <entry colname="COLSPEC0" valign="top">Event</entry>
        <entry colname="COLSPEC1" valign="top">Date</entry>
        <entry>Location</entry>
      </row>
    </thead>
    <tbody>
      <row>
        <entry>Evolution of TC 2018</entry>

WebHelp Responsive VPAT Accessibility Conformance Report

International Edition

VPAT® Version 2.3 – April 2019

Product Name/Version

Oxygen XML WebHelp Responsive

Product Description

Oxygen XML WebHelp Responsive enables you to publish DITA content on the web and present it in a user-friendly interface that is easy to navigate. You can design your WebHelp Responsive output to be available on desktop systems or various mobile devices. With **Oxygen XML WebHelp Responsive**, your published content is accessible, interactive, and convenient.

Date

May 2019

Contact Information

support@oxygenxml.com

Notes

Oxygen XML WebHelp Responsive has been designed and enhanced to adhere to the [U.S. Government Section 508 accessibility standards](#) and the [Web Content Accessibility Guidelines \(WCAG\)](#). For details, see [WebHelp Responsive Accessibility \(on page 1328\)](#).

Evaluation Methods Used:

The following applications were used for testing **Oxygen XML WebHelp Responsive**:

- Desktop browsers: Chrome, Firefox, Safari, Edge.
- Assistive technologies: NVDA, VoiceOver, JAWS, Microsoft Narrator.

Applicable Standards/Guidelines

This report covers the degree of conformance for the following accessibility standards/guidelines:

Standard/Guideline	Included In Report
Web Content Accessibility Guidelines 2.0	Level A - Yes Level AA - Yes Level AAA - No
Web Content Accessibility Guidelines 2.1	Level A - Yes Level AA - Yes Level AAA - No
Revised Section 508 standards published January 18, 2017 and corrected January 22, 2018	Yes
EN 301 549 Accessibility requirements suitable for public procurement of ICT products and services in Europe - V2.1.2 (2018-08)	No

Terms

The terms used in the Conformance Level information are defined as follows:

- **Supports:** The functionality of the product has at least one method that meets the criterion without known defects or meets with equivalent facilitation.
- **Partially Supports:** Some functionality of the product does not meet the criterion.
- **Does Not Support:** The majority of product functionality does not meet the criterion.
- **Not Applicable:** The criterion is not relevant to the product.
- **Not Evaluated:** The product has not been evaluated against the criterion. This can be used only in WCAG 2.0 Level AAA.

WCAG 2.x Report

Tables 1 and 2 also document conformance with:

Revised Section 508: Chapter 5 – 501.1 Scope, 504.2 Content Creation or Editing, and Chapter 6 – 602.3 Electronic Support Documentation.

Note:

When reporting on conformance with the WCAG 2.x Success Criteria, they are scoped for full pages, complete processes, and accessibility-supported ways of using technology as documented in the [WCAG 2.0 Conformance Requirements](#).

Table 1: Success Criteria, Level A

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.1.1 Non-text Content</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Text alternatives are provided for many instances of non-text content, with exceptions that include perma-links for subtopics and sections.
<p><u>1.2.1 Audio-only and Video-only (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The authors of the input DITA document are responsible for providing a transcript of the media content in the document.

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.2.2 Captions (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not provide prerecorded media that requires captions.
<p><u>1.2.3 Audio Description or Media Alternative (Prerecorded)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The authors of the input DITA document are responsible for providing an alternative for time-based media or audio description of the prerecorded video content in the document.</p> <p>See: G58: Placing a link to the alternative for time-based media immediately next to the non-text content</p>
<p><u>1.3.1 Info and Relationships</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text, with exceptions that include:</p> <ul style="list-style-type: none"> • Some landmarks are not marked with the corresponding role or do not have an associated label. • Some link groups are not structured using lists or are not marked as navigation regions. <p>The authors of the input DITA document are responsible for:</p>

Criteria	Conformance Level	Remarks and Explanations
		<ul style="list-style-type: none"> • Using semantic elements to mark up structure. • Using semantic markup to mark emphasized or special text. • Using caption elements to associate data table captions with data tables.
<p><u>1.3.2 Meaningful Sequence</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The product presents content in a meaningful sequence.</p> <p>Authors should use Unicode right-to-left mark (RLM) or left-to-right mark (LRM) to mix text direction inline.</p>
<p><u>1.3.3 Sensory Characteristics</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>Authors should ensure that items are referenced in the content in ways that do not depend on sensory perception.</p>
<p><u>1.4.1 Use of Color</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>(Cobalt template) Color is not used as the only visual means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.</p>
<p><u>1.4.2 Audio Control</u> (Level A)</p> <p>Also applies to:</p>	Supports	<p>There is no sound that plays automatically.</p>

Criteria	Conformance Level	Remarks and Explanations
<p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>2.1.1 Keyboard</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Most of the content is operable through a keyboard interface, with exceptions that include:</p> <ul style="list-style-type: none"> • The submenus (the user cannot tab to the submenus). • The top-level links in the main page accordion cannot be accessed. • The facets component does not have full keyboard support.
<p><u>2.1.2 No Keyboard Trap</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not contain content that traps the keyboard focus.
<p><u>2.1.4 Character Key Shortcuts</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The product does not include character key shortcuts.
<p><u>2.2.1 Timing Adjustable</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	The product does not include time limits.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>2.2.2 Pause, Stop, Hide</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not include elements that move, blink, scroll, or auto-update.
<p><u>2.3.1 Three Flashes or Below Threshold</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The product does not contain flashing content.
<p><u>2.4.1 Bypass Blocks</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	Each page contains a link at the top that goes directly to the main content area. Each page contains <i>ARIA</i> landmarks that identify the available regions.
<p><u>2.4.2 Page Titled</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Supports	Each page contains a non-empty <code><title></code> element in the <code><head></code> section.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>2.4.3 Focus Order</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Focusable components receive focus in an order that preserves meaning and operability.
<p><u>2.4.4 Link Purpose (In Context)</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The purpose of each link can be determined from the link text alone or from the link text together with its programmatically-determined link context.</p> <p>The authors can create hypertext links using text that describes the purpose of the hypertext.</p> <p>There is no control that allows the user to choose between short or long link text (G189 / SCR30).</p>
<p><u>2.5.1 Pointer Gestures</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The WebHelp Responsive output does not rely on path-based or multipoint gestures and does not provide controls that require complex gestures.
<p><u>2.5.2 Pointer Cancellation</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The product has operations that are activated on the pointer up event.
<p><u>2.5.3 Label in Name</u> (Level A 2.1 only)</p>	Supports	The names of the user interface components contain the text that is presented visually.

Criteria	Conformance Level	Remarks and Explanations
<p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>		
<p><u>2.5.4 Motion Actuation</u> (Level A 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The product does not contain functionality that can be operated by device or user motion.
<p><u>3.1.1 Language of Page</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The web pages indicate the language of the content when the content language has been specified by authors.
<p><u>3.2.1 On Focus</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	No changes of context occur when any component receives focus.
<p><u>3.2.2 On Input</u> (Level A)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	Changing the setting of any user interface component does not automatically cause a change of context.
<p><u>3.3.1 Error Identification</u> (Level A)</p> <p>Also applies to:</p>	Partially Supports	If a search operation is performed leaving the search input empty, an error message is automatically dis-

Criteria	Conformance Level	Remarks and Explanations
Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		played to the user, but no <i>aria-invalid</i> information is provided.
<p><u>3.3.2 Labels or Instructions</u> (Level A)</p> Also applies to: Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	The search input does not have a visible label specified using a label element.
<p><u>4.1.1 Parsing</u> (Level A)</p> Also applies to: Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Several HTML validation errors are reported by the W3C validator.
<p><u>4.1.2 Name, Role, Value</u> (Level A)</p> Also applies to: Revised Section 508 <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	The <i>Home</i> link from the breadcrumb does not have an associated <i>aria-label</i> .

Table 2: Success Criteria, Level AA

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.2.4 Captions (Live)</u> (Level AA)</p>	Supports	No live audio content is used.

Criteria	Conformance Level	Remarks and Explanations
<p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>1.2.5 Audio Description (Prerecorded)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The authors of the input DITA document can ensure that the output document meets this criterion.
<p><u>1.3.4 Orientation</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	Content does not restrict its view and operation to a single display orientation.
<p><u>1.3.5 Identify Input Purpose</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The content does not contain input fields that collect information about the user.
<p><u>1.4.3 Contrast (Minimum)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	The missing words element from the search results page does not have the contrast ratio 4.5:1.

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.4.4 Resize text</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	<p>Text can be resized up to 200 percent without loss of content or functionality and without using assistive technology.</p> <p>Some text content has dimensions specified in pixels rather than em units.</p>
<p><u>1.4.5 Images of Text</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>The output does not contain images of text. The authors of the input DITA content can ensure that this criterion is met.</p>
<p><u>1.4.10 Reflow</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	<p>The majority of the content can be presented without loss of information or functionality, and without requiring scrolling in two dimensions.</p> <p>Long URLs determine the page to display the horizontal scroll bar.</p>
<p><u>1.4.11 Non-text Contrast</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	<p>(Cobalt template) There is no contrast issue regarding user interface components or graphical objects.</p>
<p><u>1.4.12 Text Spacing</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	<p>There is no loss of content or functionality that occurs by setting line height (line spacing), spacing following paragraphs, letter spacing, and word spacing.</p>

Criteria	Conformance Level	Remarks and Explanations
<p><u>1.4.13 Content on Hover or Focus</u> (Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Partially Supports	<p>Tooltips and submenus are not dismissible.</p> <p>Also, the tooltips are not hoverable.</p>
<p><u>2.4.5 Multiple Ways</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	<p>There is a search form provided that will go to a page that contains the search term and links to the corresponding page. Also, a table of contents is provided.</p> <p>The authors of the input DITA document are responsible for providing links to all pages from the home page or providing links to navigate to related pages from the current page.</p>
<p><u>2.4.6 Headings and Labels</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	<p>Headings and labels describe the topic or purpose.</p> <p>DITA authors can ensure that this criterion is met.</p>
<p><u>2.4.7 Focus Visible</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Partially Supports	Placing focus on a focusable element using the mouse doesn't render a visible focus indicator. Also, the search button does not have a visible focus indicator.
<p><u>3.1.2 Language of Parts</u> (Level AA)</p> <p>Also applies to:</p>	Supports	DITA authors can ensure that this criterion is met.

Criteria	Conformance Level	Remarks and Explanations
<p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>3.2.3 Consistent Navigation</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Supports	Repeated components appear in the same relative in each page.
<p><u>3.2.4 Consistent Identification</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) – Does not apply to non-web software • 504.2 (Authoring Tool) • 602.3 (Support Docs) – Does not apply to non-web docs 	Partially Supports	<p>The output uses labels, names, and text alternatives consistently for items that have the same functionality.</p> <p>Text alternatives are provided for many instances of non-text content, with exceptions that include:</p> <ul style="list-style-type: none"> • Permalinks for subtopics and sections. • Enlarge images action. <p>The <i>Home</i> link from the breadcrumb does not have an associated <i>aria-label</i>.</p>
<p><u>3.3.3 Error Suggestion</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p>	Does Not Support	The Search input does not have the <i>aria-required</i> information set and does not contain a text description specifying that it is a required field.

Criteria	Conformance Level	Remarks and Explanations
<ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 		
<p><u>3.3.4 Error Prevention (Legal, Financial, Data)</u> (Level AA)</p> <p>Also applies to:</p> <p>Revised Section 508</p> <ul style="list-style-type: none"> • 501 (Web)(Software) • 504.2 (Authoring Tool) • 602.3 (Support Docs) 	Supports	The Web pages do not cause legal commitments or financial transactions for the user to occur, that modify or delete user-controllable data in data storage systems, or that submit user test responses.
<p><u>4.1.3 Status Messages</u>(Level AA 2.1 only)</p> <p>Also applies to:</p> <p>Revised Section 508 – Does not apply</p>	Supports	The pages do not contain status messages as defined by this criterion.

Table 3: Success Criteria, Level AAA

Revised Section 508 Report

N/A

Chapter 3: Functional Performance Criteria (FPC)

Criteria	Conformance Level	Remarks and Explanations
302.1 Without Vision	Partially Supports	<p>Most of the content is accessible without vision with exceptions that include:</p> <ul style="list-style-type: none"> • Some components do not have text alternatives or labels. • Some landmarks are not marked with the corresponding

Criteria	Conformance Level	Remarks and Explanations
		<p>role or do not have an associated label.</p> <ul style="list-style-type: none"> • Some link groups are not structured using lists or are not marked as navigation regions.
302.2 With Limited Vision	Partially Supports	<p>Most of the content is accessible with limited vision with exceptions that include:</p> <ul style="list-style-type: none"> • Some components do not have text alternatives or labels. • Some landmarks are not marked with the corresponding role or do not have an associated label. • Some link groups are not structured using lists or are not marked as navigation regions.
302.3 Without Perception of Color	Supports	<p>(Cobalt template) Color is not used as the only visual means of conveying information, indicating an action, prompting a response, or distinguishing a visual element.</p>
302.4 Without Hearing	Supports	<p>The authors can create content that does not require hearing abilities for use.</p>
302.5 With Limited Hearing	Supports	<p>The authors can create content that does not require hearing abilities for use.</p>
302.6 Without Speech	Supports	<p>The output does not require speech for use.</p>
302.7 With Limited Manipulation	Supports	<p>The WebHelp Responsive output does not rely on path-based or multipoint gestures and does not provide controls that require complex gestures.</p>
302.8 With Limited Reach and Strength	Supports	<p>The WebHelp Responsive output does not rely on path-based or multipoint</p>

Criteria	Conformance Level	Remarks and Explanations
		gestures and does not provide controls that require complex gestures.
302.9 With Limited Language, Cognitive, and Learning Abilities	Supports	The authors can create content that can be used by users with limited language, cognitive, and learning abilities.

Chapter 4: Hardware

Notes: Not Applicable - **Oxygen XML WebHelp Responsive** is not a hardware product.

Chapter 5: Software

Notes: **Oxygen XML WebHelp Responsive** is a web application, not a software product. However, the web application includes authoring functionality, hence Chapter 5: Software 504 Authoring Tools applies to this product.

501 General

Criteria	Conformance Level	Remarks and Explanations
501.1 Scope – Incorporation of WCAG 2.0 AA	See WCAG 2.x section (on page 1335)	See information in WCAG section

502 Interoperability with Assistive Technology

Criteria	Conformance Level	Remarks and Explanations
502.2.1 User Control of Accessibility Features	Not Applicable	The product is not platform software.
502.2.2 No Disruption of Accessibility Features	Supports	The product does not disrupt platform features that are defined in the platform documentation as accessibility features.

502.3 Accessibility Services

Criteria	Conformance Level	Remarks and Explanations
502.3.1 Object Information	Partially Supports	The majority of object roles, state(s), properties, boundary, name, and description are programmatically determinable.

Criteria	Conformance Level	Remarks and Explanations
		The <i>Home</i> link from the breadcrumb does not have an associated <i>aria-label</i> .
502.3.2 Modification of Object Information	Supports	States and properties that can be set by the user can be set programmatically.
502.3.3 Row, Column, and Headers	Supports	The headers associated with the rows or columns of a table can be programmatically determined.
502.3.4 Values	Supports	The current values of an object can be programmatically determined.
502.3.5 Modification of Values	Supports	Values that can be set by the user are capable of being set programmatically.
502.3.6 Label Relationships	Partially Supports	Information, structure, and relationships conveyed through presentation can be programmatically determined or are available in text. See WCAG 1.3.1 (on page 1336) .
502.3.7 Hierarchical Relationships	Supports	The content is hierarchically structured using language-specific elements and their relationships can be programmatically determined.
502.3.8 Text	Supports	The content of text objects, text attributes, and the boundary of text rendered to the screen shall be programmatically determinable.
502.3.9 Modification of Text	Supports	The editable text (search input) can be set programmatically.
502.3.10 List of Actions	Not Applicable	There are no custom actions available that can be executed on the content.

Criteria	Conformance Level	Remarks and Explanations
502.3.11 Actions on Objects	Not Applicable	There are no custom actions available that can be executed on the content.
502.3.12 Focus Cursor	Not Applicable	The product is a web application and is isolated from the underlying platform software (web browser).
502.3.13 Modification of Focus Cursor	Not Applicable	The product is a web application and is isolated from the underlying platform software (web browser).
502.3.14 Event Notification	Not Applicable	There are no automatic focus changes, caret movement, selection changes, or added components in the content.
502.4 Platform Accessibility Features	Not Applicable	This product is not platform software.

503 Applications

Criteria	Conformance Level	Remarks and Explanations
503.2 User Preferences	Not Applicable	This section does not apply to web applications.
503.3 Alternative User Interfaces	Not Applicable	The application does not provide an alternative user interface that functions as assistive technology.

503.4 User Controls for Captions and Audio Description

Criteria	Conformance Level	Remarks and Explanations
503.4.1 Caption Controls	Not Applicable	The product does not provide controls for volume adjustment.
503.4.2 Audio Description Controls	Not Applicable	The product does not provide controls for program selection.

504 Authoring Tools

Criteria	Conformance Level	Remarks and Explanations
504.2 Content Creation or Editing (if not authoring tool, enter "not applicable")	Not Applicable See the WCAG 2.x section (on page 1335)	The product is not an authoring tool. See information in WCAG section
504.2.1 Preservation of Information Provided for Accessibility in Format Conversion	Not Applicable	The product is not an authoring tool.
504.2.2 PDF Export	Not Applicable	The product is not an authoring tool.
504.3 Prompts	Not Applicable	The product is not an authoring tool.
504.4 Templates	Not Applicable	The product is not an authoring tool.

Chapter 6: Support Documentation and Services

601.1 Scope

602 Support Documentation

Criteria	Conformance Level	Remarks and Explanations
602.2 Accessibility and Compatibility Features	Partially Supports	The product documentation is distributed in the WebHelp Responsive format. See the Chapter 3 (on page 1350) and Chapter 5 (on page 1352) sections.
602.3 Electronic Support Documentation	See the WCAG 2.x section (on page 1335)	See information in the WCAG section.
602.4 Alternate Formats for Non-Electronic Support Documentation	Not Applicable	Documentation is not provided in non-electronic formats.

603 Support Services

Criteria	Conformance Level	Remarks and Explanations
603.2 Information on Accessibility and Compatibility Features	Supports	The support services cover the accessibility features.
603.3 Accommodation of Communication Needs	Supports	Support services are available by phone or e-mail.

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Tip:

You can start creating publishing templates by using the **Oxygen Styles Basket**. <https://styles.oxygenxml.com>

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, *Favicons*, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for *Oxygen Publishing Template* packages:

Figure 431. Oxygen Publishing Template Package (WebHelp Responsive)**Figure 432. Oxygen Publishing Template Package (PDF)**

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: [Creating Custom Publishing Templates for WebHelp and PDF Output](#). The Webinar slides and sample project are also available from that webpage.

[How to Add a Publishing Template to the Publishing Templates Gallery \(on page 1399\)](#)

[How to Share a Publishing Template \(on page 1567\)](#)

Publishing Templates Gallery

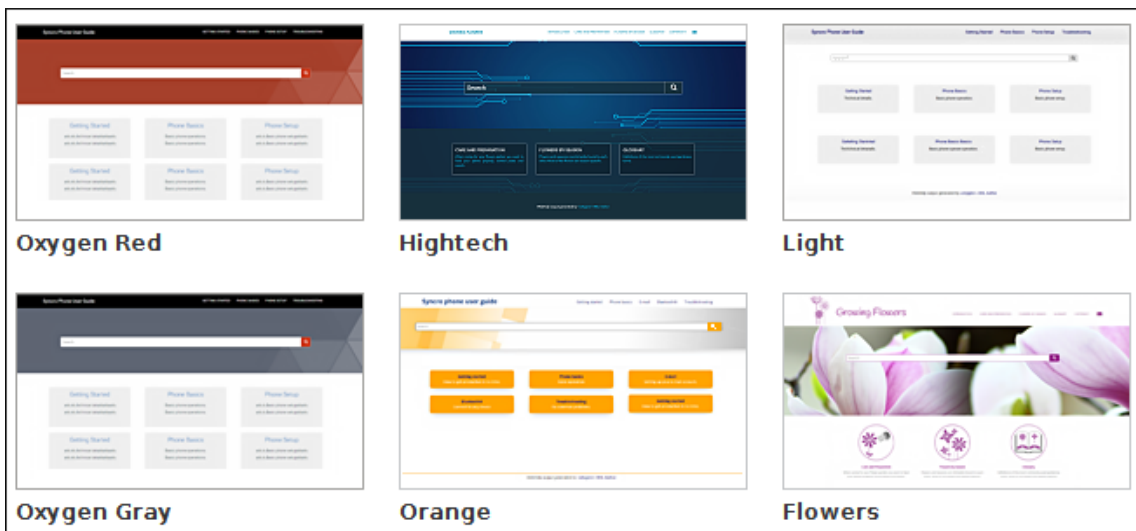

Oxygen XML Editor Eclipse plugin comes bundled with a variety of built-in templates. You can use one of them to publish your documentation or as a starting point for a new publishing template.

Built-in Templates

There are two categories of templates, *Tiles* and *Tree*. You can see the built-in templates in the **Templates** tab when editing a WebHelp Responsive transformation scenario in **Oxygen XML Editor/Author**. Each one also includes an  **Online preview** icon in the bottom-right corner that opens a webpage in your default browser that provides a sample of how the main page will look when that particular template is used to generate the output.

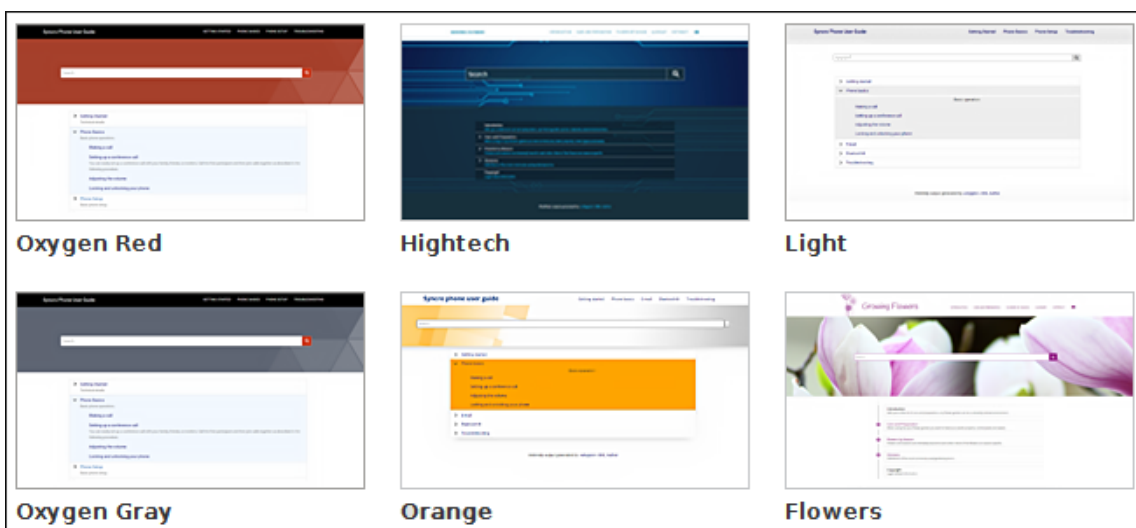

Tiles Templates

The main page in the WebHelp output presents a tile for each main topic (chapter) of the documentation.

Tree Templates

The main page in the WebHelp output presents a tree-like table of contents.

Built-in Templates Location

All built-in templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.

Custom Templates

You can use a built-in template as a starting point for [creating your own custom template \(on page 1562\)](#).

You can store all of your custom templates in a particular directory. Then, go to **Options > Preferences > DITA > Publishing** and add your directory to the list, and all the templates stored in that directory will be displayed in the preview pane in the transformation scenario's **Template** tab along with all the built-in templates.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Publishing Template Package Contents for WebHelp Responsive Customizations

An *Oxygen Publishing Template* package for WebHelp output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XHTML files, XSLT files, etc.). All the template resources can be stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with the template. It is an XML file that defines all the resources included in a template (such as CSS files, images, JS files, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the template's root folder.

A template descriptor might look like this:

```
<publishing-template>
  <name>Flowers</name>

  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>light</tag>
    </tags>
  </webhelp>
</publishing-template>
```

```

</tags>

<preview-image file="flowers-tree.png"/>

<!-- Resources (CSS, favicon, logo and others) -->
<resources>
  <!-- Main CSS file -->
  <css file="flowers.css"/>

  <!-- Resources to copy to the output folder -->
  <fileset>
    <include name="resources/**/*" />
    <exclude name="resources/**/*.svn" />
    <exclude name="resources/**/*.git" />
  </fileset>
</resources>

<parameters>
  <parameter name="webhelp.show.main.page.tiles" value="no" />
  <parameter name="webhelp.show.main.page.toc" value="yes" />
  <parameter name="webhelp.top.menu.depth" value="3" />
</parameters>
</webhelp>
</publishing-template>

```

**Tip:**

It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```

<publishing-template>
  <name>Lorem Ipsum</name>
  <description>Lorem ipsum dolor sit amet, consectetur adipiscing elit</description>
  ...

```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>` information.

```
<publishing-template>
...
<author>
  <name>John Doe</name>
  <email>jdoe@example.com</email>
  <organization>ACME</organization>
  <organizationUrl>http://www.example.com/jdoe</organizationUrl>
</author>
...
```

Webhelp Element

The `<webhelp>` element contains various details that define the WebHelp Responsive output. It is a required element if you intend on using a WebHelp Responsive transformation scenario. The elements that are allowed in this `<webhelp>` section specify the [template tags \(on page 1362\)](#), [template preview image \(on page 1362\)](#), [resources \(on page 1362\)](#) (such as CSS, JS, fonts, logos), [transformation parameters \(on page 1364\)](#), [HTML fragment extensions \(on page 1366\)](#) (used to add fragments to placeholders), [XSLT extensions \(on page 1365\)](#), or [HTML page layout files \(on page 1375\)](#).

```
<webhelp>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>

  <resources>
    ...
  </resources>

  <html-page-layouts>
    ...
  </html-page-layouts>

  <parameters>
    ...
```

```

</parameters>

</webhelp>

```

Template Tags

The `<tags>` section provides meta information about the template (such as layout type or color theme). Each *tag* is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```

<publishing-template>
  ...
  <webhelp>
    <tags>
      <tag>tree</tag>
      <tag>dark</tag>
    </tags>

```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an  **Online preview** icon in the bottom-right corner the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```

<publishing-template>
  ...
  <webhelp>
    ...
    <preview-image file="ashes/ashes-tree.png" />
    <online-preview-url>https://www.example.com/samples/tiles/ashes</online-preview-url>

```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS, JS, fonts, logos, graphics, etc.) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included, while the other types of resources are optional.

Warning:

All paths set in the `@file` attribute must be relative.

This section is defined using the **resources** element and the types of resources that can be specified include:

- **CSS files** - One or more CSS files that will define the styles of all generated HTML pages. They are referenced using the `<css>` element.
- **Favicon** - You can specify the path to an image for the *favicon* associated with your website. It is referenced using the `<favicon>` element.
- **Logo** - You can specify the path to a logo image that will be displayed in the left side of the output header. It is referenced using the `<logo>` element. Optionally, you can also specify:
 - `<target-url>` - will redirect the user to the specified URL if they click the logo in the output.
 - `<alt>` - provides an alternate text for the logo image.
- **Additional Resources (graphics, JS, fonts, folders)** - For other resources (such as images referenced in CSS, JavaScript, fonts, entire folders, etc.) that need to be included in the output, you need to instruct the transformation to include them in the output folder. You can specify one or more sets of additional resources to be copied to the output folder by using the `<fileset>` element and you can use one or more `<include>` and `<exclude>` elements. This semantic is similar to the [ANT FileSet](#).

```

<publishing-template>
...
<webhelp>
...
<resources>
  <css file="css/custom_styles.css"/>
  <css file="css/custom_fonts.css"/>

  <favicon file="images/favicon.png"/>

  <logo
    file="images/logo.png"
    target-url="http://www.example.com"
    alt="Alternate text for the logo image"/>

  <js-amd-module file="js/template-main.js"/>

  <fileset>
    <include name="common/**/*" />
    <include name="JS/**/*" />
    <exclude name="**/*.svn" />
    <exclude name="**/*.git" />
  </fileset>
</resources>

```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

The resources specified in the template descriptor are copied to the following output folder:

[\[WebHelp_OUTPUT_DIR\]/oxygen-webhelp/template](#). The following graphic illustrates the mapping between the template resources and the location where they will be copied to the output folder:

Figure 433. Template Resources Mapping

Related Information:

[How to Add a Favicon in WebHelp Systems \(on page 1424\)](#)

Transformation Parameters

You can also set one or more WebHelp transformation parameters in the descriptor file.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter
    name="webhelp.show.main.page.toc"
    value="yes" />
  <parameter
    name="webhelp.top.menu.depth"
    value="3" />
  <parameter
    name="webhelp.fragment.welcome"
    value="html-fragment/webhelp.fragment.welcome.html"
    type="filePath" />
</parameters>
</webhelp>
```

The following information can be specified in the `<parameter>` element:

Parameter name

The name of the parameter. It may be one of the [WebHelp Responsive transformation parameters \(on page 1486\)](#) or a DITA-OT HTML-based output parameter.

Note:

It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

Attention:

JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After [creating a publishing template \(on page 1562\)](#) and adding it to the [templates gallery \(on page 1399\)](#), when you select the template in the transformation scenario dialog box, the **Parameters** tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates can include one or more [supported XSLT extension points \(on page 1500\)](#). They are helpful when you want to change the structure of the HTML pages that are primarily generated from XSLT processing. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```
<publishing-template>
...
<webhelp>
...
<xslt>
  <extension
    id="com.oxygenxml.webhelp.xsl.dita2webhelp"
    file="xsl/customDita2webhelp.xsl" />
  <extension
    id="com.oxygenxml.webhelp.xsl.createMainPage"
    file="xsl/customMainPage.xsl" />
</xslt>
```

For a full list of the supported extension points, see: [XSLT-Import and XSLT-Parameter Extension Points \(on page 1500\)](#).

**Note:**

You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the <http://www.oxygenxml.com/functions> namespace.

HTML Fragment Placeholders

The HTML pages contain component placeholders that can be used to insert custom HTML fragments either by specifying a **well-formed** XHTML fragment or referencing a path to a file that contains a **well-formed** XHTML fragment (for details on how the file or fragment needs to be constructed, see [How to Insert Custom HTML Content \(on page 1407\)](#)).

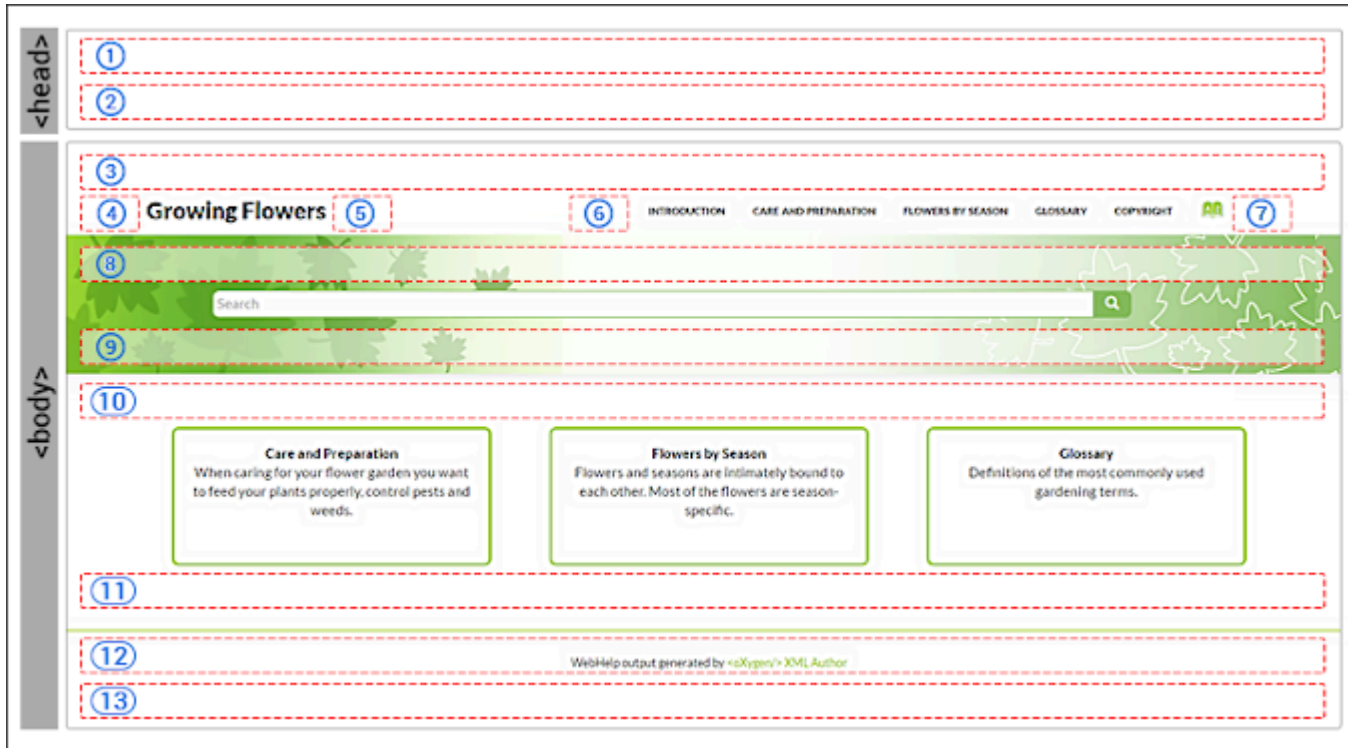

These fragments and their placeholder location are defined in the descriptor file using a `<fragment>` element inside the `<html-fragments>` section. You can specify one or more HTML fragment extension points in the descriptor file using the following structure:

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="html-fragments/webhelp_fragment_welcome.html"
    placeholder="webhelp.fragment.welcome" />
  <fragment
    file="html-fragments/webhelp_fragment_footer.html"
    placeholder="webhelp.fragment.footer" />
</html-fragments>
```

Some of these placeholders are left empty in the default output configurations, but you can use them to insert custom content.

Each placeholder has an associated parameter value in the transformation. Some of the placeholder parameters are global and can be used in all type of pages (*main page, topic page, search results page, index terms page*), while others are applicable for certain type of pages. The following diagram illustrates the predefined placeholders that are global (can be used in any of the types of pages).

Figure 434. Global Predefined Placeholders Diagram

1. Header (on page 1367)
2. After Header (on page 1367)
3. Before Body (on page 1367)
4. Before Logo and Title (on page 1368)
5. After Logo and Title (on page 1368)
6. Before Top Menu (on page 1368)
7. After Top Menu (on page 1368)
8. Before Search Input (on page 1368)
9. After Search Input (on page 1368)
10. Before Main Content (on page 1368)
11. After Main Content (on page 1368)
12. Footer (on page 1368)
13. After Body (on page 1368)

Global Placeholder Parameters

The following placeholder parameters can be used in any of the type of pages (*main page*, *topic page*, *search results page*, *index terms page*). The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **1 = webhelp.fragment.head** - Displays the specified XHTML fragment in the header section.
- **2 = webhelp.fragment.after.header** - Displays the specified XHTML fragment after the header section.
- **3 = webhelp.fragment.before.body** - Displays the specified XHTML fragment before the body.

- **4 = webhelp.fragment.before.logo_and_title** - Displays the specified XHTML fragment before the logo and title.
- **5 = webhelp.fragment.after.logo_and_title** - Displays the specified XHTML fragment after the logo and title.
- **6 = webhelp.fragment.before.top_menu** - Displays the specified XHTML fragment before the top menu.
- **7 = webhelp.fragment.after.top_menu** - Displays the specified XHTML fragment after the top menu.
- **8 = webhelp.fragment.before.search.input** - Displays the specified XHTML fragment before the search input component.
- **9 = webhelp.fragment.after.search.input** - Displays the specified XHTML fragment after the search input component.
- **10 = webhelp.fragment.before.main.content.area** - Displays the specified XHTML fragment before the main content area
- **11 = webhelp.fragment.after.main.content.area** - Displays the specified XHTML fragment after the main content area.
- **12 = webhelp.fragment.footer** - Displays the specified XHTML fragment in the footer section.
- **13 = webhelp.fragment.after.body** - Displays the specified XHTML fragment after the body.

Main Page Placeholder Parameters

The following placeholder parameters can be used in the *main page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.head.main.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.main.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.main.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.main.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.main.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.main.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.main.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.main.page** - Displays the specified XHTML fragment after the body.
- **webhelp.fragment.before.toc_or_tiles** - Displays the specified XHTML fragment before the main table of contents or tiles component on the main page.
- **webhelp.fragment.after.toc_or_tiles** - Displays the specified XHTML fragment after the main table of contents or tiles component on the main page.

Topic Page Placeholder Parameters

The following placeholder parameters can be used in the *topic page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.head.topic.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.topic.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.topic.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.topic.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.topic.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.topic.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.topic.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.topic.page** - Displays the specified XHTML fragment after the body.
- **webhelp.fragment.before.topic.toolbar** - Displays the specified XHTML fragment before the toolbar buttons above the topic content in the topic page.
- **webhelp.fragment.after.topic.toolbar** - Displays the specified XHTML fragment after the toolbar buttons above the topic content in the topic page.
- **webhelp.fragment.before.topic.breadcrumb** - Displays the specified XHTML fragment before the breadcrumb component in the topic page.
- **webhelp.fragment.after.topic.breadcrumb** - Displays the specified XHTML fragment after the breadcrumb component in the topic page.
- **webhelp.fragment.before.publication.toc** - Displays the specified XHTML fragment before the publication's table of contents component in the topic page.
- **webhelp.fragment.after.publication.toc** - Displays the specified XHTML fragment after the publication's table of contents component in the topic page.
- **webhelp.fragment.before.topic.content** - Displays the specified XHTML fragment before the topic's main content in the topic page.
- **webhelp.fragment.after.topic.content** - Displays the specified XHTML fragment after the topic's main content in the topic page.
- **webhelp.fragment.before.feedback** - Displays the specified XHTML fragment before the **Oxygen Feedback** commenting component in the topic page.
- **webhelp.fragment.after.feedback** - Displays the specified XHTML fragment after the **Oxygen Feedback** commenting component in the topic page.
- **webhelp.fragment.before.topic.toc** - Displays the specified XHTML fragment before the topic's table of contents component in the topic page.
- **webhelp.fragment.after.topic.toc** - Displays the specified XHTML fragment after the topic's table of contents component in the topic page.

Search Results Page Placeholder Parameters

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.head.search.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.search.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.search.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.search.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.search.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.search.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.search.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.search.page** - Displays the specified XHTML fragment after the body.
- **webhelp.google.search.script** - Replaces the search input component with a Google search component.

Index Terms Page Placeholder Parameters

The following placeholder parameters can be used in the *search results page*. The parameter values can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment:

- **webhelp.fragment.head.terms.page** - Displays the specified XHTML fragment in the header section.
- **webhelp.fragment.after.header.terms.page** - Displays the specified XHTML fragment after the header section.
- **webhelp.fragment.before.body.terms.page** - Displays the specified XHTML fragment before the body.
- **webhelp.fragment.before.search.input.terms.page** - Displays the specified XHTML fragment before the search input component.
- **webhelp.fragment.after.search.input.terms.page** - Displays the specified XHTML fragment after the search input component.
- **webhelp.fragment.before.main.content.area.terms.page** - Displays the specified XHTML fragment before the main content area
- **webhelp.fragment.after.main.content.area.terms.page** - Displays the specified XHTML fragment after the main content area.
- **webhelp.fragment.after.body.terms.page** - Displays the specified XHTML fragment after the body.

Using String Values in Placeholder Parameter Values

If you use strings for values of HTML fragment placeholder parameter values, the string values are written to files in the transformation's temporary directory. The values of the associated parameters reference the paths of the temporary files. This means that the HTML fragments will have a uniform processing in the *WebHelp's XSLT Module*.

Example:

Suppose the placeholder parameter has the following string value:

```
# String value
webhelp.fragment.welcome = <p>This is an HTML paragraph.</p>
```

A new file that contains the parameter's value is created:

```
[temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
```

```
<p>This is an HTML paragraph.</p>
```

The parameter's value then becomes:

```
# Absolute file path as value
webhelp.fragment.welcome= [temp-dir]/whr-html-fragments/webhelp_fragment_welcome.xml
```

Related Information:

[How to Insert Custom HTML Content \(on page 1407\)](#)

WebHelp Responsive Macros

You can use the `whc:macro` layout component to specify a macro value (a variable that will be expanded when the output files are generated).

A macro has the following syntax:

```
${macro-name}
```

or

```
${macro-name(macro-parameter)}
```

A macro name can accept any alphanumeric characters, as well as the following characters: `-` (minus), `_` (underscore), `.` (dot), `:` (colon). The value of a parameter may contain any character except the `}` (close curly bracket) character.

Implementations

The following *macros* are supported:

i18n

For localizing a string.

```
${i18n(string.id)}
```

param

Returns the value of a transformation parameter.

```
${param(webhelp.show.main.page.tiles)}
```

env

Returns the value of an environment variable.

```
${env(JAVA_HOME)}
```

system-property

Returns the value of a system property.

```
${system-property(os.name)}
```

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the [rules of the XSLT format-dateTime function specification](#).

```
${timestamp([hl]:[m01] [P] [M01]/[D01]/[Y0001])}
```

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the *oxygen-webhelp* subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```
${path(oxygen-webhelp-template-dir)}
```

Note:

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip:

Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

**Tip:**

Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

Extensibility

To add new *macros*, you can add an XSLT extension to overwrite the `wh-macro-extension` template from the `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xml` file.

```

<!-- Extension template for expanding custom macro constructs -->
<xsl:template name="wh-macro-extension">
  <xsl:param name="name" />
  <xsl:param name="params" />
  <xsl:param name="contextNode" />
  <xsl:param name="matchedString" />

  <xsl:choose>
    <xsl:when test="$contextNode instance of attribute()">
      <xsl:value-of select="$matchedString" />
    </xsl:when>
    <xsl:otherwise>
      <xsl:message>Cannot expand macro:
        [<xsl:value-of select="$matchedString" />]</xsl:message>
      <xsl:copy-of select="$contextNode" />
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>

```

The `wh-macro-extension` template has the following parameters:

- **name** - The name of the current *macro*.
- **params** - List of parameters of the current *macro* as a `string` sequence. The current *macros* parsing mechanism only allows *macros* with a maximum of one parameter. Consequently, this list will contain at most one element.
- **contextNode** - The current element or attribute where the *macro* was declared.
- **matchedString** - The entire value of the matched *macro* as specified in the HTML template page.

Combining WebHelp Responsive and PDF Customizations in a Template Package

An *Oxygen Publishing Template* package can contain both a WebHelp Responsive and PDF customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png" />
    <resources>
      <css file="flowers-wh.css" />
      <css file="flowers-page-styling.css" />
    </resources>
    <parameters>
      <parameter name="webhelp.show.main.page.tiles" value="no" />
      <parameter name="webhelp.show.main.page.toc" value="yes" />
    </parameters>
  </webhelp>
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png" />
    <resources>
      <css file="flowers-pdf.css" />
      <css file="flowers-page-styling.css" />
    </resources>
    <parameters>
      <parameter name="show.changes.and.comments" value="yes" /> />
    </parameters>
  </pdf>
</publishing-template>
```

```
<pdf>
```

```
</publishing-template>
```

Related Information:

[Publishing Template Package Contents for PDF Customizations \(on page 1556\)](#)

HTML Page Layout Files

The HTML page layout files define the default layout of the generated pages in the output for the built-in template. There are four types of pages (*main*, *search*, *topic*, *index*) and each type of page is a simple HTML file. Each page type has various components that appear by default and each component has a corresponding element and when that element is included in the HTML file, the corresponding components will appear in the output.

Warning:

It is no longer recommended for you to customize these files because if you upgrade to a newer version of **Oxygen**, those files may no longer produce the desired results and if new components have been added, you won't have access to them. Instead, use any of the other methods described in [Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#).

If you do choose to customize these HTML files, each type of page is defined inside an `<html-page-layout-files>` element in the descriptor file.

```
<publishing-template>
...
<webhelp>
...
<!-- HTML page layout files -->
<html-page-layout-files>
  <page-layout-file page="main" file="page-templates/wt_index.html"/>
  <page-layout-file page="search" file="page-templates/wt_search.html"/>
  <page-layout-file page="topic" file="page-templates/wt_topic.html"/>
  <page-layout-file page="index-terms" file="page-templates/wt_terms.html"/>
</html-page-layout-files>
```

If you do use the **html-page-layout-files** element, you must specify all four types of pages (*main*, *search*, *topic*, *index*). When not specified, the files from the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates` folder will be used to define the layout of each type of page.

HTML Page Components

Each type of page contains various components that control the layout of that page. The rendering of each component depends on the context where it is placed and its content depends on the transformed *DITA map* (on page 2678).

Some of the components can be used in all four types of pages, while some are only available for certain pages. For instance, the *Publication Title* component can be used in all pages, but the *Navigation Breadcrumb* component can only be used in the **Topic Page**.

To include a component in the output of a particular type of page, you have to reference a specific element in that particular HTML file. All the elements associated with a component should belong to the `http://www.oxygenxml.com/webhelp/components` namespace.

Every component can contain custom content or reference another component. To specify where the component content will be located in the output, you can use the `<whc:component_content>` element as a descendant of the component element. It can specify the location as before, after, or it can wrap the component content. The following snippet contains an example of each:

```
<whc:webhelp_search_input class="navbar-form wh_main_page_search"
  role="form" >
  <div class="custom-content-before">Enter search terms here:</div>
  <div class="custom-wrapper">
    <whc:component_content/>
  </div>
  <div class="custom-content-after">Results will be displayed in a new window.</div>
</whc:webhelp_search_input>
```

Main Page

The *Main Page* is the home page generated in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_index.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

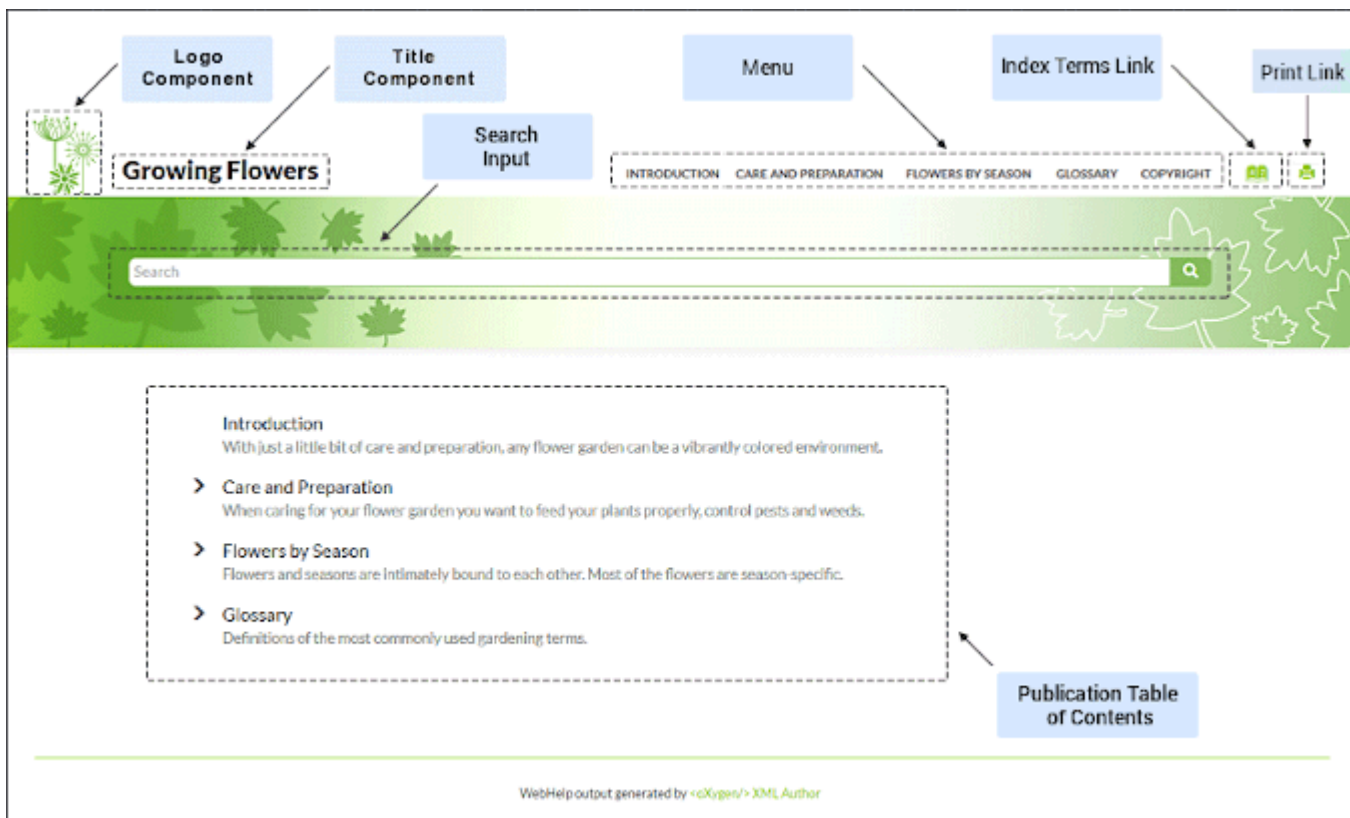

The main function of the home page is to display top-level information and provide links that help you easily navigate to any of the top-level topics of the publication. These links can be rendered in either a *Tiles* or *Tree* style of layout. The HTML page produced for the home page also consists of various other components, such as a logo, title, menu, search field, or index link.

Figure 435. Examples of Main Page Components for a Tiles Style of Layout

1. Publication Logo (on page 1378)
2. Publication Title (on page 1378)
3. Search Input (on page 1379)
4. Main Menu (on page 1379)
5. Index Terms Link (on page 1380)
6. Topic Tiles (on page 1379)
7. Print Link (on page 1379)

Figure 436. Examples of Main Page Components for a Tree Style of Layout

1. Publication Logo (on page 1378)
2. Publication Title (on page 1378)
3. Search Input (on page 1379)
4. Main Menu (on page 1379)
5. Index Terms Link (on page 1380)
6. Table of Contents (on page 1380)
7. Print Link (on page 1379)

The following components can be referenced in the *Main Page* (`wt_index.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_print_link`.

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1416\)](#).

Main Page Topic Tiles (`webhelp_tiles`)

This component generates the tiles section in the main page. This section will contain a tile for each root topic of the published documentation. Each topic tile has three sections that correspond to the topic title, short description, and image. To generate this component, the `<whc:webhelp_tiles>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_tiles
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_tiles`.

If you want to control the HTML structure that is generated for a WebHelp tile you can also specify the template for a tile by using the `<whc:webhelp_tile>` component, as in the following example:

```
<whc:webhelp_tile class="col-md-4">
  <!-- Place holder for tile's image -->
  <whc:webhelp_tile_image/>

  <div class="wh_tile_text">
    <!-- Place holder for tile's title -->
    <whc:webhelp_tile_title/>

    <!-- Place holder for tile's shordesc -->
    <whc:webhelp_tile_shordesc/>
  </div>
</whc:webhelp_tile>
```

For information about customizing the tiles, see [How to Configure the Tiles on the WebHelp Responsive Main Page \(on page 1421\)](#).

Main Page Table of Contents (`webhelp_main_page_toc`)

This component generates a simplified Table of Contents. It is simplified because it contains only two levels from the documentation hierarchy. To generate this component, the `<whc:webhelp_main_page_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_main_page_toc
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>
```

In the output, you will find an element with the class: `wh_main_page_toc`.

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link  
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Topic Page

The *Topic Page* is the page generated for each DITA topic in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_topic.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML pages produced for each topic consist of the topic content along with various other additional components, such as a title, menu, navigation breadcrumb, print icon, or side table of contents.

Figure 437. Examples of Topic Page Components

1. Publication Logo (on page 1383)
2. Publication Title (on page 1382)
3. Search Input (on page 1383)
4. Main Menu (on page 1385)
5. Index Terms Link (on page 1385)
6. Expand/Collapse All Sections (on page 1385)
7. Navigation Links (on page 1383)
8. Print Link (on page 1384)
9. Breadcrumb (on page 1383)
10. Publication Table of Contents (on page 1384)
11. Topic Content (on page 1384)
12. Topic Table of Contents (on page 1384)

The following components can be referenced in the *Topic Page* (`wt_topic.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_search_input`.

Topic Breadcrumb (`webhelp_breadcrumb`)

This component generates a breadcrumb that displays the path of the current topic. To generate this component, the `<whc:webhelp_breadcrumb>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_breadcrumb
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_breadcrumb`. This component will contain a list with items that correspond to the topics in the path. The first item in the list has a link to the main page with the `home` class. The last item in the list corresponds to the current topic and has the `active` class set.

Navigation Links (`webhelp_navigation_links`)

This component generates navigation links to the next and previous topics. To generate this component, the `<whc:webhelp_navigation_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_navigation_links
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_navigation_links`. This component will contain the links to the next and previous topics.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_print_link`.

Topic Content (`webhelp_topic_content`)

This component generates the content of a topic and it represent the content of the HTML files as they are produced by the DITA-OT processor. To generate this component, the `<whc:webhelp_topic_content>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_content
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_topic_content`.

Publication TOC (`webhelp_publication_toc`)

This component generates a mini table of contents for the current topic (on the left side). It will contain links to the children of the current topic, its siblings, and all of its ancestors. To generate this component, the `<whc:webhelp_publication_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_toc
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_publication_toc`. This component will contain links to the topics referenced in the DITA map. It also includes an expand/collapse button (either `<` to collapse or the `>` to expand).

Topic TOC (`webhelp_topic_toc`)

This component generates a topic table of contents for the current topic (on the right side) with a heading named **On this page**. It contains links to each section within the current topic and

the section corresponding to the current scroll position is highlighted. The topic must contain at least two `<section>` elements and each `<section>` must have an `@id` attribute. To generate this component, the `<whc:webhelp_topic_toc>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_topic_toc
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_topic_toc`. This component will contain links to the sections within the current topic. It also includes an expand/collapse button (either `>` to collapse or the `<` to expand).

Expand/Collapse Sections (`webhelp_expand_collapse_sections`)

This component is used to generate an icon that expands or collapses sections listed in the side table of contents within a topic. To generate this component, the `<whc:webhelp_expand_collapse_sections>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_expand_collapse_sections
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `webhelp_expand_collapse_sections`.

Topic Feedback (`webhelp_feedback`)

This component generates a placeholder for where the comments section will be presented. To generate this component, the `<whc:webhelp_feedback>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_feedback
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1416\)](#).

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Child Links (`webhelp_child_links`)

For all topics with subtopics (child topics), this component generates a list of links to each child topic. To generate this component, the `<whc:webhelp_child_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_child_links
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

Related Links (`webhelp_related_links`)

For all topics that contain related links, this component generates a list of related links that will appear in the output. To generate this component, the `<whc:webhelp_related_links>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_related_links
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Search Results Page

The *Search Results Page* is the page generated that presents search results in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_search.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of a search results component along with various other additional components, such as a title, menu, or index link.

Figure 438. Examples of Search Results Page Components

1. Publication Logo (on page 1387)
2. Publication Title (on page 1387)
3. Search Input (on page 1388)
4. Main Menu (on page 1388)
5. Index Terms Link (on page 1389)
6. Search Results (on page 1388)
7. Print Link (on page 1388)

The following components can be referenced in the *Search Results Page* (`wt_search.html`) file:

Publication Title (`webhelp_publication_title`)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (`webhelp_logo`)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_search_input`.

Search Results (`webhelp_search_results`)

This component is used to generate a placeholder to signal where the search results will be presented in the output. To generate this component, the `<whc:webhelp_search_results>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_results
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_search_results`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_print_link`.

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp_top_menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1416\)](#).

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Index Terms Page

The *Index Terms Page* is the page generated that presents index terms in the WebHelp Responsive output. The name of the HTML file that defines this page is `wt_terms.html` and it is located in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/page-templates`.

The HTML page that is produced consists of an index terms section along with various other additional components, such as a title, menu, or search field.

An alphabet that contains the first letter of the documentation index terms is generated at the top of the index page. Each letter represents a link to a specific indices section.

Figure 439. Example of Index Terms Page Components

1. Publication Logo (on page 1390)
2. Publication Title (on page 1390)
3. Search Input (on page 1391)
4. Main Menu (on page 1391)
5. Index Terms Link (webhelp_indexterms_link) (on page 1391)
6. Print Link (on page 1391)

The following components can be referenced in the *Index Terms Page* (`wt_terms.html`) file:

Publication Title (webhelp_publication_title)

This component generates the publication title in the output. To generate this component, the `<whc:webhelp_publication_title>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_publication_title
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_publication_title`.

Publication Logo (webhelp_logo)

This component generates a logo image in the output. To generate this component, the `<whc:webhelp_logo>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_logo
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In addition, you must also specify the path of the logo image in the `webhelp.logo.image` transformation parameter (in the **Parameters** tab in the transformation scenario). You can set the `webhelp.logo.image.target.url` parameter to generate a link to a URL when you click the logo image.

In the output, you will find an element with the class: `wh_logo`.

Search Input (`webhelp_search_input`)

This component is used to generate the input widget associated with search function in the output. To generate this component, the `<whc:webhelp_search_input>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_search_input
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_search_input`.

Print Link (`webhelp_print_link`)

This component is used to generate a print icon that opens the print dialog box for your particular browser. To generate this component, the `<whc:webhelp_print_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_print_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_print_link`.

Main Menu (`webhelp_top_menu`)

This component generates a menu with all the documentation topics. To generate this component, the `<whc:webhelp_top_menu>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_top_menu
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_top_menu`.

You can control the maximum level of topics that will be included in the menu using the `webhelp.top.menu.depth` transformation parameter (in the **Parameters** tab of the transformation scenario).

For information about customizing the menu, see [How to Customize the Menu \(on page 1416\)](#).

Index Terms Link (`webhelp_indexterms_link`)

This component can be used to generate a link to the index terms page (`indexterms.html`). If the published documentation does not contain any index terms, then the link will not be generated. To generate this component, the `<whc:webhelp_indexterms_link>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_indexterms_link
  xmlns:whc="http://www.oxygenxml.com/webhelp/components" />
```

In the output, you will find an element with the class: `wh_indexterms_link`. This component will contain a link to the `indexterms.html` page.

Link to Skins Resources (`webhelp_skin_resources`)

This component can be used to add a link to resources for the current WebHelp skin (such as the CSS file). To generate this component, the `<whc:webhelp_skin_resources>` element must be specified in the HTML file as in the following example:

```
<whc:webhelp_skin_resources/>
```

In the output, you will find a link to the skin resources.

Generating WebHelp Responsive Output

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Running WebHelp Responsive from Oxygen XML Editor/Author

To publish a *DITA map* (on page 2678) as **WebHelp Responsive** output, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** - This tab contains a set of built-in skins that you can use for the layout of your WebHelp system output.
- **Parameters Tab** - This tab includes numerous transformation parameters that can be set to customize your WebHelp system output.
- **Feedback Tab** - This tab is for those who want to add the **Oxygen Feedback comments component** at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** - This tab allows you to filter certain content elements from the generated output.

- **Advanced Tab** - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

Result: When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

Automating the WebHelp Responsive Output for DITA

DITA-based WebHelp output can be generated from an automated publishing process [using a command line outside of Oxygen XML Editor/Author](#) or an automatic publishing system, such as *Jenkins* or *Travis*. **However, to do this, you must purchase an additional Oxygen XML WebHelp license.**

Adding Oxygen Feedback to WebHelp Responsive Documentation

You can add Oxygen Feedback in WebHelp Responsive for DITA output to benefit from a modern commenting system, advanced ready-to-use search engine, administrative interface, and **Oxygen XML Editor/Author** integration.

Comments Component

A comments component is presented in your WebHelp Responsive output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by **Oxygen Feedback**, a modern comment management system that can be integrated with your WebHelp Responsive output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

External Search Engine

Oxygen Feedback can be [configured as an external search engine](#) for the **Oxygen WebHelp Responsive** output. This function can be enabled from the *Content Indexing and Search* section that is available in the *Version Settings* page.

Administration Interface

Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software. You simply need to create an [Oxygen Feedback site configuration in the administration interface](#), copy the HTML installation fragment that is generated at the end of the creation process, and paste the generated fragment in the **Feedback** tab in the WebHelp Responsive transformation scenario dialog box (*on page 2559*).

Oxygen XML Editor/Author Integration

An add-on is available that contributes a **Feedback Comments Manager** view in *Oxygen XML Editor/Author* where the documentation team can see all the comments added in your WebHelp

output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Deploying the Oxygen Feedback Comments Component

Prerequisite

To install and manage **Oxygen Feedback**, you will need to obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the *administration login page* (<https://feedback.oxygenxml.com/login>). You can click on **Log in with Google** or **Log in with Facebook** to create an account using your Google or Facebook credentials, or click the **Sign Up** tab to create an account using your name and email address.
2. Click the **Add site** button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the **Settings** page, enter a **Name** and **Description** for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the [Site Settings topic](#). Click **Continue**.
4. In the **Initial version** page, enter the **Base URL** for your website (you can add additional URLs by clicking the  **Add** button). You can also specify an **Initial version** if you want it to be something other than *1.0*. If you do not plan to have multiple versions, leave the version as *1.0*. For more details, see the [Initial Version topic](#).
5. [Optional] To configure Oxygen Feedback as an external search engine check the **Enable content indexing** option.
6. Click **Continue**.
7. In the **Installation** page, choose a site generation option:
 - a. If you will generate the documentation using a transformation scenario in *Oxygen XML Editor/Author*, select the **Oxygen XML Editor** option and continue with these steps:
 - i. Copy the generated HTML fragment and click **Finish**.
 - ii. In *Oxygen XML Editor/Author*, open the **Configure Transformation Scenario(s)** dialog box.
 - iii. Select and duplicate the **DITA Map WebHelp Responsive** scenario.
 - iv. Go to the **Feedback** tab.
 - v. Click the **Edit** button and paste the generated installation fragment.
 - b. If you will generate the documentation using a command-line script, select the **Oxygen XML WebHelp** option and continue with these steps:
 - i. Copy the generated HTML fragment and click **Finish**.
 - ii. Create an XML file (for example, `feedback-install.xml`) with the generated installation fragment.

- iii. Use the `webhelp.fragment.feedback` parameter in your command-line script to specify the path to the file you just created. For example:

```
dita.bat -Dwebhelp.fragment.feedback=c:\path\to\feedback-install.xml
```

- 8. [Optional] If you want the **Oxygen Feedback** comments component to fill the entire page width, contribute a custom CSS file (use the `args.css` parameter to reference it) that contains the following style rule:

```
div.footer {
    float: none;
}
```

For more details about **Oxygen Feedback**, how to configure settings, moderate comments, view statistics, and much more, see the [Oxygen Feedback user guide](#).

Also, to see a demonstration of **Oxygen Feedback** being integrated into WebHelp Responsive output, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

Customizing WebHelp Responsive Output

Oxygen XML Editor Eclipse plugin provides support for customizing the **WebHelp Responsive** output to suit your specific needs. The **WebHelp Responsive** output is based upon the *Bootstrap* responsive front-end framework and is available for DITA document types.

To change the overall appearance of your **WebHelp Responsive** output, you can use several different customization methods or a combination of methods. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying existing templates, create your own layout pages, or by configuring certain options and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp Responsive system output, such as how to configure the tiles on the main page, add logos in the title area, integrate with social media, localizing the interface, and much more.

For an in-depth look at WebHelp Responsive features and some customization tips, watch our Webinar: [DITA Publishing and Feedback with Oxygen Tools](#).

Working with Publishing Templates

An *Oxygen Publishing Template (on page 2680)* defines all aspects of the layout and styles of the **WebHelp Responsive** output. It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output. The recommended method for customizing the *WebHelp Responsive* output is to use a custom publishing template.

This section contains topics about how to create, edit, publish, and share publishing templates.

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new *Oxygen Publishing Template (on page 2680)*, follow these steps:

1. Create a folder that will contain all the template files.
2. In **Oxygen XML Editor/Author**, open the new document wizard (use **File > New** or the  **New** toolbar button), then choose the **Publishing Template Descriptor** template.

Figure 440. Choosing the Publishing Template Descriptor Document Template

3. Save the `.opt` file into your customization directory.
4. Open the `.opt` file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a **DITA Map WebHelp Responsive** or **DITA Map PDF - based on HTML5 & CSS** transformation, the easiest way to create a new *Oxygen Publishing Template (on page 2680)* is to select an existing template

in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.

Step Result: This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.
7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (on page 1375)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

Step Result: A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the `.opt` file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWwO8>

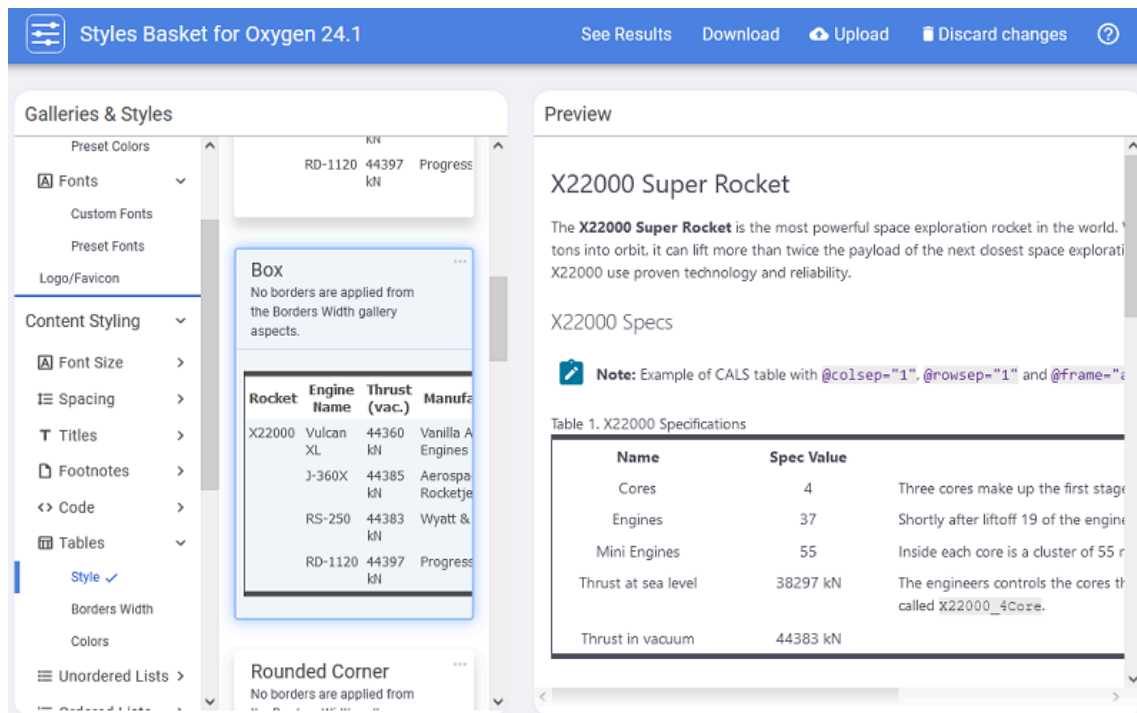

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an *Oxygen Publishing Template (on page 2680)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map WebHelp Responsive** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

Figure 441. Oxygen Styles Basket Interface

Resources

For more information about the **Oxygen Styles Basket**, see the following resources:

- **Video: Introducing the New Oxygen Styles Basket**
- **Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch**

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

How to Edit a Packed Publishing Template

To edit an existing *Oxygen Publishing Template (on page 2680)* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project Explorer** view.
3. Using the **Project Explorer** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

Related Information:

[Publishing Template Package Contents for PDF Customizations \(on page 1556\)](#)

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

How to Add a Publishing Template to the Publishing Templates Gallery

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a WebHelp Responsive transformation.
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.
This will open the preferences page.
3. Click the **Add** button and specify the location of your template directory.
Your template directory is now added to the **Additional Publishing Templates Galleries** list.
4. Click **OK** to return to the transformation scenario dialog box.
All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

How to Use a Publishing Template from a Command Line

Before you run the transformation, you need to know if the publishing template has a [single template descriptor file](#) or [multiple descriptor files \(on page 1359\)](#). If you don't know, open the ZIP archive or folder and check for files with the `.opt` extension.

Using a Publishing Template with a Single Descriptor

A template with a single descriptor is used for a single customization.

To run from a command line, you need to use the [webhelp.publishing.template](#) parameter (on page 1486). This parameter specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

Command-Line Example:

• Windows:

```
dita.bat
--format=webhelp-responsive
--input=c:\path\to\mySample.ditamap
--output=c:\path\to\output
-Dwebhelp.publishing.template=custom-template
```

• Linux/macOS:

```
dita
--format=webhelp-responsive
--input=/path/to/mySample.ditamap
```

```
--output=/path/to/output  
-Dwebhelp.publishing.template=custom-template
```

**Tip:**

You can also start the `dita` process by passing it a [DITA OT Project File](#). Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Using a Publishing Template with Multiple Descriptors

A template with multiple descriptors contains multiple customizations.

Because the publishing template is self-contained, it is used to reuse resources that are common to multiple publications.

To run from a command line, you need to use the `webhelp.publishing.template` ([on page 1486](#)) and `webhelp.publishing.template.descriptor` ([on page 1486](#)) parameters.

The `webhelp.publishing.template` ([on page 1486](#)) parameter specifies the path to the ZIP archive (or root folder) while the `webhelp.publishing.template.descriptor` ([on page 1486](#)) parameter specifies the name of the descriptor you want to use.

Command-Line Example:

- **Windows:**

```
dita.bat  
  
--format=webhelp-responsive  
  
--input=c:\path\to\mySample.ditamap  
  
--output=c:\path\to\output  
  
-Dwebhelp.publishing.template=custom-template  
  
-Dwebhelp.publishing.template.descriptor=flowers.opt
```

- **Linux/macOS:**

```
dita  
  
--format=webhelp-responsive  
  
--input=/path/to/mySample.ditamap  
  
--output=/path/to/output  
  
-Dwebhelp.publishing.template=custom-template  
  
-Dwebhelp.publishing.template.descriptor=flowers.opt
```

**Tip:**

You can also start the `dita` process by passing it a [DITA OT Project File](#). Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Troubleshooting: Errors Encountered when Loading Templates

When the **Templates** tab of a **WebHelp Responsive** transformation scenario dialog box is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the [template descriptor file \(on page 1359\)](#) are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

 Some templates could not be loaded. [More details](#)

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected [descriptor file structure \(on page 1359\)](#).

Also, if a template could be loaded, but certain elements could not be found in the [descriptor file \(on page 1359\)](#), a warning icon () will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid [preview-image element \(on page 1362\)](#) cannot be found.

Converting Old Templates to Newer Versions

WebHelp templates that were created in older versions of Oxygen XML Editor Eclipse plugin can be converted to the Publishing Template format that was introduced in Oxygen XML Editor Eclipse plugin version 20.0. This section contains several procedures for converting old templates depending on the version they were created in.

Convert Version 24.1 Publishing Templates to Version 25

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 24.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 25.0:

1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 268\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v25**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 25.0.

[Convert Version 21 Publishing Templates to Version 22 \(on page 1404\)](#)

[Convert Version 20 Publishing Templates to Version 21 \(on page 1404\)](#)

Convert Version 24.0 Publishing Templates to Version 24.1

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 24.0, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 24.1:

1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 268\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24.1**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 24.1.

Related information

[Convert Version 21 Publishing Templates to Version 22 \(on page 1404\)](#)

[Convert Version 20 Publishing Templates to Version 21 \(on page 1404\)](#)

Convert Version 23 Publishing Templates to Version 24

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 23.0 or 23.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 24:

1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 268\)](#) and the easiest way to do this is to drag and drop the folder).

Note:

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v24**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 24.

Related information

[Convert Version 20 Publishing Templates to Version 21 \(on page 1404\)](#)

Convert Version 21 Publishing Templates to Version 22

If you have a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 21.0 or 21.1, the following conversion procedure is required for the template to be compatible with Oxygen XML Editor Eclipse plugin version 22:

1. In the **Project Explorer** view, add the root directory for your custom Publishing Template (you can [use a linked folder \(on page 268\)](#) and the easiest way to do this is to drag and drop the folder).

**Note:**

If your template is stored as a ZIP archive, you first need to unzip it.

2. Expand your template directory, right-click the `page-templates` subfolder, and select **Refactoring > XML Refactoring**.
3. In the **XML Refactoring** dialog box, scroll to the **Publishing Template** section and select **Migrate HTML Page Layout Files to v22**, then click **Next**.
4. The **Scope** should be left as **Selected project resources**.
5. You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.
6. Click **Finish** to perform the conversion.

Result: The converted Publishing Template can now be used in version 22.

Changing the Layout and Styles

This section contains topics that explain how to customize the output using CSS, inserting HTML fragments, changing the layout of the main page, and more.

How to Use CSS Styling to Customize the Output

The most common way to customize WebHelp Responsive output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario (using an [Oxygen Publishing Template \(on page 2680\)](#) or a transformation parameter). This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

**Tip:**

When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Create the Custom CSS

As a practical example, the following procedure changes the background color of the footer bar in the WebHelp output:

1. Use the browser's CSS inspector to identify the current CSS code that styles the footer bar. In this particular case, the pertinent code that would be identified is:

```
.wh_footer {  
    font-size: 15px;  
    line-height: 1.7em;  
    background-color: #000;  
}
```

2. If you want to test the color you want to apply as the background of this particular element, use the browser's CSS inspector to change the value of the `background-color` attribute. After you find a suitable color, copy that new code.
3. Create a custom CSS file and paste or enter the copied code. For example:

```
.wh_footer {  
    background-color: #255890;  
}
```

4. Save the custom CSS file at a location of your convenience.
5. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1407) or the `args.css` parameter (on page 1407).

**Fastpath:**

Regenerating the output to see the changes made in the CSS is not required. Instead, you can directly edit the files in *WebHelp Output Directory/oxygen-webhelp/template* and reload the page in your browser. Once you obtained the desired output, simply copy the stylesheet back to your publishing template folder.

Referencing the CSS Using a Publishing Template

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Using the **Project Explorer** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add your custom CSS in the `resources` section.

```
<publishing-template>
...
<webhelp>
...
<resources>
...
<css file="resources/MyCustom.css" />
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the `args.css` Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Insert Custom HTML Content

You can add custom HTML content in the WebHelp Responsive output by inserting it in a well-formed XML file (or specifying it in a **well-formed** XHTML fragment) that will be referenced in the transformation (either from an [Oxygen Publishing Template \(on page 2680\)](#) or using one of the [HTML fragment placeholder parameters \(on page 1487\)](#)). This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

The XML File

There are several things to consider regarding this XML file:

- **Well-Formedness** - If the content of the file is not *XML Well-formed (on page 545)*, the transformation will automatically convert non-well-formed HTML content to a well-formed XML equivalent (assuming the `webhelp.enable.html.fragments.cleanup` transformation parameter is set to **true**).

For example, if the HTML content includes several `<script>` or `<link>` elements, the XML fragment would have multiple root elements and to make it well-formed, it would be wrapped in an `<html>` element.

This element tag will be filtered out and only its children will be copied to the output documents.

Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

Note:

The converted fragments are stored in a file located in the `whr-html-fragments` subfolder of the transformation's temporary directory.

Tip:

If you do not want the transformation to automatically convert non-well-formed content into well-formed XML content, you can set the `webhelp.enable.html.fragments.cleanup` transformation parameter to **false**. This will instead cause the transformation to fail if at least one HTML fragment is not well-formed.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js" />
  <link rel="stylesheet" type="text/css"
    href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

If you want that the path of your resource to be relative to the *templates directory (on page 1356)*, you can use the `${oxygen-webhelp-template-dir}` macro.

To copy the referenced resources to the output directory, follow the procedure in: [How to Copy Additional Resources to Output Directory \(on page 1467\)](#).

- **Inline JavaScript or CSS Content:**

JavaScript:

```
<script type="text/javascript">
  /* Include JavaScript code here. */
```

```
function myFunction() {
    return true;
}
</script>
```

CSS:

```
<style>
    /* Include CSS style rules here. */

    *{
        color:red
    }
</style>
```

Note:

If you have special characters (e.g. `&`, `<`) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

Otherwise, the WebHelp transformation automatically wraps inline JavaScript or CSS content in an XML comment. Also, if the commented content contains constructs that are not allowed in an XML comment, those constructs are escaped.

[Important] XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```
<script type="text/javascript">
    <!--
        /* Include JavaScript code here. */

        function myFunction() {
            return true;
        }
    -->
</script>
```

Using WebHelp Macros

The XML file can use WebHelp macros, which are variables that will be expanded when the content of the HTML fragment file will be copied in the final output.

There are two possibilities for using macros:

- **Directly in attribute values** - For example, if you want to reference a JavaScript file from the Publishing Template directory, you can use the following construct:

```
<script type="text/javascript" src="{path(oxygen-webhelp-template-dir)}/"></script>
```

- **In text content** - Using the `<whc:macro>` template component:

```
<script type="text/javascript">
  var outDirPath = '<whc:macro value="{path(oxygen-webhelp-output-dir)}"'
  xmlns:whc="http://www.oxygenxml.com/webhelp/components"/>' ;
  console.log("The output directory path is:", outDirPath);
</script>
```

Note:

When using the `<whc:macro>` element, you should also include the `xmlns:whc="http://www.oxygenxml.com/webhelp/components"` namespace declaration for the `whc` prefix. This is necessary for the XML fragment to be well-formed.

The following *macros* are supported:

i18n

For localizing a string.

```
{i18n(string.id)}
```

param

Returns the value of a transformation parameter.

```
{param(webhelp.show.main.page.tiles)}
```

env

Returns the value of an environment variable.

```
{env(JAVA_HOME)}
```

system-property

Returns the value of a system property.

```
{system-property(os.name)}
```

timestamp

Can be used to format the current date and time. Accepts a string (as a parameter) that determines how the date and time will be formatted (format string or *picture string* as it is known in the XSLT specification). The format string must comply with the [rules of the XSLT format-dateTime function specification](#).

```
{timestamp([h1]:[m01] [P] [M01]/[D01]/[Y0001])}
```

path

Returns the path associated with the specified path ID. The following paths IDs are supported:

- **oxygen-webhelp-output-dir** - The path to the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-assets-dir** - The path to the `oxygen-webhelp` subdirectory from the output directory. The path is relative to the current HTML file.
- **oxygen-webhelp-template-dir** - The path to the template directory. The path is relative to the current HTML file.

```
${path(oxygen-webhelp-template-dir)}
```

Note:

New paths IDs can be added by overriding the `wh-macro-custom-path` template from `com.oxygenxml.webhelp.responsive\xsl\template\macroExpander.xsl`:

```
<!-- Extension template for expanding a custom path macro. -->
<xsl:template name="wh-macro-custom-path">
  <xsl:param name="pathId"/>
  <xsl:value-of select="$pathId"/>
</xsl:template>
```

map-xpath

Can be used to execute an XPath expression over the DITA map file from the temporary directory.

Tip:

Available in all template layout HTML pages.

```
${map-xpath(/map/title)}
```

topic-xpath

Can be used to execute an XPath expression over the current topic.

Tip:

Available only in the topic HTML page template (`wt_topic.html`).

```
${topic-xpath(string-join(//shortdesc//text(), ' '))}
```

oxygen-webhelp-build-number

Returns the current WebHelp distribution ID (build number).

```
${oxygen-webhelp-build-number}
```

Referencing the HTML fragment using a Publishing Template

1. If you have not already created a Publishing Template, see [Working with Publishing Templates \(on page 1395\)](#).
2. Insert the HTML content in a file that is XML well-formed (for example, `custom-html.xml`).
3. Using the **Project Explorer** view, copy your custom XML file in a folder inside publishing the template root folder (for example, in the `custom_footer_template/html-fragments` folder).
4. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add a reference to the custom HTML fragment in the `html-fragments` section.

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="html-fragments/custom-html.xml"
    placeholder="webhelp.fragment.head" />
  </fragment>
</html-fragments>
</webhelp>
</publishing-template>
```

Note:

If you want to insert the content in another location within the output document, you can reference the XML file from any other [HTML Fragment extension points \(on page 1366\)](#).

5. Open the *DITA Map WebHelp Responsive* transformation scenario.
6. Click the **Choose Custom Publishing Template** link and select your template.
7. Click **OK** to save the changes to the transformation scenario.
8. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

Referencing the HTML Fragment using a Transformation Parameter

1. Insert the HTML content in a well-formed XML file.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.

Note:

If you want to insert the content in another location within the output document, you can reference the XML file from any other [HTML Fragment extension points \(on page 1366\)](#).

4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: Your additional content will be included at the end of the `<head>` element of your output document.

Related Information:[HTML Fragment Placeholders \(on page 1366\)](#)[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

How to Change Numbering Styles for Ordered Lists

Ordered lists (``) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

```
<ol outputclass="number-alpha">
  <li>A</li>
  <li>B</li>
  <li>C</li>
</ol>
```

2. Add the following code snippet in a custom CSS file:

```
ol.number-alpha{
  list-style-type: lower-alpha;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using [an Oxygen Publishing Template \(on page 1413\)](#) or the `args.css` parameter [\(on page 1414\)](#).

Referencing the Custom CSS from a Publishing Template

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Using the **Project Explorer** view, copy your custom CSS in a folder inside the publishing template root folder (for example, in the `custom_footer_template/resources` folder).
3. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add your custom CSS in the *resources* section.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <css file="resources/MyCustom.css" />
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.

6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

Referencing the CSS Using the *args.css* Parameter

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
2. Set the `args.css` parameter to the path of your custom CSS file.
3. Set the `args.copycss` parameter to `yes` to automatically copy your custom CSS in the output folder when the transformation scenario is processed.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your custom CSS will be applied as a final layer on top of any existing CSS rules and the output will reflect the changes you made.

How to Add Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the `@outputclass` attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the `@outputclass` attribute on the `<codeblock>` element and set its value to one of the predefined language values. The **Content Completion Assistant** offers a list of the possible values when adding the `@outputclass` attribute in **Text** mode but there are also two simple ways to set the value in **Author** mode:

- Select the `<codeblock>` element in the editor and in the **Attributes** view, click on the **Value** cell for the `@outputclass` attribute and select one of the predefined values (for example, `language-xml`).
- Select the `<codeblock>` element in the editor and use the **Alt + Enter** keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the **Value** drop-down menu.

The predefined values that can be selected are:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp

- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
- language-sql
- language-xquery

**Attention:**

It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Tip:**

Starting with version 24.0, the language values can also be set without using the `language-` prefix.

Example:

The following codeblock with the `@outputclass` set as `language-css`:

```
<codeblock outputclass="language-css" id="codeblock_1">@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}</codeblock>
```

would like this in WebHelp output:

```
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
```

```

}
}
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}

```

How to Show or Hide Navigation Links in Topic Pages

The [topic pages \(on page 1315\)](#) in WebHelp Responsive output can contain navigation links (← **Previous** / **Next** → arrows) that can be used to navigate to the previous or next topic.

How to Control Which Topic Pages Include Navigation Links

The navigation links are controlled by the `@collection-type` attribute. For example, if you set `collection-type="sequence"` on a parent topic reference in your DITA map, navigation links will be generated in the output for all of its child topics (from children to parent, and from child to previous sibling and next sibling).

```

<map id="example_map" title="Example Map">
  <topicref href=" ../topics/ParentTopic.dita" collection-type="sequence">
    <topicref href=" ../topics/Childtopic.dita"/>
  </topicref>

```

How to Generate Navigation Links for All Topics (Ignoring the Collection Type Attribute)

You can use the `webhelp.default.collection.type.sequence` parameter in the transformation and set its value to `yes` to generate navigation links for all topics, regardless of whether or not the `collection-type` attribute is present.

How to Hide All Navigation Links

To hide all navigation links, use the `webhelp.show.navigation.links` parameter in the transformation and set its value to `no`.

How to Change the Main Page Layout

This section contains topics that explain how to customize the layout of the main page in the WebHelp Responsive output.

How to Customize the Menu

By default, the menu component is displayed in all WebHelp Responsive pages. However, you might want to hide it completely, or only display some of its menu entries.

How to Hide Some of the Menu Entries

There are two methods for doing this. One of them involves editing the *DITA map* (on page 2678) and marking the topics that do not need to be included in the menu, and another one that uses a small CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics will not be displayed in the menu, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the `topicref` element (or any of its specializations) for each topic you do not want to be displayed in the menu:

```
<topicmeta>
  <data name="wh-menu">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics will not be displayed in the menu, follow these steps:

1. Make sure you set an ID on the topic that you do not want to include in the menu.
2. Create a new CSS file that contains a rule that hides the menu entry generated for the topic (identified by the topic ID `growing-flowers` in the following example). The CSS file should have content that is similar to this:

```
.wh_top_menu *[data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1407) or the `args.css` parameter (on page 1407).

How to Hide the Entire Menu

If you do not want to include a main menu in the pages of the WebHelp Responsive output, you can instruct the transformation scenario to skip the menu generation completely.

Using a Publishing Template

To hide the menu using an *Oxygen Publishing Template* (on page 1356), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the `webhelp.show.top.menu` parameter in the *parameters* section with its value set to `no`.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="webhelp.show.top.menu" value="no" />
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To hide the menu using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.show.top.menu` parameter to `no`.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add a Welcome Message in the WebHelp Responsive Main Page

The main page of the WebHelp Responsive output contains a set of [empty placeholders \(on page 1366\)](#) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.welcome` parameter displays text content above the search box in the main page.

Using a Publishing Template

To add a customized welcome message in the main page of the WebHelp Responsive output using an *Oxygen Publishing Template (on page 1356)*, follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the `webhelp.fragment.welcome` parameter in the *parameters* section with its value set to one of the following:

- A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
- A path to a file that contains well-formed XHTML content.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="webhelp.fragment.welcome" value="c:\myMessage.xhtml" />
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a customized welcome message in the main page of the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.fragment.welcome` parameter with its value set to one of the following:
 - A small well-formed XHTML fragment (such as: `<i>Welcome to the User Guide</i>`).
 - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom message will be displayed above the search box in the main page.

How to Create a Custom Footer

The main page of the WebHelp Responsive output contains a set of [empty placeholders \(on page 1366\)](#) that can be used to display customized text fragments. These placeholders are available to you through WebHelp Responsive transformation scenario parameters. For example, the placeholder identified through the `webhelp.fragment.footer` parameter displays the custom content at the bottom of the page.

Using a Publishing Template

To create a custom footer in the WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1356\)](#), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the `webhelp.fragment.footer` parameter in the `html-fragments` section with its value set to a path of a file that contains well-formed XHTML content.

```
<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment file="html/footer.xhtml" placeholder="webhelp.fragment.footer" />
</html-fragments>
</webhelp>
```

Important:

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

Using a Transformation Scenario in Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To create a custom footer in the WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.fragment.footer` parameter with its value set to one of the following:
 - A small well-formed XHTML fragment.
 - A path to a file that contains well-formed XHTML content.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

Result: In the WebHelp output, your custom footer will be displayed at the bottom of the page.

How to Configure the Tiles on the WebHelp Responsive Main Page

The *tiles* version of the main page of the WebHelp Responsive output displays a tile for each topic found on the first level of the *DITA map* (on page 2678). However, you might want to customize the way they look or even to hide some of them.

Depending on your particular setup, you can choose to customize the tiles either by setting metadata information in the *DITA map* or by customizing the CSS that is associated with the *DITA map*.

How to Hide Some of the Tiles

If your documentation is very large or there is a large number of topics on the first level, you might want to hide some of the tiles. Also, this might be useful if you only want to display the topics in the first page that are most relevant to your intended audience.

There are two methods for doing this. One of them involves editing the *DITA map* and marking the topics that do not need to be displayed as tiles, and another one that uses a small CSS customization level to hide some tiles identified by the ID of the topic.

Editing the DITA Map

To edit the metadata in the *DITA map* to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that you do not want to be displayed as a tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="hide" value="yes"/>
  </data>
</topicmeta>
```

Customizing the CSS

To customize the CSS to control which topics on the first level of the *DITA map* will not be displayed as a tile, follow these steps:

1. Make sure you set an ID on the topic you want to hide.
2. Create a new CSS file that contains a rule that hides the tile generated for the topic (identified in the following example by the topic ID `growing-flowers`). The CSS file should have content that is similar to this:

```
.wh_tile [data-id='growing-flowers'] {
  display:none;
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1407) or the `args.css` parameter (on page 1407).

How to Add an Image to the Tiles

There are two methods that you can use to add an image to a tile. One of them involves editing the *DITA map*, and the other uses a CSS customization.

Editing the DITA Map

To edit the metadata in the *DITA map* to set an image to be displayed in a tile, follow these steps:

1. Open the *DITA map* in the **Text** editing mode of Oxygen XML Editor Eclipse plugin.
2. Add the following metadata information in the `<topicref>` element (or any of its specializations) for each first-level topic that will have an image displayed in the corresponding tile:

```
<topicmeta>
  <data name="wh-tile">
    <data name="image" href="img/tile-image.png" format="png">
    <data name="attr-width" value="64"/>
    <data name="attr-height" value="64"/>
  </data>
```

```
</data>
</topicmeta>
```

**Note:**

The `@attr-width` and `@attr-height` attributes can be used to control the size of the image, but they are optional.

Customizing the CSS

To customize the CSS to set an image to be displayed in a tile, follow these steps:

1. Make sure you set an ID on the topic that you want the tile to include an image.
2. Create a new CSS file that contains a rule that associates an image with a specific tile. The CSS file should have content that is similar to this:

```
.wh_tile[data-id='growing-flowers']> div {
    background-image:url('resources/flower.png');
}
```

3. Reference the CSS file in a *WebHelp Responsive* transformation using an *Oxygen Publishing Template* (on page 1407) or the `args.css` parameter (on page 1407).

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published output or the output directory.

How to Add a Logo Image in the Title Area

You can customize **WebHelp Responsive** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template* (on page 1356), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1562).
2. Open the [template descriptor file](#) (on page 1359) associated with your publishing template and add the `<logo>` element in the `<resources>` section and set the `@file` attribute value to the path of your logo.

3. If you also want to add a link to your website when you click the logo image, set its URL in the `@target-url` attribute.

```

<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      <logo
        file="images/logo.png"
        target-url="http://www.example.com"
        alt="Alternate text for the logo image"/>
    </resources>
  </webhelp>

```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.logo.image` parameter to the path of your logo.
3. If you also want to add a link to your website when you click the logo image, set its URL in the `webhelp.logo.image.target.url` parameter.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

How to Add a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image.

This customization can be done using an *Oxygen Publishing Template* or using a transformation scenario from within **Oxygen XML Editor/Author**.

Using a Publishing Template

To add a *favicon* to your WebHelp output using an *Oxygen Publishing Template (on page 1356)*, follow this procedure:

1. If you have not already created a Publishing Template, see [Working with Publishing Templates \(on page 1395\)](#).
2. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the `<favicon>` element in the `resources` section. The path to the image is relative to the template root folder.

```

<publishing-template>
  ...
  <webhelp>
    ...
    <resources>
      ...
      <favicon file="images/favicon.png"/>

```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: Browsers that provide *favicon* support display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
2. Open the **Parameters** tab and set the `webhelp.favicon` parameter to the path of your image.
3. Click **OK** to save the changes to the transformation scenario.
4. Run the transformation scenario.

How to Add Video and Audio Objects in DITA WebHelp Output

You can insert references to video and audio media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics and then publish them to WebHelp output. The media objects can be played directly in all HTML5-based outputs, including WebHelp systems.

To add media objects in the WebHelp output generated from DITA documents, follow the procedures below.

Adding Videos to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the video through one of the following methods:
 - Use the  **Insert Media Object** toolbar action ([on page 2419](#)).
 - Drag (or copy) the video file from your system explorer or the **Project Explorer** view ([on page 269](#)) and drop (or paste) it into your document.
 - Manually add an `<object>` element, as in one of the following examples:

```
<object outputclass="video" type="video/mp4" data="MyVideo.mp4" />
```

or, instead of the `@data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="video">
  <param name="src" value="videos/MyVideo.mp4" />
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `<object>` element to an HTML5 `<video>` element.

```
<video controls="controls"><source type="video/mp4" src="MyVideo.mp4"></source>
</video>
```

Adding Audio Clips to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the audio clip through one of the following methods:

- Use the  **Insert Media Object** toolbar action (*on page 2419*).
- Drag (or copy) the audio file from your system explorer or the **Project Explorer** view (*on page 269*) and drop (or paste) it into your document.
- Manually add an `<object>` element, as in one of the following examples:

```
<object outputclass="audio" type="audio/mpeg" data="MyClip.mp3" />
```

or, instead of the `@data` attribute, you can specify the video using a parameter like this:

```
<object outputclass="audio">
  <param name="src" value="audio/MyClip.mp3" />
</object>
```

2. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `<object>` element to an HTML5 `<audio>` element.

```
<audio controls="controls"><source type="audio/mpeg" src="MyClip.mp3"></source>
</audio>
```

Adding Embedded HTML Frames (such as YouTube videos) to DITA WebHelp Output

1. Edit the DITA topic and insert a reference to the embedded object by using the  **Insert Media Object** toolbar action (*on page 2419*) or by manually adding an `<object>` element, as in one of the following examples:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4" />
```

or, instead of the `@data` attribute, you can specify the object using a parameter like this:

```
<object outputclass="iframe">
  <param name="src" value="http://www.youtube.com/embed/m_vv2s5Trn4" />
</object>
```

2. If you want the video to be allowed to play in full screen mode once the document is converted to XHTML output, also add an `allowfullscreen` parameter and set its value to **true**:

```
<object outputclass="iframe" data="https://www.youtube.com/embed/m_vv2s5Trn4" />
  <param name="allowfullscreen" value="true" />
</object>
```

Tip:

If you copy the embed code from the source and paste it into the **Insert Media** dialog box (see the specific instructions: [here \(on page 2422\)](#)), the `allowfullscreen` parameter will automatically be added and all you have to do is set the value to **true**.

3. Apply a **DITA to WebHelp** transformation to obtain the output.

Result: The transformation converts the `<object>` element to an HTML5 `<iframe>` element.

```
<iframe controls="controls" src="https://www.youtube.com/embed/m_vv2s5Trn4">
</iframe>
```

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics \(on page 2419\)](#)

How to Add MathML Equations in WebHelp Output

Currently, the majority of modern browsers have native support to render **MathML** equations embedded in the **HTML** code. If your browser that does not have support for MathML, [MathJax](#) is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript" id="MathJax-script" async
  src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/3.0.0/es5/latest?tex-mml-cthtml.js">
</script>
```

Result: The equation should now be properly rendered in the WebHelp output for other browsers.

Related information[How to Insert Custom HTML Content \(on page 1407\)](#)[Getting Started with MathJax Components](#)

Searching the Output

This section contains topics that explain how to use some of the search features in WebHelp Responsive output.

Built-in JS Based Search Engine Customizations

How to Change Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DITA. The properties file includes instructions and examples to help you with your customization. The file is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\indexer\scoring.properties`.

The following values can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Index Japanese Content

To optimize the indexing of Japanese content in WebHelp pages, the *Lucene Kuromoji Japanese analyzer* can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Restriction:

The *Kuromoji* analyzer does not work if your WebHelp output is accessed locally. In this scenario, a warning message will be displayed informing you that the *Kuromoji* analyzer is disabled.

It is possible to hide this warning message by using a transformation parameter named `webhelp.enable.search.kuromoji.js`. By default, its value is **yes**, which means the *Kuromoji* analyzer is enabled by default. To hide the warning message, set the value of that parameter to **no** using either of the methods listed below. When it is set to **no**, the *Kuromoji* analyzer is disabled even if you deploy your WebHelp output on a web server.

Using a Publishing Template

To add a logo in the title area of your WebHelp output using an *Oxygen Publishing Template* (on page 1356), follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#) (on page 1562).
2. Open the [template descriptor file](#) (on page 1359) associated with your publishing template and add the `default.language` parameter in the `parameters` section with its value set to `ja-jp`.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="default.language" value="ja-jp" />
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `default.language` parameter to `ja-jp`.

**Note:**

Alternatively, you could set the `@xml:lang` attribute on the root of the [DITA map \(on page 2678\)](#) and the referenced topics to `ja-jp`. Another alternative for DITA output is to use the `webhelp.search.japanese.dictionary` parameter to specify a path to a Japanese dictionary that will be used by the *Kuromoji* morphological engine (note that the encoding for the dictionary must be **UTF8**).

2. Run the WebHelp transformation scenario to generate the output.

How to Implement a Custom Search Filter

It is possible to implement a custom search filter (search input component) in your WebHelp Responsive output. The search input component is where users enter search queries to locate certain content within the WebHelp output.

To integrate a custom search filter, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
 - A folder named `js`.
 - A folder named `fragments`.
3. In the `js` folder, create a file named `search-filter.js`.
4. As a starting point, you can copy the following content to the `search-filter.js` file:

```
/**
 * Object that implements the methods required by WebHelp to run a search filter.
 */
function CustomSearchFilter() {

  /**
   * Method required to run the search filter in webhelp. It is called when the users
   * executes the query in the search page.
   *
   * @param {WebHelpAPI.SearchResult} searchResult The search result for the executed
   query.
   *
   * @return A list of WebHelpAPI.SearchResult objects
   */
  this.filterResults = function (searchResult) {
    // implement filter
  }
}
```

```

        return filteredResults;
    }
}

// Set the Search Filter to WebHelp
WebHelpAPI.setCustomSearchFilter(new CustomSearchFilter());
...

```

**Note:**

See the [API Search Objects section \(on page 1441\)](#) for details on how to create a `WebHelpAPI.SearchResult` object.

5. Implement your custom search filter.
6. In the **fragments** folder, create a file named **search-filter-script-fragment.xml**.
7. In the **search-filter-script-fragment.xml** file, define the scripts that are required for your custom search filter to run. For example:

```

<div>
    <script src="{oxygen-webhelp-template-dir}/js/search-filter.js"></script>
</div>

```

8. Copy the **js** folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources \(on page 1362\)](#) for more details):

```

<fileset>
    <include name="js/**"/>
</fileset>

```

9. Set the transformation parameters needed to enable the custom search filter. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```

<html-fragments>
    <fragment file="fragments/search-filter-script-fragment.xml"
        placeholder="webhelp.fragment.head.search.page"/>
</html-fragments>

```

10. Run the transformation with this publishing template selected.

How to Exclude Certain DITA Topics from Search Results

There are several ways to exclude certain DITA resources from your WebHelp system's search results. This is useful if you have topics in your *DITA map (on page 2678)* structure that you do not want to be included in search results for your WebHelp system. The first method involves setting a parameter in the WebHelp transformation scenario and the second involves setting an attribute for each DITA topic reference that you want to exclude.

Transformation Parameter Method

To exclude DITA topics from WebHelp search results using a transformation parameter, follow these steps:

1. Create a simple text file that will contain your excluded file patterns. Each pattern must be on a new line. The patterns are considered to be relative to the output directory and they accept wildcards such as '*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

Example: Suppose that in your project, you want to exclude all files located in the `resources` directory and all files located in the `topics` directory that have a `.bak` file extension. You could create a simple text file (for example, named `exclude.properties`), and add the following lines:

```
resources/*
topics/*.bak
```

2. Set the `webhelp.search.custom.excludes.file` parameter to specify the path to the file that contains the excluded file patterns (for example, `exclude.properties` in step 1). The parameter can be specified in the *parameters* section of the template descriptor file (on page 1364) associated with your publishing template or in the **Parameters** tab of the transformation scenario dialog box in **Oxygen XML Editor/Author**.
3. Run the transformation.

Search Attribute Method

The WebHelp **Search** engine does not index DITA topics that have the `@search` attribute set to `no`.

To exclude DITA topics from WebHelp search results using this attribute, follow these steps:

1. Edit the *DITA map* and for any `<topicref>` that you want to exclude from search results, set the `@search` attribute to `no`. For example:

```
<topicref href="../../../topics/internal-topic1.dita" search="no"/>
```

2. Save your changes to the *DITA map*.
3. Run your WebHelp system transformation.

Oxygen Feedback Search Engine

How to Configure Faceted Search in WebHelp Output

A *faceted search* is a powerful tool that allows users to refine search results by selecting filters or facets. *Facets* are predefined categories that are associated with search results. By selecting one or more facets, users can narrow down their search results to a specific category or set of categories.

Configure Oxygen Feedback as an External Search Engine

To enable faceted searches, you need to have a search engine that supports this functionality. The **Oxygen Feedback** search engine implements faceted searches and can be easily configured as a search engine for

WebHelp, see [Adding Oxygen Feedback to WebHelp Responsive Documentation \(on page 1393\)](#) for more details.

Attention:

The default search engine that comes embedded in the WebHelp Responsive output does not support faceted searches.

Defining Facets Using a DITA Subject Scheme Map

A [subject scheme map](#) can be used to define controlled values and subject definitions. *Subject definitions* are classifications and sub-classifications that compose a tree. Subject definitions provide semantics that can be used in conjunction with taxonomies and ontologies.

The `<subjectdef>` element is used to define both a subject category and a list of controlled values. The parent `<subjectdef>` element defines the category, and the children `<subjectdef>` elements define the controlled values.

The following example defines the "Operating system" category, with "Linux" and "Windows" sub-categories. The controlled values (facet values) are: "RedHat Linux", "SUSE Linux", "Windows 7", and "Windows 10".

```
<subjectScheme>
  ...
  <hasInstance>
    <subjectdef keys="os" navtitle="Operating system">
      <subjectdef keys="linux" navtitle="Linux">
        <subjectdef keys="redhat" navtitle="RedHat Linux"/>
        <subjectdef keys="suse" navtitle="SUSE Linux"/>
      </subjectdef>
      <subjectdef keys="windows" navtitle="Windows">
        <subjectdef keys="win7" navtitle="Windows 7"/>
        <subjectdef keys="win10" navtitle="Windows 10"/>
      </subjectdef>
    </subjectdef>
  </hasInstance>
  ...
</subjectScheme>
```

Associating Faceted Values With a Topic Using a DITA Classification Map

The [classification domain](#) provides elements that enable map authors to indicate information about the subject matter of DITA topics. The subjects are defined in subject scheme maps, and the subjects are referenced using the `@keyref` attribute.

The following example shows you how to associate a faceted value with a topic:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Classification Map//EN" "classifyMap.dtd">
```

```

<map>
  <title>Classification map</title>
  <topicref keyref="how-to-install-on-suse.dita">
    <topicsubject keyref="linux">
      <subjectref keyref="suse"/>
    </topicsubject>
  </topicref>

  <topicref keyref="how-to-install-win7.dita">
    <topicsubject keyref="windows">
      <subjectref keyref="win7"/>
    </topicsubject>
  </topicref>
</map>

```

**Note:**

The facet information cascades into child `<topicref>` elements.

Refining the Search Results by Using Facets in the Search Page

The configured facets are displayed in the search page, allowing you to narrow down the results.

When a user selects a facet, the search results are updated to only include the topics that match the selected facets. If multiple facet values are selected from the same category/facet, the search results display all topics with at least one facet. On the other hand, if multiple facet values from distinct facets are selected, the search results display all topics with all selected facet values.

[Adding Oxygen Feedback to WebHelp Responsive Documentation \(on page 1393\)](#)

How to Add Searchable Labels in WebHelp Output

It is possible to add *searchable labels* in WebHelp Responsive output that can be clicked to search for topics with that exact same label. Labels are textual words attached to a DITA topic that enables it to be easily found using the search function. These labels can help you organize your topics, making it more accessible to retrieve topics for a specific text.

Configure Oxygen Feedback as an External Search Engine

To enable *searchable labels*, you need to have a search engine that supports this functionality. The **Oxygen Feedback** search engine implements *searchable labels* and can be easily configured as a search engine for WebHelp. See [Adding Oxygen Feedback to WebHelp Responsive Documentation \(on page 1393\)](#) for more details.

**Attention:**

The default search engine that comes embedded in the WebHelp Responsive output does not support searchable labels. It will simply perform a standard search using the content within the label.

How to Add Searchable Labels in a DITA Topic

The generation of *searchable labels* in the WebHelp Responsive output is activated by default. You need to insert the desired text (to be displayed in the label in the output) in a `<keyword>` element with an `@outputclass` attribute set to **label** within the prolog of each topic that you want to have that label displayed in the output.

**Note:**

You can right-click anywhere within the topic in **Author** mode and select **Insert > Insert Label** to quickly insert the needed structure in the prolog.

For example:

```
<prolog>
  <metadata>
    <keywords>
      <keyword outputclass="label">Customization</keyword>
    </keywords>
  </metadata>
</prolog>
```

This would add a label that contains the text "Customization" in the output for the particular topic. If the user clicks that label, the search engine will search for all topics that have this same label defined.

Transformation Parameters for Generating Searchable Labels

You can have more control over how the labels are generated in the WebHelp Responsive output by using the `webhelp.labels.generation.mode` transformation parameter. The possible values for this parameter are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the WebHelp Responsive output.

**Note:**

The default value for the `webhelp.labels.generation.mode` transformation parameter is **keywords-label**.

Searchable Labels in WebHelp Responsive Output

The WebHelp Responsive transformation will generate a component that renders the text value of the `<keyword>` element. When the user clicks that component, they will be redirected to the search page with the search query populated for them and the search engine will display all topics that have the same text value defined in the prolog.

Custom Search Engine

How to Integrate Google Search in WebHelp Responsive Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Responsive** output and you can specify where you want the results to appear in your WebHelp page.

Using a Publishing Template

To integrate the *Google Search Engine* into your WebHelp Responsive output using an *Oxygen Publishing Template (on page 1356)*, follow this procedure:

1. Go to the [Google Custom Search Engine page](#) using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine component for your site.

Important:

For the **Layout**, you must select **Results only** for the *Google Search Engine* to work with **Oxygen XML WebHelp Responsive**.

4. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
(function() {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') +
    '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

5. Save the script into a well-formed HTML file called `googlecse.html`.

6. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the `webhelp.google.search.script` parameter in the `parameters` section with its value set to reference the `googlecse.html` file that you created earlier.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter
    name="webhelp.google.search.script"
    value="resources/googlecse.html"
    type="filePath"/>
</parameters>
</webhelp>
```

7. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
- Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the [HTML5 version for the GCSE](#)). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
 - Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
- Open the *DITA Map WebHelp Responsive* transformation scenario.
 - Click the **Choose Custom Publishing Template** link and select your template.
 - Click **OK** to save the changes to the transformation scenario.
 - Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

- Go to the [Google Custom Search Engine page](#) using your Google account.
- Select the **Create a custom search engine** button.
- Follow the on-screen instructions to create a search engine for your site.

Important:

For the **Layout**, you must select **Results only** for the *Google Search Engine* to work with **Oxygen XML WebHelp Responsive**.

4. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
(function() {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') + '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})();
</script>
```

5. Save the script into a well-formed HTML file called `googlecse.html`.

6. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.

7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.

8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.

a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the [HTML5 version for the GCSE](#)). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).

b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.

9. Click **Ok** and run the transformation scenario.

Replacing the Search Engine Only

It is possible to replace the internal search engine that is used by **Oxygen XML WebHelp** by using a custom JavaScript file. This customization method allows you to replace the search engine but keep the search results presentation.

To replace WebHelp's internal search engine, follow this procedure:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):

```

    * @param {Function} errorHandler Needs to be called if the search operation fails to
    *                               execute successfully. It needs to have the type
    *                               of String.
    */
    this.onPageChangedHandler = function(pageToShow, maxItemsPerPage, query, successHandler,
errorHandler) {
        // implement search engine
        // const searchResult = externalSearchEngine(pageToShow, maxItemsPerPage, query);

        // convert the result to WebHelpApi.SearchResult
        // const formattedResult = convert(searchResult);

        // call successHandler with the converted result.
        // successHandler(formattedResult)
    }
}

// Set the Search Engine to WebHelp
WebHelpAPI.setCustomSearchEngine(new CustomSearchEngine());

```

**Note:**

See the [API Search Objects section \(on page 1441\)](#) for details on how to convert your custom search engine results to `WebHelpAPI.SearchResult`.

5. Implement your search engine.
6. In the `fragments` folder, create a file named `search-engine-script-fragment.xml`.
7. In the `search-engine-script-fragment.xml` file, define the scripts that are required for your search engine to run. For example:

```

<div>
    <script src="{oxygen-webhelp-template-dir}/js/search-engine.js"></script>
</div>

```

8. Copy the `js` folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources \(on page 1362\)](#) for more details):

```

<fileset>
    <include name="js/**"/>
</fileset>

```

9. Set the transformation parameters needed to enable the search filter. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```

<html-fragments>
    <fragment file="fragments/search-engine-script-fragment.xml"

```

```
placeholder="webhelp.fragment.head.search.page"/>
</html-fragments>
```

API Search Objects

To replace the WebHelp Search Engine, you will need to convert your custom search result into WebHelp API Objects that WebHelp will use to render your search result on the search page. To convert your custom search result, you will have to create the following objects:

1. *WebHelpAPI.SearchMeta* is a JavaScript object used to hold additional information for the search result. To create such an object, the following fields are required:

- **String: searchEngineName** - The name of the search engine used to retrieve the search result.
- **Integer: totalSearchItems** - The total number of search items the search engine returned.
- **Integer: currentPage** - The current page to display.
- **Integer: maxItemsPerPage** - The maximum number of items that can be displayed on a page.
- **Integer: totalPages** - The number of total pages for the search result.
- **String: originalSearchExpression** - The query string the user typed in the search input field.

```
conse searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
maxItemsPerPage, totalPages, origianlSearchExpresion);
```

2. *WebHelpAPI.SearchDocument* is a JavaScript object used to hold the search result for a single topic/HTML page. To create such an object, the following fields are required:

- **String: linkLocation** - The URL to the topic.
- **String: title** - The topic title.
- **String: shortDescription** - The topic short description.

```
const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);
```

3. *WebHelpAPI.SearchResult* is a JavaScript object used to display the search results in the search page. To create such an object, the following fields are required:

- **WebHelpAPI.SearchMeta: searchMeta** - Contains additional information for the search result.
- **Array[WebHelpAPI.SearchDocument]: documents** - An array with the matching documents (HTML pages) for the search result.

```
conse searchMeta = new WebHelpAPI.SearchMeta(searchEngineName, totalSearchItems, currentPage,
maxItemsPerPage, totalPages, origianlSearchExpresion);

const searchDocument = new WebHelpAPI.SearchDocument(linkLocation, title, shortDescription);

const documents = [searchDocument]; // An array with one element.

const searchResult = new WebHelpAPI.SearchResult(searchMeta, documents);
```

Replacing the Search Engine and Results Presentation

It is possible to integrate a custom search engine and replace the search results area into your WebHelp Responsive output. This is done by using the following transformation parameters:

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

To integrate a custom search engine into your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Create the following items in the folder that contains your publishing descriptor file (the `.opt` file):
 - A file named `custom-search-results-fragment.xml`.
 - A file named `custom-search-script-fragment.xml`.
 - A folder named `js`.
3. In the **custom-search-results-fragment.xml** file, define the HTML structure that will be used as the search results area. For example:

```
<div id="cumstom-search-results">...</div>
```

Note:

The custom search engine script will need to find an HTML element from the HTML structure that will be used as the search results area and write the search results inside it. In this example, it is the `<div>` element with the id `custom-search-results`.

4. In the `js` folder, create a file named **custom-search.js**.
5. As a starting point, you can copy the following content to the **custom-search.js** file:

```
document.addEventListener('DOMContentLoaded', (event) => {
  const params = new URLSearchParams(window.location.search);
  const searchQuery = params.get('searchQuery');
  // Implement your custom search engine
  // Display the search results
});
```

Important:

The value entered by the user in the search page will be available in the URL's query parameters in a parameter named `searchQuery`.

**Attention:**

`URLSearchParams` is not supported on all browsers (it is used as an example). A list with the supported browsers can be found [here](#). A different solution should be used if you need to support other browsers.

6. Implement your custom search engine.

**Note:**

The search results should be pushed into the `<div>` element created earlier with the id `custom-search-results`.

7. In the **custom-search-script-fragment.xml** file, define the scripts that are required for your custom search engine to run. For example:

```
<div>
  <script src="{oxygen-webhelp-template-dir}/js/custom-search.js"></script>
</div>
```

8. Copy the **js** folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources \(on page 1362\)](#) for more details):

```
<fileset>
  <include name="js/**"/>
</fileset>
```

9. Set the transformation parameters needed to enable the custom search engine. For this, open the `.opt` file and add the following content inside the `<webhelp>` element:

```
<html-fragments>
  <fragment file="custom-search-script-fragment.xml"
    placeholder="webhelp.fragment.custom.search.engine.script"/>
  <fragment file="custom-search-results-fragment.xml"
    placeholder="webhelp.fragment.custom.search.engine.results"/>
</html-fragments>
```

10. Run the transformation with this publishing template selected.

**Tip:**

A sample publishing template that overrides WebHelp's default search engine is available to download [here](#). You can use it as a starting point for your customization.

How to Display Custom Title in Search Results

It is possible to display a custom title for topics in the search results page. This can be achieved by adding the `<searchtitle>` element inside the particular DITA topic (or within the topic reference in the DITA map). The `<searchtitle>` element is used to specify the title that is displayed by search tools that locate the topic. This is useful when the topic has a title that makes sense in the context of a single information set, but may be too general in a list of search results. If the `<searchtitle>` is specified, then the search results page will display the contents inside the `<searchtitle>` as the topic title.

For details about the `<searchtitle>` element (including an example), see <https://docs.oasis-open.org/dita/v1.2/os/spec/langref/searchtitle.html>.

How to Trigger a Search Query When WebHelp is Loaded

You can use the `searchQuery` URL parameter to perform a search operation when WebHelp is loaded. This opens the search results page with the specified search query processed. The URL should look something like this:

```
http://localhost/webhelp/search.html?searchQuery=deploying%20feedback
```

Configuring the Search Engine Optimization

A **DITA Map WebHelp** transformation scenario produces a `sitemap.xml` file that is used by search engines to aid crawling and indexing mechanisms. A *sitemap* lists all pages of a WebHelp system and allows web admins to provide additional information about each page, such as the date it was last updated, change frequency, and importance of each page in relation to other pages in your WebHelp deployment.

Important:

If the `webhelp.sitemap.base.url` parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If the `webhelp.sitemap.base.url` parameter is not specified, the `loc` element will only contain the relative path of the page.

You can also set these additional parameters:

- **webhelp.sitemap.change.frequency** - Specifies how frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`).
- **webhelp.sitemap.priority** - Specifies the priority of each page (a value ranging from 0.0 to 1.0).

The structure of the `sitemap.xml` file looks like this:

```
<urlset xmlns="http://www.sitemaps.org/schemas/sitemap/0.9">
  <url>
    <loc>http://www.example.com/topics/introduction.html</loc>
    <lastmod>2014-10-24</lastmod>
    <changefreq>weekly</changefreq>
```

```

<priority>0.5</priority>
</url>
<url>
  <loc>http://www.example.com/topics/care.html#care</loc>
  <lastmod>2014-10-24</lastmod>
  <changefreq>weekly</changefreq>
  <priority>0.5</priority>
</url>
.
.
.
</urlset>

```

Each page has a `<url>` element structure containing additional information, such as:

- **loc** - The URL of the page. This URL must begin with the protocol (such as `http`), if required by your web server. It is constructed from the value of the `webhelp.sitemap.base.url` parameter from the transformation scenario and the relative path to the page (collected from the `href` attribute of a `topicref` element in the *DITA map*).

Note:

The value must have fewer than 2,048 characters.

- **lastmod** (optional) - The date when the page was last modified. The date format is `YYYY-MM-DD hh:mm:ss`.
- **changefreq** (optional) - Indicates how frequently the page is likely to change. This value provides general information to assist search engines, but may not correlate exactly to how often they crawl the page. Valid values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.change.frequency` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Note:

The value `always` should be used to describe documents that change each time they are accessed. The value `never` should be used to describe archived URLs.

- **priority** (optional) - The priority of this page relative to other pages on your site. Valid values range from 0.0 to 1.0. This value does not affect how your pages are compared to pages on other sites. It only lets the search engines know which pages you deem most important for the crawlers. The first time the `sitemap.xml` file is generated, the value is set based upon the value of the `webhelp.sitemap.priority` parameter in the DITA WebHelp transformation scenario. You can change the value in each `url` element by editing the `sitemap.xml` file.

Creating and Editing the `sitemap.xml` File

Follow these steps to produce a `sitemap.xml` file for your WebHelp system, which can then be edited to fine-tune search engine optimization:

1. **Edit** the transformation scenario you currently use for obtaining your WebHelp output. This opens the **Edit DITA Scenario** dialog box.
2. Open the **Parameters** tab and set a value for the following parameters:
 - **webhelp.sitemap.base.url** - The URL of the location where your WebHelp system is deployed.

Note:

This parameter is required for Oxygen XML Editor Eclipse plugin to generate the `sitemap.xml` file.

- **webhelp.sitemap.change.frequency** - How frequently the WebHelp pages are likely to change (accepted values are: `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, and `never`).
 - **webhelp.sitemap.priority** - The priority of each page (value ranging from 0.0 to 1.0).
3. Run the transformation scenario.
 4. Look for the `sitemap.xml` file in the transformation's output folder. Edit the file to fine-tune the parameters of each page, according to your needs.

Localization

This section contains topics that explain how to use the localization support in WebHelp Responsive output.

How to Localize the Interface of WebHelp Responsive Output

Oxygen XML Editor Eclipse plugin comes with support for the following built-in languages: English, French, German, Japanese, and Chinese. It is possible to edit existing localization strings or add a new language.

Static labels used in the WebHelp output are stored in translation files that have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English labels are kept in the `strings-en-us.xml` file.

These translation files are collected from two locations:

- **`DITA-OT-DIR/plugins/org.dita.base/xsl/common` folder** - DITA-OT's default translations (generated text for `<note>`, `<fig>`, and `<table>` elements).
- **`DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization` folder** - These translations are contributed by the WebHelp plugin and extend the default ones provided by DITA-OT. The labels defined in this folder take precedence over the DITA-OT defaults.

There are two major reasons you may want to use modify the translation files: to modify the existing strings or to translate to a new language.

Related Information:[How to Index Japanese Content \(on page 1429\)](#)[Customizing Generated Text](#)

Modifying the Existing Strings

To modify the generated text for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xsl.strings* extension point. The following procedure is for changing English labels, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the *DITA-OT-
DIR/plugins/* location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>

  <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml"/>
  <lang xml:lang="en-us" filename="strings-en-us.xml"/>
</langlist>
```

4. Copy the strings you want to change from [the translation files \(on page 1446\)](#) to the `strings-en-us.xml` file. Make sure you leave the name attribute unchanged because this is the key used to look up the string. A sample content might be:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Draft comment">ADDRESS THIS DRAFT COMMENT</str>
</strings>
```

5. Use the [Integrate/Install DITA-OT Plugins](#) transformation scenario (on page 1197) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1300).

Adding a New Language

To add a new language for WebHelp transformations, you need to create a DITA-OT extension plugin that uses the *dita.xsl.strings* extension point. The following sample procedure is for adding translation files for the Polish language, but you can adapt it for any language:

1. Create a `com.oxygenxml.webhelp.localization` plugin directory inside the `DITA-OT-DIR/plugins/` location.
2. Create a `plugin.xml` file inside that `com.oxygenxml.webhelp.localization` directory with the following content:

```
<plugin id="com.oxygenxml.webhelp.localization">
  <require plugin="com.oxygenxml.webhelp.responsive"/>

  <feature extension="dita.xsl.strings" file="webhelp-extension-strings.xml"/>
</plugin>
```

3. Create a `webhelp-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="pl" filename="strings-pl-pl.xml"/>
  <lang xml:lang="pl-PL" filename="strings-pl-pl.xml"/>
</langlist>
```

4. Copy the WebHelp strings file (`DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/oxygen-webhelp/resources/localization/strings-en-us.xml`) to your plugin directory, and rename it as `strings-pl-pl.xml`.
5. In the `strings-pl-pl.xml` file, change the `@xml:lang` attribute on the root element that conforms with the new language.

```
<strings xml:lang="pl-PL">
  ...
</strings>
```

6. Translate the content of each `<str>` element (make sure to leave the `name` attribute unchanged).

```
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
  ...
</strings>
```

7. Copy the common DITA-OT strings defined in the `DITA-OT-DIR/plugins/org.dita.base/xsl/common/strings-en-us.xml` file. It defines a set generated text available for HTML-based transformations (such as `<note>`, `<fig>`, and `<table>` elements). Translate the content of each `<str>` element.

```
<strings xml:lang="pl-PL">
  ...
  <str name="webhelp.content" js="true" php="false">Polish translation for 'Content'.</str>
  <str name="webhelp.search" js="true" php="false">Polish translation for 'Search'</str>
  ...
  <str name="Figure">Polish translation for 'Figure'</str>
```

```
<str name="Table">Polish translation for 'Table'</str>
...
</strings>
```

- Use the [Integrate/Install DITA-OT Plugins](#) transformation scenario (on page 1197) found in the **DITA Map** section in the [Configure Transformation Scenario\(s\)](#) dialog box (on page 1300).

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, edit the [DITA map](#) (on page 2678) and set the `@xml:lang` attribute on its root element (`<map>`). The corresponding attribute value can be set for following RTL languages:

- **ar-eg** - Arabic
- **he-il** - Hebrew
- **ur-pk** - Urdu

Integrating Social Media and Google Tools in the WebHelp Output

This section contains topics that explain how to integrate some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Responsive Output

It is possible to integrate Facebook™ into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a Facebook™ *Like* widget to your WebHelp output using an [Oxygen Publishing Template](#) (on page 1356), follow this procedure:

- Go to the [Facebook Developers](#) website.
- Fill in the displayed form, then click the **Get Code** button.
- Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
```

```

        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
    }(document, 'script', 'facebook-jssdk'));
    -->
</script>
<div class="fb-like" data-layout="standard" data-action="like"
      data-show-faces="true" data-share="true"/>
</div>

```

4. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template.
5. Use [one of the parameters that begin with `webhelp.fragment` \(on page 1366\)](#) in the `html-fragments` section of the descriptor file. Set the value of that parameter to reference the `facebook-widget.xml` file that you created earlier.

```

<publishing-template>
    ...
    <webhelp>
        ...
        <html-fragments>
            <fragment
                file="HTML-fragments/facebook-widget.xml"
                placeholder="webhelp.fragment.after.toc_or_tiles"/>
        </html-fragments>
    </webhelp>

```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a Facebook™ *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Facebook Developers](#) website.
2. Fill in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line. The content of the XML file should look like this:

```

<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
      }(document, 'script', 'facebook-jssdk'));
    -->
  </script>
  <div class="fb-like" data-layout="standard" data-action="like"
    data-show-faces="true" data-share="true"/>
</div>

```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit [one of the parameters that begin with `webhelp.fragment` \(on page 1366\)](#). Set that parameter to reference the `facebook-widget.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Add Tweet Button in WebHelp Responsive Output

It is possible to integrate X™ (formerly known as Twitter) into your **WebHelp Responsive** output and you can specify where you want the widget to appear in your WebHelp page.

Using a Publishing Template

To add a X™ *Tweet* widget to your WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1356\)](#), follow this procedure:

1. Go to the [Tweet button generator](#) page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```

<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>

```

```

<!--
  !function (d, s, id) {
    var
    js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
? 'http': 'https';
    if (! d.getElementById(id)) {
      js = d.createElement(s);
      js.id = id;
      js.src = p + '://platform.twitter.com/widgets.js';
      fjs.parentNode.insertBefore(js, fjs);
    }
  }
  (document,
  'script', 'twitter-wjs');
-->
</script>
</div>

```

4. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template.
5. Use one of the parameters that begin with *webhelp.fragment* (on page 1366) in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `tweet-button.xml` file that you created earlier.

```

<publishing-template>
...
<webhelp>
...
<html-fragments>
  <fragment
    file="HTML-fragments/tweet-button.xml"
    placeholder="webhelp.fragment.after.toc_or_tiles"/>
  </html-fragments>
</webhelp>

```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To add a X™ *Tweet* widget to your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Tweet button generator](#) page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
? 'http': 'https';
        if (! d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '://platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
      (document,
        'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
5. Switch to the **Parameters** tab. Depending on where you want to display the button, edit [one of the parameters that begin with `webhelp.fragment` \(on page 1366\)](#). Set that parameter to reference the `tweet-button.xml` file that you created earlier.
6. Click **Ok** and run the transformation scenario.

How to Integrate Google Analytics in WebHelp Responsive Output

You can use *Google Analytics* to track and report site data for your **WebHelp Responsive** output.

Using a Publishing Template

To integrate *Google Analytics* into your WebHelp Responsive output using an *Oxygen Publishing Template* (on [page 1356](#)), follow this procedure:

1. Create a new [Google Analytics account](#) (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
  m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

  ga('create', 'UA-XXXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Open the [template descriptor file](#) (on page 1359) associated with your publishing template.
6. Use the [webhelp.fragment.after.body](#) parameter (on page 1488) in the *html-fragments* section of the descriptor file. Set the value of that parameter to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.

```
<publishing-template>
  ...
  <webhelp>
    ...
    <html-fragments>
      <fragment
        file="HTML-fragments/googleAnalytics.xml"
        placeholder="webhelp.fragment.after.body"/>
    </html-fragments>
  </webhelp>
```

7. Open the *DITA Map WebHelp Responsive* transformation scenario.
8. Click the **Choose Custom Publishing Template** link and select your template.
9. Click **OK** to save the changes to the transformation scenario.
10. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new [Google Analytics account](#) (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
  m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

  ga('create', 'UA-XXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Edit the *DITA Map WebHelp Responsive* transformation scenario and choose a *template*.
6. Switch to the **Parameters** tab. Edit the `webhelp.fragment.after.body` parameter (*on page 1488*) and set it to reference the `googleAnalytics.xml` file that you created earlier. The content of this file will be copied at the end of all generated output pages, right before the ending `<body>` element. This ensures that the page is loaded before the Google Analytics servers are contacted, thus reducing page loading time.
7. Click **Ok** and run the transformation scenario.

Ant Extensions for WebHelp Responsive

The WebHelp Responsive plugin provides extension points that allow you to implement custom Ant targets to perform additional operations before and after certain processing stages. The following extension points are available in WebHelp Responsive:

whr-init-pre

Runs a custom Ant target before the `whr-init` processing stage.

whr-init-post

Runs a custom Ant target after the `whr-init` processing stage.

whr-collect-indexterms-pre

Runs a custom Ant target before the `whr-collect-indexterms` processing stage.

whr-collect-indexterms-post

Runs a custom Ant target after the `whr-collect-indexterms` processing stage.

whr-toc-xml-pre

Runs a custom Ant target before the `whr-toc-xml` processing stage.

whr-toc-xml-post

Runs a custom Ant target after the `whr-toc-xml` processing stage.

whr-context-help-map-pre

Runs a custom Ant target before the `whr-context-help-map` processing stage.

whr-context-help-map-post

Runs a custom Ant target after the `whr-context-help-map` processing stage.

whr-sitemap-pre

Runs a custom Ant target before the `whr-sitemap` processing stage.

whr-sitemap-post

Runs a custom Ant target after the `whr-sitemap` processing stage.

whr-copy-resources-pre

Runs a custom Ant target before the `whr-copy-resources` processing stage.

whr-copy-resources-post

Runs a custom Ant target after the `whr-copy-resources` processing stage.

whr-create-topic-pages-pre

Runs a custom Ant target before the `whr-create-topic-pages` processing stage.

whr-create-topic-pages-post

Runs a custom Ant target after the `whr-create-topic-pages` processing stage.

whr-create-main-page-pre

Runs a custom Ant target before the `whr-create-main-page` processing stage.

whr-create-main-page-post

Runs a custom Ant target after the `whr-create-main-page` processing stage.

whr-create-search-page-pre

Runs a custom Ant target before the `whr-create-search-page` processing stage.

whr-create-search-page-post

Runs a custom Ant target after the `whr-create-search-page` processing stage.

whr-create-indexterms-page-pre

Runs a custom Ant target before the `whr-create-indexterms-page` processing stage.

whr-create-indexterms-page-post

Runs a custom Ant target after the `whr-create-indexterms-page` processing stage.

whr-search-index-pre

Runs a custom Ant target before the `whr-search-index` processing stage.

whr-search-index-post

Runs a custom Ant target after the `whr-search-index` processing stage.

To use Ant extension points for WebHelp Responsive, follow these steps:

1. In the `DITA-OT-DIR/plugins/` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.ant.extensions`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that extends the WebHelp Responsive plugin and specifies an Ant extension point with your custom Ant project file that contains the new build targets. For example:

```
<plugin id="com.oxygenxml.webhelp.responsive.custom.ant.extensions">
  <require plugin="com.oxygenxml.webhelp.responsive" />
  <feature extension="ant.import" file="custom_build_file.xml" />
</plugin>
```

3. Create the **custom_build_file.xml** file (in the folder you created in step 1) that contains your custom Ant project implementing one or more extension points:

```
<project name="custom.ant.extensions.integrator" basedir=".">
  <target name="custom-whr-init-pre" extensionOf="whr-init-pre">
    <echo>Extension point that executes before whr-init</echo>
  </target>
  <target name="custom-whr-init-post" extensionOf="whr-init-post">
    <echo>Extension point that executes after whr-init</echo>
  </target>
</project>
```

4. Integrate the plugin into the DITA-OT. In the `DITA-OT-DIR/bin` directory of the DITA Open Toolkit, run one of the following scripts, depending on your operating system:
 - Windows: `DITA-OT-DIR/bin/dita.bat --install`
 - Linux/macOS: `sh DITA-OT-DIR/bin/dita --install`
5. Execute a DITA Map to WebHelp Responsive transformation script.

XSLT Extensions for WebHelp Responsive

Since WebHelp Responsive output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the WebHelp Responsive transformations.

There are two methods available to override the XSLT stylesheets implied by the WebHelp Responsive transformation.

- Use *XSLT-import extension points* from an *Oxygen Publishing Template (on page 2680)*.

Note:

Use this method if you want to affect only the transformations that use this *publishing template*.

- Use *XSLT-import extension points* from a DITA-OT extension plugin.

**Note:**

This method will affect all the outputs generated with the WebHelp system.

Related information

[WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points \(on page 1500\)](#)

How to Use XSLT Extension Points from a Publishing Template

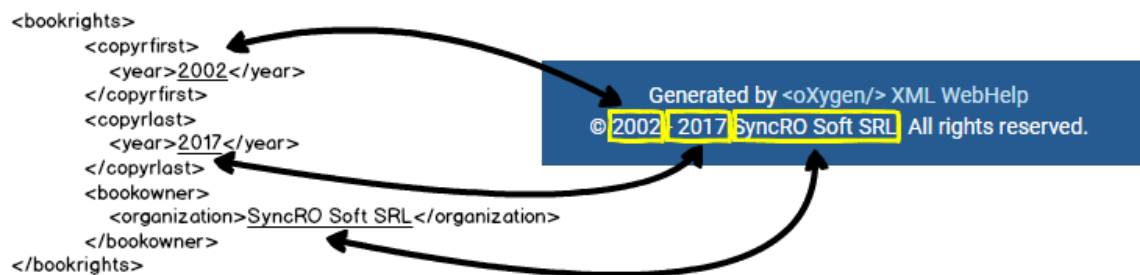

This example demonstrates how to use WebHelp XSLT-import Extension Points from an *Oxygen Publishing Template (on page 1555)*.

Use Case 1: Add Copyright Information Extracted from a DITA Bookmap

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmap:

```
<bookrights>
  <copyrfirst>
    <year>2002</year>
  </copyrfirst>
  <copyrlast>
    <year>2017</year>
  </copyrlast>
  <bookowner>
    <organization>SyncRO Soft SRL</organization>
  </bookowner>
</bookrights>
```

Figure 442. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the `main page template (on page 1376)` to

expand its components. The main page template declares a component for the footer section that looks like this:

```
<div class=" footer-container text-center ">
  <whc:include_html href="{webhelp.fragment.footer}"/>
</div>
```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                    exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>
      </xsl:when>

      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
        <span class="copyright_years">
          &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
        </span>
      </xsl:when>
    </xsl:choose>

    <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
      <span class="organization">
        <xsl:text> </xsl:text><xsl:value-of
          select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization"/>
        <xsl:text>. All rights reserved.</xsl:text>
      </span>
    </xsl:if>
  </div>
</xsl:template>
```

To add this functionality using a [Oxygen Publishing Template](#), follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.

Step Result: You should have the `custom_footer_template` folder linked in your project.

3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.

Step Result: You should have the `custom_footer_template/xslt` folder in your project.

4. Create your customization stylesheet (for example, `custom_mainpage.xslt`) in the `custom_footer_template/xslt` folder. Edit it to override the template that produces the footer section:

```
<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                    exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst" />
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast" />
        </span>
      </xsl:when>

      <!-- Adds only the first year if last is not defined. -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
        <span class="copyright_years">
          &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst" />
        </span>
      </xsl:when>
    </xsl:choose>

    <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
      <span class="organization">
        <xsl:text> </xsl:text><xsl:value-of
          select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization" />
      </span>
    </xsl:if>
  </div>
</template>
```

```

        <xsl:text>. All rights reserved.</xsl:text>
    </span>
</xsl:if>
</div>
</xsl:template>

```

5. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.webhelp.xsl.createMainPage` XSLT extension point.

```

<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
                file="xslt/customMainPage.xsl"
                id="com.oxygenxml.webhelp.xsl.createMainPage" />
        </xslt>
    </webhelp>
</publishing-template>

```

6. Open the *DITA Map WebHelp Responsive* transformation scenario.
7. Click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes to the transformation scenario.
9. Run the transformation scenario.

Use Case 2: Add Generation Time in the Output Footer

Another possible customization for the main page is to add the generation time in its footer. A transformation parameter is used to control whether or not this customization is active.

Figure 443. Generation Time Added in the WebHelp Footer

To add this functionality, follow these steps:

1. In the customization stylesheet that you just created (for example, `custom_mainpage.xsl`), modify the template by adding the following XSLT code at the end.

```

<xsl:if test="oxyf:getParameter('webhelp.footer.add.generation.time') = 'yes'">
    <div class="generation_time">
        Generation date: <xsl:value-of
            select="format-dateTime(
                current-dateTime(),
                '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
    </div>
</xsl:if>

```

```
</div>
</xsl:if>
```

**Note:**

You can read the value of a WebHelp transformation parameter from your XSLT extension stylesheets by using the `getParameter(param.name)` function from the `http://www.oxygenxml.com/functions` namespace.

2. Open the **template descriptor file** (on page 1359) associated with your publishing template and set the `webhelp.footer.add.generation.time` parameter to the default value.

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter
    name="webhelp.footer.add.generation.time"
    value="yes" />
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. In the **Parameters** tab, you can change the value of the `webhelp.footer.add.generation.time` parameter.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

How to Use XSLT Extension Points from a DITA-OT Plugin

In this example, the main page footer is modified by adding copyright information extracted from the DITA bookmark or by adding the output generation time. The first use-case uses an *XSLT-Import* extension point while the second uses an *XSLT-Parameter* extension point.

**Note:**

This customization is available as a GitHub project at: <https://github.com/oxygenxml/com.oxygenxml.webhelp.responsive.custom.footer>.

Use Case 1: WebHelp *XSLT-Import* extension point to add copyright information extracted from a DITA Bookmark

Suppose you want to customize the WebHelp Responsive main page by adding information about the legal rights associated with the book in the footer (for example, copyright dates and owner). This information is specified in the bookmark:

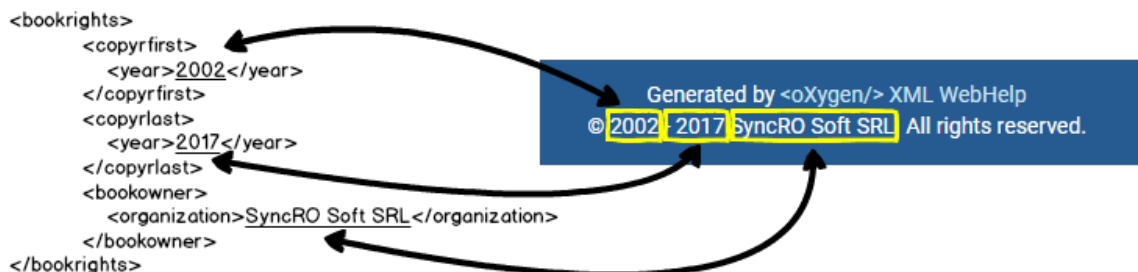

```
<bookrights>
  <copyrfirst>
    <year>2002</year>
```

```

</copyrfirst>
<copyrlast>
  <year>2017</year>
</copyrlast>
<bookowner>
  <organization>SyncRO Soft SRL</organization>
</bookowner>
</bookrights>

```

Figure 444. Example: Copyright Information Added in the WebHelp Footer

The XSLT stylesheet that generates the main page is located in: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`. This XSLT stylesheet declares the `copy_template` mode that processes the main page template to expand its components. The main page template (on page 1376) declares a component for the footer section that looks like this:

```

<div class=" footer-container text-center ">
  <whc:include_html href="{webhelp.fragment.footer}"/>
</div>

```

In the following example, the extension stylesheet will add a template that matches this component. It applies the default processing and adds the copyright information at the end.

```

<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->
  <div class="copyright_info">
    <xsl:choose>
      <!-- Adds the start-end years if they are defined -->
      <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
                    exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
        <span class="copyright_years">
          &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst"/>
          -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast"/>
        </span>

```

```

</xsl:when>

<!-- Adds only the first year if last is not defined. -->
<xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
  <span class="copyright_years">
    &#xa9; <xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst" />
  </span>
</xsl:when>
</xsl:choose>

<xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
  <span class="organization">
    <xsl:text> </xsl:text><xsl:value-of
      select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization" />
    <xsl:text>. All rights reserved.</xsl:text>
  </span>
</xsl:if>
</div>
</xsl:template>

```

You can implement this functionality with a WebHelp extension plugin that uses the **com.oxygenxml.webhelp.xsl.createMainPage** extension point (on page 1501). This extension point allows you to specify a customization stylesheet that will override the template described above.

To add this functionality as a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.webhelp.responsive.custom.footer`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```

<plugin id="com.oxygenxml.webhelp.responsive.custom.footer">
  <feature extension="com.oxygenxml.webhelp.xsl.createMainPage"
    file="custom_mainpage.xsl" />
</plugin>

```

3. Create your customization stylesheet (for example, **custom_mainpage.xsl**), and edit it to override the template that produces the footer section:

```

<xsl:template match="*:div[contains(@class, 'footer-container')]" mode="copy_template">
  <!-- Apply the default processing -->
  <xsl:next-match/>

  <!-- Add a div containing the copyright information -->

```

```

<div class="copyright_info">
  <xsl:choose>
    <!-- Adds the start-end years if they are defined -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst) and
      exists($toc/*:topicmeta/*:bookrights/*:copyrlast)">
      <span class="copyright_years">
        &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst" />
        -<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrlast" />
      </span>
    </xsl:when>

    <!-- Adds only the first year if last is not defined. -->
    <xsl:when test="exists($toc/*:topicmeta/*:bookrights/*:copyrfirst)">
      <span class="copyright_years">
        &#xa9;<xsl:value-of select="$toc/*:topicmeta/*:bookrights/*:copyrfirst" />
      </span>
    </xsl:when>
  </xsl:choose>

  <xsl:if test="exists($toc/*:topicmeta/*:bookrights/*:bookowner/*:organization)">
    <span class="organization">
      <xsl:text> </xsl:text><xsl:value-of
        select="$toc/*:topicmeta/*:bookrights/*:bookowner/*:organization" />
      <xsl:text>. All rights reserved.</xsl:text>
    </span>
  </xsl:if>
</div>
</xsl:template>

```

4. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (*on page 1197*) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (*on page 1300*).
5. Run a **DITA Map WebHelp Responsive** transformation scenario to obtain the customized side TOC.

Use-Case 2: WebHelp XSLT-Parameter Extension Point to Control if Generation Time is Displayed in the Output

Another possible customization for the main page is to add the generation time in its footer. You can use an *XSLT-Parameter* extension point to control whether or not this customization is active. In this case, you can use the `com.oxygenxml.webhelp.xsl.createMainPage.param` extension point (*on page 1502*).

Figure 445. Generation Time Added in the WebHelp Footer

To add this functionality, follow these steps:

1. Create a DITA-OT plugin structure by following the first 3 steps in the [procedure above \(on page 1462\)](#).
2. In the customization stylesheet that you just created (for example, **custom_mainpage.xml**), declare `webhelp.footer.add.generation.time` as a global parameter and modify the template by adding the following XSLT code at the end.

```
<xsl:if test="$webhelp.footer.add.generation.time = 'yes'">
  <div class="generation_time">
    Generation date: <xsl:value-of select="format-dateTime(
      current-dateTime(), '[h1]:[m01] [P] on [M01]/[D01]/[Y0001].')"/>
  </div>
</xsl:if>
```

3. Edit the **plugin.xml** file to specify the **com.oxygenxml.webhelp.xml.createMainPage.param** extension point and a custom parameter file by adding the following line:

```
<feature extension="com.oxygenxml.webhelp.xml.createMainPage.param" file="params.xml" />
```

4. Create a custom parameter file (for example, **params.xml**). It should look like this:

```
<dummy>
  <param name="webhelp.footer.add.generation.time"
    expression="{webhelp.footer.add.generation.time}"
    if="webhelp.footer.add.generation.time" />
</dummy>
```

5. Use the [Integrate/Install DITA-OT Plugins](#) transformation scenario (on page 1197) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1300).
6. Edit a **DITA Map WebHelp Responsive** transformation scenario and in the **Parameters** tab (on page 2558), specify the desired value (yes or no) for your custom parameter (`webhelp.footer.add.generation.time`).
7. Run the transformation scenario.

[\[DITA-OT\] XSLT-Import Extension Points](#)

[\[DITA-OT\] XSLT-Parameter Extension Points](#)

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Responsive output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as graphics, JavaScript, CSS, entire folders, or other resources) to the output directory either by using an [Oxygen Publishing Template \(on page 2680\)](#) or the `webhelp.custom.resources` parameter.

Copying Additional Resources to the Output Directory using a Publishing Template

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Add a new `<fileset>` element in the `resources` section of the template descriptor file (on page 1362).

```
<publishing-template>
...
<webhelp>
...
<resources>
  <fileset>
    <include name="custom-resources/**/*" />
    <exclude name="**/*.git" />
  </fileset>
```

Note:

Relative paths in the descriptor file are relative to the template root folder.

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Results: All files from the custom resources directory will be copied to the *WebHelp Output Directory/oxygen-webhelp/template* folder.

Copying Additional Resources to the Output Directory using a Transformation Parameter

1. Place all your resources in the same directory.
2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Results: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add an Edit Link to Launch Oxygen XML Web Author

You can embed *Edit* links in the DITA WebHelp Responsive output that will automatically launch a particular document in [Oxygen XML Web Author](#). A reviewer can then click the link to open the particular file in Oxygen XML Web Author where they can make or propose changes.

Using a Publishing Template

To embed an *Edit* link in the DITA Map WebHelp Responsive output using an [Oxygen Publishing Template \(on page 1356\)](#), follow this procedure:

1. If you have not already created a Publishing Template, see [Working with Publishing Templates \(on page 1395\)](#).
2. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the following parameters with their values set to the URLs:
 - **editlink.ditamap.edit.url** - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser's address bar.
 - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. *&tags-mode=no-tags*).

```
<publishing-template>
...
<webhelp>
...
<parameters>
  <parameter name="editlink.ditamap.edit.url"
             value="webdav-https://dav.box.com/dav/my.ditamap" />
</parameters>
</webhelp>
```

3. Open the *DITA Map WebHelp Responsive* transformation scenario.
4. Click the **Choose Custom Publishing Template** link and select your template.
5. Click **OK** to save the changes to the transformation scenario.
6. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

For example:

- **Windows:**

```
dita.bat -i c:\mySample.ditamap -f webhelp-responsive -Deditlink.ditamap.edit.url=webdav-https://dav.box.com/dav/my.ditamap
```

- **macOS/ Linux:**

```
dita -i /mySample.ditamap -f webhelp-responsive -Deditlink.ditamap.edit.url=webdav-https://dav.box.com/dav/my.ditamap
```

Using a Transformation Scenario in Oxygen XML Editor/Author

To embed an *Edit* link in the DITA Map WebHelp Responsive output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **DITA Map WebHelp Responsive** transformation scenario and open the **Parameters** tab.
2. Set values for the following parameters:
 - **editlink.ditamap.edit.url** - The URL of the Oxygen XML Web Author that have opened the DITA map for editing.
 - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Must start with & (e.g.: *&tags-mode=no-tags*).
3. Run the transformation scenario.

Result: In the WebHelp output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

How to Flag DITA Content in WebHelp Output

Flagging content in WebHelp output involves defining a set of images that will be used for marking content across your information set.

To flag DITA content, you need to create a filter file that defines properties that will be applied on elements to be flagged. Generally, flagging is supported for *block elements (on page 2676)* (such as paragraphs), but not for phrase-level elements within a paragraph. This ensures that the images that will flag the content are easily scanned by the reader, instead of being buried in the text.

Using a Publishing Template

To flag content in DITA Map to WebHelp output using an *Oxygen Publishing Template (on page 1356)*, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

**Note:**

For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Open the [template descriptor file \(on page 1359\)](#) associated with your publishing template and add the `args.filter` parameter in the `parameters` section with its value set to the path of the DITAVAL file you created.

```
<publishing-template>
...
<webhelp>
...
  <parameters>
    <parameter name="args.filter" value="resources/myFile.ditaval"/>
  </parameters>
</webhelp>
```

4. Open the *DITA Map WebHelp Responsive* transformation scenario.
5. Click the **Choose Custom Publishing Template** link and select your template.
6. Click **OK** to save the changes to the transformation scenario.
7. Run the transformation scenario.

Using a Transformation Scenario in Oxygen XML Editor/Author

To flag content in the DITA Map to WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a DITA filter file (DITAVAL) and add it in a directory of your choice (for example, named `myFile.ditaval`).
2. Define the property for the elements you want to be flagged. For example, if you want to flag any element that has the `@audience` attribute set to `programmer`, the content of the DITAVAL file should look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<val>
  <prop att="audience" val="programmer" action="flag"
  img="D:\resource\delta.gif" alt="sample alt text"/>
</val>
```

**Note:**

For an element to be flagged, at least one attribute-value pair needs to have a property declared in the DITAVAL file.

3. Edit a **DITA Map to WebHelp** transformation scenario.
4. Specify the DITAVAL file in the **Filters** tab (with the **Use DITAVAL File** option).
5. Run the transformation scenario.

Related Information:

[Filtering Profiling Values with a DITAVAL File \(on page 2602\)](#)

How to View MathML Equations in HTML Output

By default, only **Firefox** can render **MathML** equations embedded in the **HTML** code. **MathJax** is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DocBook or DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (WebHelp, CHM, EPUB, etc.), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript"
  src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/2.7.1/MathJax.js?config=TeX-AMS-MML_HTMLorMML" >
</script>
```

Alternate Method for DITA

For DITA documents, you can also use the following procedure:

1. Create an XML file that contains a script similar to the one shown in the example above.
2. Edit the DITA Map transformation scenario and open the **Parameters** tab.
3. Set the following parameter to point to the XML file created in step 1:
 - **WebHelp Responsive Systems** - Set the `webhelp.fragment.head` parameter to point to your XML file.
 - **WebHelp Classic Systems** - Set the `webhelp.head.script` parameter to point to your XML file.
 - **Any other type of HTML-based publishing** - Set the `args.hdf` parameter to point to your XML file.
4. Run the transformation scenario.

Result: The equation should now be properly rendered in other browsers, such as Edge, IE, or Chrome.

How to Disable Caching in WebHelp Responsive Output

In cases where a set of WebHelp Responsive pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a web browser on the client side, (rather than re-using an outdated *cached* version in the browser).

To disable caching in WebHelp Responsive output, follow this procedure:

1. Create a new well-formed XML file and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

Note:

The code should look like this:

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>
    <meta http-equiv="Pragma" content="no-cache" />
    <meta http-equiv="Expires" content="-1" />
  </head>
</html>
```

2. Edit the *DITA Map WebHelp Responsive* transformation scenario and open the **Parameters** tab.
3. Edit the value of the `webhelp.fragment.head` parameter and set it to the absolute path of your XML file.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: Your additional content is included at the end of the `<head>` element of your output document.

How to Add a Link to PDF Documentation

It is possible to add a component in your WebHelp output that links to an external PDF resource. For example, it could link to the PDF equivalent of the documentation. This is achieved by configuring some transformation parameters and the link component is added in the header/breadcrumb stripe, next to the navigation links.

The transformation parameters used for generating a PDF link component in the WebHelp Responsive output are:

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

How to Add a Custom Component for WebHelp Output

This topic explains how to use several customization methods to define and implement a custom component for WebHelp output pages.

Predefined components

The WebHelp output is based on a set of [HTML Page Layout Files \(on page 1375\)](#) that define the default layout of the generated pages. Each layout file is made of a set of various components. Each component is described using an associated XML element that is processed at the generation time resulting in its associated component being included in the output pages.

Here are a few examples of predefined components: **Logo, Title, Menu, Search Input, Topics Tiles, Topic Breadcrumb, Topic Content, Publication Table of Contents**. A complete list with all the available components is available here: [Layout of the Responsive Page Types \(on page 1311\)](#).

For example, the page component that is used to define the Search Input field in the WebHelp HTML pages is defined as follows:

```
<!-- Search form -->
<whc:webhelp_search_input class="navbar-form wh_topic_page_search search" role="form"/>
```

At publishing time, the above component will be expanded into:

```
<div class=" wh_search_input navbar-form wh_topic_page_search search">
  <form id="searchForm" method="get" role="search" action="../search.html">
    <div>
      <input type="search" placeholder="Search "
        class="wh_search_textfield ui-autocomplete-input" id="textToSearch"
        name="searchQuery" aria-label="Search query" required="required"
        autocomplete="off" />
      <button type="submit" class="wh_search_button" aria-label="Search">
        <span class="search_input_text">Search</span>
      </button>
    </div>
  </form>
</div>
```

```
</form>
</div>
```

Customization Methods

The most common customization methods for the WebHelp Responsive output include:

- Apply custom CSS styles (on page 1405) to change the default layout and styles.
- Insert additional HTML content (on page 1407) using one of the available HTML Fragment Placeholder parameters (on page 1366).
- Extend the default processing using XSLT Extension Points (on page 1365).
- Configure available Transformation Parameters (on page 1486).

Use Case: Custom Link Component

For the subsequent procedure, suppose you have a DITA project for a User Manual and you also have various video demonstrations available on your website that supplement the documentation. You may want to link a video demonstration for a particular feature in its associated DITA topic in the WebHelp output.

You could simply add a link somewhere in your DITA topic, but this approach would not be very suitable for a printable (PDF) version of your User Manual. Thus, you need to include the link to the associated video demonstration only in the WebHelp output of your User Manual (and not the PDF version).

One way to link a video with its associated topic is to include its URL in the metadata section. For example:

```
<prolog>
  <metadata>
    <othermeta name="video-link" content="https://www.youtube.com/watch?v=zNmXfKWXw08" />
  </metadata>
</prolog>
```

Next, you need to instruct WebHelp to pick up the URL from the metadata and generate a link in a specific location of the HTML output page. You can achieve this by creating your own WebHelp custom component.

Creating a Custom Component

You can combine several of the available customization methods to define and implement your own WebHelp custom component.

Figure 446. Custom Component

To create a custom component that displays a link to the current topic's associated video tutorial, follow these steps:

1. Define your component. For example, it may have the following form:

```
<comp:video-link xmlns:comp="http://example.com/custom-components"/>
```

The component is an XML element that belongs to a custom defined namespace.

2. Insert the component in your topic pages. To do this, you will have to save the associated XML element in an HTML Fragment file (for example, named `video-link-fragment.xml`).
3. Reference the HTML Fragment file in your current [Publishing Template's descriptor file](#) (*on page 1359*) and associate it with an HTML Fragment placeholder that is available for the topic pages (`webhelp.fragment.before.topic.toolbar` in this case):

```
<html-fragments>
  <fragment file="component/html-fragment/video-link-fragment.xml"
    placeholder="webhelp.fragment.before.topic.toolbar"/>
</html-fragments>
```

Note:

The HTML Fragment file is referenced using a path relative to the Publishing Template root directory.

4. Create a custom XSLT file that processes the custom component and picks up the video URL available in the current topic's metadata and generates a link to the page that contains the video:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:comp="http://example.com/custom-components"
  exclude-result-prefixes="xs comp"
  version="3.0">

  <!-- Custom component implementation -->
  <xsl:template match="comp:video-link" mode="copy_template">
    <xsl:param name="ditaot_topicContent" tunnel="yes"/>
    <!-- Look for a 'video-link' <meta> element in the current topic content -->
    <xsl:variable name="videoLinkMeta"
      select="$ditaot_topicContent//*:meta[@name='video-link']"/>
    <xsl:if test="exists($videoLinkMeta)">
      <div class="video-link-container">
        <a href="{ $videoLinkMeta[1]/@content }"
          class="video-link" target="_blank" aria-label="Video">
          <span>Video</span>
        </a>
      </div>
```

```

    </xsl:if>

</xsl:template>

</xsl:stylesheet>

```

The HTML content generated for your component will look like this:

```

<div class="video-link-container">
  <a href="https://www.youtube.com/watch?v=zNmXfKWXwO8"
    class="video-link" target="_blank"
    aria-label="Video">
    <span>Video</span>
  </a>
</div>

```

5. Reference the above XSL file in your Publishing Template's descriptor file using the XSLT extension point associated with the XSL module that generates an HTML file for each DITA topic:

```

<xslt>
  <extension file="component/xsl/video-link-impl.xsl"
    id="com.oxygenxml.webhelp.xsl.dita2webhelp" />
</xslt>

```

6. Create a custom CSS file that contains the rules for styling the output for your component:

```

@import url('https://fonts.googleapis.com/icon?family=Material+Icons');

.video-link-container {
  display: flex;
  align-items: center;
  flex-grow: 10;
  justify-content: flex-end;
}

.video-link {
  display: flex;
  align-items: center;
  color: #fff !important;
}

.video-link:before {
  content: "smart_display";
  font-family: 'Material Icons';
  font-size: 20px;
  display: inline-block;
  word-wrap: normal;
}

```

```

    white-space: nowrap;
}

.video-link span {
    display: none;
}

.wh_right_tools {
    padding: 0;
}

```

7. Reference the above CSS file in your Publishing Template's descriptor file:

```

<resources>
  <!-- .... -->
  <css file="component/css/video-link.css"/>
</resources>

```

Result: An icon that is a link to the video appears in the header stripe in the output page.

Figure 447. Custom Link to Video Component

Sample Publishing Template

A sample Publishing Template that contains all the above customizations is available here: <https://github.com/oxygenxml/oxygen-publishing-template-samples/tree/master/templates/video-link-custom-component>.

How to Generate Google Structured Data

It is possible to generate Google Structured Data (`<script>` elements that contain a JSON-LD object) in the DITA WebHelp Responsive output. Google uses this JSON-LD object to better understand the contents of the page and display special search results in a Google Search.

Tip:

For more details, see [Google Search Central: Understand how structured data works](#).

To generate Google Structured Data in WebHelp output, use the following transformation parameter:

google.structured.data

Specifies whether or not Google Structured Data will be generated in the output. If set to **yes**, the transformation automatically generates Google Structured Data for **Questions and Answers** topics, DITA Task topics, and from `<data>` elements found inside a topic that has the `@name="oxy:question"` construct. If set to **no** (default value), the transformation will not generate Google Structured Data.

Generating Google Structured Data for DITA Tasks Topics

When Google Structured Data is enabled, the DITA Task `<title>`, `<shordesc>`, and `<step>` elements are mapped to the [HowTo](#) JSON-LD object. For example, the following DITA Task topic:

```
<task id="task_id">
  <title>My task</title>
  <shordesc>Task description</shordesc>
  <steps>
    <step>
      <cmd>Step 1 content.</cmd>
    </step>
    <step>
      <cmd>Step 2 content.</cmd>
    </step>
  </steps>
</task>
```

will generate the following structure in the output:

```
<script type="application/ld+json" id="jsonld-howto">
  {
    "@context": "https://schema.org",
    "@type": "HowTo",
    "name": "My task",
    "description": "Task description",
    "supply": [],
    "tool": [],
    "step": [
      {
        "@type": "HowToStep",
        "text": "<span class=\"topic/ph task/cmd ph cmd\">Step 1 content.</span>"
      },
      {
        "@type": "HowToStep",
        "text": "<span class=\"topic/ph task/cmd ph cmd\">Step 2 content.</span>"
      }
    ]
  }
</script>
```

```

    }
  ]
}
</script>

```

Generating for Questions and Answers Topics

When Google Structured Data is enabled, the QA topic `<qagroup>` elements are mapped to the [FAQPage](#) JSON-LD object. For example, the following QA topic:

```

<qatopic id="qa_id">
  <title>FAQ Page 1</title>
  <qabody>
    <qagroup>
      <question>What is a car engine?</question>
      <answer>The car engine is a device that uses fuel to create mechanical power that can
        turn the car's wheels.</answer>
    </qagroup>
  </qabody>
</qatopic>

```

will generate the following structure in the output:

```

<script type="application/ld+json" id="jsonld-faq">
{
  "@context": "https://schema.org",
  "@type": "FAQPage",
  "mainEntity": [
    {
      "@type": "Question",
      "name": "What is a car engine?",
      "acceptedAnswer": {
        "@type": "Answer",
        "text": "<div class=\"- topic/div qatopic/answer div answer\">The car engine is a
device that uses fuel to create mechanical power that can turn the car's wheels.</div>"
      }
    }
  ]
}
</script>

```

Generating from `<data>` elements found inside a topic

When Google Structured Data is enabled, the WebHelp Responsive transformation will map the `<data>` elements found inside a topic to a [FAQPage](#) JSON-LD object. There are 2 different use cases depending on where the `<data>` element is found in the document:

- In the `<prolog>` element. For example, this content:

```
<concept id="lawnmowerconcept">
  <title>Lawnmower</title>
  <shortdesc>The lawnmower is a machine used to cut grass in the yard.</shortdesc>
  <prolog>
    <metadata>
      <data name="oxy:question">What tools are necessary to cut the grass?</data>
    </metadata>
  </prolog>
  <conbody>
    <p>Lawnmowers can be electric, gas-powered, or manual.</p>
  </conbody>
</concept>
```

will generate the following structure in the output:

```
<script type="application/ld+json" id="jsonld-faq">
  {
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [
      {
        "@type": "Question",
        "name": "What tools are necessary to cut the grass?",
        "acceptedAnswer": {
          "@type": "Answer",
          "text": "<div class=\"- topic/body concept/conbody body conbody\">
            <p class=\"- topic/shortdesc shortdesc\">The lawnmower is a machine
            used to cut grass in the yard.</p> <p class=\"- topic/p p\">Lawnmowers can be electric,
            gas-powered, or manual.</p> </div>"
        }
      }
    ]
  }
</script>
```

**Important:**

The answer represents the HTML result of the entire content inside the topic.

- Inside the topic body elements. For example, content:

```
<topic id="concept-id">
  <title>Morning</title>
  <shortdesc>In the morning we have breakfast.</shortdesc>
  <body>
    <ul>
      <data name="oxy:question">What do people drink in the morning?</data>
      <li>Tea</li>
      <li>Milk</li>
    </ul>
  </body>
</topic>
```

will generate the following structure in the output:

```
<script type="application/ld+json" id="jsonld-faq">
  {
    "@context": "https://schema.org",
    "@type": "FAQPage",
    "mainEntity": [
      {
        "@type": "Question",
        "name": "What do people drink in the morning?",
        "acceptedAnswer": {
          "@type": "Answer",
          "text": "<div class=\"- topic/body body\"><ul class=\"- topic/ul ul\"></ul>
<li class=\"- topic/li li\">Tea</li> <li class=\"- topic/li li\">Milk</li> </div>"
        }
      }
    ]
  }
</script>
```

**Important:**

The answer represents the HTML result of the entire block where the `<data>` element is located inside.

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```
Related information
  Target Topic
  Target Concept
  Target Task
```

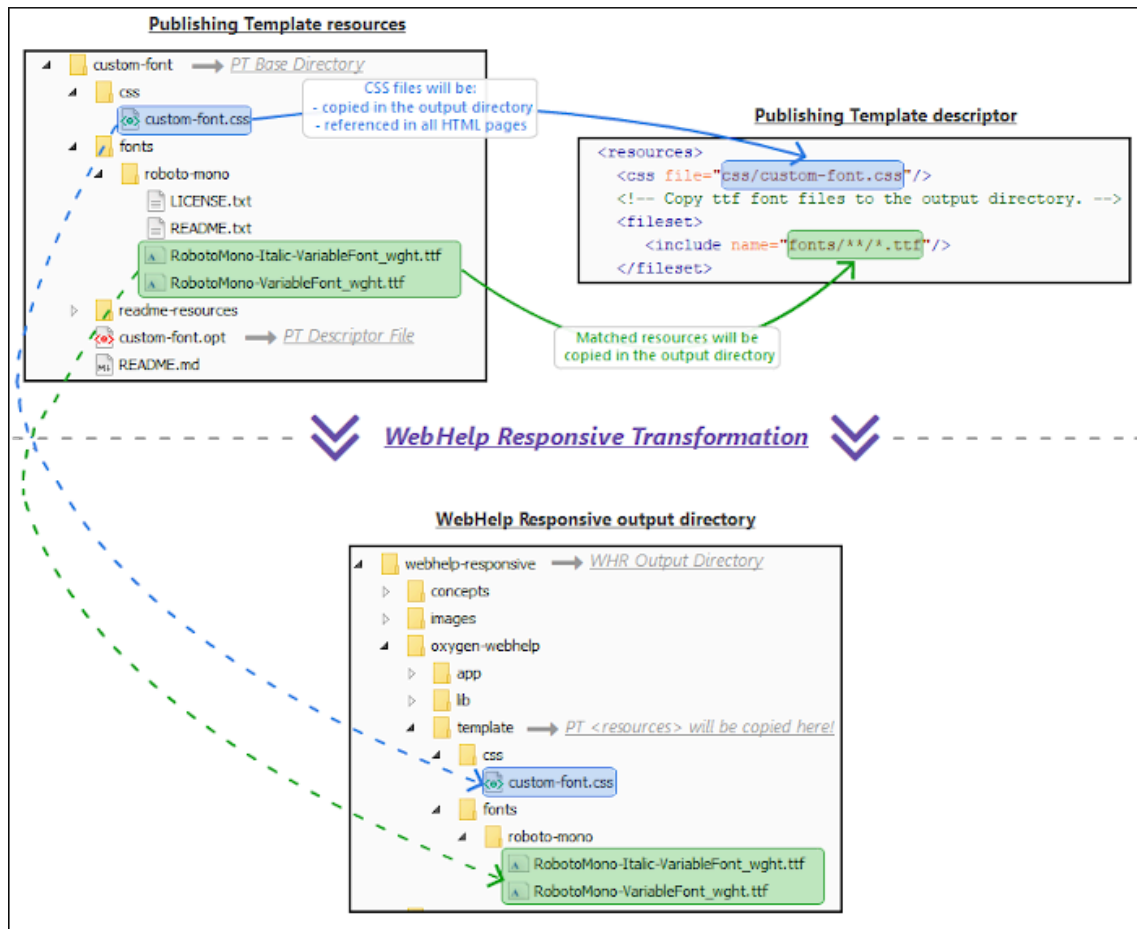

It is possible to group the links by target type (topic type) by setting the `webhelp.rellinks.group.mode=group-by-type` parameter. The output will look like this:

```
Related concepts
  Target Concept
Related tasks
  Target Task
Related information
  Target Topic
```

How to Use a Local Font in WebHelp Responsive Output

It is possible to use a local fonts in WebHelp Responsive output by copying the local font file to the output directory through a Publishing Template and referencing the font files using `@font-face` rules within a custom CSS.

Figure 448. Referencing Local Fonts in a Publishing Template

To use a local font in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Add the local font files to the `fonts` folder within your Publishing Template directory structure. For example:

```
fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf
fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf
```

3. Configure WebHelp Responsive to copy the font file to the output directory. Define a `<fileset>` that matches the location of the font files in the `<resources>` section of your Publishing Template's descriptor file.

```
<resources>
  <!-- Copy ttf font files to the output directory. -->
  <fileset>
    <include name="fonts/**/*.*.ttf" />
  </fileset>
</resources>
```

All the files matched by this fileset will be copied to the output directory. The additional resources will be copied in the following subfolder of the output directory:

```
{OUTPUT-DIR}/oxygen-webhelp/template/
```

4. Create a custom CSS file in your Publishing Template directory.

```
css/custom-font.css
```

5. Reference the CSS file in the `<resources>` section of the Publishing Template's descriptor file. This means that the CSS file will be referenced in each HTML page within the WebHelp Responsive output.

```
<resources>
  <css file="css/custom-font.css"/>
  <!-- ... -->
</resources>
```

6. Add `@font-face` definitions that reference the font files in your custom CSS file. The font files can be referenced using relative URLs since the CSS and the font files included in the Publishing Template package will be copied together in the output folder.

```
@font-face {
  font-family: 'Roboto Mono';
  font-style: normal;
  src: url('../fonts/roboto-mono/RobotoMono-VariableFont_wght.ttf') format('truetype');
}

@font-face {
  font-family: 'Roboto Mono';
  font-style: italic;
  src: url('../fonts/roboto-mono/RobotoMono-Italic-VariableFont_wght.ttf')
  format('truetype');
}
```

7. Add a CSS rule that applies the custom font on all elements.

```
body {
  font-family: 'Roboto Mono', sans-serif;
}
```

8. Run the transformation with the publishing template selected.

Figure 449. Output Example

How to Use JQuery in WebHelp Responsive Output

The JQuery library that comes bundled with WebHelp is accessible in the browser's global context so that developers have access to use it.

To use the JQuery library in your WebHelp Responsive output, follow these steps:

1. If you have not already created a Publishing Template, see [How to Create a Publishing Template](#).
2. Create the following items in the folder that contains your publishing template's descriptor file (the `.opt` file):
 - A folder named **js**
 - A folder named **fragments**
3. In the **js** folder, create a file named `custom.js`.
4. As a starting point, you can copy the following content to the `custom.js` file:

```
$(document).ready(function () {
    // Your JQuery code.
});
```

5. In the **fragments** folder, create a file named `jquery-scripts.html` with the following content:

```
<html>
  <script src="{oxygen-webhelp-template-dir}/js/custom.js" defer="defer"></script>
</html>
```

**Important:**

Make sure that the `@defer` attribute is present on the `<script>` element.

- Copy the `js` folder to the output folder during the transformation process. For this, open the `.opt` file and add the following content in the `<resources>` section (see [Template Resources](#) for more details):

```
<fileset>
  ...
  <include name="js/**" />
  ...
</fileset>
```

- Include the `jquery-scripts.html` file in your WebHelp Responsive output by opening the `.opt` file and add the following content inside the `<webhelp>` element:

```
<html-fragments>
  <fragment file="jquery-scripts.html" placeholder="webhelp.fragment.head"/>
</html-fragments>
```

- Run the transformation with your publishing template selected.

WebHelp Responsive Transformation Parameters

In addition to the [common DITA-OT transformation parameters](#) and the [HTML-based Output Parameters](#), there are numerous other supported parameters that are specific to the WebHelp Responsive output.

Publishing Template Parameters

`webhelp.publishing.template`

Specifies the path to the ZIP archive (or root folder) that contains your custom WebHelp Responsive template.

**Note:**

The built-in templates are stored in the `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates` folder.

**Note:**

Relative paths are resolved based on the current working directory.

`webhelp.publishing.template.descriptor`

Specifies the name of the descriptor to be loaded from the WebHelp Responsive template package. If it is not specified, the first encountered descriptor will be automatically loaded.

Custom Resource Parameters

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.logo.image.target.url

Specifies a target URL that is set on the logo image. When you click the logo image, you will be redirected to this address.

webhelp.logo.image

Specifies a path to an image displayed as a logo in the left side of the output header.

webhelp.logo.image.alt

Specifies a value that will be set in the `@alt` attribute of the logo image. If the parameter is not specified, the `@alt` attribute will contain the publication title. Note that this parameter makes sense only in conjunction with the `webhelp.logo.image` parameter.

Oxygen Feedback Parameter

webhelp.fragment.feedback

You can integrate **Oxygen Feedback** with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an **Oxygen Feedback site configuration**, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

Context Sensitive Help Parameter

webhelp.csh.disable.topicID.fallback

Specifies whether or not topic ID *fallbacks* are enabled when computing the mapping of context sensitive help and `resourceid` information is not available. Possible values are **false** (default) and **true**.

HTML Fragment Extension Parameters

webhelp.enable.html.fragments.cleanup

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to **true** (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to **false**, the transformation will fail if at least one HTML fragment is not well-formed.

webhelp.enable.scroll.to.search.term

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are **no** (default) and **true**.

webhelp.fragment.after.body

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.main.page

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.search.page

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.terms.page

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.topic.page

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.feedback

This parameter can be used to display a given XHTML fragment after the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.search.page

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.terms.page

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.logo_and_title

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

webhelp.fragment.after.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.feedback

This parameter can be used to display a given XHTML fragment before the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.main.page

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

Important:

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

Output Component Parameters

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.sticky.header

Controls whether or not the header section will remain *sticky* in the output. Possible values are **yes** (default) or **no**.

webhelp.enable.sticky.publication.toc

Controls whether or not the publication table of contents will remain *sticky* in the output. Possible values are **yes** (default) or **no**.

webhelp.enable.sticky.topic.toc

Controls whether or not the topic table of contents will remain *sticky* in the output. Possible values are **yes** (default) or **no**.

webhelp.figure.title.placement

Controls the placement of the title for figures (relative to the image). Possible values include **top** (default) and **bottom**.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.rellinks.group.mode

Specifies the related links grouping mode. All links can be grouped into a single "Related Information" heading or links can be grouped by their target type (topic, task, or concept). Allowed values: **single-group** (default) or **group-by-type**.

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.full.size.image

Specifies if responsive images that are displayed with a smaller dimension than their original size can be clicked to see an enlarged version of the image. The default value is `yes`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is `yes` (meaning the index terms icon is displayed). If set to `false`, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.skip.main.page.generation

If set to `true`, the default main page is not generated in the output. The default value is `false`.

webhelp.table.title.placement

Controls the placement of the title for tables. Possible values include **top** (default) and **bottom**.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to `yes`), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to `no` (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Search-Related Parameters**webhelp.enable.search.autocomplete**

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.google.search.results

A file path that specifies the location of a well-formed XHTML file containing the Google Custom Search Engine element `gcse:searchresults-only`. You can use all supported attributes for this element. It is recommended to set the `@linkTarget` attribute to `frm` for frameless (*iframe*) version of WebHelp or to `contentWin` for the frameset version of WebHelp. The default value for this attribute is `_blank` and the search results will be loaded in a new window. If this parameter is not specified, the following code will be used `<gcse:searchresults-only linkTarget="frm"></gcse:searchresults-only>`.

webhelp.google.search.script

A file path that specifies the location of a well-formed XHTML file containing the Custom Search Engine script from Google.

webhelp.search.default.operator

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to `or` and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the `div.not-indexed` value will not index all `<div>` elements that have a `@class` attribute with the value of `not-indexed`. Use a comma separator to specify more than one element.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be **UTF8**.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the `webhelp.search.enable.pagination` parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if,for,is`).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.sitemap.base.url

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the *DITA map*, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

Publishing Speedup Parameters**parallel**

A common parameter with other transformation types. When set to **true** (default value is **false**), the publishing pre-processing stages are run in parallel slightly improving the publishing time.

store-type

A common parameter with other transformation types. When set to **memory**, the processing stages use internal memory to store temporarily processed documents, thus decreasing the publishing time but slightly increasing the amount of internal memory used for the process. When publishing on Windows, setting this parameter can decrease the publishing times by about one-third.

**Note:**

The `fix.external.refs.com.oxygenxml` parameter is not supported when running the transformation from a command line. This parameter is normally used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references.

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

[Setting DITA-OT Parameters](#)

WebHelp Responsive XSLT-Import and XSLT-Parameter Extension Points

XSLT extension points can be used from either from an *Oxygen Publishing Template* or from a DITA-OT extension plug-in.

Extension Points from an Oxygen Publishing Template

The publishing template allows you to specify an XSLT extension point. The extension point will only affect the transformations that use the particular template.

Important:

While the publishing templates only support referencing one extension point at a time, you can use `xslt:include` or `xslt:import` to aggregate multiple modules.

For a specific example of how to use an extension in a publishing template, see: [How to Use XSLT Extension Points from a Publishing Template \(on page 1458\)](#).

Example:

```

<publishing-template>
    ...
    <webhelp>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.webhelp.xsl.createMainPage"
                file="xsl/customMainPage.xsl" />
        </xslt>
    </webhelp>
</publishing-template>

```

Extension Points from a DITA-OT Extension Plug-in

The DITA-OT plug-in installer adds an XSLT import statement in the default WebHelp XSLT so that the XSLT stylesheet referenced by the extension point becomes part of the normal build. You can use these extension points to override XSLT processing steps.

Example:

```

<plugin id="com.oxygenxml.webhelp.responsive.extension">
    <feature extension="com.oxygenxml.webhelp.xsl.dita2webhelp"
        file="xsl/fixup.xsl" />
</plugin>

```

XSLT-Import Extension Points

The following extension points are supported:

com.oxygenxml.webhelp.xsl.dita2webhelp

Extension point to override the XSLT stylesheet (`dita2webhelp.xsl`) that produces an HTML file for each DITA topic. The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\dita2webhelp\dita2webhelp.xsl`

com.oxygenxml.webhelp.xsl.createMainPage

Extension point to override the XSLT stylesheet (`createMainPage.xsl`) that produces the WebHelp Responsive main HTML page (`index.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles\createMainPage.xsl`

com.oxygenxml.webhelp.xsl.createNavLinks

Extension point to override the XSLT stylesheets that are used to generate navigation links in the WebHelp Responsive pages. These stylesheets can be found in the `navLinks` folder: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\navLinks\`

com.oxygenxml.webhelp.xsl.createSearchPage

Extension point to override the XSLT stylesheet (`createSearchPage.xsl`) that produces the WebHelp Responsive search HTML page (`search.html`). The location of this file is

`DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles
\createSearchPage.xsl`

com.oxygenxml.webhelp.xsl.createIndexTermsPage

Extension point to override the XSLT stylesheet (`createIndextermsPage.xsl`) that produces the WebHelp Responsive index terms HTML page (`indexterms.html`). The location of this file is `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\mainFiles
\createIndextermsPage.xsl`

com.oxygenxml.webhelp.xsl.createTocXML

Extension point to override the XSLT stylesheet (`tocDita.xsl`) that produces the `toc.xml` file. This file contains information extracted from the *DITA map (on page 2678)* and it is mainly used to construct the WebHelp Table of Contents and navigational links. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl
\navLinks\tocDita.xsl`.

com.oxygenxml.webhelp.xsl.contextHelpMap

Extension point to override the XSLT stylesheet (`contextHelpMapDita.xsl`) that generates the context sensitive help mapping. The path to this stylesheet is: `DITA-OT-DIR\plugins\com.oxygenxml.webhelp.responsive\xsl\contextHelp
\contextHelpMapDita.xsl`.

***XSLT-Parameter* Extension Points**

If your customization stylesheet declares one or more XSLT parameters and you want to control their values from the transformation scenario, you can use one of the following XSLT parameter extension points:

com.oxygenxml.webhelp.xsl.dita2webhelp.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.dita2webhelp** extension point (*on page 1501*).

com.oxygenxml.webhelp.xsl.createMainPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createMainPage** extension point (*on page 1501*).

com.oxygenxml.webhelp.xsl.createNavLinks.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createNavLinks** extension point (*on page 1501*).

com.oxygenxml.webhelp.xsl.createSearchPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createSearchPage** extension point (*on page 1501*).

com.oxygenxml.webhelp.xsl.createIndexTermsPage.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createIndexTermsPage** extension point (*on page 1502*).

com.oxygenxml.webhelp.xsl.createTocXML.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.createTocXML** extension point (on page 1502).

com.oxygenxml.webhelp.xsl.contextHelpMap.param

Use this extension point to pass parameters to the stylesheet specified using the **com.oxygenxml.webhelp.xsl.contextHelpMap** extension point (on page 1502).

[\[DITA-OT\] XSLT-Parameter Extension Points](#)

WebHelp Classic Output for DocBook (Deprecated)

The **WebHelp Classic** variant is designed for desktop systems when feedback from users is not necessary and it is available for DocBook. You can also integrate a feedback system that provides the ability for your users to add comments in the output. This section contains information about configuring a WebHelp Classic system and customizing the output.

This type of WebHelp system can be generated by using the **DocBook WebHelp Classic (Deprecated)** (on page 1201) transformation scenario.

WebHelp Classic Output Layout and Features

Layout of the WebHelp Classic System Interface

The layout of the **WebHelp Classic** system consists of the following components:

Left Pane or Frame

This section on the left side of the help system includes the following tabs:

Content

A typical table of contents style presentation of your content. You can use the  **Expand all**/ **Collapse all** buttons to expand or collapse all the topics presented in the Table of Contents.

**Note:**

You can enhance the appearance of items in the *Table of Contents*. See the [Customizing WebHelp Classic Output](#) chapter (on page 1511) for more details.

Index

Presents the index terms for your content. If your content does not contain any `<indexterm>` elements, this tab is not generated.

Search Results

This tab is generated when the **Search** field is used. It presents the search results in the form of links to topics where the search terms are found, along with a rating scheme for each result. For more details, see the [Search Feature section \(on page 1505\)](#).

Upper Pane or Frame

The upper section of the help system includes the following features:

Search Field

Use this feature to perform searches in your content. When you enter search terms in this field, the results are displayed in the **Search Results** tab in the left section of the help system, along with a rating scheme for each result. For more details, see the [Search Feature section \(on page 1505\)](#).

Frames Option

Click on this option to display the output rendered in HTML frames.

Print Option

Opens a dialog box with various printing options and a print preview.

Navigation Links

You can navigate through the content of your output using the navigation links or arrows in the upper-right part of the page. These arrows allow you to move to the **↑ Parent topic**, **← Previous topic**, or **→ Next topic**. Links to the parent topics of the currently open topic are also presented at the top of the page.

Tip:

To hide the **Parent**, **Next**, and **Previous** links, you can edit the transformation scenario and set the value of the `args.hide.parent.link` parameter to `yes`.

Main Pane or Frame

The content of the help pages are rendered and displayed in this main section.

Figure 450. WebHelp Classic Output

The screenshot shows a web help page titled "Growing Flowers". At the top right, there is a search bar and icons for a list and print. Below the title, there are navigation links: "Content", "Index", "Flowers by Season / Spring Flowers", "Parent topic", "Previous topic", and "Next topic". A left sidebar contains a tree view with categories like "Introduction", "Care and Preparation", "Pruning", "Garden Preparation", "Flowers by Season", "Spring Flowers", "Iris", "Snowdrop" (highlighted), "Summer Flowers", "Autumn Flowers", "Winter Flowers", "Glossary", and "Copyright". The main content area features the heading "Snowdrop" and a sub-heading "From Wikipedia, the free encyclopedia." Below this is a paragraph explaining that snowdrops are members of the genus *Galanthus* in the family *Amaryllidaceae*. A photograph of a snowdrop flower is shown. Further down, a paragraph describes *Galanthus nivalis* as the most widespread representative of the genus. At the bottom, there is a "Related information" section with a link to "Iris". The footer of the page reads "WebHelp output generated by <Oxygen/> XML Author".

WebHelp Classic Search Engine

Search Rules

Rules that are applied during a search include:

- You can use quotes to perform an exact search for multiple word phrases (for example, "grow flowers" will only return results if both words are found consecutively and exactly as they are typed in the search field). This type of search is known as a *phrase search*.
- *Boolean Search* is supported using the following operators: *and*, *or*, *not*. When there are two adjacent search terms without an operator, *or* is used as the default search operator (for example, *grow flowers* is the same as *grow or flowers*).
- The space character separates keywords (an expression such as *grow flowers* counts as two separate keywords).
- Words composed by merging two or more words with colon (":"), minus ("-"), underline ("_"), or dot (".") characters count as a single word.
- Your search terms should contain two or more characters (note that stop words will be ignored). This rule does not apply to CJK (Chinese, Japanese, Korean) languages.

- When searching for multiple words in CJK (Chinese, Japanese, Korean) languages that often have them appear in strings without a space separator, you may need to add a space to separate the words. Otherwise, WebHelp will not find results. For example, Chinese uses a specialized character for space separators, but the current WebHelp implementation cannot detect such specialized characters, so to search for **开始之前** (it translates as "before you begin" or "before start"), you have to enter **开始 之前** (notice the space between the second and third symbols) in the search field.

**Note:**

Phrase searches (two or more consecutive words in an exact order) do not work for CJK (Chinese, Japanese, Korean) languages.

5-Star Rating Mechanism and Sorting

The **Search** feature is also enhanced with a rating mechanism that computes scores for every result that matches the search criteria. These scores are then translated into a 5-star rating scheme and the stars are displayed to the right of each result. The search results are sorted depending on the following:

- Search entries that satisfy the phrase search criterion are presented first.
- The number of keywords found in a single page (the higher the number, the better).
- The context (for example, a word found in a title, scores better than a word found in unformatted text).

The search ranking order, sorted by relevance is as follows:

- The search term is included in a meta keyword.
- The search term is in the title of the page.
- The search term is in bold text in a paragraph.
- The search term is in normal text in a paragraph.

Excluded Terms

To improve performance, the **Search** feature excludes certain *stop words*. For example, the English version of the *stop words* includes: *a, an, and, are, as, at, be, but, by, for, if, in, into, is, it, no, not, of, on, or, such, that, the, their, then, there, these, they, this, to, was, will, with*.

WebHelp Classic Search Results Tab

When you enter search terms in the **Search** field at the top of the help system, the results are displayed in the **Search Results** tab in the left section. When you click on a result in the **Search Results** tab, that result is displayed in the main pane with the search terms highlighted. If you press **Enter** with the **Search** field empty, the highlights are removed.

Snowdrop

From Wikipedia, the free encyclopedia.

Snowdrop is the common name for members of the **genus *Galanthus***, a small genus of about 20 **species** in the family **Amaryllidaceae**; snowdrops are among the first **bulbs** to bloom in spring, although certain **species** flower in late autumn and winter.

Galanthus nivalis is the best-known and most widespread representative of the genus ***Galanthus***. It is native to a large area of Europe, stretching from the Pyrenees in the west, through France and Germany to Poland in the north, Italy, Northern Greece and European Turkey. It has been introduced and is widely naturalised elsewhere. Although it is often thought of as a British native wild flower, or to have been brought to the British Isles by the Romans, it was probably introduced around the early sixteenth century.

All **species** of ***Galanthus*** are **perennial**, herbaceous plants which grow from bulbs. The flower has no petals: it consists of six tepals, the outer three being larger and more convex than the inner series. An important feature which helps to distinguish between **species** (and to help to determine the parentage of hybrids) is their "**vernation**" (the arrangement of the emerging leaves relative to each other). This can be "**applanate**", "**supervolute**" or "**explicative**". In **applanate vernation** the two leaf blades are pressed flat to each other within the bud and as they emerge; **explicative** leaves are also pressed flat against each other, but the edges of the leaves are folded back or sometimes rolled; in **supervolute** plants one leaf is tightly clasped around the other within the bud and generally remains at the point where the leaves emerge from the soil.

[Iris](#)

Webhelp output generated by XML Author

Missing Terms

If you enter multiple search terms (other than *stop words*), for any result that the search engine found at least one term but not one or more of the other terms, the **Missing** terms will be listed below each result.

Tag Element Scoring Values

HTML tag elements are also assigned a scoring value and these values are evaluated for the search results. For information about editing these values, see [How to Change Element Scoring in Search Results \(on page 1525\)](#).

Browser Compatibility

This output format is compatible with the most recent versions of the following common browsers:

- Edge
- Chrome
- Firefox
- Safari
- Opera

**Important:**

Due to some security restrictions in certain browsers (Google Chrome), WebHelp Classic pages loaded from the local system (through URLs of the `file:///...` format) may not work properly. It is recommended that you load WebHelp Classic pages in Google Chrome only from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`).

**Warning:**

Due to some restrictions in web browsers regarding JavaScript code, the *frameless* version (`index.html` start page) of the WebHelp Classic system should only be loaded from a web server (with a URL such as `http://your.server.com/webhelp/index.html` or `http://localhost/web_pages/index.html`). When loading WebHelp Classic pages from the local file system, the *frameset* version (`index_frames.html` start page) of the WebHelp Classic system should be used instead (`file:///...`).

Syntax Highlights in 'programlisting' Elements

The DocBook `<programlisting>` element supports settings values in its `@language` attribute. For some of these predefined values, syntax highlights are automatically generated in the WebHelp output:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell

- language-php
- language-python
- language-ruby
- language-sql
- language-xquery

[Deploying the Oxygen Feedback Comments Component for DocBook \(on page 1509\)](#)

Generating WebHelp Classic Output for DocBook

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author** or from a command-line tool outside **Oxygen XML Editor/Author**.

Running from Oxygen XML Editor/Author

To publish DocBook content to WebHelp Classic output from a transformation scenario inside **Oxygen XML Editor/Author**, use one of the following procedures, depending on whether or not you want a feedback section in your output.

WebHelp Classic Output

To publish a DocBook document as a **WebHelp Classic** system, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** action from the toolbar.
2. Select the **DocBook WebHelp Classic (Deprecated)** scenario from the **DocBook 4** or **DocBook 5** section.
3. Click **Apply associated**.

When the transformation is complete, the output is automatically opened in your default browser.

Automating the WebHelp Classic Output for DocBook

DocBook-based WebHelp output can be generated from an automated publishing process using a command-line tool outside of **Oxygen XML Editor/Author**. **However, to do this, you must purchase an additional [Oxygen XML WebHelp license](#).**

Deploying the Oxygen Feedback Comments Component for DocBook

You can add a comments component in your WebHelp Classic output to provide a simple and efficient way for your community to interact and offer feedback. The comments component is contributed by **Oxygen Feedback**, a modern comment management system that can be integrated with your WebHelp Classic output to provide a comments area at the bottom of each WebHelp page where readers can add new comments or reply to existing ones.

Oxygen Feedback includes a modern, user-friendly administration interface where you can moderate comments, manage users, view statistics, and configure settings. It is very easy to integrate and there are no requirements for installing additional software.

An add-on is also available that contributes a **Feedback Comments Manager view** in *Oxygen XML Editor/Author* where the documentation team can see all the comments added in your WebHelp output. This means they can react to user feedback by making corrections and updating the source content without leaving the application.

Adding the Feedback System to WebHelp Classic Documentation

Prerequisite

To install and manage **Oxygen Feedback**, you must obtain a license for the product. This requires that you choose a subscription plan during the installation procedure. To see the subscription plans prior to installing the product, go to: https://www.oxygenxml.com/oxygen_feedback/buy_feedback.html.

Installation Procedure

1. Log in to your Feedback account from the *administration login page* (<https://feedback.oxygenxml.com/login>). You can click **Log in with Google** or **Log in with Facebook** to create an account using your Google or Facebook credentials, or click the **Sign Up** tab to create an account using your name and email address.
2. Click the **Add site** button to create a site configuration. If you have not already selected a subscription plan, you will be directed to a page where you can choose from several options.
3. In the **Settings** page, enter a **Name** and **Description** for the site configuration. There are some optional settings that can be adjusted according to your needs. For more details, see the [Site Settings topic](#). Click **Continue**.
4. In the **Initial version** page, enter the **Base URL** for your website (you can add additional URLs by clicking the  **Add** button). You can also specify an **Initial version** if you want it to be something other than 1.0. If you do not plan to have multiple versions, leave the version as 1.0. For more details, see the [Initial Version topic](#). Click **Continue**.
5. In the **Installation** page, choose a site generation option:
 - a. If you will generate the documentation using a transformation scenario in *Oxygen XML Editor/Author*, select the **Oxygen XML Editor** option and continue with these steps:
 - i. Copy the generated HTML fragment and click **Finish**.
 - ii. Create an XML file (for example, `feedback-install.xml`) with the generated installation fragment.
 - iii. In *Oxygen XML Editor/Author*, open the **Configure Transformation Scenario(s)** dialog box.
 - iv. Select and duplicate the **DocBook WebHelp Classic (Deprecated)** scenario ([on page 1201](#)).
 - v. Go to the **Parameters** tab.
 - vi. Set the `webhelp.footer.file` parameter to reference the path of the fragment file created earlier.

- b. If you will generate the documentation using a command-line script, select the **Oxygen XML WebHelp** option and continue with these steps:
 - i. Copy the generated HTML fragment and click **Finish**.
 - ii. Create an XML file (for example, `feedback-install.xml`) with the generated installation fragment.
 - iii. Use the `webhelp.footer.file` parameter in your command-line script to specify the path to the file you created. For example:

```
docbook.bat -Dwebhelp.footer.file=c:\path\to\feedback-install.xml
```

6. [Optional] If you want the **Oxygen Feedback** comments component to fill the entire page width, contribute a custom CSS file (use the `html.stylesheet` parameter to reference it) that contains the following style rule:

```
div.footer {
  float: none;
}
```

For more details about **Oxygen Feedback**, how to configure settings, moderate comments, view statistics, and much more, see the [Oxygen Feedback user guide](#).

Customizing WebHelp Classic Output

Oxygen XML WebHelp provides support for customizing the **WebHelp Classic** output to suit your specific needs. The **WebHelp Classic** type of output is designed for desktop systems and features a familiar *tri-pane* layout. You can use this system to publish DocBook documents. You can also integrate a feedback system to allow your users to add comments to your output.

To change the overall appearance of the **WebHelp Classic** output, you can use the visual [WebHelp Skin Builder tool \(on page 1511\)](#), which does not require knowledge of CSS language. If you are familiar with CSS and coding, you can style your WebHelp output through your own custom stylesheets. You can also customize your output by modifying option and parameters in the transformation scenario.

This section includes topics that explain various ways to customize your WebHelp system output, such as how to improve the appearance of the Table of Contents, add logo images in the title area, integrate with social media, add custom headers and footers, and much more.

Changing the Layout and Styles

This section contains some topics that explain how to customize the layout and style of your WebHelp Classic output using custom CSS, inserting custom HTML content, and more.

WebHelp Skin Builder

The **WebHelp Skin Builder** is a simple, easy-to-use tool, specially designed to assist users to visually customize the look and feel of the WebHelp output. It is implemented as an online tool hosted on the **Oxygen XML** website and allows you to experiment with various styles and colors over a documentation sample.

To be able to use the **Skin Builder**, you need:

- An Internet connection and unrestricted access to **Oxygen XML** website.
- A late version web browser.

To start the **Skin Builder**, use a web browser to go to <https://www.oxygenxml.com/webhelp-skin-builder>.

Skin Builder Layout

The left side panel of the **Skin Builder** is divided into 3 sections:

- **Actions** - Contains the following two buttons:
 - **Import** - Opens an **Import CSS** dialog box that allows you to load a CSS stylesheet and apply it over the documentation sample.
 - **Export** - Saves all properties as a CSS file.
- **Settings** - Includes a **Highlight selection** option that helps you identify the areas affected by a particular element customization.
 - When hovering an item in the customizable elements menu, the affected sample area is highlighted with a dotted blue border.
 - When an item in the customizable elements menu is selected, the affected sample area is highlighted with a solid red border.
- **Customize** - Provides a series of customizable elements organized under four main categories:
 - Header
 - TOC Area
 - Vertical Splitter
 - Content

For each customizable element, you can alter properties such as background color or font face. Any alteration made in the customizable elements menu is applied in real time over the sample area.

Creating a Customization Skin

1. You can start with one of the built-in skins or a CSS stylesheet applied over the sample using the **Import** button.
2. Use the elements in the **Customize** section to set properties that modify the look of the skin. By default, all customizable elements display a single property, but you can make more visible by clicking the **+ Add** button and choosing from the available properties.

Note:

If you want to revert a particular property to its initial value, click the  **Reset** button.

3. When you are happy with the skin customizations you have made, click the **Export** button. All settings will be saved in a CSS file.

Apply a Customization Skin to a DocBook to WebHelp Classic Transformation Scenario

1. Start Oxygen XML Editor Eclipse plugin.
2. Load the DocBook file you want to produce as a WebHelp output.
3. In the **Parameters** tab, set the `webhelp.skin.css` parameter to point to the previously exported CSS.
4. To customize the logo, use the following parameters: `webhelp.logo.image` and `webhelp.logo.image.target.url`.
5. Run the transformation to obtain the WebHelp output.

Resources

For more information about using the WebHelp Skin Builder, watch our video demonstration:

<https://www.youtube.com/embed/32PGX-PQx0>

How to Use CSS Styling to Customize WebHelp Output

The most common way to customize the look and style of your WebHelp output is to use custom CSS styling. This method can be used to make small, simple styling changes or more advanced, precise changes. To implement the styling in your WebHelp output, you simply need to create the custom CSS file and reference it in your transformation scenario or script. This custom file will be the final CSS to be applied so its content will override the styles in the other pre-existing CSS files.

Using the CSS Inspector to Identify Content for Custom CSS File

You can use your browser's CSS inspector to identify the pertinent code in the current CSS files and you can even make changes directly in the CSS inspector to test the results so that you know exactly what content to use in your custom CSS file.

In most popular browsers (such as Chrome, Firefox, and Edge), you can access the CSS inspector by using **F12** or by selecting **Inspect Element** (or simply **Inspect**) from the contextual menu.

Tip:

When using Safari on macOS, you must first enable the Develop menu by going to the Advanced settings and selecting **Show Develop menu in menu bar**. Then you can select **Show Web Inspector** from the Develop menu or click **Command + Option + I**.

Referencing the Custom CSS Using Oxygen XML Editor/Author

To use a custom CSS to style WebHelp output and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create your custom CSS file.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.
3. Run the WebHelp transformation scenario to generate the output.

Referencing the Custom CSS Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To use a custom CSS to style WebHelp output and use a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Create your custom CSS file.
2. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
3. Execute the transformation script.

How to Add Custom HTML Content in WebHelp Classic Output

You can add custom HTML content in the WebHelp Classic output by inserting it in a well-formed XML file that will be referenced in the transformation. This content may include references to additional JavaScript, CSS, and other types of resources, or such resources can be inserted inline within the HTML content that is inserted in the XML file.

Using Oxygen XML Editor/Author

To include custom HTML content in the WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
 - **Well-Formedness** - If the content of the file is not *XML Well-formed* (on page 545), (or fragments are not well-formed), the transformation will fail.

A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an `<html>` element. This element tag will be filtered out and only its children will be copied to the

output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `${oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="${oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css"
        href="${oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: [How to Copy Additional Resources to Output Directory \(on page 1523\)](#).

- **Inline JavaScript or CSS Content:**

JavaScript:

```
<script type="text/javascript">
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
</script>
```

CSS:

```
<style>
  /* Include CSS style rules here. */

  *{
    color:red
  }
</style>
```

Note:

If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

[Important] XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```

<script type="text/javascript">
  <!--
    /* Include JavaScript code here. */

    function myFunction() {
      return true;
    }
  -->
</script>

```

2. Edit the WebHelp Classic transformation scenario.
3. Go to the **Parameters** tab.
4. Edit the value of the `webhelp.head.script` parameter and set it to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:**

If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

5. Click **OK** to save the changes and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To include custom HTML content in the WebHelp Classic output using a **script outside of Oxygen XML Editor/Author** (on page 1509), follow this procedure:

1. Insert the HTML content in a well-formed XML file considering the following notes:
 - **Well-Formedness** - If the content of the file is not *XML Well-formed* (on page 545), (or fragments are not well-formed), the transformation will fail.

A common use case is if you want to include several `<script>` or `<link>` elements. In this case, the XML fragment has multiple root elements and to make it well-formed, you can wrap it in an

`<html>` element. This element tag will be filtered out and only its children will be copied to the output documents. Similarly, you can wrap your content in `<head>`, `<body>`, `<html/head>`, or `<html/body>` elements.

- **Referencing Resources in the XML File** - You can include references to local resources (such as JavaScript or CSS files) by using the built-in `#{oxygen-webhelp-output-dir}` macro to specify their paths relative to the output directory:

```
<html>
  <script type="text/javascript" src="#{oxygen-webhelp-output-dir}/js/test.js"/>
  <link rel="stylesheet" type="text/css"
        href="#{oxygen-webhelp-output-dir}/css/test.css" />
</html>
```

To copy the referenced resources to the output directory, follow the procedure in: [How to Copy Additional Resources to Output Directory \(on page 1523\)](#).

- **Inline JavaScript or CSS Content:**

JavaScript:

```
<script type="text/javascript">
  /* Include JavaScript code here. */

  function myFunction() {
    return true;
  }
</script>
```

CSS:

```
<style>
  /* Include CSS style rules here. */

  *{
    color:red
  }
</style>
```

Note:

If you have special characters (for example, `&`, `<`) that break the well-formedness of the XML fragment, it is important to place the content inside an XML comment.

[Important] XML comment tags (both the start and end tags) must be on lines by themselves. If they are on the same line as any of the script's content, it will likely result in a JavaScript error.

```

<script type="text/javascript">
  <!--
    /* Include JavaScript code here. */

    function myFunction() {
      return true;
    }
  -->
</script>

```

2. Use the `webhelp.head.script` parameter in your transformation script and set its value to reference the URL of the XML file created in step 1. Your additional content will be included at the end of the `head` element of your output document.

**Note:**

If you want to include the content in the `body` element, use the `webhelp.body.script` parameter instead.

3. Execute the transformation script.

[How to Copy Additional Resources to Output Directory \(on page 1523\)](#)

How to Change Number Styles for Ordered Lists

Ordered lists (``) are usually numbered in XHTML output using numerals. If you want to change the numbering to alphabetical, follow these steps:

1. Define a custom `@outputclass` value and set it as an attribute of the ordered list, as in the following example:

```

<ol outputclass="number-alpha">
  <li>a</li>
  <li>b</li>
  <li>c</li>
</ol>

```

2. Add the following code snippet in a custom CSS file:

```

ol.number-alpha{
  list-style-type: lower-alpha;
}

```

3. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.stylesheet` parameter to the path of your custom CSS file
4. Run the transformation scenario.

How to Change the Icons in a WebHelp Classic Table of Contents

You can change the icons that appear in a WebHelp Classic table of contents by assigning new image files in a custom CSS file. By default, these icons are defined with the following CSS codes (the first example is the icon that appears for a collapsed menu and the second for an expanded menu):

```
.hasSubMenuClosed{
    background: url('../img/book_closed16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

```
.hasSubMenuOpened{
    background: url('../img/book_opened16.png') no-repeat;
    padding-left: 16px;
    cursor: pointer;
}
```

Using Oxygen XML Editor/Author

To assign other icons and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (`[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`).
3. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.stylesheet` parameter to the path of your custom CSS file.
4. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To assign other icons and use a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Create a custom CSS file that assigns your desired icons to the `.hasSubMenuClosed` and `.hasSubMenuOpened` properties.

```
.hasSubMenuClosed{
    background: url('TOC-my-closed-button.png') no-repeat;
}

.hasSubMenuOpened{
    background: url('TOC-my-opened-button.png') no-repeat;
}
```

2. It is recommended that you store the image files in the same directory as the default icons (`[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\img\`).
3. Reference your custom CSS file. Use the `html.stylesheet` parameter in your transformation script and set its value to the path of your custom CSS file.
4. Execute the transformation script.

How to Customize the Appearance of Selected Items in the Table of Contents

The appearance of selected items in the table of contents of WebHelp Classic output can be enhanced.

For example, to highlight the background of the selected item, follow these steps:

1. Locate the `toc.css` file in the following directory: `[DocBook XSL directory]\com.oxygenxml.webhelp.classic\oxygen-webhelp\resources\css`.
2. Edit that CSS file, find the `menuItemSelected` class, and change the value of the `background` property.
3. Run the transformation.

**Note:**

You can also overwrite the same value from your own custom CSS and then specify the path to your CSS in the transformation scenario by using the `html.stylesheet` parameter and set its value to the path of your custom CSS file.

Adding Graphics and Media Resources

This section contains topics that explain how to add media resources to the published WebHelp Class output or to the output directory.

How to Add a Favicon in WebHelp Systems

You can add a custom *favicon* to your WebHelp output by simply using a parameter in the transformation scenario to point to your *favicon* image. This is available for DocBook WebHelp output using the **WebHelp Classic** transformation.

Using Oxygen XML Editor/Author

To add a *favicon* to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit the WebHelp transformation scenario and open the **Parameters** tab.
2. Locate the `webhelp.favicon` parameter and enter the file path that points to the image that will be used as the *favicon*.
3. Run the transformation scenario.

Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

Using a Script Outside of Oxygen XML Editor/Author

**Important:**

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a *favicon* to your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Specify the file path that points to the image that will be use as the *favicon* using the `webhelp.favicon` parameter.
2. Execute the transformation script.

Result: Browsers that provide *favicon* support will display the *favicon* (typically in the browser's address bar, in the list of bookmarks, and in the history).

How to Add a Logo Image in the Title Area

You can customize **WebHelp Classic** output to include a logo in the title area. It will be displayed before the publication title. You can also specify a URL that can be used to send users to a specific website when they click the logo image.

This customization can be done using a transformation scenario from within **Oxygen XML Editor/Author** or using a command-line script outside of **Oxygen XML Editor/Author**.

Using Oxygen XML Editor/Author

To add a logo in the title area of your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Edit a **WebHelp Classic** transformation scenario, then open the **Parameters** tab.
2. Specify the path to your logo in the `webhelp.logo.image` parameter.
3. If you also want to add a link to your website when you click the logo image, set the URL in the `webhelp.logo.image.target.url` parameter.
4. Run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a logo in the title area of your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Specify the path to your logo using the `webhelp.logo.image` parameter.
2. If you also want to add a link to your website when you click the logo image, set the URL using the `webhelp.logo.image.target.url` parameter.
3. Execute the transformation script.

How to Add Videos in DocBook WebHelp Classic Output

You can insert references to videos in your DocBook topics and then publish them to **WebHelp Classic** output. The videos can be played directly in all HTML5-based outputs, including WebHelp systems.

To add videos in the **WebHelp Classic** output generated from DocBook documents, follow these steps:

1. Edit the DocBook document and reference the video using a `<mediaobject>` element, as in the following example:

```
<mediaobject>
  <videoobject>
    <videodata fileref="http://www.youtube.com/watch/v/VideoName" />
  </videoobject>
</mediaobject>
```

2. Apply a *WebHelp* transformation scenario to obtain the output.

How to Copy Additional Resources to Output Directory

You can copy additional resources (such as JavaScript, CSS or other resources) to the output directory of a WebHelp system by using the `webhelp.custom.resources` parameter.

Using Oxygen XML Editor/Author

To copy additional resources to the output directory using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Place all your resources in the same directory.
2. Edit the WebHelp transformation scenario, then open the **Parameters** tab.
3. Edit the value for the `webhelp.custom.resources` parameter and set it to the absolute path of the directory in step 1.
4. Click **OK** to save the changes to the transformation scenario.
5. Run the transformation scenario.

Result: All files from the new directory will be copied to the root of the WebHelp output directory.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To copy additional resources to the output directory using a [script outside of Oxygen XML Editor/Author](#) (on [page 1509](#)), follow this procedure:

1. Place all your resources in the same directory.
2. Specify the absolute path to that directory using the `webhelp.custom.resources` parameter.
3. Execute the transformation script.

Result: All files from the new directory will be copied to the root of the WebHelp output directory.

How to Add MathML Equations in WebHelp Output

Currently, the majority of modern browsers have native support to render **MathML** equations embedded in the **HTML** code. If your browser that does not have support for MathML, **MathJax** is a solution to properly view MathML equations embedded in **HTML** content in a variety of browsers.

If you have DITA content that has embedded **MathML** equations and you want to properly view the equations in published HTML output types (such as WebHelp), you need to add a reference to the MathJax script in the **head** element of all HTML files that have the equation embedded.

For example:

```
<script type="text/javascript" id="MathJax-script" async
  src="https://cdnjs.cloudflare.com/ajax/libs/mathjax/3.0.0/es5/latest?tex-mml-cthtml.js">
</script>
```

Result: The equation should now be properly rendered in the WebHelp output for other browsers.

Searching the Output

This section contains topics that explain how to customize some of the search features in WebHelp Classic output.

How to Change Element Scoring in Search Results

The WebHelp **Search** feature is enhanced with a rating mechanism that computes scores for every page that matches the search criteria. HTML tag elements are assigned a scoring value and these values are evaluated for the search results. The WebHelp directory includes a properties file that defines the scoring values for tag elements and this file can be edited to customize the values according to your needs.

To edit the scoring values of HTML tag element for enhancing WebHelp search results, follow these steps:

1. Edit the scoring properties file for DocBook WebHelp systems ([DocBook XSL directory]\com.oxygenxml.webhelp.classic\indexer\scoring.properties). The properties file includes instructions and examples to help you with your customization.

The values that can be edited in the `scoring.properties` file:

```
h1 = 10
h2 = 9
h3 = 8
h4 = 7
h5 = 6
h6 = 5
b = 5
strong = 5
em = 3
i=3
u=3
div.toc=-10
title=20
div.ignore=ignored
meta_keywords = 20
meta_indexterms = 20
meta_description = 25
shortdesc=25
```

2. Save your changes to the file.
3. Re-run your WebHelp transformation.

How to Index Japanese Content in WebHelp Classic

To optimize the indexing of Japanese content in WebHelp pages, the *Lucene Kuromoji Japanese analyzer* can be used. This analyzer is included in the **Oxygen XML Editor/Author** installation kit.

Using Oxygen XML Editor/Author

To activate the Japanese indexing in your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese. Edit a **DocBook to WebHelp** transformation scenario and in the **Parameters** tab, set the value of the `l10n.gentext.default.language` parameter to `ja`.
2. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To activate the Japanese indexing in your WebHelp output using a script outside of **Oxygen XML Editor/Author**, follow this procedure:

1. Set the language for your content to Japanese. Use the `l10n.gentext.default.language` parameter in your transformation script and set its value to `ja`.
2. Execute the transformation script.

Related information

[How to Localize the Interface of DocBook to WebHelp Classic Output \(on page 1526\)](#)

Localization in WebHelp Classic Output

This section contains topics that explain the localization support for DocBook WebHelp Classic transformations.

How to Localize the Interface of DocBook to WebHelp Classic Output

Static labels that are used in the WebHelp output are kept in translation files in the `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` folder. Translation files have the `strings-lang1-lang2.xml` name format, where `lang1` and `lang2` are ISO language codes. For example, the US English text is kept in the `strings-en-us.xml` file.

To localize the interface of the WebHelp output for DocBook transformations, follow these steps:

1. Look for the `strings-[lang1]-[lang2].xml` file in `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization` directory (for example, the Canadian French file would be: `strings-fr-ca.xml`). If it does not exist, create one starting from the `strings-en-us.xml` file.

2. Translate all the labels from the above language file. Labels are stored in XML elements that have the following format: `<str name="Label name">Caption</str>`.
3. Make sure that the new XML file that you created in the previous two steps is listed in the file `[DocBook XSL directory]/com.oxygenxml.webhelp.classic/oxygen-webhelp/resources/localization/strings.xml`. For example, a Canadian French file would be listed as: `<lang xml:lang="fr-ca" filename="strings-fr-ca.xml">`.
4. Edit any of the DocBook to WebHelp transformation scenarios (with or without feedback) and set the **l10n.gentext.default.language** parameter to the code of the language you want to localize (for example, *fr-ca* for Canadian French).
5. Run the transformation scenario to produce the WebHelp output.

Related Information:

[How to Index Japanese Content in WebHelp Classic \(on page 1525\)](#)

How to Activate Support for Right-to-Left (RTL) Languages

To activate support for RTL (right-to-left) languages in WebHelp output, set the `@xml:lang` attribute with the corresponding attribute value:

- **ar-eg** - Arabic
- **he-il** - Hebrew
- **ur-pk** - Urdu

Integrating Social Media and Google Tools in the WebHelp Classic Output

Oxygen XML Editor Eclipse plugin includes support for integrating some of the most popular social media sites in WebHelp output.

How to Add a Facebook Like Button in WebHelp Classic Output

It is possible to integrate Facebook™ into your **WebHelp Classic** output and the widget will appear in the footer sections of your WebHelp page.

Using Oxygen XML Editor/Author

To add a Facebook™ *Like* widget to your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.

- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
      }(document, 'script', 'facebook-jssdk'));
    -->
  </script>
  <div class="fb-like" data-layout="standard" data-action="like"
    data-show-faces="true" data-share="true"/>
</div>
```

4. In **Oxygen XML Editor/Author**, click the  **Configure Transformation Scenario(s)** action from the toolbar.
5. Select an existing WebHelp Classic transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `facebook-widget.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a Facebook™ *Like* widget to your WebHelp output using a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Go to the [Facebook Developers](#) website.
2. Fill-in the displayed form, then click the **Get Code** button.
3. Copy the two code snippets and paste them into a `<div>` element inside an XML file called `facebook-widget.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="facebook">
  <div id="fb-root"/>
  <script>
    <!--
      (function(d, s, id) {
        var js, fjs = d.getElementsByTagName(s)[0];
        if (d.getElementById(id)) return;
        js = d.createElement(s); js.id = id;
        js.src = "//connect.facebook.net/en_US/sdk.js#xfbml=1&version=v2.0";
        fjs.parentNode.insertBefore(js, fjs);
      }(document, 'script', 'facebook-jssdk'));
    -->
  </script>
  <div class="fb-like" data-layout="standard" data-action="like"
    data-show-faces="true" data-share="true"/>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `facebook-widget.xml` file that you created earlier.
5. Execute the transformation script.

How to Add Tweet Button in WebHelp Classic Output

It is possible to integrate X™ (formerly known as Twitter) into your **WebHelp Classic** output and the widget will appear in the footer section of your WebHelp page.

Using Oxygen XML Editor/Author

To add a X™ *Tweet* widget to your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Tweet button generator](#) page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.

3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:

- The file must be well-formed.
- The code for each `<script>` element must be included in an XML comment.
- The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
? 'http': 'https';
        if (! d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '://platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
      (document,
        'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. In **Oxygen XML Editor/Author**, click the  **Configure Transformation Scenario(s)** action from the toolbar.
5. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
6. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `tweet-button.xml` file that you created earlier.
7. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To add a X™ *Tweet* widget to your WebHelp Classic output using a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Go to the [Tweet button generator](#) page.
2. Fill in the displayed form. The **Preview and code** area displays the code that you will need.
3. Copy the code snippet displayed in the **Preview and code** area and paste it into a `<div>` element inside an XML file called `tweet-button.xml`. Make sure you follow these rules:
 - The file must be well-formed.
 - The code for each `<script>` element must be included in an XML comment.
 - The start and end tags for the XML comment must be on a separate line.

The content of the XML file should look like this:

```
<div id="twitter">
  <a href="https://twitter.com/share" class="twitter-share-button">Tweet</a>
  <script>
    <!--
      !function (d, s, id) {
        var
          js, fjs = d.getElementsByTagName(s)[0], p = /^http:/.test(d.location)
? 'http': 'https';
        if (! d.getElementById(id)) {
          js = d.createElement(s);
          js.id = id;
          js.src = p + '://platform.twitter.com/widgets.js';
          fjs.parentNode.insertBefore(js, fjs);
        }
      }
      (document,
        'script', 'twitter-wjs');
    -->
  </script>
</div>
```

4. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `tweet-button.xml` file that you created earlier.
5. Execute the transformation script.

How to Integrate Google Analytics in WebHelp Classic Output

You can use *Google Analytics* to track and report site data for your **WebHelp Classic** output.

Using Oxygen XML Editor/Author

To integrate *Google Analytics* into your WebHelp Classic output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Create a new [Google Analytics account](#) (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
  m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

  ga('create', 'UA-XXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. In **Oxygen XML Editor/Author**, click the  **Configure Transformation Scenario(s)** action from the toolbar.
6. Select an existing WebHelp transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.footer.file` parameter to reference the `googleAnalytics.xml` file that you created earlier.
8. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To integrate *Google Analytics* into your WebHelp Classic output using a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Create a new [Google Analytics account](#) (if you do not already have one) and log on.
2. Choose the Analytics solution that best fits the needs of your website.
3. Follow the on-screen instructions to obtain a **Tracking Code** that contains your *Tracking ID*. A **Tracking Code** looks like this:

```
<script>
  (function(i,s,o,g,r,a,m){i['GoogleAnalyticsObject']=r;i[r]=i[r]||function(){
  (i[r].q=i[r].q||[]).push(arguments)},i[r].l=1*new Date();a=s.createElement(o),
  m=s.getElementsByTagName(o)[0];a.async=1;a.src=g;m.parentNode.insertBefore(a,m)
  })(window,document,'script','//www.google-analytics.com/analytics.js','ga');

  ga('create', 'UA-XXXXXXX-X', 'auto');
  ga('send', 'pageview');
</script>
```

4. Save the Tracking Code (obtained in the previous step) in a new XML file called `googleAnalytics.xml`. Note that the file should only contain the tracking code.
5. Use the `webhelp.footer.file` parameter in your transformation script and set its value to reference the `googleAnalytics.xml` file that you created earlier.
6. Execute the transformation script.

How to Integrate Google Search in WebHelp Classic Output

It is possible to integrate the *Google Search Engine* into your **WebHelp Classic** output and you can specify where you want the results to appear in your WebHelp page.

Using Oxygen XML Editor/Author

To integrate the *Google Search Engine* into your WebHelp output using a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Go to the [Google Custom Search Engine page](#) using your Google account.
2. Select the **Create a custom search engine** button.
3. Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
  (function() {
    var cx =
      '000888210889775888983:8mn4x_mf-yg';
    var gcse = document.createElement('script');
    gcse.type = 'text/javascript';
    gcse.async = true;
```

```

gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') + ' //www.google.com/cse/cse.js?cx=' + cx;
var s = document.getElementsByTagName('script')[0];
s.parentNode.insertBefore(gcse, s);
}
})();
</script>

```

4. Save the script into a well-formed HTML file called `googlecse.html`.
5. In **Oxygen XML Editor/Author**, click the  **Configure Transformation Scenario(s)** action from the toolbar.
6. Select an existing WebHelp Responsive transformation scenario (depending on your needs, it may be with or without feedback) and click the **Duplicate** button to open the **Edit Scenario** dialog box.
7. Switch to the **Parameters** tab and edit the `webhelp.google.search.script` parameter to reference the `googlecse.html` file that you created earlier.
8. You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
 - a. Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the [HTML5 version for the GCSE](#)). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
 - b. Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
9. Click **Ok** and run the transformation scenario.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To integrate the *Google Search Engine* into your WebHelp Classic output using a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Go to the [Google Custom Search Engine page](#) using your Google account.
2. Select the **Create a custom search engine** button.

- Follow the on-screen instructions to create a search engine for your site. At the end of this process you should obtain a code snippet that looks like this:

```
<script>
(function() {
  var cx =
    '000888210889775888983:8mn4x_mf-yg';
  var gcse = document.createElement('script');
  gcse.type = 'text/javascript';
  gcse.async = true;
  gcse.src = (document.location.protocol == 'https:' ?
    'https:' : 'http:') + '//www.google.com/cse/cse.js?cx=' + cx;
  var s = document.getElementsByTagName('script')[0];
  s.parentNode.insertBefore(gcse, s);
})
})();
</script>
```

- Save the script into a well-formed HTML file called `googlecse.html`.
- Use the `webhelp.google.search.script` parameter in your transformation script and set its value to reference the `googlecse.html` file that you created earlier.
- You can also use the `webhelp.google.search.results` parameter to choose where to display the search results.
 - Create an HTML file with the following content: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>` (you must use the [HTML5 version for the GCSE](#)). For more information about other supported attributes, see [Google Custom Search: Supported Attributes](#).
 - Set the value of the `webhelp.google.search.results` parameter to the file path of the file you just created. If this parameter is not specified, the following code is used: `<div class="gcse-searchresults-only" data-autoSearchOnLoad="true" data-queryParameterName="searchQuery"></div>`.
- Execute the transformation script.

Miscellaneous Customization Topics

This section contains miscellaneous topics about how to customize the WebHelp Classic output.

How to Disable Caching in WebHelp Classic Output

In cases where a set of WebHelp Classic pages need to be updated on a regular basis to deliver the latest version of the documentation, the WebHelp pages should always be requested from the server upon re-loading it in a Web browser on the client side, rather than re-using an outdated *cached* version in the browser.

To disable caching in WebHelp Classic output, follow this procedure:

1. Edit the following file: `[OXYGEN_INSTALL_DIR]\frameworks\docbook\xsl\com.oxygenxml.webhelp.classic\xsl\createMainFiles.xsl`.
2. Locate the following template in the XSL file: `<xsl:template name="create-toc-common-file">` and add the following code snippet:

```
<meta http-equiv="Pragma" content="no-cache" />
<meta http-equiv="Expires" content="-1" />
```

**Note:**

The code should look like this:

```
<html>
  <head>
    <xsl:if test="$withFrames">
      <base target="contentwin"/>
    </xsl:if>
    <meta http-equiv="Content-Type" content="text/html; charset=utf-8"/>
    <!-- Disable caching of WebHelp pages in web browser. -->
    <meta http-equiv="Pragma" content="no-cache" />
    <meta http-equiv="Expires" content="-1" />
    ....
```

3. Save your changes to the file.
4. Re-run your WebHelp transformation scenario.

How to Publish WebHelp Classic Output on a SharePoint Site

Since WebHelp output must be published locally, on the same machine where the WebHelp process is running, to publish your files directly to a SharePoint library you need to map a network drive to connect to SharePoint and change your file extensions to `.aspx`, as described in the steps below.

Using Oxygen XML Editor/Author

To publish WebHelp Classic output on a SharePoint site and use a transformation scenario from within **Oxygen XML Editor/Author**, follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: <https://support.microsoft.com/en-us/kb/2616712>.
2. Edit the WebHelp transformation scenario and open the **Parameters** tab. Set the `html.ext` parameter to `.aspx`.
3. Run the WebHelp transformation scenario to generate the output.

Using a Script Outside of Oxygen XML Editor/Author

Important:

Running WebHelp transformations from a script outside of **Oxygen XML Editor/Author** requires an additional license and some additional setup:

- You must have a valid license for the **Oxygen XML WebHelp Plugin** (https://www.oxygenxml.com/buy_webhelp.html).
- The **Oxygen XML WebHelp Plugin** must be installed and integrated.

To publish WebHelp Classic output on a SharePoint site and use a [script outside of Oxygen XML Editor/Author](#) (on page 1509), follow this procedure:

1. Map a network drive to connect to your SharePoint library. For more information, see: <https://support.microsoft.com/en-us/kb/2616712>.
2. Use the `html.ext` parameter in your transformation script and set its value to `.aspx`.
3. Execute the transformation script.

DITA to PDF Output Customization

Oxygen XML Editor Eclipse plugin provides support for generating PDF output using transformation scenarios for certain types of documents (for example, DITA, DocBook, TEI, and JATS) and Oxygen XML Editor Eclipse plugin supports several different types of processors. There are numerous ways to customize the published output to fit your specific needs.

CSS-based DITA to PDF Customization

Oxygen XML Editor Eclipse plugin comes bundled with a **DITA-OT CSS-based PDF Publishing Plugin** for transforming DITA maps or single topics to PDF, while styling the resulting output using CSS. It is the base of two types of transformation scenarios:

DITA Map Transformation Type (DITA Map PDF - based on HTML5 & CSS)

This transformation type converts DITA maps to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5` transtype is used. Because the structure of the HTML5 intermediate format resembles the one used in WebHelp output, it is possible to reuse parts of your CSS file you developed for a WebHelp customization.

Single Topic Transformation Type (DITA PDF - based on HTML5 & CSS)

This transformation type converts a single DITA topic to PDF using a CSS-based processing engine and HTML5 as an intermediate format. For this transformation, the `pdf-css-html5-single-topic` transtype is used. This transformation is derived from the DITA Map PDF - based on HTML5 & CSS transformation type but applies on a single topic.

Overview

This section contains topics that provide a basic overview of the **DITA-OT CSS-based PDF Publishing Plugin**, technical details, and some additional resources to help you with your customizations.

**Tip:**

For more information and some tips in regard to publishing DITA documents to PDF using CSS, watch our Webinars:

- [Transforming DITA documents to PDF using CSS, Part 1 – Page Definitions, Cover Page and PDF Metadata.](#)
- [Transforming DITA documents to PDF using CSS, Part 2 – Book Design, Pagination, Page Layout, and Bookmarks.](#)
- [Transforming DITA documents to PDF using CSS, Part 3 – Advanced Fonts Usage.](#)
- [Transforming DITA documents to PDF using CSS, Part 4 – Advanced CSS Rules.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 1 – Basic CSS Layout.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 2 – Lists, Tables and Images.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 3 – Global Page Layout.](#)
- [Transforming XML and HTML documents to PDF using CSS, Part 4 – Advanced Functionalities.](#)

Resources

Customizing the PDF output requires knowledge of CSS, Paged Media, and DITA. The following list provides some resources to help you:

- **CSS** - You can find a good tutorial here: https://developer.mozilla.org/en-US/docs/Learn/CSS/Introduction_to_CSS. Also, the specification is available on the W3C (<https://www.w3.org/Style/CSS/Overview.en.html>) or on the MDN (<https://developer.mozilla.org/en-US/docs/Web/CSS>) websites.
- **CSS Paged Media** - This is a part of the CSS specification that shows how to organize your publication in pages, how to use headers/footers, page breaks, and other page-related issues. The specification is available here: <https://www.w3.org/TR/CSS2/page.html>. Also, there is a set of hands-on examples in the **Oxygen PDF Chemistry** user guide: <https://www.oxygenxml.com/doc/ug-chemistry/>.
- **DITA** - You will need a basic understanding of DITA elements, attributes, and structure. A good resource is *The DITA Style Guide - Best Practices for Authors* by Tony Self. It is available at: www.ditastyle.com and: https://www.oxygenxml.com/dita/styleguide/c_DITA_Authoring_Concepts.html. You can find all

the details for every DITA element on OASIS website: <http://docs.oasis-open.org/dita/v1.2/os/spec/DITA1.2-spec.html>.

- **HTML5** - You will need a good knowledge of HTML5. You can find resources here: <https://developer.mozilla.org/en-US/docs/Web/Guide/HTML/HTML5>
- **Webinars** - Some helpful webinars are available on our website: https://www.oxygenxml.com/publishing_engine/videos.html?category=Webinars. They explain how to generate PDF from DITA documents using CSS, step-by-step.

Related Information:

[DITA-OT DAY 2017: Using CSS to Style PDF Output](#)

Supported Processors

The **DITA-OT CSS-based PDF Publishing Plugin** supports the following CSS processors:

- **Oxygen PDF Chemistry** - This is recommended processor because the built-in CSS files were fine-tuned for this processor. For example, [metadata extraction \(on page 1625\)](#) only functions with this processor. If the plugin is started from an **Oxygen XML Editor/Author** distribution, a Chemistry installation is not needed.
- **Prince XML** - A commercial product, available at: <https://www.princexml.com/>.
- **Antenna House** - A commercial product, available at: <https://www.antennahouse.com/formatter>.

Technical Details

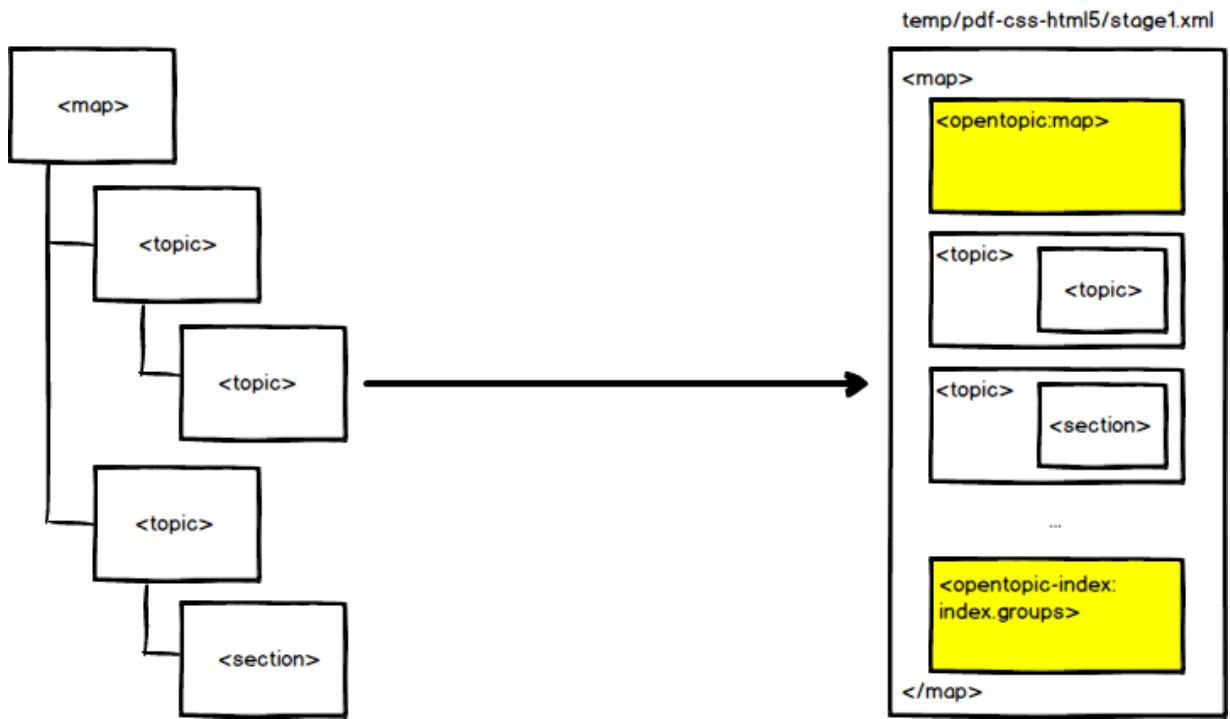

The **DITA-OT CSS-based PDF Publishing Plugin** comes bundled in the **Oxygen XML Editor/Author** distributions. The plugin ID is: **com.oxygenxml.pdf.css**. It is installed in the `[OXYGEN-INSTALL-DIR]frameworks/dita/DITA-OT/plugins/com.oxygenxml.pdf.css` folder.

It has the following transformation types:

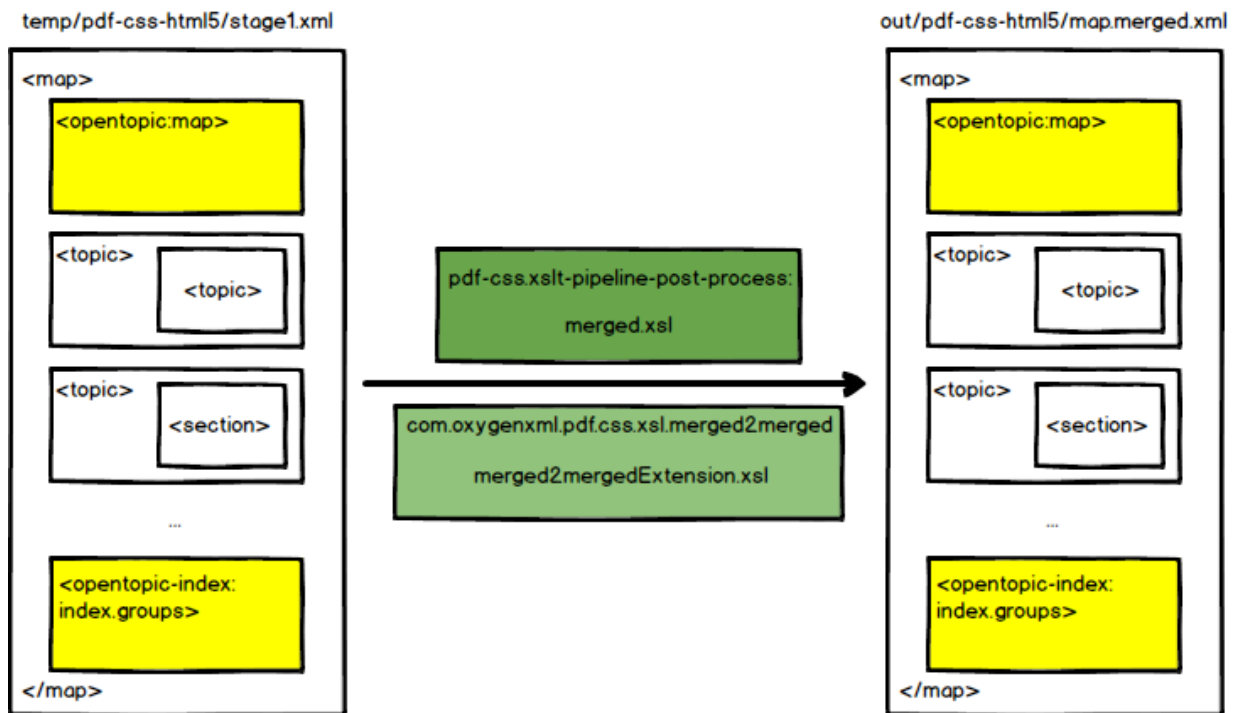

- **pdf-css-html5** (*DITA Map PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA map converted to HTML5).
- **pdf-css-html5-single-topic** (*DITA PDF - based on HTML5 & CSS transformation*) - CSS styling applied over a merged HTML5 document (the merged DITA topic converted to HTML5).

This is how it works:

1. It expands all the topic references into a temporary clone of the map, resolving keys and reused content. For the single topic transformation the result is a file with the keys and content resolved.
2. It generates a structure for the table of contents and index. The result is a merged map with all the references resolved. When transforming a single topic, the TOC and Index are not added to the merged file, this includes only the contents of the topic.

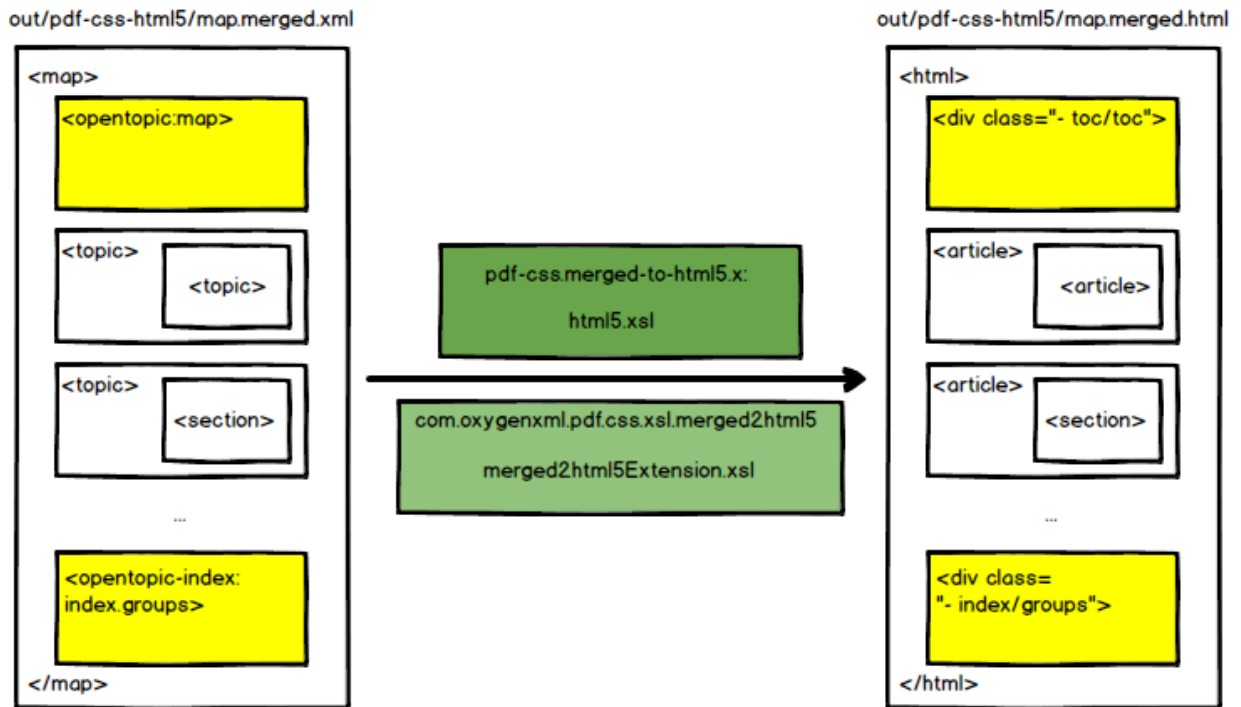

3. It post-processes the merged map. It fixes some of the structure in the TOC and index, moves the *frontmatter* and *backmatter* to the correct places, transforms any change tracking and review processing instructions to elements that can be styled later, etc. During this phase, the `com.oxygenxml.pdf.css.xsl.merged2merged` (on page 1757) extension points are also called. The result is another merged map.

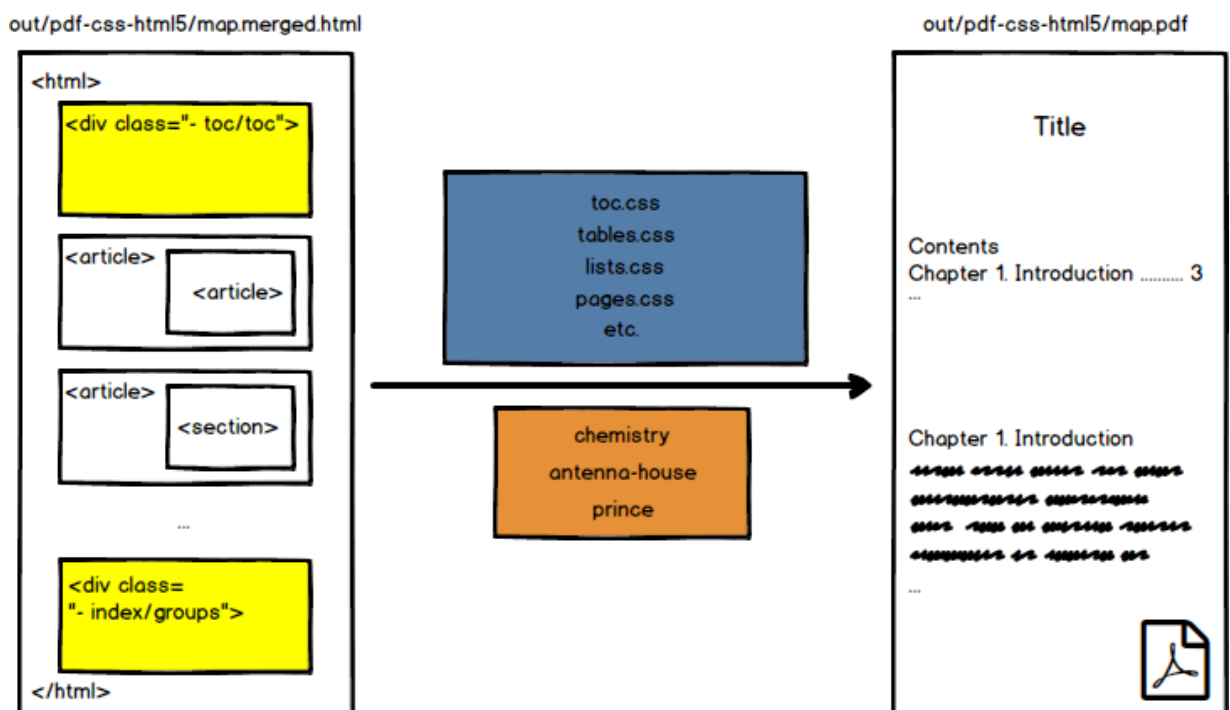

Note:

In the single topic transformation type (**DITA PDF - based on HTML5 & CSS**), these steps are simplified.

4. It converts the post-processed merged map or topic into a single HTML5 file. The generated HTML elements have the `@class` attribute from their original DITA elements. This means that you can either use selectors that were designed for DITA structure, or ones for the HTML structure. For more details, see [Reusing the Styling for WebHelp and PDF Output](#) (on page 1712). During this phase, the `com.oxygenxml.pdf.css.xsl.merged2html5` (on page 1757) extensions points are also called.

5. It uses a collection of CSS stylesheets against the merged HTML5 file and uses a PDF processor to generate the final PDF. References to the CSS files are collected from the [publishing template](#) (on page 1556).

Increasing Memory Allocation for Java

If you are working with a large project with extensive metadata or key references, you may need to increase the amount of memory that is allocated to the Java process that performs the publishing.

There can be two situations where an out of memory error can be triggered:

- From the DITA-OT basic processing (the preparation of the merged HTML document).
- From the Chemistry PDF CSS processor (the transformation of the merged HTML document to PDF).

When the Transformation is Started from Oxygen

To alter the memory allocation setting from the transformation scenario, follow these steps:

1. Open the **Configure Transformation Scenario(s)** dialog box.
2. Select your transformation scenario, then click **Edit**.
3. Go to the **Advanced** tab.
4. Uncheck the **Prefer using the "dita" command** option
5. Locate the **JVM Arguments** and increase the default value. For instance, to set 2 gigabytes as the maximum amount of memory, you can use: `-Xmx2g`. If you do not specify the **-Xmx** value in this field, by default, the application will use a maximum of 512 megabytes when used with a 32-bit Java Virtual Machine and one gigabyte with a 64-bit Java Virtual Machine.

**Note:**

This memory setting is used by both the DITA-OT process and the Chemistry CSS processor.

When the Transformation is Started from the Command Line

- **If the DITA-OT process fails with Out Of Memory Error:** you can change the value of the `ANT_OPTS` environment variable from a command line for a specific session.

Example: To increase the JVM memory allocation to 1024 MB for a specific session, issue the following command from a command prompt (depending on your operating system):

- **Windows**

```
set ANT_OPTS=%ANT_OPTS% -Xmx1024M
```

- **Linux/macOS**

```
export ANT_OPTS="$ANT_OPTS -Xmx1024M"
```

**Tip:**

To persistently change the memory allocation, change the value allocated to the `ANT_OPTS` environment variable on your system.

- **If the Chemistry PDF CSS processor fails with an Out Of Memory Error:** try adding the `baseJVMArgLine` parameter to the DITA-OT command line. For example:

```
-DbaseJVMArgLine=-Xmx2048m
```

Transformation Parameters

This list includes the most common customization parameters that are available in the **DITA Map PDF - based on HTML5 & CSS** transformation scenario. Other standard DITA-OT parameters were omitted for clarity, but they are supported.

Note:

These parameters must be prefixed by "-D" when used from a command line.

args.allow.external.coderefs	Enables the inclusion of code files that are located outside the DITA map folder hierarchy, referenced using the DITA <code><coderef></code> element. Allowed values are yes or no (default).
args.chapter.layout	Specifies whether chapter-level TOCs are generated for bookmaps. When set to MINITOC , a small section with links is added at the beginning of each chapter. The default is BASIC . For details, see: Table of Contents on a Page (Mini TOC) (on page 1660) . Allowed values: <ul style="list-style-type: none"> • BASIC - No chapter TOC is created. • MINITOC - A chapter-level TOC is generated. • MINITOC-BOTTOM-LINKS - A chapter-level TOC is generated, with the links under the chapter description.
args.css	You can use this to specify a list of CSS URLs to be used in addition to those specified in the <code>dita.css.list</code> parameter or publishing template. The files must have URL syntax and be separated using semicolons.
args.css.param.*	You can use this parameter pattern to set attributes on the root of the merged map. This means you can activate specific CSS rules from your custom CSS using custom attributes. For examples, see: Styling Through Custom Parameters (on page 1754) .
args.css.param.clone-referenced-footnotes	You can use this parameter to control the footnotes behavior:

	<ul style="list-style-type: none"> • When set to yes, footnotes that are referenced multiple times throughout a publication are cloned and placed at the bottom of the page for each occurrence. • When set to no (default value), only the first footnote reference is placed at the bottom of the page and subsequent references point back to the original footnote.
args.css.param.numbering	<p>You can use this parameter to change the numbering of the first-level topics (chapters) and nested topics. Allowed values:</p> <ul style="list-style-type: none"> • shallow - Only the topics from the first level are numbered (chapters). This is the default. • deep - All the topics from the map are numbered (nested topics up to level 3). • deep-chapter-scope - Similar to deep, but in addition, the page numbers, figures, and table numbers are reset at the start of each first-level topic (chapter). The table and figure titles (and the links to them) are prefixed with the chapter numbers. The generic cross reference links contain both the first-level topic (chapter) numbers and the page numbers to avoid ambiguity. This parameter value is only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario. • deep-chapter-scope-no-page-reset - Similar to <code>deep-chapter-scope</code>, but the page numbers do not reset at the start of each first-level topic (chapter). The generic cross reference links contain only the page number. This parameter value is only available for the DITA Map PDF - based on HTML5 & CSS transformation scenario. <p>For more details, see Numbering Types (on page 1646).</p>
args.css.param.numbering-sections	<p>Controls whether or not the sections are included in the table of contents. When set to yes (sections are included), they are numbered according to the numbering scheme set by the <code>args.css.param.numbering</code> parameter.</p>
args.css.param.show-onpage-lbl	<p>Controls whether or not the links will have an <code>on page NN</code> label after them. This parameter has different defaults, depending on the transformation type. For map transformations (<code>pdf-css-html5</code> trans type), the default is yes. For topic transformations (<code>pdf-css-html5-single-topic</code> trans type), the default is no.</p>

args.css.param.show-profiling-attributes	<p>Controls whether or not the profiling attributes are displayed in the output.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • yes • no (default)
args.css.param.title.layout	<p>Changes the structure of the title element. In the output, the title area consists of two parts: one is the number of the chapter (and optionally, the sections number), and one is the title text. This parameter allows a switch between normal text flow (in-line flow) and a table layout where the number is placed in one cell and the text in the other (to avoid wrapping text under the chapter number).</p> <ul style="list-style-type: none"> • normal • table (avoid wrapping text under counter)
args.draft	<p>Specifies whether or not the content of <code><draft-comment></code> and <code><required-cleanup></code> elements is included in the output.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • no (default) - No draft information is shown in the output. • yes - The draft information is shown in the output.
args.figurelink.style	<p>Specifies how cross references to figures are styled in output. Allowed values:</p> <ul style="list-style-type: none"> • NUMBER - Only the number of the figures are shown in links. • TITLE - Only the title of the figures are shown in links. • NUMTITLE (default) - Both the title and number of the figures are shown in links.
args.gen.task.lbl	<p>Specifies whether or not to generate headings for sections within task topics. Allowed values: YES or NO (default). When set to YES, headings such as "About this task", "Before you begin", "Procedure", or "What to do next", are shown in the task contents.</p>
args.hyph.dir	<p>Specifies the directory that contains custom hyphenation dictionaries. For more details see: Hyphenation (on page 1690).</p>
args.input	<p>Specifies the main DITA map file for your documentation project.</p>

args.keep.output.debug.files	Specifies whether or not the debug files generated during the transformation should be kept in the output folder. Allowed values: YES (default) or NO .
args.output.base	<p>Specifies the name of the output file without a file extension. By default, the name of the PDF file is derived from the name of the DITA map file. This parameter allows you to override it.</p> <p>A common use-cases is to use the ditamap title instead of the ditamap filename, the parameter value then become <code>\${xpath_eval(normalize-space(string-join(*[contains(@class, 'map/map')]/*[contains(@class, 'topic/title')]/text()))}</code>.</p> <div data-bbox="576 685 1437 949" style="border: 1px solid #0070c0; border-radius: 10px; padding: 10px; background-color: #e6f2ff;"> <p> Note:</p> <p>To replace spaces by a custom separator the query should call the <code>replace()</code> function: <code>\${xpath_eval(replace(normalize-space(string-join(*[contains(@class, 'map/map')]/*[contains(@class, 'topic/title')]/text()), '\s', '_'))}</code>.</p> </div>
args.rellinks.group.mode	Specifies the related links grouping mode. All links can be grouped into a single "Related Information" group or links grouped by their target type (topic, task, or concept). Allowed values: single-group (default) or group-by-type . For more details see: How to Group Related Links by Type (on page 1723) .
args.tablelink.style	<p>Specifies how cross references to tables are styled in output. Allowed values:</p> <ul style="list-style-type: none"> • NUMBER - Only the number of the tables are shown in links. • TITLE - Only the title of the tables are shown in links. • NUMTITLE (default) - Both the title and number of the tables are shown in links.
clean.temp	Specifies whether or not the DITA-OT deletes the files in the temporary directory after it finishes a build. Allowed values: yes (default) or no .
chemistry.security.policy	Specifies a Java policy file that applies to the Chemistry process. A template can be found here: plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry/config/chemistry.policy .
chemistry.security.workspace	Specifies a directory where the temporary files and font cache created by the Chemistry process need to be stored. This becomes required when the <code>chemistry.security.policy</code> is specified.
chemistry.security.resources.dir	Path to an additional folder that Chemistry will use to read its resources (CSS, images). The process already has read access to the input map

	folder, the publishing templates folder, and the OPE install folder. This optional parameter should only be used when the <code>chemistry.security-.policy</code> parameter is set.
<code>chemistry.security.resources-.host</code>	The host, specified as <code>name:port</code> , that Chemistry will use to get resources (e.g. CSS files, images, fonts). This optional parameter should only be used when the <code>chemistry.security.policy</code> parameter is set.
<code>css.processor.path.antenna-house</code>	Path to the Antenna House executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\AHFCmd.exe</code> on Windows).
<code>css.processor.path.chemistry</code>	Path to the Oxygen PDF Chemistry executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\chemistry.bat</code> on Windows). If this parameter is not set, the plugin will use the system's PATH environment variable to locate and start Oxygen PDF Chemistry .
<code>css.processor.path.prince</code>	Path to the Prince executable file that needs to be run to generate the PDF (for example, <code>C:\path\to\prince.exe</code> on Windows).
<code>css.processor.type</code>	Specifies the processor to use for the transformation. Allowed values: chemistry (default), antenna-house , or prince .
<code>default.language</code>	Specifies the default language for source documents. Examples: fr , de , zh , etc. Depending on the transformation type, the actual number of supported languages can vary, see: Localization (on page 1794) .
<code>drop.block.margins.at.page-.boundary</code>	Specifies that the top and bottom margins associated with a block element should be discarded when the block is at the top or bottom of the page. Allowed values: YES (default) or NO .
<code>editlink.ditamap.edit.url</code>	Use this parameter to add an <i>Edit</i> link next to the topic title in the Web-Help output. When a user clicks the link, the topic is opened in Oxygen XML Web Author or Content Fusion where they can make changes that can be saved to a file server. The value should be set as the edit URL of the <i>main DITA map</i> used for publishing your output. The easiest way to obtain the URL is to open the map in Web Author or Content Fusion and copy the URL from the browser's address bar.
<code>editlink.additional.query.parameters</code>	You can use this optional parameter to add additional parameters to be appended to each generated edit link. Each parameter must start with <code>&</code> (for example: <code>&tags-mode=no-tags</code>).
<code>editlink.remote.ditamap.url</code> (deprecated)	Use this parameter in conjunction with <code>editlink.web.author.url</code> to add an <i>Edit</i> link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the <i>main DITA map</i> . For example, a GitHub

	custom URL might look like this: https://getFileContent/oxygenxml/userguide/master/UserGuide.ditamap .
editlink.web.author.url (deprecated)	This parameter needs to be used in conjunction with <code>editlink.remote-.ditamap.url</code> to add an <i>Edit</i> link next to the topic title in the PDF output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: https://www.oxygenxml.com/oxygen-xml-web-author/ .
enable.chunk.processing	Enables the processing of the <code>@chunk</code> attribute. By default, this stage is skipped but it needs to be enabled, for example, if both the <code>@chunk</code> and <code>@copy-to</code> attributes are present on a <code><topicref></code> . Accepted values: true or false .
enable.latin.glyph.substitutions	When set to yes (default), glyph substitution is enabled (if the particular font supports it). This applies to Latin-based scripts only (the substitutions are always enabled in other types of scripts). If you encounter problems rendering or copying accented glyphs (e.g. <i>umlauts</i> or other <i>diacritics</i>), it might be helpful to set this parameter to no to disable the font glyph substitutions. Another example of a case when you might need to disable the substitutions is a situation where an accented character cannot be mapped to a compound glyph, resulting in the glyph not being rendered in the PDF output.
	<div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #E6F2FF;">  Warnings: <ul style="list-style-type: none"> • Disabling substitutions also disables Latin ligatures. • Disabling substitutions is not recommended unless absolutely necessary. It is better practice to use another font if you can find one that does not have the rendering issues. </div>
expand.xpath.in.svg.templates	Expands XPath expressions (whose format is <code>\${expression}</code>) contained in SVG templates. Allowed values: yes (default) or no .
figure.title.placement	Controls the title placement of the figures, relative to the image. Possible values include top (default) and bottom .
filter.unused.glossentries	When set to no (default), all glossary entries are displayed in the glossary. If set to yes , only referenced entries are displayed.
fix.external.refs.com.oxygenxml	The DITA Open Toolkit usually has problems processing references that point to locations outside of the processed DITA map directory. This pa-

	parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: true or false (default).
hide.frontpage.toc.index.glossary	When set to yes , the generated structures (table of contents, index list, front page, etc.) are removed from the output. The default is no .
image.resolution	You can use this parameter to set the default resolution used by images. It works mainly on <i>vector</i> images since <i>raster</i> images have their resolution defined in their metadata. The default is 96 (dpi). For more information, see how to change images resolution (on page 1724) .
pdf.accessibility	When set to yes , the PDF output is generated in compliance with the PDF/Universal Accessibility standard (also known as ISO 14289). The default is no .
pdf.archiving.mode	Specifies the archiving mode. The PDF output will be generated in compliance with the PDF/A standard. Allowed values (not set by default): <ul style="list-style-type: none"> • PDF/A-1a • PDF/A-1b • PDF/A-2a • PDF/A-2b • PDF/A-2u • PDF/A-3a • PDF/A-3b • PDF/A-3u
pdf.version	Use this parameter to specify the version of the produced PDF. It has no impact on the set of PDF features used by the engine, but may be used to signal a compatibility level to the PDF readers. The default is 1.5 .
pdf.security.restrict.printhq	Restricts high quality printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.assembledoc	Restricts assembling document (e.g. adding pages). Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.accesscontent	Restricts extracting text and graphics. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.fillinforms	Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .

pdf.security.restrict.annotations	Restricts filling in existing interactive forms. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.print	Restricts printing. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.copy	Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.restrict.edit	Restricts copying content. Used for protecting the PDF Document. The restriction is off by default. Accepted values: yes or no .
pdf.security.user.password	User password. The document can be opened using this password. When the owner password parameter is not specified, the user password gives full rights to the people using it. When the owner password parameter is specified, the people can open the document using the user password but restrictions will apply. Missing by default.
pdf.security.owner.password	Owner password. There are no restrictions for people using this password.
pdf.security.encrypt.metadata	Encrypts the metadata. By default active when other security parameters are set. Accepted values: yes or no .
show.changes.and.comments	When set to yes , the user comments, colored highlights and tracked changes are shown in the output.
show.changes.and.comments.as.changebars	When set to yes (default) and the <code>show.changes.and.comments</code> parameter is also set to yes , the user comments and tracked changes are shown as change bars in the PDF output. This parameter can be used in conjunction with the <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameter to choose whether the change bars are displayed in footnotes or sticky notes. You can override this from your customization CSS (on page 1567) .
show.changes.and.comments.as.pdf.sticky.notes	When set to yes (default) and the <code>show.changes.and.comments</code> parameter is also set to yes , the user comments and tracked changes are shown in the PDF output as sticky note annotations. When set to no , the comments and tracked changes are left in the document model and are styled by the default CSS rules as footnotes. You can override this from your customization CSS (on page 1567) .
show.changed.text.in.pdf.sticky.notes.content	When set to yes (default) and both the <code>show.changes.and.comments</code> and <code>show.changes.and.comments.as.pdf.sticky.notes</code> parameters are also set to yes , the inserted and deleted text is shown in the sticky note anno-

	tations. When set to no , only the <i>inserted</i> and <i>deleted</i> labels are shown in the annotations (this is useful for search scope).
show.image.map.area.numbers	When set to yes , a counter for each area from the image map is displayed over the image, near the defined shape. The default is no .
show.image.map.area.shapes	When set to yes , each of the image map area shapes is displayed with a translucent fill over the image. You can use this to debug your image maps. The default is no .
show.media.as.link	When set to yes , media objects will not appear and an external link is generated for each one instead.
sort.and.group.glossentries	When set to no (default), elements in the glossary are sorted based upon the document order. If set to yes , elements in the glossary are sorted alphabetically and grouped by their first letter.
store-type	Setting this parameter to memory will increase the processing speed and thus, could help decrease the publishing time.
table.title.placement	Controls the placement of the title for tables. Possible values include top (default) and bottom .
table.title.repeat	Specifies whether or not a table caption should repeat on other pages when the table spans onto multiple pages. The caption is not repeated for tables nested in lists or other tables. Allowed values are yes (default) or no .
use.css.for.embedded.svg	When set to yes (default), the CSS files specified in the publishing template or by the <code>args.css</code> parameter are also applied on embedded SVG elements. Allowed values are yes and no .
use.navtitles.in.all.links	Specifies whether a <code><navtitle></code> defined in a topic or a topic reference should be used as the display name for all links or only in the table of contents. Allowed values are yes and no (default).
parallel	Specifies whether or not certain pre-processing tasks should be run in parallel. Setting this parameter to true may add a small increase to the publishing speed. Allowed values are: true and false (default).

The following parameters can be used to specify a publishing template:

pdf.publishing.template	Specifies the path to the folder containing the custom PDF template.
pdf.publishing.template.descriptor	Specifies the name of the descriptor file to be loaded from the PDF template folder or package. If not specified, the first encountered descriptor file is loaded.

The following parameter is available on all DITA transformations when using the **Oxygen Publishing Engine**:

args.disable.security.checks	<p>Specifies whether or not to load external entities that are not solved through catalogs. For security reasons, the default is no.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • yes • no (default)
------------------------------	----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------

The following parameters are only available for the **DITA PDF - based on HTML5 & CSS** single DITA topic transformation scenario (`pdf-css-html5-single-topic` trans type):

args.root.map	<p>Specifies the path of the root map file used to expand the key references in the published topic.</p>
args.enable.root.map.key.processing	<p>Indicates whether or not the keys should be processed using the root map parameter.</p> <p>Allowed values:</p> <ul style="list-style-type: none"> • auto (default) • yes • no

Console Logging

To activate the logging of the last processing stage, involving the usage of the Chemistry processor to generate the PDF from the merged HTML, use the `--verbose` (or `-v`) DITA-OT parameter from the command line.

Note:

When the transformation is started from an **Oxygen** application, this parameter is automatically set.

License Key

When running the **Oxygen PDF Chemistry** engine or the **Oxygen Publishing Engine** from inside a started **Oxygen XML Editor/Author** installation, an extra license key is not required. The sections below pertain to running the publishing from the command line.

Chemistry License

If you have an **Oxygen PDF Chemistry** license key, you will be able to generate PDF output that is not stamped with the **Chemistry** logo image from the command line.

To install your **Chemistry** license key:

- If you are using the version of **Chemistry** that comes bundled in **Oxygen XML Editor/Author**, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/lib/oxygen-pdf-chemistry` folder.
- If you are using another **Chemistry** installation, make sure you place the `licensekey.txt` file in that folder.

Oxygen Publishing Engine License

If you have purchased a license for the **Oxygen Publishing Engine**, you will be able to produce both PDF and WebHelp output without any restrictions from the command line.

To install your **Oxygen Publishing Engine** license key, save the license key text in a file with the name `licensekey.txt` and place it in the `DITA-OT-DIR` folder.

Generating PDF Output

The publishing process can be initiated from a transformation scenario within **Oxygen XML Editor/Author**, from a command line outside **Oxygen XML Editor/Author**, or from an integration server.

Generating PDF from a Command Line

To publish the PDF output from a command line outside of **Oxygen XML Editor/Author**, you can use the `dita` startup script that comes bundled with the *DITA Open Toolkit* distribution.

The command line supports all [the parameters specific to the PDF transformation \(on page 1543\)](#). Here is an example of how to write the commands:

- **Windows:**

```
dita.bat -f pdf-css-html5 -i C:\path\to\map.ditamap -o C:\path\to\output\folder -v
```

- **Linux/macOS:**

```
dita -f pdf-css-html5 -i /path/to/map.ditamap -o /path/to/output/folder -v
```

**Note:**

You can use the long form of the command-line options (e.g. `--format` or `--input`).

Generating PDF from an Integration Server

PDF output can be automatically generated from a Continuous Integration/Continuous Delivery system, such as *Jenkins*.

To integrate PDF output with the Jenkins CI tool, follow these steps:

1. Create a Maven project to incorporate **Oxygen Publishing Engine**.
2. Go to the root of your Maven project and edit the `pom.xml` file to include the following fragment:

```

<project xmlns="http://maven.apache.org/POM/4.0.0"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://maven.apache.org/POM/4.0.0
    http://maven.apache.org/xsd/maven-4.0.0.xsd">
  <modelVersion>4.0.0</modelVersion>

  <groupId>com.oxygenxml</groupId>
  <artifactId>oxygen-oxygen-pdf-css-generator</artifactId>
  <version>1.0</version>

  <properties>
    <!-- The path to Oxygen Publishing Engine -->
    <dita-ot-dir>/path/to/oxygen-publishing-engine</dita-ot-dir>
    <!-- The path to the DITA map that you want to process. -->
    <input-file>/path/to/map.ditamap</input-file>
    <!-- The path of the output directory. -->
    <output-dir>/path/to/output/folder</output-dir>
    <!-- The path to the PDF publishing template folder (containing the .opt file). -->
    <publishing-template>/path/to/template/folder</publishing-template>
  </properties>

  <build>
    <plugins>
      <plugin>
        <groupId>org.codehaus.mojo</groupId>
        <artifactId>exec-maven-plugin</artifactId>
        <version>1.6.0</version>
        <executions>
          <execution>
            <id>generate-pdf-css</id>
            <phase>generate-sources</phase>
            <goals>
              <goal>exec</goal>
            </goals>
            <configuration>
              <executable>${dita-ot-dir}/bin/dita</executable>
              <arguments>
                <argument>--format=pdf-css-html5</argument>
                <argument>--input=${input-file}</argument>
                <argument>--output=${output-dir}</argument>
                <argument>-Dpdf.publishing.template=${publishing-template}</argument>
                <argument>-v</argument>
              </arguments>
            </configuration>
          </execution>
        </executions>
      </plugin>
    </plugins>
  </build>
</project>

```

```

        </arguments>
    </configuration>
</execution>
</executions>
</plugin>
</plugins>
</build>
</project>

```

3. Go to the Jenkins top page and create a new Jenkins job. Configure this job to suit your particular requirements, such as the build frequency and location of the Maven project.

Publishing Templates

An *Oxygen Publishing Template* defines all aspects of the layout and styles for output obtained from the following transformation scenarios:

- **WebHelp Responsive**
- **DITA Map PDF - based on HTML5 & CSS**

It is a self-contained customization package stored as a ZIP archive or folder that can easily be shared with others. It provides the primary method for customizing the output.

Tip:

You can start creating publishing templates by using the **Oxygen Styles Basket**. <https://styles.oxygenxml.com>

Some possible customization methods include:

- Add additional template resources to customize the output (such as logos, *Favicons*, or CSS files).
- Extend the default processing by specifying one or more XSLT extension points.
- Specify one or more transformation parameters to customize the output.
- Customize various aspects of the output through simple CSS styling.
- For **WebHelp Responsive** output, change the layout of the main page or topic pages by customizing which components will be displayed and where they will be positioned in the page.

The following graphics are possible sample structures for *Oxygen Publishing Template* packages:

Figure 452. Oxygen Publishing Template Package (WebHelp Responsive)

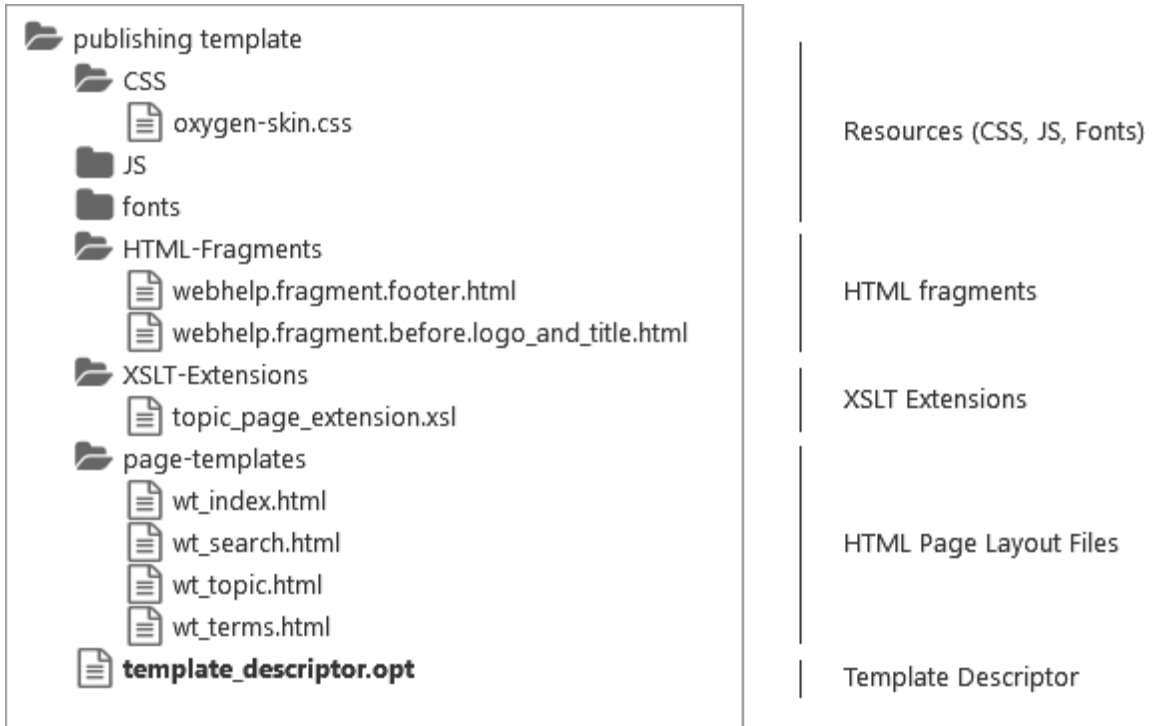

Figure 453. Oxygen Publishing Template Package (PDF)

For information about creating and customizing publishing templates, and how to adjust the WebHelp and PDF output through CSS styling and other customization methods, watch our Webinar: [Creating Custom Publishing Templates for WebHelp and PDF Output](#). The Webinar slides and sample project are also available from that webpage.

- [How to Share a Publishing Template \(on page 1567\)](#)

Publishing Template Package Contents for PDF Customizations

An *Oxygen Publishing Template* for PDF output must contain a template descriptor file and at least one CSS file, and may contain other resources (such as graphics, XSLT files, etc.). All the template resources can be

stored in either a ZIP archive or in a folder. It is recommended to use a ZIP archive because it is easier to share with others.

Template Descriptor File

Each publishing template includes a descriptor file that defines the meta-data associated with template. It is an XML file with certain elements that defines all the resources included in a template (such as CSS files, images, and transformation parameters).

The template descriptor file must have the `.opt` file extension and must be located in the templates' root folder.

A PDF template descriptor might look like this:

```
<publishing-template>
  <name>Flowers</name>

  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png" />

    <resources>
      <css file="flowers.css" />
    </resources>

    <parameters>
      <parameter name="figure.title.placement" value="top" />
    </parameters>
  </pdf>
</publishing-template>
```

Tip:

It is recommended to edit the template descriptor in **Oxygen XML Editor/Author** because it provides content completion and validation support.

Template Name and Description

Each template descriptor file requires a `<name>` element. This information is displayed as the name of the template in the transformation scenario dialog box.

Optionally, you can include a `<description>` and it displayed when the user hovers over the template in the transformation scenario dialog box.

```

<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light colored template</description>
  ...

```

Template Author

Optionally, you can include author information in the descriptor file and it displayed when the user hovers over the template in the transformation scenario dialog box. This information might be useful if users run into an issue or have questions about a certain template.

If you include the `<author>` element, a `<name>` is required and optionally you can include `<email>`, `<organization>`, and `<organizationUrl>`.

```

<publishing-template>
  ...
  <author>
    <name>John Doe</name>
    <email>jdoe@example.com</email>
    <organization>ACME</organization>
    <organizationUrl>http://www.example.com/jdoe</organizationUrl>
  </author>
  ...

```

PDF Element

The `<pdf>` element contains various details about the template and its resources that define the PDF output. It is a required element if you intend on using a DITA Map to PDF transformation scenario. The elements that are allowed in this `<pdf>` section specify the [template tags \(on page 1559\)](#), [template preview image \(on page 1559\)](#), [resources \(on page 1559\)](#) (such as CSS files), [transformation parameters \(on page 1560\)](#), or [XSLT extensions \(on page 1561\)](#).

```

<pdf>
  <tags>
    ...
  </tags>
  <preview-image file="MyPreview.png"/>

  <resources>
    ...
  </resources>

  <parameters>
    ...

```

```

</parameters>

</pdf>

```

Template Tags

The `<tags>` section provides meta information about the template (such as color theme). Each *tag* is displayed at the top of the **Templates** tab window in the transformation scenario dialog box and they help the user filter and find particular templates.

```

<publishing-template>
  ...
  <pdf>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>

```

Template Preview Image

The `<preview-image>` element is used to specify an image that will be displayed in the transformation scenario dialog box. It provides a visual representation of the template to help the user select the right template. The image dimensions should be 200 x 115 pixels and the supported image formats are: JPEG, PNG, or GIF.

You can also include an `<online-preview-url>` element to specify the URL of a published sample of your template. This will display an  **Online preview** icon in the bottom-right corner of the image in the transformation scenario dialog box and if the user clicks that icon, it will open the specified URL in their default browser.

```

<publishing-template>
  ...
  <pdf>
    ...
    <preview-image file="ashes/ashes-tree.png" />
    <online-preview-url=https://www.example.com/samples/tiles/ashes</online-preview-url>

```

Template Resources

The `<resources>` section of the descriptor file specifies a set of resources (CSS files) that are used to customize various components in the generated output. These resources will be copied to the output folder during the transformation process. At least one CSS file must be included (using the `<css>` element).

```

<publishing-template>
  ...
  <pdf>
    ...
    <resources>

```

```

<css file="css/custom_styles.css"/>
<css file="css/custom_fonts.css"/>
</resources>

```

**Note:**

All relative paths specified in the descriptor file are relative to the template root folder.

Transformation Parameters

You can also set one or more transformation parameters in the descriptor file.

```

<publishing-template>
...
<pdf>
...
<parameters>
  <parameter name="show.changes.and.comments" value="yes"/>
</parameters>
</pdf>

```

The following information can be specified in the `<parameters>` element:

Parameter name

The name of the parameter. It may be one of the transformation parameters listed in the **Parameters** tab of the **DITA Map PDF - based on HTML5 & CSS** transformation scenario or a DITA-OT PDF-based output parameter.

**Note:**

It is not recommended to specify an input/output parameter in the descriptor file (such as the input Map, DITAVAL file, or temporary directory).

**Attention:**

JVM arguments like `-Xmx` cannot be specified as a transformation parameter.

Parameter Value

The value of the parameter. It should be a relative path to the template root folder for file paths parameters.

Parameter Type

The type of the parameter: `string` or `filepath`. The `string` value is default.

After creating a publishing template (on page 1562) and adding it to the templates gallery (on page 1566), when you select the template in the transformation scenario dialog box, the **Parameters** tab will automatically be updated to include the parameters defined in the descriptor file. These parameters are displayed in italics.

XSLT Extension Points

The publishing templates support one or more XSLT extension points. They can be specified using the `<xslt>` element in the descriptor file using the following structure:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl" />
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2merged"
    file="xslt/merged2mergedExtension.xsl" />
</xslt>
```

For more information about the available extension points, see: [XSLT Extensions for PDF Transformations \(on page 1757\)](#).

Combining PDF and WebHelp Responsive Customizations in a Template Package

An *Oxygen Publishing Template* package can contain both a PDF and WebHelp Responsive customization in the same template package and you can use that same template in both types of transformations. The template descriptor file can define the customization for both types by including both a `<webhelp>` and `<pdf>` element and some of the resources can be reused. Resources referenced in elements in the `<webhelp>` element will only be used for WebHelp transformations, and resources referenced in the elements in the `<pdf>` element will only be used in PDF transformations.

```
<publishing-template>
  <name>Flowers</name>
  <description>Flowers themed light-colored template</description>

  <webhelp>
    <tags>
      <tag>purple</tag>
      <tag>light</tag>
    </tags>
    <preview-image file="flowers-preview.png" />
```

```

<resources>
  <css file="flowers-wh.css"/>
  <css file="flowers-page-styling.css"/>
</resources>
<parameters>
  <parameter name="webhelp.show.main.page.tiles" value="no"/>
  <parameter name="webhelp.show.main.page.toc" value="yes"/>
</parameters>
</webhelp>
<pdf>
  <tags>
    <tag>purple</tag>
    <tag>light</tag>
  </tags>
  <preview-image file="flowers-preview.png"/>
  <resources>
    <css file="flowers-pdf.css"/>
    <css file="flowers-page-styling.css"/>
  </resources>
  <parameters>
    <parameter name="show.changes.and.comments" value="yes"/>"/>
  </parameters>
</pdf>
</publishing-template>

```

How to Create a Publishing Template

To create a customization, you can start from scratch or from an existing template, and then adapt it according to your needs.

Creating a Publishing Template Starting from Scratch

To create a new *Oxygen Publishing Template (on page 2680)*, follow these steps:

1. Create a folder that will contain all the template files.
2. In **Oxygen XML Editor/Author**, open the new document wizard (use **File > New** or the  **New** toolbar button), then choose the **Publishing Template Descriptor** template.

Figure 454. Choosing the Publishing Template Descriptor Document Template

3. Save the `.opt` file into your customization directory.
4. Open the `.opt` file in the editor and customize it to suit your needs.

Creating a Publishing Template Starting from an Existing Template

If you are using a **DITA Map WebHelp Responsive** or **DITA Map PDF - based on HTML5 & CSS** transformation, the easiest way to create a new *Oxygen Publishing Template (on page 2680)* is to select an existing template in the transformation scenario dialog box and use the **Save template as** button to save that template into a new template package that can be used as a starting point.

To create a new *Oxygen Publishing Template*, follow these steps:

1. Open the transformation scenario dialog box and select the publishing template you want to export and use as a starting point.
2. **Optional:** You can set one or more transformation parameters from the **Parameters** tab and the edited parameters will be exported along with the selected template. You will see which parameters will be exported in the dialog box that is displayed after the next step.
3. Click the **Save template as** button.

Step Result: This opens a template package configuration dialog box that contains some options and displays the parameters that will be exported to your template package.

4. Specify a name for the new template.
5. **Optional:** Specify a template description.
6. **Optional:** The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** or **DITA Map to PDF - based on HTML5 & CSS**). You can use the **Include WebHelp customization** and **Include PDF customization** options to specify whether your custom template will include both types of customizations.
7. **Optional:** For **WebHelp Responsive** customizations, you can select the **Include HTML Page Layout Files** option if you want to copy the default *HTML Page Layout Files (on page 1375)* in your template package. They are helpful if you want to change the structure of the generated HTML pages.
8. In the **Save as** field, specify the name and path of the ZIP file where the template will be saved.

Step Result: A new ZIP archive will be created on disk in the specified location with the specified name.

9. Open the `.opt` file in the editor and customize it to suit your needs.

For more information about creating and customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWwO8>

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an *Oxygen Publishing Template (on page 2680)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map WebHelp Responsive** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either WebHelp or PDF output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

Figure 455. Oxygen Styles Basket Interface

Resources

For more information about the **Oxygen Styles Basket**, see the following resources:

- [Video: Introducing the New Oxygen Styles Basket](#)
- [Webinar: Using Oxygen Styles Basket to Create CSS Customization from Scratch](#)

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

How to Edit a Packed Publishing Template

To edit an existing *Oxygen Publishing Template (on page 2680)* package, follow these steps:

1. Unzip the ZIP archive associated with the *Oxygen Publishing Template* in a separate folder.
2. Link the folder associated with the template in the **Project Explorer** view.
3. Using the **Project Explorer** view, you can modify the resources (CSS, JS, fonts) within the *Oxygen Publishing Template* folder to fit your needs.
4. Open the publishing template descriptor file (.opt extension) in the editor and modify it to suit your needs.
5. **Optional:** Once you finish your customization, you can archive the folder as a ZIP file.

How to Use a Publishing Template in a PDF Transformation

From Oxygen XML Editor/Author

A publishing template can be used for PDF output from the **DITA Map PDF - based on HTML5 & CSS** transformation scenario (or from the **DITA PDF - based on HTML5 & CSS** transformation scenario).

The **Templates** tab in the transformation scenario dialog box displays all the templates that are available in your template gallery. To use a particular template in the transformation scenario, simply select it from this tab and then continue configuring the transformation using the other tabs to suit your needs.

To add the publishing template to your templates gallery, follow these steps:

1. Open the transformation scenario dialog box by editing a **DITA Map PDF - based on HTML5 & CSS** transformation (or a **DITA PDF - based on HTML5 & CSS** transformation scenario).
2. In the **Templates** tab, click the **Configure Publishing Templates Gallery** link to.

Step Result: This will open the preferences page.

3. Click the **Add** button and specify the location of your template directory.

Step Result: Your template directory is now added to the **Additional Publishing Templates Galleries** list.

4. Click **OK** to return to the transformation scenario dialog box.

Result: All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

From a Command Line

You can use the `pdf.publishing.template` parameter to point to the `*.opt` (publishing template) file:

```
dita.bat
--input=map\test.ditamap"
"-Dpdf.publishing.template=full_path_to_template_dir/my_template.opt"
--format=pdf-css-html5
...
```

Or use the two parameters to indicate the folder containing the publishing templates and the name of the publishing template file relative to that folder:

```
dita.bat
--input=map\test.ditamap"
```

```
"-Dpdf.publishing.template=full_path_to_template_dir"
"-Dpdf.publishing.template.descriptor=my_template.opt"
--format=pdf-css-html5
...
```

**Tip:**

You can also start the `dita` process by passing it a [DITA OT Project File](#). Inside the project file you can specify as parameters for the `webhelp-responsive` transformation type the WebHelp-related parameters.

Related Information:

[Transformation Parameters \(on page 1543\)](#)

How to Share a Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder in your project.
2. Go to **Options > Preferences > DITA > Publishing** and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (`.xpr`).

Customizing PDF Output Using CSS

The publishing process is driven by a *customization CSS*.

**Warning:**

You should not edit the CSS stylesheet from `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print`. Instead, create your own customization.

To change the styling of the output for the **DITA Map PDF - based on HTML5 & CSS** or the **DITA PDF - based on HTML5 & CSS** transformation scenarios you can either create your own custom CSS rules or create a publishing template using the **Oxygen Styles Basket**.

Create Custom CSS Rules from Scratch

1. Create a CSS file that will contain all of your customizations. It is recommended to create this file in your project directory so you can edit it easily.

**Tip:**

If you use the default Chemistry processor in **Oxygen XML Editor/Author**, you can use LESS instead of CSS. In this case, the customization files should have the `.less` extension.

2. Add your custom CSS rules. As a good starting point, you can check the various topics in this section for assistance with specific types of customizations.
3. Link the CSS file. For this, you have two options:
 - Create a publishing template, create the customization CSS file inside the template folder, and link it to the publishing template descriptor. For assistance, see [Publishing Templates \(on page 1356\)](#).
 - Choose an existing publishing template, then edit the scenario and set the full path to the custom CSS file as the value of the `args.css` parameter. The rules from custom CSS will override the rules from the template CSS files.
4. Run the transformation scenario.

Creating a Publishing Template Using the Oxygen Styles Basket

Another way to create an *Oxygen Publishing Template (on page 2680)* is to use the **Oxygen Styles Basket**. This tool is a handy free-to-use web-based visual tool that helps you create your own *Publishing Template Package* to customize your **DITA Map PDF - based on HTML5 & CSS** transformation scenarios.

It is based on galleries that you can visit to pick styling aspects to create a custom look and feel. Various different types of styles can be selected (such as fonts, tables, lists, spacing, code) and all changes can be seen in the **Preview** pane. You can also click the **See Results** button to generate a preview of either PDF or WebHelp output.

It is possible to **Download** the current template or **Upload** a previously generated template for further customization.

Figure 456. Oxygen Styles Basket Interface

Debugging the CSS

If you notice that some of the CSS properties were not applied as expected, some of the tips offered in this topic might help you with the debugging process.

**CAUTION:**

Do not modify the built-in rules directly in the CSS files from the **Oxygen XML Editor/Author** installation. Instead, copy the rules to your own customization CSS.

Inspecting the Merged Map File

During the transformation stages, two merged map files are created. These files could be used to help debug unexpected results.

1. The first thing you should try is to check the file structure of the **HTML merged map file**. This file can be found in the `out/pdf-css` directory and it has the `.merged.html` file extension (you will also find a `.merged.xml` file that aggregates the entire DITA map structure). You can open the HTML files in **Oxygen XML Editor/Author** to examine the structure. Optionally, you can use the pretty print feature (**Format and Indent**) to make the structure easier to read.
2. If the structure is as expected, you can start checking that the CSS selectors are written correctly against the document structure.
3. If the CSS selectors are correctly written, you can start inspecting how the styles are applied (you can try any of the methods listed below).

Inspecting the Applied Styles Using a Browser

The following procedure explains how to inspect the applied CSS styles using Chrome, but any modern browser can be used and the procedure for each of them is similar:

1. Open the file ending in `.merged.html`.
2. Open the **Chrome Developer Tools** by using  > **More Tools > Developer Tools** (or press **CTRL+SHIFT+I**).
3. Activate the **Rendering** pane by using  > **More Tools > Rendering** then select **print** from the **Emulate CSS media** section. This will activate the CSS selectors enclosed in `@media print {..}`:

**Note:**

This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

4. Right-click on the element you want to inspect and select the **Inspect** action, you will see the element (in the **Elements** pane) and the list of styles that are applied on it (in the **Styles** pane):

The screenshot displays the Oxygen XML Editor interface. The top toolbar includes icons for navigation and a warning icon. The main area shows the DOM Explorer with a tree view of XML elements. The selected element is a table with attributes like `class`, `frame`, `id`, and `data-cols`. Below the DOM Explorer is the Styles pane, which shows a list of styles applied to the selected element, including `element.style`, `Layer <anonymous>`, `*[class~="topic/table"]:has(*[class~="topic/title"])`, `*[class~="topic/table"], *[class~="topic/simpletable"]`, and `.frame-none`. The right side of the interface shows a visual representation of the table's box model, with a central blue box labeled "560x207.500" surrounded by a green padding box, an orange border box, and a yellow margin box. Arrows point from the text "Current inspected element" to the selected table element in the DOM Explorer and from the text "Styles applied on selected element" to the styles list in the Styles pane.

**Tip:**

Clicking any of the stylesheet links from the **Styles** pane opens the original CSS files in the **Sources** pane. Editing the rules in that pane results in a live preview of how the change will affect the output (these modifications will be lost on reload).

Inspecting the Applied Styles Using Oxygen XML Editor/Author

To inspect the applied CSS styles using **Oxygen**:

1. In **Oxygen XML Editor/Author**, open the file ending in `.merged.html`.
2. From the **Styles** toolbar, choose the **+ Print Ready** entry. This will activate certain CSS selectors enclosed in `@media print {..}`.

**Note:**

This allows you to debug the styling of elements, the table of contents, and the index, but not the styles of the page margin boxes (headers, footers) or page breaks.

- Right-click on the element you want to inspect and select the **Inspect Styles** action. The dedicated **CSS Inspector** view will be opened and it will show the applied CSS rules.

**Tip:**

With this file open in **Author** mode, it might be helpful to switch the **Tags Display Mode** to **Full Tags with Attributes**. You might be able to identify the selector you need to style without using the **CSS Inspector** view.

Other Debugging Techniques

Here are some other debugging techniques you may find useful:

- Add background and border properties to the specific CSS rule. If they do not appear in the output, then there is a problem with the rule selector.
- Add the `!important` keyword to a property that is not applied, or make the selector more specific (by adding more parent selectors).
- Add the following fragment in your customization CSS to show how the elements are mapped to PDF:

```
* {
  border: 1pt solid blue !important;
}

*:before(1000) {
  content: oxy_name() !important;
  color: orange;
}

*:before(900) {
  content: "[ class= '" attr(class) "'" ] " !important;
  color: orange;
}
```

This will show the element name, its class attribute, and will paint a blue border around each of the elements in the output. It will not show the page margin boxes or some content elements that are hidden.

How to Speed up CSS Development and Debugging

You may have already run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario before using this procedure.

You can speed up your CSS development considerably by not invoking the entire pipeline of transforming your DITA maps to PDF. Instead, you can directly transform the [merged map \(on page 1569\)](#) (`.merged.html`) into PDF using **Oxygen PDF Chemistry**.

1. Open the `.merged.html` located in the output directory in the editor.
2. Configure a new **XML to PDF transformation with CSS** scenario. There is no need to set the CSS URL in the resulting dialog box. The stylesheets are already declared in the file `<head>`. This scenario uses the Chemistry CSS processor.
3. **Optional:** Enable the console output of the CSS processor from: **Options > Preferences > XML > PDF Output > CSS-based Processors**.

Now you can make incremental changes to the CSS stylesheet and quickly see the results by transforming the merged file directly.

Fastpath:

If your changes only involve element styling (with no specific paged media CSS rules and properties), you can simply open the merged file in a browser (such as Chrome or Firefox) and refresh at each CSS change, as shown in: [Debugging the CSS \(on page 1569\)](#).

How to Use XPath Expressions in CSS

How to Write XPath Expressions

To use XPath expressions in CSS, you need to use the `oxy_xpath()` function. These XPath expressions are used to extract the content from the HTML merged DITA map document.

The following example shows how to display the product name meta-information before the front page title:

```
*[class~="front-page/front-page-title"]:before {
    text-align: left;
    content: oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()[1]");
    display: block;
}
```

Important:

Do not use the DITA element names directly. You must use the DITA `@class` attribute instead, as these attributes are propagated to the HTML elements while the element names can be lost. By using the class selectors, you also cover DITA specializations.

Tip:

Use the "[1]" XPath predicate to select the first value from the document. Do not forget the parenthesis between the node to be selected.

For example: `oxy_xpath("//*[contains(@class, 'topic/prodname')]/text()[1]")`.

Note that the meta-information might be copied multiple times in the output, inherited by the `<topicref>` elements, so you might get more values than expected.

**Other Notes:**

- You can call the `oxy_xpath()` function in `string-set` property.
- You can use content extracted using the `oxy_xpath()` function in both pseudo-elements and `@page` at-rules.
- Do not use strings as values for pseudo-elements content because they are not supported in them.

How to Debug XPath Expressions

Suppose that you need to display the publication author in the bottom-left part of the cover page.

The ditamap content is the following:

```
<map>
  <title>The Art of Bike Repair</title>
  <topicmeta>
    <author>John Doe</author>
  </topicmeta>
  ...
</map>
```

To debug an XPath expression:

1. Read the [XPath Expressions Guidelines \(on page 1573\)](#).
2. Launch the transformation of the DITA map using your customization CSS.
3. Open the `[MAP_NAME].merged.html` file (from the output folder) in **Oxygen XML Editor/Author**. You will find this inside the HTML:

```
<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">John Doe</div>
  </div>
  <div class="- front-page/front-page-title front-page-title">
    <div class="- topic/title title">The Art of Bike Repair</div>
  </div>
</div>
```

4. Activate the **XPath Builder view (Window > Show View > XPath/XQuery Builder)**.
5. Paste your XPath expression (for example: `//*[contains(@class, "front-page/front-page")]/*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()`) and click the  **Execute XPath** button. Check if it returns the expected results.
6. Copy the expression in your customization CSS and define the rules that will use it. For example:

```

:root {
  string-set: author oxy_xpath('//*[contains(@class, "front-page/front-page")]\
  /*[contains(@class, "map/topicmeta")]/*[contains(@class, "topic/author")]/text()');
}

@page front-page {
  @bottom-left {
    content: "Created by " string(author);
  }
}

```

**Note:**

The "\" character used in the expression allows the multi-line display without breaking the query.

7. Run the transformation again to obtain the desired output.

**Note:**

The XPath builder has a function that allows it to display the document path of the current element from the editor ( **Settings drop-down menu** >  **Update on cursor move**). Alternatively, you can right-click the element in the merged document and select the **Copy XPath** action, then paste it in the XPath builder.

[XPath Builder Documentation](#)

[XPath Examples \(w3schools.com\)](#)

Default Page Definitions

All page definitions are found in: `[PLUGIN_DIR]css/print/p-pages-and-headers.css`.

**Note:**

This is listed solely for illustration purposes, as the plugin might use something different.

There are page definitions for the default page, chapter page, table of contents page, front matter page, back matter page, index page, large tables page, and blank page.

Default Page

The default page imposes a header that contains the publication title, chapter, and section title. They alternate on the left or right side of the page:

```

@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
  }
  counter(page);
}

@page :right{
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
  }
  counter(page);
}

```

**Tip:**

To override the default rules defined for named pages (such as chapter or table of contents), you need to use more specific page rules that contain the page name:

```

@page :left, table-of-contents:left, chapter:left {
  @top-left {
    content: "...";
  }
}

@page :right, table-of-contents:right, chapter:right{
  @top-right {
    content: "...";
  }
}

```

Chapter Page

This is inherited from the default page. The chapter page is associated with the topics marked as chapters, usually direct children of the map. It clears the header from the first page of each chapter. If you need to add other information to the chapter headers, make sure you override these rules in your CSS:

```

@page chapter{
  /* Currently inherit from the default page. */
}

/* No headers on the chapter first page. */
@page chapter:first:left{
  @top-left {

```

```

    content: none;
}
}
@page chapter:first:right{
  @top-right {
    content: none;
  }
}

```

Table of Contents Page

The table of content page. It clears the headers and uses a lower roman page number in the header.

```

@page table-of-contents {
  @top-left      { content: none; }
  @top-center    { content: none; }
  @top-right     { content: none; }
  @bottom-left   { content: none; }
  @bottom-center { content: none; }
  @bottom-right  { content: none; }
}

@page table-of-contents:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

@page table-of-contents:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}

/* Do not put a header on the first page of the TOC */
@page table-of-contents:first:left {
  @top-left {
    content: none;
  }
}

@page table-of-contents:first:right {
  @top-right {
    content: none;
  }
}

```

Front Matter and Back Matter Page

The bookmap front matter and back matter page. It clears the headers.

```
@page matter-page {
  @top-left-corner    {      content:none }
  @top-center         {      content:none }
  @top-right-corner   {      content:none }
  @bottom-left-corner {      content:none }
  @bottom-left        {      content:none }
  @bottom-center      {      content:none }
  @bottom-right       {      content:none }
  @bottom-right-corner{      content:none }
}

@page matter-page:left {
  @top-left           {      content: counter(page, lower-roman); }
}

@page matter-page:right {
  @top-right          {      content: counter(page, lower-roman); }
}
```

Index Page

The page that contains the index terms (appears only if there are such items in your topics). It uses a lower alpha page number in the footer:

```
@page index {
  @top-left-corner    {      content:none }
  @top-left           {      content:none }
  @top-right          {      content:none }
  @top-right-corner   {      content:none }
  @top-center         {      content:none }
  @bottom-left-corner {      content:none }
  @bottom-left        {      content:none }
  @bottom-right       {      content:none }
  @bottom-right-corner{      content:none }
  @bottom-center      {
    content: counter(page, lower-alpha);
    font-size: 11pt;
  }
}

@media oxygen-chemistry {
```

```

@page index {
    column-count: 2;
    column-fill: auto;
}
}

```

When transformed, the page layout is spread on two columns.

Large Tables Page

The big tables are placed on a rotated page, with orientation landscape:

```

@page landscape-page:right {
    size: landscape;

    @top-left {
        content: none;
    }
    @top-center {
        content: none;
    }
    @top-right {
        content: none;
    }

    @right-bottom {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
        transform: rotate(90deg);
        vertical-align: middle;
        text-align: right;
    }
}

@page landscape-page:left {
    size: landscape;

    @top-left {
        content: none;
    }
    @top-center {
        content: none;
    }
    @top-right {

```

```

    content: none
}

@right-top {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
    transform: rotate(90deg);
    vertical-align: middle;
    text-align: left;
}
}

```

Blank Page

The following example clears the header for the blank pages that may be created by a `page-break-before`, `page-break-after`, or by using [double side pagination \(on page 1667\)](#):

```

@page :blank{
    @top-left {
        content: none;
    }
    @top-right {
        content: none;
    }
}

```

Page Size

This is where you can find information on how the page sizes are defined.

Page Size - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-page-size.css` file contains the default page rules. It uses the US-LETTER size (8.5 X 11 inches). The content of this file is:

```

@page {
    padding-top: 0.2em;
    padding-bottom: 0.2em;
    size: us-letter;
    margin: 1in;
}

```

Note:

This is listed solely for illustration purposes, as the plugin might use something different.

How to Change the Page Size

Suppose you want to publish using the standard A4 page size, with a margin of 2cm.

In your [customization CSS \(on page 1567\)](#), use:

```
@page {  
    size: A4;  
    margin: 2cm;  
}
```

If you need different margins depending on the page side:

```
@page {  
    size: A4;  
    margin: 2cm;  
}  
  
@page :left {  
    margin-right: 4cm;  
}  
  
@page :right {  
    margin-left: 4cm;  
}
```

This would only increase the gutter margins or the inside margins needed for binding of the final book. The other margins would remain 2cm.

How to Change the Page Orientation

Suppose you want to publish on a landscape page orientation. The default is portrait, so you need to change it by using the size property. This will contain both the physical measurements and the orientation. In your [customization CSS \(on page 1567\)](#), use:

```
@page {  
    size: us-letter landscape;  
}
```

How to Change the Page Settings for a Specific Element

Suppose your publication mainly uses a portrait page orientation, but there are some topics that have wide images. To avoid having the images bleed outside of the page, you could use a wider page setting (landscape).

1. Mark the topic with an `@outputclass` attribute and give it a distinct value (for example, **wide**), you can set the attribute on the root element of the topic or on the `<topicref>` element from the map.

**Note:**

The `@outputclass` values from the `<topicref>` automatically propagate to the root of the topic from the [merged map \(on page 1569\)](#).

2. In your [customization CSS \(on page 1567\)](#), match the output class and associate it with a named page. In the following example, the page has a landscape orientation and small margins. This technique works for any element (e.g. a table or list) not just for a topic.

```
@page wide-page {
  size: letter landscape;
  margin: 0.5in;
}

*[outputclass = 'wide'] {
  page: wide-page !important;
}
```

**Note:**

The `!important` rule is necessary to override the default page settings.

Page Headers and Footers

The page headers and footers use the string sets defined for publication, chapter, and section titles. These string-sets are defined in the [numbering CSS \(on page 1642\)](#):

parttitle

Set to the title of the current part (only for DITA bookmaps that use parts).

chaptertitle

Set to the title of the current chapter (Shallow and Deep numbering).

sectiontitle

Set to the title of each section (Deep numbering only).

To see where the default page rules are defined, see: [Default Page Definitions \(on page 1575\)](#).

Although you may define string sets in your customization CSS, you need to take into account the fact that the string-set CSS property is not additive, and matching the same elements will end up breaking the current definitions. A very common use-case is to match the title element that is also used in the default CSS. The best approach, in this case, is to take a look at the rules from the [numbering CSS \(on page 1642\)](#), copy the ones dealing with string sets to your customization, then alter the property definition by adding your definition to the existing ones (and not removing the existing ones).

Related Information:[Numbering \(on page 1642\)](#)

Page Headers and Footers - Built-in CSS

The headers and footers are part of the page definitions. To see how the default page layouts are defined, see: [Default Page Definitions \(on page 1575\)](#).

How to Change the Size of Headers and Footers

This is directly related to the page margins and size.

The headers and footers are placed in the so-called [page margin boxes](#), a series of rectangular areas residing in the page margins.

To affect the margins of all page definitions, you may use the following rule:

```
@page {
  margin-top:3cm !important;
  margin-bottom:3cm !important;
  margin-left:2cm !important;
  margin-right:2cm !important;
}
```

If you want to affect only a specific page, like the first page from chapters for instance, you must use more specific page selectors. See the [Default Page Definitions \(on page 1575\)](#) for details.

Note that the page margin boxes fill the entire page margin. This means the `margin-top`, for example, dictates the height of the `@top-left-corner`, `@top-left`, `@top-center`, `@top-right`, `@top-right-corner` margin boxes. These cannot have margins on themselves, so to change the position of the content inside them, you must use `padding` properties:

```
@page {
  @top-left {
    content: "...";
    padding: 1cm;
  }
  ..
}
```

How to Change the Font of the Headers and Footers

To change the font for all the headers and footers, in your [customization CSS \(on page 1567\)](#), add a CSS rule similar to this:

```
@page {
  font-size: 12pt;
```

```
font-family: "Arial";
}
```

**Important:**

These settings apply to all page margin boxes, but not to the text inside the page.

If you want to change the settings only for a specific page type (for example, the table of contents), use the name of the page:

```
@page table-of-contents {
    font-size: 12pt;
    font-family: "Arial";
}
```

[How to Change the Header of the Table of Contents \(on page 1658\)](#)

How to Display Chapter's Headers on First Page

By default, the header is not displayed on the first page of each chapter:

```
/* No headers on the chapter first page. */
@page chapter:first:left{
    @top-left {
        content: none;
    }
}
@page chapter:first:right{
    @top-right {
        content: none;
    }
}
```

If you want to display them on the first page, you just need to override the above default rules with the following default content:

```
@page chapter:first:left{
    @top-left {
        content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
        counter(page);
    }
}
@page chapter:first:right{
    @top-right {
```

```

    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
}
}

```

**Tip:**

It is also possible to import the `[PLUGIN_DIR]/css/print/p-optional-pages-and-headers.css` stylesheet into your custom CSS.

How to Position Text in the Headers and Footers

By default, the name of the publication and chapter titles are placed in the `top-left` or `top-right` page margin boxes:

```

@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
  }
}

@page :right{
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
  }
}

```

If you want to change this, you should use the `content` CSS properties of other page margin boxes, and inhibit the ones in the above content. For example, to set the chapter title in the page top left corner, you can use:

```

@page :left {
  @top-left {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
  }
  @top-left-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
counter(page);
    white-space: nowrap;
    text-align:left;
  }
}

```

```

@page :right{
  @top-right {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
  counter(page);
  }
  @top-right-corner {
    content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
  counter(page);
    white-space: nowrap;
    text-align: right;
  }
}

```

**Note:**

The corner page margin boxes are fixed and limited as the available space. Above, the `text-align` and `white-space` properties are used to make the text bleed out of these boxes towards the center of the page. If you plan to add an image or artwork background, you should consider using the technique described in: [How to Decorate the Header by Using a Background Image on the Entire Page \(on page 1590\)](#).

How to Change the Header Separators

There are some `strings` defined for parts, chapters, and sections. Each of these strings start with the `" | "` character as a separator. For example, in the header of a page, you may find a sequence of strings:

```
My Publication | Introduction | Getting Started
```

- "My Publication" is the value of the `maptitle` string.
- "Introduction" is the value of the `chaptertitle` string.
- "Getting Started" is the value of the `sectiontitle` string.

There might be cases where you want to change this separator. You will need to recompose the header content using the above string sets. Suppose you want to use `" - "` as a separator. In your [customization CSS \(on page 1567\)](#), add the following CSS rule:

```

*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
    chaptertitle "",
    chaptertitle-no-prefix ""; /* Avoid propagating a past chapter title on a new part */
}

*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
  string-set: chaptertitle " - " counter(chapter) " - " content(),

```

```

    chaptertitle-no-prefix " " counter(chapter) " - " content();
}

```

If you enabled the [deep numbering for chapters and subsections \(on page 1646\)](#), then use:

```

*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-part] > *[class
  ~= "topic/title"] {
  string-set: parttitle " - " counter(part, upper-roman) " - " content(),
    parttitle-no-prefix " " counter(part, upper-roman) " - " content(),
    chaptertitle "",
    chaptertitle-no-prefix ""; /* Avoid propagating a past chapter title on a new part */
}
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) >
*[class ~= "topic/title"] {
  string-set: chaptertitle " - " counters(chapter-and-sections, ".") " - " content(),
    chaptertitle-no-prefix " " counters(chapter-and-sections, ".") " - " content(),
    sectiontitle ""; /* Avoid propagating a past section title on a new chapter */
}
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) >
*[class ~= "topic/topic"] > *[class ~= "topic/title"] {
  string-set: sectiontitle " - " counters(chapter-and-sections, ".") " - " content();
}

```

How to Simplify the Header (Keep Only the Chapter Title)

The headers display information such as *map title*, *part title*, *chapter title*, and *section title*, ending in the page number.

```

content: string(maptitle) string(parttitle) string(chaptertitle) string(sectiontitle) " | "
  counter(page);

```

This might be too much if you have long titles. The solution is to override the default header content.

In your [customization CSS \(on page 1567\)](#), add the following CSS rule:

```

@page :left {
  @top-left {
    content: string(chaptertitle) " | " counter(page);
  }
}
@page :right {
  @top-right {
    content: string(chaptertitle) " | " counter(page);
  }
}

```

**Important:**

Some of the CSS default page rules are more important. If you see that the content does not change:

- Try to also specify the name of the page, to increase the specificity of the rules:

```
@page :left, table-of-contents:left, chapter:left{
  ...
}
@page :right, table-of-contents:right, chapter:right{
  ...
}
```

- Add an `!important` classifier just before the semi-colon.

```
@top-right {
  content: string(chaptertitle) " | " counter(page) !important;
}
```

How to Style a Part of the Text from the Header

If you need to style a fragment of text (for example, a company slogan) with certain colors or font styles, you have several options:

- Use an SVG image as the background for a page margin box or for the entire page. See: [How to Add a Background Image to the Header \(on page 1589\)](#).
- Use the `oxy_label` constructor. This is a function that creates a text label with a set of styles.

```
@page {
  @top-right {
    content: oxy_label(text, "My Company", styles, "color:red; font-size: larger;")
    ' '
    oxy_label(text, "Product", styles, "color:blue;
text-decoration:underline;");
  }
}
```

You can combine the `oxy_label` with `oxy_xpath`, to extract and style a piece of text from the document:

```
content: oxy_label(text, oxy_xpath("/some/xpath"), styles, "color:blue; ");
```

**Note:**

These functions work only with the Chemistry CSS processor.

**Note:**

You cannot use `string()` inside an `oxy_label()`. As a workaround, to apply styling on the dynamic text retrieved by a `string()` function you can define some overall styles for the entire page margin box and then use the `oxy_label` to style differently the static text.

```
@page {
  @top-right {
    color: red;
    content: oxy_label(text, "My Company", styles, "color:black")
    ' '
    string(chaptertitle); /* This inherits the styling from @top-right*/
  }
}
```

- Use two adjacent page margin boxes, and style them differently:

```
@page {
  @top-center {
    content: "First part";
    color: red;
    text-align:right;
  }
  @top-left {
    content: "- Second part";
    color: blue;
    text-align:left;
  }
}
```

How to Add a Background Image to the Header

A common use-case is to add a background image to one of the page corners.

```
@page :left {
  @bottom-left-corner{
    content: " ";
    background-image:
url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}
```

**Important:**

Always specify a `content` property. If not, the page margin box will not be generated.

Another use-case is to use the `@top-left` or `@top-right` page margin boxes. These boxes have an automatic layout and they can be very small if they have no content. If there is no text to be placed over the image, use a series of non-breaking spaces (`\A0`) to increase the box width as in the following example (alternatively, you can use the technique described in [How to Decorate the Header by Using a Background Image on the Entire Page \(on page 1590\)](#)):

```
@page :left {
  @top-left{
    content: '\A0\A0\A0\A0\A0\A0\A0\A0\A0\A0';
    background-image:
url('https://www.oxygenxml.com/resellers/resources/OxygenXMLEditor_icon.svg');
    background-repeat:no-repeat;
    background-position:50% 50%;
  }
}
```

**Note:**

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Related Information:

[Images and Figures \(on page 1723\)](#)

[How to Add a Background Image for the Cover \(on page 1609\)](#)

[How to Add a Link in Headers and Footers \(on page 1596\)](#)

How to Decorate the Header by Using a Background Image on the Entire Page

If you want to precisely position artwork and the page margin boxes are not sufficient, it is possible to use a background image for the entire page.

This technique consists of creating an image (SVG is the best since it is a vector image) as wide as the page that would contain the logo and placing other decorations at the desired locations. This offers the best results and the position of the artwork does not depend on the page margin contents.

Example:

```
@page :left, chapter:left, chapter:first:left {
  background-image: url('img/page_background_image_with_logos_and_artwork_for_left_page.svg');
  background-repeat: no-repeat;
```

```
background-position: 50% 50%;

background-size: 8.5in 11.5in; /* Optional: Adapt to your page size. */

}
```

For a list of all the possible page names, see: [Default Page Definitions \(on page 1575\)](#).

Related Information:

[How to Add a Background Image for the Cover \(on page 1609\)](#)

How to Change Header Text for Each Topic

It is possible to dynamically change the header depending on the content in a topic. The following example assumes that the data to be presented in the header is located in the metadata section of each topic. One way is to specify it in the DITA map is by using the `<topicmeta>` element for the `<topicref>` topic reference:

```
...

<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
  ...

```

In the above example, there is set of key value pairs with the name `header-data`. This information is automatically copied into the content in the [merged map file \(on page 1569\)](#), like this:

```
<topic ... >
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your
  solution.</shortdesc>
  <prolog class="- topic/prolog ">
    ...
    <data class="- topic/data " name="header-data" value="ID778-3211"/>
    ...

```

This information can be extracted from the CSS:

```
/* Define the string set variable that contains the text extracted from the data element */
*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-data"] {
  string-set: hdrstr attr(value);
}

/* Using the value='none' stops applying the image. */
*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-data"][value="none"] {
  string-set: hdrstr "";
}

```

```

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(hdrstr);
  }
}

```

Notes:

The string set is applied to all pages that follow the data element, until another data element changes it:

```

...
<topicref href="topics/installing.dita">
  <topicmeta>
    <data name="header-data" value="ID778-3211"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="..."> <!-- Uses the same value -->
<topicref href="topics/change.dita">
  <topicmeta>
    <data name="header-data" value="ID990-3200"/>
  </topicmeta>
</topicref>
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->
<topicref href="..."> <!-- The string set is changed now -->

```

To clear the text, use the `none` value:

```

...
<topicref href="..."> <!-- The string set is void now -->
...

```

How to Change Header Images for Each Chapter

It is possible to dynamically change an image in the header depending on the chapter. For this, you need to define an image reference in the metadata section of each chapter. One way is to specify it in the DITA map by using the `<topicmeta>` element for the `<chapter>` topic reference:

```

...
<chapter href="topics/installing.dita">

```

```

<topicmeta>
  <data name="header-image" value="img/installing.png"/>
</topicmeta>
...

```

In the above example, there is set of key value pairs with the name `header-image`. The `img/installing.png` is an image reference relative to the DITA map URI. This information is automatically copied into the content in the merged map file (on page 1569), like this:

```

<topic is-chapter="true" ... >
  <title class="- topic/title ">Installing</title>
  <shortdesc class="- topic/shortdesc ">You install components to make them available for your
  solution.</shortdesc>
  <prolog class="- topic/prolog ">
    ...
  <data class="- topic/data " name="header-image" value="img/installing.png"/>
  ...

```

This information can be picked up from CSS:

```

/* Define the string set variable that contains an URL */
*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-image"] {
  string-set: imgst oxy_url(oxy_xpath('/*/@xtrf'), attr(value));
}

/* Using the value='none' stops applying the image. */
*[class ~= "topic/topic"] *[class ~= "topic/data"][name="header-image"][value="none"] {
  string-set: imgst "";
}

/* Use the string set variable in one of the page margin boxes. */
@page chapter {
  @top-left-corner {
    content: string(imgst);
    font-size:0; /* remove the font ascent and descent */
  }
}

```

Details: The `@value` attribute is used to build a URL relative to the URI of the DITA map. To determine the base URI of the DITA map, the `@xtrf` attribute was used from the root element of the merged map document, extracted using the `oxy_xpath` function.

**Notes:**

- The image is always aligned vertically to the middle of available space from the page margin box.
- Make sure you use an image of the correct size. For example, if you want to place the image in the top-left corner of the page, assuming the top and left page margins are 1 in, then make sure the image is a square having a size of 1 in.
- The image is applied to all pages that follow the data element, until another data element changes it:

```

...
<chapter href="topics/installing.dita">
  <topicmeta>
    <data name="header-image" value="img/installing.png"/>
  </topicmeta>
</chapter>
<chapter href="..."> <!-- Uses the same installing.png image -->
<chapter href="..."> <!-- Uses the same installing.png image -->
<chapter href="..."> <!-- Uses the same installing.png image -->
<chapter href="topics/change.dita">
  <topicmeta>
    <data name="header-image" value="img/change.png"/>
  </topicmeta>
</chapter>
<chapter href="..."> <!-- Uses the same change.png image -->
<chapter href="..."> <!-- Uses the same change.png image -->
<chapter href="..."> <!-- Uses the same change.png image -->

```

To clear the image, use the `none` value:

```

...
  <data name="header-image" value="none"/>
...

```

How to Add a Multi-line Copyright Notice to the Footer

Suppose you want to add a footer with the following two lines of text at the end of each page that is shown on the right side:

```

© 2017 - My Company Ltd
All rights reserved

```

For this, you need to specify a rule that matches all the right pages and adds that content in the `bottom-center`. In your [customization CSS \(on page 1567\)](#), add the following CSS rule:

```
@page :right{
  @bottom-center {
    content: "@ 2017 - My Company Ltd \A All rights reserved";
    font-size: 0.5em;
    color: silver;
  }
}
```

Note:

Other page rules (such as the *table-of-contents*) override the contents of the `@bottom-center` because they are more specific. If you need to also print the copyright in the TOC pages, then use this as the selector:

```
@page :right, table-of-contents:right {
  ...
}
```

Note:

To use new lines (`\n` characters) in your headers or footers, use the `\A` notation, as in the example above.

How to Add a Group of Topics to the Footer

To create a footer that contains the content of several topic files, but only on the last page, there are two possible approaches:

Method 1: Using the `position:fixed` CSS Property

1. Group all the footer topics under a single parent topic, under the last topic from your DITA map. For example, you can have the following map structure:

```
...
End topic
  Footer container topic
    Footer content topic 1
    Footer content topic 2
```

2. Add an `@outputclass=footer` on the `<topic>` root element of the footer container topic, or on its `<topicref>` in the map.
3. Use the CSS `position: fixed` property to position this topic to the bottom of the page:

```

*[outputclass ~= "footer"] {
    position: fixed;

    bottom: 0.5in;
    left: 0.5in;

    width: 5in;
    height: 200pt;
}

```

**Note:**

Make sure the width and height are enough for the content of the footer to fit. Be careful because the content might bleed out of the page. Use bottom and left values to position the block in the page.

Method 2: Using the float:footnote CSS Property

The second approach would be to declare the footer block as a footnote. Assuming the same DITA Map structure as above, you can use the following CSS fragment:

```

*[outputclass ~= "footer"] {
    float: footnote;
}

*[outputclass ~= "footer"]:footnote-call{
    color: transparent;
    font-size: 0;
}

*[outputclass ~= "footer"]:footnote-marker{
    color: transparent;
    font-size: 0;
}

```

**Note:**

Use transparent colors and/or zero size font to avoid the display of the footnote counters.

How to Add a Link in Headers and Footers

Method 1: Using an SVG Link Attribute

It is possible to add a link inside the document header (or footer) by using the `<a>` element inside an SVG document. For example, suppose you have the following SVG document named *custom.svg*.

```
<svg width="180" height="20" viewBox="0 0 180 20" xmlns="http://www.w3.org/2000/svg"
xmlns:xlink="http://www.w3.org/1999/xlink">
  <a xlink:href="https://www.oxygenxml.com/chemistry-html-to-pdf-converter.html">
    <rect x="0" y="0" width="180" height="20" opacity="0"/>
    <text x="5" y="15" fill="blue">Oxygen PDF Chemistry</text>
  </a>
</svg>
```

This creates an SVG link with *PDF Chemistry* displayed as its text (the content of the `<text>` element).

Note:

If you just want to add a link without text, you can define a rectangle that contains the link instead of text.

To display the link, you just need to set your SVG file as the content of one of the page margin boxes:

```
@page {
  @top-left {
    content: url("custom.svg");
  }
}
```

Method 2: Using the CSS *-oxy-link* Property

It is also possible to add a link inside the document header (or footer) by using the `-oxy-link` property on the `@page` margin box declaration. The entire page margin box will behave as a link and will be clickable.

```
@page {
  @top-left {
    content: "Link";
    -oxy-link: "https://www.oxygenxml.com/";
    color:blue;
  }
}
```

How to Change the Header Styling Depending on Page Side

To modify the styling of the default page headers, add the following CSS rule in your [customization CSS](#) (on [page 1567](#)):

```
@page :left {
  @top-left {
    color:navy;
    font-style:italic;
  }
  @top-right {
```

```

        color:red;
    }
}

```

If you intend to modify **just the headers of the table of contents**, use the `table-of-contents` page rule selector:

```

@page table-of-contents:left {
    @top-left {
        color:navy;
        font-style:italic;
    }
    @top-right {
        color:red;
    }
}

```

How to Use XPath Computed Data or Images in the Header or Footer

A very simple approach is to use the `oxy_xpath` directly in the `content` property:

```

@page front-page {
    @top-center {
        content: "Created: " oxy_xpath('//*[contains(@class, " topic/created "][1]');
    }
}

```

Example 1: Compute the Number of Words

The following example computes the number of words from the publication. It counts all the words, including the ones from the TOC, but does not take the static labels into account:

```

@page front-page {
    @bottom-center {
        content: "Number of words: "
            oxy_xpath("string-length(normalize-space()) - \
                string-length(translate(normalize-space(),' ','')) +1");
    }
}

```

Note:

The XPath expression from the page rules is evaluated in the context of the document root element, so you will need to use absolute expressions starting with `/` or `//`. This is different from the case when the `oxy_xpath` is used in CSS rules that match an element. In this case, the XPath expressions are evaluated in the context of the matched element and you can use relative paths.

**Tip:**

XPath 2.0 is supported (not schema aware).

Example 2: Retrieve Image from a Document and Insert it in the Header

Another example is to use an image from the document in the publication header:

```
<bookmeta>
  <metadata>
    ...
    <data name="cover">
      <image href="product-cover.png" outputclass="cover-image" />
    </data>
    ...
  </metadata>
</bookmeta>
```

```
@page {
  @top-center {
    content: url("oxy_xpath('//*[contains(@outputclass, "cover-image")]@href)");
  }
}
```

If the URL returned by `oxy_xpath` is not absolute, it is considered to be relative to the CSS file. To obtain an absolute URL from one relative to the XML document, you can use in the XPath expression functions like `resolve-uri` and `document-uri`:

```
@page {
  @top-center {
    content: url(oxy_xpath("resolve-uri('//*[contains(@outputclass, 'cover-image')]@href),
document-uri(')')"));
  }
}
```

Example 3: Insert the Current Date in the Footer

Another example is to use the `oxy_xpath` function to compute the current date and insert it in the publication footer:

```
@page {
  @bottom-left {
    content: oxy_xpath('current-date()');
  }
}
```

Example 4: Picking up Metadata from the Original Map

Another example is to use the `oxy_xpath` function to extract the title, or any other element text value from the original processed DITA map file. For this, you can use the `@xtrf` attribute that is set on the root element of the merged map. This attribute contains the URL of the input map.

```
:root{
    string-set: maptitle oxy_xpath('document(@xtrf)/*[contains(@class, " map/map
    ")]/*[contains(@class, " topic/title ")]/text()');
}
```

<http://zvon.org/xxl/XPathTutorial/General/examples.html>

[Oxygen User Guide: oxy_xpath\(\) Function](#)

How to Add a Line Under the Header

There are two ways to add a horizontal line under the header.

Method 1: Add a Border in the Page Margin Boxes

To add a horizontal line that would stretch across the width of the page, add a bottom border to each of the 5 margin boxes in the top side of the page (`top-left-corner`, `top-left`, `top-center`, `top-right`, `top-right-corner`).

If you consider that the space between the header and the bottom border is too large, you could also change the alignment by adding a `vertical-align: bottom;` declaration in the page margin boxes.

For example, if you need to set some text as a header in the top-left margin box and insert a horizontal line under it, the customization CSS would look something like this:

```
@page chapter, chapter:first:left:right, front-page{

    padding-top: 1em;

    @top-left {
        content: "Custom header";
        color: gray;
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }

    @top-center{
        content: " ";
        border-bottom: 1px solid black;
        vertical-align: bottom;
    }
}
```

```

}

@top-right{
  content: " ";
  border-bottom: 1px solid black;
  vertical-align: bottom;
}

@top-right-corner{
  content: " ";
  border-bottom: 1px solid black;
  vertical-align: bottom;
}

@top-left-corner{
  content: " ";
  border-bottom: 1px solid black;
  vertical-align: bottom;
}

```

**Note:**

The `padding-top: 1em;` is used to avoid the border at the bottom of the header that joins with the page content.

Method 2: Use a Background Image

An alternative method is to add a horizontal line/border under an existing header (or in any other part of the page) using an SVG image, as described in [How to Add a Background Image to the Header \(on page 1589\)](#).

How to Change the Headings Using a Parameter

Suppose you need to change the headings of your publication by specifying a static text in a parameter.

First, establish a name for your parameter (it must start with the `args.css.param.` prefix). For example, you could name it `args.css.param.heading.text`. It will have the text value that you will pass when starting the transformation. This parameter does not have to be registered anywhere as it will be automatically recognized and passed as an XML attribute on the root of the merged file, as specified in [Styling Through Custom Parameters \(on page 1754\)](#).

Next, alter your customization CSS to make use of the parameter value. In the example below, the text is placed in the central part of the header:

```

@page front-page, table-of-contents, chapter {
  @top-center{

```

```

    content: oxy_xpath("/*/@heading.text");
}
}

```

**Note:**

You can use any XPath 2.0 here. It will be executed in the context of the merged map document, so you can collect data from it. You can use *if/then/else* expressions if your parameter is a switch.

The text does not affect the first pages from the page sequences because [the built-in CSS page rules \(on page 1575\)](#) clear the content from the headers. If you need the text content on all pages, you might consider adding an `!important` keyword after the `content` property value, or increase the specificity of the page selectors, like this:

```

@page front-page,
    table-of-contents,
    table-of-contents:first:left,
    table-of-contents:first:right,
    chapter:first:left,
    chapter:first:right{
    @top-center{
        ...
    }
}

```

Another use case is to alter the string-sets that are used in the headers (not the headers directly), as it is explained here: [How to Use XPath Computed Data or Images in the Header or Footer \(on page 1598\)](#). You can use this technique to alter the chapter titles as in the following example:

```

*[class ~= "map/map"][numbering^='deep']
  *[class ~= "topic/topic"][is-chapter]:not([is-part]) >
    *[class ~= "topic/title"] {
    string-set:
      chaptertitle " | " counters(chapter-and-sections, ".") " - "
    oxy_xpath("/*/@heading.text") content(),
    sectiontitle "";
}

```

**Note:**

This is a rule copied from `p-numbering-deep.css` and it may change if future versions.

How to Change the Headings depending on the Language

It is possible to customize the text displayed in the headings depending on the language of the publication.

In this case, you can simply use of the `@lang` attribute in your customization CSS. In the following example, the page counter displayed in the bottom part of the page is preceded by the word "Page", according to the selected language:

```
@page chapter {
  @bottom-center {
    content: oxy_xpath("if (@lang='es') then 'Página' \
                      else if (@lang='it') then 'Pagina' \
                      else 'Page'") " " counter(page);
  }
}
```

Note:

Backslashes (\) are used to split the XPath into multiple lines to make it easier to read.

How to Display the Chapter and the Page Number in the Footer

It is possible to display the chapter number along with the page number in the footer of each page. For example, a CC-PP (using a 2-digits numbering) display can be done using the following CSS rules:

```
*[class ~= "map/map"] *[class ~= "topic/topic"][is-part] {
  string-set: chapternumber "";
}
*[class ~= "map/map"] *[class ~= "topic/topic"][is-chapter]:not([is-part]) {
  string-set: chapternumber counter(chapter, decimal-leading-zero);
}
*[class ~= "map/map"] *[class ~= "bookmap/frontmatter"]
*[class ~= "map/map"] *[class ~= "bookmap/backmatter"]
*[class ~= "map/map"] *[class ~= "topic/topic"][is-part] ~ *[class ~= "topic/topic"]:not([is-part])
{
  string-set: chapternumber "";
}
...
@page chapter {
  @bottom-center {
    content: string(chapternumber) "-" counter(page, decimal-leading-zero);
  }
}
```

Page Breaks

The page breaks can be controlled in multiple ways:

1. By creating an `@page` and assigning it to an element will create a page break between this element and the sibling elements that have a different page.
2. Using the CSS properties: `page-break-before`, `page-break-after`, or `page-break-avoid`.
3. In your DITA topic, set the `@outputclass` attribute on the topic root (or any element) to contain one of the `page-break-before`, `page-break-after`, or `page-break-avoid` values. If you want to control the page breaking from the DITA map, use the `@outputclass` attribute on the `<topicref>`, with any of the values mentioned above.

[Double Side Pagination \(on page 1667\)](#)

[Oxygen PDF Chemistry: Controlling Page Breaks](#)

Page Breaks - Built-in CSS

Page break properties are used in: `[PLUGIN_DIR]css/print/p-page-breaks.css`.

How to Avoid Page Breaks in Lists and Tables

To avoid splitting elements over two pages, you can use the `page-break-inside` CSS property. For example, if you want to impose this on tables and lists, then add the following rules to your [customization CSS \(on page 1567\)](#):

```
*[class ~= "topic/table"] {
    page-break-inside:avoid;
}
*[class ~= "topic/ol"] {
    page-break-inside:avoid;
}
*[class ~= "topic/ul"] {
    page-break-inside:avoid;
}
```

**Note:**

Since the task steps are inherited from `topic/ol`, they will also not be split over two separate pages. However, if you want to allow this, add the following CSS rule:

```
*[class ~= "task/steps"] {
    page-break-inside:auto;
}
```

**Note:**

Another way to do this is to mark the element with an `@outputclass` set to `page-break-avoid`.

How to Force a Page Break Before or After a Topic or Another Element

If you want to force a page break **before all** the second-level topics (for example, sections in chapters that are usually kept flowing one after another without page breaks), add the following in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "map/map"] > *[class ~= "topic/topic"] > *[class ~= "topic/topic"] {
  page-break-before: always;
}
```

If you need to break at third or fourth level topics, add more `.. > *[class ~= "topic/topic"]` selectors to the expression.

If you want to force a page break **for a specific topic**, mark the topic (or any other element you need to control page breaking for) with an `@outputclass` attribute set to one of these values:

page-break-before

Use this for a page break before the marked element.

page-break-after

Use this for a page break after the marked element.

page-break-avoid

Use this to avoid page breaks inside the marked element.

For example, to force a page break before a certain topic, use:

```
<topic outputclass="page-break-before" ... >
```

Note:

You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. In this way you can reuse the topic in another context where the page breaking is not necessary.

You can also control page breaking for lists, paragraphs, or any other block type elements. The following example avoids page breaks inside an ordered list:

```
<ol outputclass="page-break-avoid" ... >
```

How to Add a Blank Page After a Topic

If you want to add a new blank page after a topic, add the following rules to your [customization CSS \(on page 1567\)](#).

Style the separating blank page:

```
@page topic-separating-page{
  @top-left {
    content: " ";
  }
}
```

```

}
@top-right {
  content: "";
}
@top-center {
  content: "This page is blank";
}
}

```

Associate this page to the `:after` pseudo-element of the topic:

```

*[class~="topic/topic"][outputclass~="add-separator-page"]:after {
  content: " ";
  display: block;
  page: topic-separating-page;
}

```

In the XML content, on the `<topic>` element, set the `@outputclass` to the `add-separator-page` value.

```

<topic outputclass="add-separator-page"> ... </topic>

```

The `:after` pseudo-element will be created next to the topic content and will be placed on the `topic-separating-page`.

Use the page margin box selectors to override the default content from the headers/footers.

Note:

You can set the output class on the `<topicref>` element from the DITA map instead of the `<topic>` element. This allows you to reuse the topic in another context where the page breaking is not necessary.

How to Enforce a Number of Lines from Paragraphs that Continue in Next Page

In typography, an *orphan* is the first line of a paragraph that appears alone at the bottom of a page (the paragraph continues on a subsequent page), while a *widow* is the last line of a paragraph that appears alone at the top of a page. The default is 2 for each of them. You can control this number by adding the following to your [customization CSS \(on page 1567\)](#):

```

:root {
  widows: 4;
  orphans: 4;
}

```

**Note:**

As a difference from the W3C standard, the `widows` and `orphans` CSS properties are applied to lists as well (the default is 2). This means that a list that spans consecutive pages will have either zero or at least 2 lines on each of the pages.

How to Avoid Page Breaks Between Top-Level Topics (Chapters)

If you plan to publish a simple map with just one level of topics (such as a list of topics), then the automated page breaks between these topics might not be desired.

In this case, you can use the following CSS snippet to disable the page breaks between chapters:

```
*[class ~= "topic/topic"][is-chapter] {
  -oxy-page-group:auto;
}
```

Related Information:

[Oxygen PDF Chemistry User Guide: Chapter Page Placement and Styling](#)

Cover (Title) Page

Customizing the cover page is one of the most requested customization requests.

Cover Page - XML Fragment

The merged map file (*on page 1569*) contains the `<oxy:front-page>` element, as a child of the root element. This contains the metadata and an `<oxy:front-page-title>` element with the title structure.

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
      ...
    </bookmeta>
    <oxy:front-page-title>
      <booktitle xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
        class="- topic/title bookmap/booktitle ">
        <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
        <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
        <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product tasks</booktitlealt>
      </booktitle>
    </oxy:front-page-title>
  </oxy:front-page>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div class="- map/map bookmap/bookmap bookmap" ... >
  <div class=" front-page/front-page front-page">
    <div class="- map/topicmeta bookmap/bookmeta boometa">
      ...
    </div>
    <div class=" front-page/front-page-title front-page-title">
      <div class="- topic/title bookmap/booktitle booktitle">
        <div class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</div>
        <div class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</div>
        <div class="- topic/ph bookmap/booktitlealt booktitlealt">Product tasks</div>
      </div>
    </div>
  </div>
  ...

```

Cover Page - Built-in CSS rules

The element with the class `frontpage/frontpage` is associated with a page named *front-page* with no headers or footers. The front page title is styled with a bigger font. The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-front-page.css`.

```
@media print {

  *[class~="front-page/front-page"] {
    page: front-page;
  }

  /* Prevents the front-page title margin collapsing */
  *[class~="front-page/front-page"]::before(1000) {
    display:block;
    content: "\A";
    font-size:0;
  }

  *[class~="front-page/front-page-title"] {
    display:block;
    text-align:center;
    margin-top:3in;
    font-size:2em;
    font-family:arial, helvetica, sans-serif;
    font-weight:bold;
  }
}
```

```

}

@page front-page {
    @top-left-corner { content:none }
    @top-left { content:none }
    @top-center { content:none }
    @top-right { content:none }
    @top-right-corner { content:none }
    @bottom-left-corner { content:none }
    @bottom-left { content:none }
    @bottom-center { content:none }
    @bottom-right { content:none }
    @bottom-right-corner { content:none }
}
}

```

**Note:**

This is listed solely for illustration purposes, as the plugin might use something different.

How to Add a Background Image for the Cover

The simplest way is to create an SVG image as large as the entire physical page and set it as the background for the *front-page*. This makes it easy to accomplish a good positioning of the graphical elements or artwork. In the foreground, you can place text fragments using a series of `:after` pseudo-elements bound to the front page title.

To set the size to an SVG image, you should specify the `@width` and `@height` attributes on the `<svg>` root element using specified unit values (in, cm, etc.) This should be enough only if all the coordinates from your drawing have unit identifiers.

If you are using unit-less coordinates in your drawing like the following:

```
<polygon points="17.78 826.21 577.51 ...."
```

Next, make sure you also specify the `@viewBox` attribute on the `<svg>` root element that defines the abstract rectangle that contains the drawing:

```
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 600 850">
```

The following SVG document has the `@width`, `@height`, and `@viewBox` attributes. The width and height have physical units (in inches), while the view box and rectangle coordinates are unit-less.

```

<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE svg PUBLIC "-//W3C//DTD SVG 1.1//EN"
    "http://www.w3.org/Graphics/SVG/1.1/DTD/svg11.dtd">
<svg xmlns="http://www.w3.org/2000/svg" width="8.5in" height="11in" viewBox="0 0 110 110">

```

```

<desc>A gradient as big as a page.</desc>

<defs>
  <linearGradient id="lc"
    x1="0%" y1="0%"
    x2="0%" y2="100%"
    spreadMethod="pad">
    <stop offset="0%" stop-color="#00DD00" stop-opacity="1"/>
    <stop offset="100%" stop-color="#00AA00" stop-opacity="1"/>
  </linearGradient>
</defs>

<rect x="5" y="5" width="100" height="100" rx="10" ry="10"
  style="fill:url(#lc);
  stroke: #005000;
  stroke-width: 3;"/>

<text x="33%" y="50%" color="#FFFFFFAA"> Sample </text>
</svg>

```

This example shows a gradient. It is the size of a US-LETTER page and can be used in a publication using this page size.

Note:

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

In your [customization CSS \(on page 1567\)](#), add the following:

```

@page front-page {
  background-image: url("us-letter.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

```

For smaller artworks, you can use `background-position` with percentage values to position and center the artwork (for example, a company logo):

```

@page front-page {
  background-image: url("company-logo.svg");
  background-position: 50% 5%; /* The first is the alignment on the X axis, the second on the Y axis.*/
  background-repeat: no-repeat;
}

```

**Note:**

The text from the SVG or PDF background images is searchable in the PDF reader.

How to Display the Background Cover Image Before the Title

It is possible to split the front-page display into two pages so that the background image appears on one page and the title on another. The solution is to define a new page for the main title:

```
@page front-page {
  @top-left { content: none; }
  @top-right { content: none; }
  @bottom-center { content: none; }

  background-image: url("us-letter.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

@page main-title-page {
  @top-left { content: none; }
  @top-right { content: none; }
  @bottom-center { content: none; }
}

*[class ~= "front-page/front-page-title"]:before {
  display: block;
  content: "\2002";
  margin-bottom: 3in;
}

*[class ~= "front-page/front-page-title"] {
  page: main-title-page;
}
```

How to Use Different Background Cover Images Based on Bookmap or Map Information

It is common to use the same CSS file for customizing multiple publications, and you may need to set a different cover for each of them. The solution is to use an XPath expression to extract some information from the document, and based on that, select the SVG images.

```
@page front-page {
  background-image: url(oxy_xpath("\
```

```

        if(//*[contains(@class, ' topic/prodname ')] [1] = 'gardening') then 'bg-gardening.svg'
    else\
        if(//*[contains(@class, ' topic/prodname ')] [1] = 'soil') then 'bg-soil.svg'\
        else 'bg-default.svg'\
    "));
    background-position:center;
}

```

The backslash (\) is used to continue the expression string on the subsequent lines (there should be no spaces after it). For more use cases solved using XPath, see: [Metadata \(on page 1625\)](#).

Related Information:

[Oxygen PDF Chemistry: Graphics](#)

How to Change Styling of the Cover Page Title

Match the front page title element in your [customization CSS \(on page 1567\)](#) based on its class attribute:

```

*[class ~= "front-page/front-page-title" {
    margin-top: 1in;
    font-size: 3em;
}

```

Important:

Make sure the sum of the top and bottom margins and paddings for this element do not exceed the physical dimension of the page. If this happens, an extra blank page may appear before the cover page. Usually, it is enough to specify only the top margin.

How to Add Text to the Cover Page

If you need to add arbitrary text to the cover page, you can use the front page title element as an anchor and add as many blocks of text as you need after it, and style them differently.

In your [customization CSS \(on page 1567\)](#), add the following:

```

*[class ~= "front-page/front-page-title"]:after(1) {
    display:block;
    content: "DRAFT VERSION";
    font-size: large;
    color: red;
    text-align:center;
}

*[class ~= "front-page/front-page-title"]:after(2) {

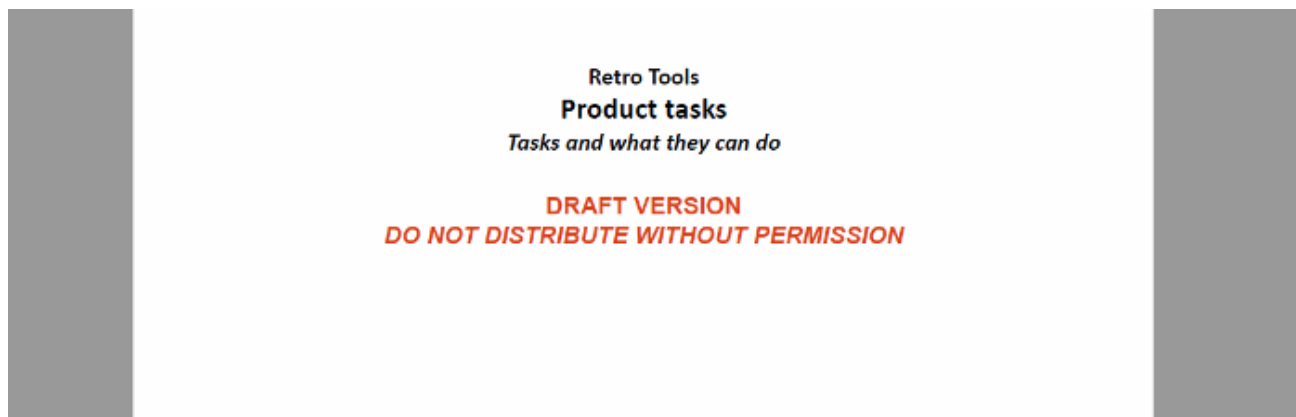

```

```

display:block;
content: "DO NOT DISTRIBUTE WITHOUT PERMISSION";
font-size: large;
color: red;
text-align:center;
font-style: italic;
}

```

The result is:

To use content from the document, you can use the `oxy_xpath` function in the `content` property. For a more complex example, including the generation of a new page for the synthetic `:after` elements, see: [How to Show Metadata in the Cover Page \(on page 1630\)](#).

Related Information:

[How to Show Metadata in the Cover Page \(on page 1630\)](#)

How to Place Cover on the Right or Left Side

In your [customization CSS \(on page 1567\)](#), add the following CSS rules:

```

*[class ~="front-page/front-page"]{
    page-break-before:left;
}

```

Note:

This will create an empty page at the beginning of the publication, moving the cover content on the needed side.

For more information, see: [Oxygen PDF Chemistry: Controlling Page Breaks](#).

Related Information:

[Double Side Pagination \(on page 1667\)](#)

How to Add a Second Cover Page and Back Cover Page

It is possible to add a second cover page after the front-page by defining another page-selector:

```
@page second-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  @bottom-center {content: none;}

  background-image: url("second-cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~= 'front-page/front-page']:after{
  page: second-cover;
  page-break-after: always;
  display: block;
  content: "\2002";
}
```

If you want to add a back cover page, you should use an `:after` pseudo element on the map itself:

```
*[class ~= "map/map"]:after
```

and bind it to another `@page` declaration:

```
@page back-cover {
  @top-left {content: none;}
  @top-right {content: none;}
  @bottom-center {content: none;}

  background-image: url("back-cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~= "map/map"]:after {
  page: back-cover;
  content: "\2002";
}
```

**Note:**

For any `background-image`, it is recommended to use SVG instead of PNG (or JPG) because it scales it to the page size.

**Tip:**

To add multiple cover pages, use multiple-leveled pseudo selectors, such as `:after(1)`, `:after(2)`. Remember that the larger the value, the more distant the pseudo element is to the target element.

How to Dynamically Add a Second Cover Page

It is possible to dynamically set the path to the SVG image that will be displayed on the secondary cover page.

First, you need to declare a `<data>` element in the *bookmap*'s metadata that contains the URL to your cover image:

```
<bookmap>
  <booktitle>
    ...
  </booktitle>
  <bookmeta>
    <metadata>
      <data name="second-cover-url" value="covers/second-cover.svg" />
    </metadata>
  </bookmeta>
  ...
</bookmap>
```

**Note:**

This can also be done on a normal DITA map by using the `<topicmeta>` after the map's `<title>`.

Next, you need to modify the page declaration inside your CSS stylesheet and replace the `background-image` property value with the result of the `oxy_xpath()` function:

```
@page second-cover {
  ...
  background-image: url(oxy_xpath("//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class,
'topic/data')][@name='second-cover-url']/@value"));
  ...
}
```

**Tip:**

You can reuse the same stylesheet on multiple maps. You just need to change the data value for each of them.

How to Add a Specific Number of Empty Pages After the Cover Page

In your [customization CSS \(on page 1567\)](#), add the following CSS rules:

```
@page my-blank-page {  
    /* Hide the page numbers */  
    @top-left {content: none;}  
    @top-right {content: none;}  
}  
  
*[class ~= 'front-page/front-page']:after(1){  
    page:my-blank-page;  
    display:block;  
    content: '\2002';  
    color:transparent;  
    page-break-after:always;  
}  
  
*[class ~= 'front-page/front-page']:after(2){  
    page:my-blank-page;  
    display:block;  
    content: '\2002';  
    page-break-after:always;  
}  
  
*[class ~= 'front-page/front-page']:after(3){  
    page:my-blank-page;  
    display:block;  
    content: '\2002';  
    page-break-after:always;  
}
```

**Note:**

The `\2002` character is a space that is not shown on the pages, but gives a value for the content property.

Related Information:

[How to Force an Odd or Even Number of Pages in a Chapter \(on page 1669\)](#)

How to Add a Copyright Page after the Map Cover (Not for Bookmaps)

Regular DITA maps do not have the concept of a copyright notice. This is available only in the DITA *bookmap* structure.

If you are constrained to using a regular map and you need to add a copyright page between the front cover and the TOC, use the following technique:

In your [customization CSS \(on page 1567\)](#), declare a new page layout:

```
@page copyright-notice-page {
  @top-left {
    content:none; /* Clear the headers for the copyright page */
  }
  @top-right {
    content:none;
  }
}
```

The element with the class `front-page/front-page` element contains the title of the publication and generates the cover page. A synthetic `:after` element is created that follows this element and it is placed on a different page.

```
*[class~="front-page/front-page"]:after{
  display:block;

  page: copyright-notice-page; /* Moves the synthetic element on a new page. */

  margin-top:90%; /* use margins to position the text in the page */
  margin-left: 5em;
  margin-right: 5em;

  content: "Copyright 2018-2019 MyCorp Inc. \A All rights reserved";

  text-align:center; /* More styling */
  color:blue;
}
```

If you need to add more content as blocks, use the `:after(2)`, `:after(3)` pseudo-elements:

```
*[class~="front-page/front-page"]:after(2){
  display:block;
  page: copyright-notice-page; /* Continue on the same page as the first ':after'. */
  content: "Some more styled text";
  color:red;
}
```

If you want to extract information from the document, use the `oxy_xpath()` function. For example, if the copyright info is stored in the map like this:

```
<map ...>
  <topicmeta>
    <copyright>
      <copyryear year="2018"/>
      <copyrholder>MyCorp Inc.</copyrholder>
    </copyright>
  </topicmeta>
  ...
```

then use this:

```
*[class ~= "front-page/front-page"]:after(3) {
  display: block;
  page: copyright-notice-page;
  content:
    "Year: "
    oxy_xpath('//*[contains(@class, " front-page/front-page ")]/*[contains(@class, "
map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyryear
"]/@year')
    "\A Holder: "
    oxy_xpath('//*[contains(@class, " front-page/front-page ")]/*[contains(@class, "
map/topicmeta ")]/*[contains(@class, " topic/copyright ")]/*[contains(@class, " topic/copyrholder
"])/text()');
  color: green;
}
```

[How to Debug XPath Expressions \(on page 1574\)](#)

How to Remove the Cover Page and TOC

If you need to hide or remove the cover page, the table of contents or other structures, match the elements with a `front-page/front-page` and `toc/toc` classes in your [customization CSS \(on page 1567\)](#):

```
*[class ~= 'map/map'] > *[class ~= 'toc/toc'] {
  display:none !important;
}
*[class ~= 'map/map'] > *[class ~= 'front-page/front-page']{
  display:none !important;
}
*[class~='topic/topic'][is-chapter] {
```

```
-oxy-page-group : auto;
}
```

How to Add a Cover in Single-Topic Publishing

It is possible to add a cover page before the topic when publishing a single-topic PDF (without a DITA map) using the DITA PDF - based on HTML5 & CSS transformation scenario.

For example, to add a background image before the published topic, you need to create a new `@page` rule and add it in a block before the actual content of the document:

```
@page topic-cover {
  @top-left {content: none;}
  @top-right {content: none;}

  background-image: url("img/cover.svg");
  background-position: center;
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

:root::before {
  page: topic-cover;
  display: block;
  content: "\2002";
  page-break-after: always;
}
```

How to Use SVG Templates for Creating Dynamic Cover Pages

It is possible to use XPath expressions inside SVG templates to insert dynamic text when creating PDF output using the DITA Map PDF - based on HTML5 & CSS scenario.

Using SVG Template as a Cover Page

A common use-case is when you want to create a custom cover page and this cover should display metadata information (i.e. the author, dates, and copyright information):

1. In the source `<bookmap>`, the various metadata elements are inserted inside the `<bookmeta>` element:

```
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
```

```

<bookmeta>
  <author>Howe Tudit</author>
  <critdates>
    <created date="2015-01-01"/>
    <revised modified="2016-04-03"/>
    <revised modified="2016-03-05"/>
  </critdates>
  ...
  <bookrights>
    <copyrfirst>
      <year>2004</year>
    </copyrfirst>
    <copyrlast>
      <year>2007</year>
    </copyrlast>
    <bookowner>
      <organization>Retro Tools, Inc.</organization>
    </bookowner>
  </bookrights>
</bookmeta>
...

```

2. The corresponding `merged.html` file will have the following content:

```

...
<div class="- front-page/front-page front-page">
  <div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
    <div class="- topic/author author">Howe Tudit</div>
    <div class="- topic/critdates critdates">
      <div date="2015-01-01" class="- topic/created created"></div>
      <div modified="2016-04-03" class="- topic/revised revised"></div>
      <div modified="2016-03-05" class="- topic/revised revised"></div>
    </div>
    ...
    <div class="- topic/data bookmap/bookrights data bookrights">
      <div class="- topic/data bookmap/copyrfirst data copyrfirst">
        <div class="- topic/ph bookmap/year ph year">2004</div>
      </div>
      <div class="- topic/data bookmap/copyrlast data copyrlast">
        <div class="- topic/ph bookmap/year ph year">2007</div>
      </div>
      <div class="- topic/data bookmap/bookowner data bookowner">
        <div class="- topic/data bookmap/organization data organization">Retro Tools,
          Inc.</div>
      </div>
    </div>
  </div>
</div>

```

```

    </div>
  </div>
</div>
<div class="- front-page/front-page-title front-page-title">
  <div class="- topic/title bookmap/booktitle title booktitle">
    <span class="- topic/ph bookmap/booklibrary ph booklibrary">Retro Tools</span>
    <span class="- topic/ph bookmap/mainbooktitle ph mainbooktitle">Product
      tasks</span>
    <span class="- topic/ph bookmap/booktitlealt ph booktitlealt">Tasks and what they
      can do</span>
  </div>
</div>
</div>
...

```

3. The cover image (for example, named `cover.template.svg`) should display `<bookmeta>` node information (author, creation date, and copyright information) and the `<mainbooktitle>` will be displayed rotated.

```

<svg version="1.1" id="Layer_1" xmlns="http://www.w3.org/2000/svg"
  xmlns:xlink="http://www.w3.org/1999/xlink" x="0px" y="0px"
  viewBox="0 0 610 790" style="enable-background:new 0 0 610 790;" xml:space="preserve">
<style type="text/css">
  .st0{fill:url(#SVGID_1_);}
  .st1{opacity:0.31;fill:#FFFFFF;enable-background:new    ;}
  .st2{fill:#FFFFFF;}
  .st3{fill:#F04C3E;}
  .st4{fill:none;stroke:#FFFFFF;stroke-width:0.3685;stroke-miterlimit:2.6131;}
  .st5{font-family:'Arial';}
  .st6{font-size:24.3422px;}
  .st7{font-size:10px;}
  .st8{font-size:63.3422px;font-weight:bold;}
  .st9{fill:#F04C3E;stroke:#000000;stroke-miterlimit:10;}
</style>
<linearGradient id="SVGID_1_" x1="305.6" y1="799.9393" x2="305.6" y2="8.9393"
  gradientUnits="userSpaceOnUse">
  <stop offset="1.848748e-02" style="stop-color:#2F639F"/>
  <stop offset="1" style="stop-color:#1C3E72"/>
</linearGradient>
<rect x="0.1" y="0.1" class="st0" width="611" height="791"/>
<path class="st1" d="M143.4,700.51381.3-381.3c35.2-35.2,35.2-92.3,
  0-127.5L332.1-0.9H0.1v685.6115.8,15.8C51.1,735.7,108.2,735.7,143.4,700.5z"/>
<path class="st2" d="M1.5,617.6c29.2,22.6,71.4,20.5,98.2-6.3l315.2-315.2c29.1-29.1,
  29.1-76.3,0-105.4L224.8,0.5H1.5V617.6z"/>

```

```

<text transform="matrix(1 0 0 1 419.998 615.9277)" class="st2 st5 st6">
  ${//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/author')]}
</text>
<text transform="matrix(1 0 0 1 419.998 660.9277)" class="st2 st5 st6">
  ${//*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/created')]/@date}
</text>
<text transform="matrix(1 0 0 1 471.998 749.9277)" class="st2 st5 st7">@
  ${
    concat(/*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class,
'bookmap/bookrights')]
    /*[contains(@class, 'bookmap/organization')], ' ',
    /*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'bookmap/bookrights')]
    /*[contains(@class, 'bookmap/copyrlast')]/*[contains(@class, 'bookmap/year')]
  }
</text>
<text transform="matrix(0.7071 -0.7071 0.7071 0.7071 88.1369 568.6693)" class="st9 st5 st8">
  ${
    /*[contains(@class, 'front-page/front-page-title')]
    /*[contains(@class, 'bookmap/mainbooktitle')]
  }
</text>
</svg>

```

**Notes:**

- XPath expressions are not expanded if the SVG template is open in **Author** mode.
- XPath expressions can be tested (without `${}`) using the XPath/XQuery Builder view.
- XPath *Conditional Expressions*, *For Expressions*, and *Let Expressions* are supported.

**Important:**

- If you received the SVG image from someone else (e.g. a graphics designer), make sure that the text from the image was not converted to glyph shapes and that it is rendered using the `<text>` element.
- The SVG `<text>` element does not wrap the text if it overflows the image. If you have longer text that needs to be rendered, you might consider using multiple `<text>` elements and more evolved XPath expressions (for example, using the `substring()` function) to place the text on multiple lines.

**Tip:**

You can ask a designer to fill the image with some placeholders that you can later find and replace with your XPath expressions. In the above SVG, the designer could place the text

Here comes the author, that you replace with `${/*[contains(@class, 'bookmap/bookmeta')]/*[contains(@class, 'topic/author')]}:`

```
<text transform="matrix(1 0 0 1 419.998 615.9277)" class="st2 st5 st6">
```

Here comes the author

```
</text>
```

4. The CSS stylesheet should declare the template file as a **background-image** for the cover (on page 1609). Also the following example hides the `<mainbooktitle>` and its bookmark (it is displayed in the template):

```
@page front-page {
  background-image: url("cover.template.svg");
  background-repeat: no-repeat;
  background-size: 100% 100%;
}

*[class ~= "bookmap/booktitle"] {
  display: none;
}

*[class ~= "front-page/front-page-title"]
> *[class ~= "bookmap/booktitle"]
> *[class ~= "bookmap/mainbooktitle"] {
  bookmark-level: 0;
}
```

5. After the transformation, the final document cover will look like this:

[How to Use XPath Expressions in CSS \(on page 1573\)](#)

[SVG Templates](#)

Metadata

DITA has a solid vocabulary for specifying metadata. There are `<prolog>` elements in the topics, and `<topicmeta>`, `<bookmeta>` elements in the bookmaps. They can be used to define authors, dates, audiences, organizations, etc. See: <https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/metadata-in-maps-and-topics.html>

It is up to you to decide where this information should be presented, in the PDF content or in the PDF document properties.

Metadata - XML Fragment

In the merged map file (*on page 1569*), the metadata section is placed inside the `<oxy:front-page>` element. This is different from the original placement in the map or bookmap (after the title), but allows for the usage of information from it in the title page.

Bookmaps

This is an example of a section taken from a merged bookmap. It only contains some of the possible metadata elements. The `bookmeta` metadata section is inherited from `topicmeta`:

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
  xmlns:opentopic-index="http://www.idiominc.com/opentopic/index" cascade="merge"
  class="- map/map bookmap/bookmap "
  ditaarch:DITAArchVersion="1.3" >

  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

    <bookmeta xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
      class="- map/topicmeta bookmap/bookmeta ">
      <author class="- topic/author ">Howe Tudit</author>
      <bookid class="- topic/data bookmap/bookid ">
      <isbn class="- topic/data bookmap/isbn ">071271271X</isbn>
      <booknumber class="- topic/data bookmap/booknumber ">SG99-9999-00</booknumber>
      <maintainer class="- topic/data bookmap/maintainer ">
      <organization class="- topic/data bookmap/organization ">ACME Tools</organization>
      <person class="- topic/data bookmap/person "/>
    </maintainer>
  </bookid>
  <bookrights class="- topic/data bookmap/bookrights ">
    ...
    <bookowner class="- topic/data bookmap/bookowner ">
  </organization class="- topic/data bookmap/organization ">ACME Tools, Inc.</organization>
  </bookowner>
</bookrights>
```

```

</bookmeta>

<oxy:front-page-title>
    ...
...

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div
  class="- map/map bookmap/bookmap bookmap" ... >

  <div class=" front-page/front-page front-page">

    <div
      class="- map/topicmeta bookmap/bookmeta boometa">
      <div class="- topic/author author">Howe Tudit</div>
      <div class="- topic/data bookmap/bookid bookid">
        <div class="- topic/data bookmap/isbn isbn">071271271X</div>
        <div class="- topic/data bookmap/booknumber booknumber">SG99-9999-00</div>
        <div class="- topic/data bookmap/maintainer maintainer">
          <div class="- topic/data bookmap/organization organization">ACME Tools</div>
          <div class="- topic/data bookmap/person person"/>
        </div>
      </div>
      <div class="- topic/data bookmap/bookrights bookrights">
        ...
        <div class="- topic/data bookmap/bookowner bookowner">
          <div class="- topic/data bookmap/organization organization">
            ACME Tools, Inc.
          </div>
        </div>
      </div>
    </div>
  </div>
  <div class=" front-page/front-page-title front-page-title">
    ...
...

```

Maps

The maps have a more simple structure, they use the `<topicmeta>` element for metadata sections. This is also a simplified example, as there may be many more elements in the metadata section:

```

<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
      xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
      cascade="merge" class="- map/map "
      ditaarch:DITAArchVersion="1.3">
  ...

<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">

  <topicmeta class="- map/topicmeta ">
    <author class="- topic/author ">Dan C</author>
    <metadata class="- topic/metadata ">
      <prodinfo class="- topic/prodinfo ">
        <prodname class="- topic/prodname ">oXygen PDF CSS DITA Plugin</prodname>
      </prodinfo>
    </metadata>
    <audience class="- topic/audience "/>
  </topicmeta>
  ...

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
      xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
      cascade="merge" class="- map/map "
      ditaarch:DITAArchVersion="1.3">
  ...

<div class=" front-page/front-page front-page">

  <div class="- map/topicmeta topicmeta">
    <div class="- topic/author author">Dan C</div>
    <div class="- topic/metadata metadata">
      <div class="- topic/prodinfo prodinfo">
        <div class="- topic/prodname prodname">oXygen PDF CSS DITA Plugin</div>
      </div>
    </div>
    <div class="- topic/audience audience"/>
  </topicmeta>
  ...

```

Metadata - Built-in CSS rules

The `[PLUGIN_DIR]/css/print/p-meta.css` file contains the rules that extract metadata.

How to Create a Searchable PDF

To make a PDF searchable, you need to add some `<keyword>` or `<indexterm>` elements inside bookmaps, maps, or topics. Most of the search engines will parse the resulting document and extract those keywords and create a search base.

Note:

Both `<keyword>` and `<indexterm>` elements can be combined inside the `<keywords>` element. They will be equally processed by the search engine.

In the generated PDF, keywords are displayed in the Document Properties.

Bookmaps

If you want your keywords to appear inside a bookmap, you need to define them inside the `<bookmeta>` element:

```
<bookmap>
...
<bookmeta>
  <keywords>
    <keyword>web server</keyword>
    <keyword>hard disk</keyword>
  </keywords>
</bookmeta>
```

Maps

If you want your keywords to appear inside a map, you need to define them inside the `<topicmeta>` element:

```
<map>
...
<topicmeta>
  <keywords>
    <keyword>flowers</keyword>
    <indexterm>care and preparation</indexterm>
    <keyword>seasons</keyword>
  </keywords>
</topicmeta>
```

Topics

If you want your keywords to appear inside one or more topics, you need to define them inside the `<prolog>` element:

```

<topic>
  ...
  <prolog>
    <metadata>
      <keywords>
        <indexterm>iris</indexterm>
      </keywords>
    </metadata>
  </prolog>

```

**Warning:**

Keywords must be at map level or at topic level, you cannot combine them.

How to Add the Publication Audience to the Custom PDF Metadata

The audience element indicates the users the publication is addressing. This can be placed inside a `<topicmeta>` element in a `<map>` as in the following example:

```

<map>
  ...
  <topicmeta>
    ...
    <audience type="programmer" job="programming" experiencelevel="expert"/>

```

To collect the `@type` attribute, add the following in your customization CSS (on page 1567):

```

*[class ~= "map/map"] > *[class ~= "map/topicmeta"] > *[class ~= "topic/audience"] {
  -oxy-pdf-meta-custom: "Audience" attr(type);
}

```

**Notice:**

It is best to use the class selector (such as `*[class ~= "map/topicmeta"]`) instead of `topicmeta` to cover cases where the elements are specialized (for instance, in a bookmap the `bookmeta` is a `topicmeta`, so your selector will also function for bookmaps, not only simple maps.

**Note:**

The selector begins with `map >` to choose the `<topicmeta>` that is a direct child of the map, not other `<topicmeta>` elements from other `<topicref>` elements.

**Tip:**

You can define multiple key value pairs by separating them with commas:

```
-oxy-pdf-meta-custom: "Audience" attr(type), "Job" attr(job)
```

The metadata is displayed in the **Custom** tab of the **Document Properties** dialog box from Acrobat Reader:

How to Show Metadata in the Cover Page

The following CSS extensions are used in the subsequent examples:

- **oxy_xpath** - Executes an XPath expression and returns string content. Use this whenever you need to extract data from an element other than the one matched by the CSS rule selector.
- **:after(N)** - Creates more than one *after* pseudo-element. The argument value represents how far the generated content is from the real content. For example, in the [second code snippet in the next section \(on page 1631\)](#), the content of the `:after` is closer to the title (upper) than the content of the `:after(2)`.

**Note:**

The `attr()` CSS function can also be used but it is limited to extracting attribute values from the matched element.

Processing Metadata for Bookmaps

Suppose you need to present the **Author** and the **ISBN** (when it exists) just under the publication title and suppose your bookmap contains:

```
<bookmap id="taskbook">
  <booktitle>
    <booklibrary>Retro Tools</booklibrary>
    <mainbooktitle>Product tasks</mainbooktitle>
    <booktitlealt>Tasks and what they can do</booktitlealt>
  </booktitle>
  <bookmeta>
    <author>Howe Tudit</author>
    <critdates>
      <created date="1/1/2015"/>
      <revised modified="3/4/2016"/>
      <revised modified="3/5/2016"/>
    </critdates>
    <bookid>
      <isbn>071271271X</isbn>
      <booknumber>SG99-9999-00</booknumber>
    ...
```

The entire `<booktitle>` element content is displayed on the first page of the PDF, so if you need to add the information after it, in your [customization CSS \(on page 1567\)](#), add the following CSS rules:

```
*[class ~= "bookmap/booktitle"]:after {
  display: block;
  content: "by " oxy_xpath('//*[contains(@class, " bookmap/bookmeta ")]/*[contains(@class, "
topic/author ")]/text()');
  margin-top: 4em;
  text-align: center;
  color: gray;
}
*[class ~= "bookmap/booktitle"]:after(2) {
  display: block;
  content: oxy_xpath('if(//*[contains(@class, " bookmap/isbn ")]) then concat("ISBN
", /*[contains(@class, " bookmap/isbn ")]/text() else "");
  text-align: center;
```

```
color: gray;
}
```

Processing Metadata for DITA Maps

Suppose you need to present the **Revision Date** just under the publication title and suppose your DITA map contains:

```
<map>
  <title>Growing Flowers</title>
  <topicmeta>
    <critdates>
      <revised modified="2021-04-26"/>
    </critdates>
  ...
```

The entire `<title>` element content is displayed on the first page of the PDF. If you need to add the information after it, add the following CSS rules in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "front-page/front-page-title"] > *[class ~= "topic/title"]:after {
  display: block;
  content: "last revision " oxy_xpath('//*[contains(@class, " map/topicmeta ")] [1] \
  /*[contains(@class, " topic/revised ")]/@modified');
  margin-top: 4em;
  text-align: center;
  color: gray;
}
```

Note:

The `[1]` predicate is used to avoid duplicated results as the `topicmeta` is included in all children topics.

Generating Synthetic Pages for Metadata

Suppose you need to show this information on a page that follows the title page, instead of on the title page. In this case, you need to prepare a named page and place the content in it. Add the following rules in your [customization CSS \(on page 1567\)](#):

```
@page page-for-meta {
  background-color: yellow; /* Just to see it better */
  @top-left-corner {
    content: ""; /* Remove the default header */
  }
  @top-right-corner {
    content: ""; /* Remove the default header */
  }
}
```

```

}

*[class ~= "bookmap/booktitle"]:after {
    page: page-for-meta;
}

*[class ~= "bookmap/booktitle"]:after(2) {
    page: page-for-meta;
}

```

How to Show Metadata in the Header or Footer

The header and footer are composed of page margin boxes that can be populated with static text by using *string-sets*.

If you need to add some of the map metadata to the header of the front page (for example, the **creation date**), add the following CSS rules in your [customization CSS \(on page 1567\)](#):

```

*[class ~= "front-page/front-page"] >
  *[class ~= "map/topicmeta"] >
    *[class ~= "topic/critdates"] >
      *[class ~= "topic/created"]{
        string-set: mapcreated attr(date);
      }

@page front-page {
  @top-center {
    content: "Created: " string(mapcreated);
  }
}

```

Note:

The *front-page* is the name of a page that used to present the element with the class "front-page/front-page". The above page rule is combined with the default styles.

How to Show Metadata Information (Revision History) in the Topic Prologue

This topic explains how to present metadata information that is normally hidden in the published output. For the example that follows, this will be the revision history list:

```

<task id="task_3ml_qm3_rf">
  <title>Removing the battery</title>
  <shortdesc/>
  <prolog>
    <change-historylist>

```

```

    <change-item>
      <change-revisionid>abd3</change-revisionid>
      <change-completed>Build no 1.</change-completed>
    </change-item>
    <change-item>
      <change-revisionid>bc72</change-revisionid>
      <change-completed>Build no 2.</change-completed>
    </change-item>
  </change-historylist>
  ....

```

By default, the `<prolog>` element is hidden (`display:none`) and has several properties that make it collapse, even if the display property is changed.

- It has a transparent color.
- The font has size zero.
- The width and height values are zero.

Start by resetting the prolog properties, but only for prologs that contains a history list. The others will be kept hidden.

```

*[class~="topic/prolog"]:has(*[class~="relmgmt-d/change-historylist"]){
  display:block;
  color:inherit;
  font-size:1rem;
  width:auto;
  height:auto;
}

```

Next, the following will keep the children of the prolog hidden (other than the change history):

```

*[class~="topic/prolog"]:has(*[class~="relmgmt-d/change-historylist"]) >
*:not([class~="relmgmt-d/change-historylist"]){
  display:none;
}

```

The `<change-item>`, `<change-revisionid>`, and `<change-completed>` (like the descendents of the `<change-historylist>`) are specializations of the `topic/data` element and are also hidden in the output, so you need to make them visible. In the following selector, you can add more classes, depending on what elements you want to be visible.

```

*[class~="relmgmt-d/change-item"],
*[class~="relmgmt-d/change-revisionid"],
*[class~="relmgmt-d/change-completed"]{
  display:block;
}

```

Now some styling for the entire list:

```
*[class~="relmgmt-d/change-historylist"] {
    font-size: 1rem;
    border: 3pt solid silver;
    padding: 0.5em;
}
*[class~="relmgmt-d/change-historylist"]:before {
    content: "Revision History:";
    font-weight: bold;
}
```

And the child elements:

```
/* Example of styling some of the descendents of the history list. */
*[class~="relmgmt-d/change-item"] {
    margin: 1em;
}
*[class~="relmgmt-d/change-revisionid"]:before {
    content: "Revision ID: " !important;
    font-weight: bold;
}
*[class~="relmgmt-d/change-completed"]:before {
    content: "Completed: " !important;
    font-weight: bold;
}
```

In the output, the history list is now visible:

Removing the battery

```
Revision ID: abd3
Completed: Build no 1.

Revision ID: bc72
Completed: Build no 2.
```

How to Remove or Change the PDF Keywords

The keywords defined in the prolog sections of topics are automatically collected and set as PDF keywords. These are shown by the readers in the PDF document properties window.

If you need to remove them, you can use the following CSS snippet in your [customization CSS \(on page 1567\)](#):

```
:root {
  -oxy-pdf-meta-keywords: "";
}
```

To change them, if you have a hard-coded list, you just enumerate each of them in the property content, separating them with comma:

```
:root {
  -oxy-pdf-meta-keywords: "alpha, beta, gamma";
}
```

If you need to extract them by other criteria from the merged map, you can use the `oxy_xpath()` function instead of the hard-coded list.

How to Remove the PDF Publication Title Property

The title defined in the PDF reader is automatically collected from the map's main title.

If you want to display the map name instead of the title, you can use one of the following rules in your customization CSS (*on page 1567*):

```
/*
 * Titles (maps).
 */
*[class ~= "front-page/front-page-title"] *[class ~= "topic/title"]:not([class
~= 'bookmap/booktitle']) {
  -oxy-pdf-meta-title: unset;
}
```

```
/*
 * Titles (bookmaps).
 */
*[class ~= "front-page/front-page"] *[class ~= "bookmap/booktitle"] > *[class
~= "bookmap/mainbooktitle"] {
  -oxy-pdf-meta-title: unset;
}
```

How to Change the PDF Publication Title Property

The `<title>` element of a bookmap is quite complex and contains elements for the book library and an alternate title:

```
<booktitle>
  <booklibrary>Retro Tools</booklibrary>
  <mainbooktitle>Main Book Title</mainbooktitle>
  <booktitlealt>Book Title Alternative</booktitlealt>
</booktitle>
```

For the publication title, the built-in CSS uses only the content of the `<mainbooktitle>`. If you want to collect all of the text from the `<booktitle>`, you can add the following rule to your [customization CSS \(on page 1567\)](#):

```
:root {
  -oxy-pdf-meta-title: oxy_xpath('(//*[contains(@class, "bookmap/booktitlealt")][1]/text()');
  -oxy-pdf-meta-description: "";
}
```

An XPath expression is used to collect all the `<booktitlealt>` elements from the merged map, select the first one, then use its text.

The built-in CSS uses the `<booktitlealt>` as the PDF description. In the example above, this property is cleared since it was moved as a title.

How to Use Data Elements from the Map to Create Custom PDF Metadata

To use a key value in the CSS, the key must be referenced from the content (either a topic or map).

If you do not have it referenced, you may force a reference by using the `<topicmeta>` or `<bookmeta>` section of your map and a `<data>` element. This has no effect on the published content, but allows the CSS rules to use its content.

```
<bookmeta>
  ....
  <data keyref="my_key" />
  ....
</bookmeta>
```

This is expanded in the merged HTML file to:

```
<div class="- map/topicmeta bookmap/bookmeta topicmeta bookmeta">
  ...
  <div keyref="my_key" class="- topic/data data">
    <div class="- topic/keyword keyword">KEY VALUE</div>
  </div>
  ...
</div>
```

Suppose that you need the expanded key value in the footer of the publication. You can define a string-set on this `data` element:

```
*[class ~= "topic/data"][keyref="my_key"] {
  string-set: key-string content(text);
}
@page {
  @bottom-left {
    content: "My key is: " string(key-string) !important;
```

```
}
}
```

Or you can use the value from a `:before` pseudo-element, like the one for the title:

```
*[class ~= "topic/title"]:before {
  content: oxy_xpath("//*[@contains(@class, 'topic/data')][@keyref = 'my_key']//text());
}
```

Another use-case is to use the key as a source for a custom PDF document property:

```
*[class ~= "topic/data"][keyref="my_key"] {
  -oxy-pdf-meta-custom: attr(keyref) content(text);
}
```

How to Control the PDF Viewer

The PDF document may contain settings for the PDF Viewer. This helps to make the viewing experience common for all of the readers. For example, you can specify the zoom level that the document is presented, or whether the outline view should be displayed.

There are several CSS properties you can use. These properties should be set on the root element. If they are set on multiple elements, the first one will be taken into account.

Examples

- To hide the PDF Viewer toolbar and menu bar:

```
:root {
  -oxy-pdf-viewer-hide-menubar: true;
  -oxy-pdf-viewer-hide-toolbar: true;
}
```

- To make the document be displayed with a different zoom level:

```
:root {
  -oxy-pdf-viewer-zoom: 50%;
}
```

- To make the PDF Viewer just as large as the displayed document (e.g. if there is a zoom level that makes the document smaller, then the window of the viewer will be just as big as the page):

```
:root {
  -oxy-pdf-viewer-fit-window: true;
}
```

- If you need the pages to be displayed as a single continuous column (to be able to scroll in a single view port), use:

```
:root {
  -oxy-pdf-viewer-page-layout: one-column;
}
```

The supported include: `single-page`, `two-columns-left`, and [more](#).

- To make the document outline view visible, use:

```
:root {
  -oxy-pdf-viewer-page-mode: use-outlines;
}
```

The supported values include: `use-thumbs`, `use-none`. For more details, see the list of [Chemistry extension CSS properties](#).

Front Matter and Back Matter

The *front matter* is a series of topics that are usually placed after the cover page and before the TOC or the content.

The *back matter* is a series of topics that are usually placed after the content of the book.

Front Matter and Back Matter - XML Fragment

In the merged map file ([on page 1569](#)), the *frontmatter* topic references are wrapped in a `<frontmatter>` element that has the class `bookmap/frontmatter`. Then, the referenced content is marked with the attribute `@is-frontmatter="true"`:

```
<bookmap xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page class="- front-page/front-page ">
    ...
  </oxy:front-page>
  <opentopic:map xmlns:ot-placeholder="http://suite-sol.com/namespaces/ot-placeholder"
  class="- toc/toc ">
    ...
    <frontmatter xmlns:dita-ot="http://dita-ot.sourceforge.net/ns/201007/dita-ot"
    class="- map/topicref bookmap/frontmatter ">
      ...
      <topicref class="- map/topicref " href="#unique_1" type="concept">
        ...
      </frontmatter>
    </opentopic:map>
    <concept
      class="- topic/topic concept/concept "
      is-frontmatter="true"
      topicrefclass="- map/topicref bookmap/bookabstract " ...>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```
<div xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <div class=" front-page/front-page front-page">
    ...
  </div>
  <div class="- toc/toc toc">
    <div class="- map/topicref bookmap/frontmatter topicref frontmatter">
      <div href="#unique_2" type="topic" class="- map/topicref topicref">
        ...
      </div>
    </div>
  </div>
  <article
    class="- topic/topic concept/concept topic concept nested0"
    is-frontmatter="true"
    topicrefclass="- map/topicref bookmap/bookabstract " ...>
```

Note:

The process also applies for the backmatter topic references inside a `<backmatter>` element with the `bookmap/backmatter` class and referenced content with the `@is-backmatter="true"` attribute both in the merged map and merged HTML files.

Front Matter and Back Matter - Built-in CSS

The built-in CSS rules are in `[PLUGIN_DIR]/css/print/p-bookmap-frontmatter-backmatter.css`. By default, it associates the top-level topics that do not represent chapters to a `matter-page` style of page layout. Each child topic starts on a new page.

Related Information:

[Page Headers and Footers \(on page 1582\)](#)

How to Remove Page Breaks Between Front Matter Child Topics

If you do not like the fact that all the topics that enter a bookmap frontmatter start on a new page, you can disable this by using the following rules in your *customization CSS (on page 1567)*:

```
*[class ~= "map/map"] > *[class ~= "topic/topic"][is-frontmatter]{
  page-break-before: auto;
}
```

How to Style the Front Matter and Back Matter Topics

Style all the Topics with the Same Aspect

All the topics referenced from the `<frontmatter>` and `<backmatter>` bookmap elements are formatted using the `matter-page` as defined in [Default Page Definitions \(on page 1575\)](#). In the merged file, the `<backmatter>` and `<frontmatter>` elements are omitted, and their child topic content is matched using a CSS rule like the one below:

```
*[class ~= "map/map"] > *[class ~= "topic/topic"][is-backmatter],
*[class ~= "map/map"] > *[class ~= "topic/topic"][is-frontmatter]{
  page: matter-page;
  ...
}
```

Style the Topics Depending on Their Role

There might be cases when you need to distinguish between certain types of topics that have different roles in your publication:

- Preface
- Notice
- Abstract
- Copyright

These are referenced from the DITA map by specialized `<topicref>` elements, with different class attribute values.

The class attribute values are then passed by the transformation process onto the corresponding topic elements from the merged map content. For example, a topic that was referenced by a `<preface>` map element now has a "bookmap/preface" value in its `@topicrefclass` attribute:

```
<topic
  class="- topic/topic "
  id="unique_1"
  topicrefclass="- map/topicref bookmap/preface " .. >
  ...
</topic>
```

This can be used to match and apply various styling choices, or even a particular page layout:

```
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
```

```
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}
```

Numbering

The topics in this section contain some technical details in case you need to fine-tune the way the numbering works.

Numbering - Built-in CSS

The built-in CSS rules are in:

- `[PLUGIN_DIR]/css/print/p-numbering-shallow.css`
- `[PLUGIN_DIR]/css/print/p-numbering-deep.css`
- `[PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope.css`
- `[PLUGIN_DIR]/css/print/p-numbering-deep-chapter-scope-no-page-reset.css`

The first CSS (shallow) contains rules that add a "Chapter NN" before the first-level topics from the publication, the second one (deep) contains rules that add a deep structure of counters on all topics referenced from the map (at any level), the third one (chapter-scope) creates a chapter scope-oriented numbering (meaning that the numbering for pages, tables, figures, and links to them are reset for each chapter), and the last one is similar to the third except that page numbers do not reset. For more details, see [Numbering Types \(on page 1646\)](#).

Numbering - Input XML Fragments

The numbering affects multiple logical parts of your publication, the table of contents, headers/footers, chapter titles, figures and tables titles:

The Table of Contents

The table of contents is a tree of `<topicref>` elements.

```
<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
  <oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author"
    class=" front-page/front-page ">
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class=" toc/toc ">
    <title class="- topic/title ">Publication Title</title>
    <topicref is-chapter="true" class="- map/topicref " ... >
      <topicmeta class="- map/topicmeta " ... >
        <navtitle href="#unique_1" class="- topic/navtitle ">Overview</navtitle>
        ...
      </topicref>
    </opentopic:map>
  </map>
```

```

</topicmeta>
<topicref class="- map/topicref " ...>
  <topicmeta class="- map/topicmeta " data-topic-id="dcp_resources">
    <navtitle href="#unique_2" class="- topic/navtitle ">Resources</navtitle>
    ...
  </topicmeta>
</topicref>
...
</opentopic:map>
...
</map>

```

**Note:**

The `<opentopic:map>` element contains the effective table of contents structure.

**Note:**

The TOC items are the elements with the class: `- map/topicref`.

**Note:**

The ones identified as chapters have the `@is-chapter` attribute set.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- map/map map" ...>
  <div
    class=" front-page/front-page front-page">
    ...
  </div>
  <div class=" toc/toc toc">
    <div class="- topic/title title">Publication Title</title>

    <div is-chapter="true" class="- map/topicref topicref" ... >
      <div class="- map/topicmeta topicmeta" ... >
        <div href="#unique_1" class="- topic/navtitle navtitle">Overview</div>
        ...
      </div>
    <div class="- map/topicref " ...>
      <div class="- map/topicmeta " data-topic-id="dcp_resources">
        <div href="#unique_2" class="- topic/navtitle ">Resources</div>
        ...
      </div>
    </div>
  </div>

```

```

        </div>
    </div>
    ...
</div>
...
</div>

```

The Header and Footers

These are based on string sets generated for the titles. The complete set of strings is defined in:

[INSTALLATION_DIR]/css/print/p-pages-and-headers.css.

The CSS rules that build the string sets are matching the map title from the front page and the titles from the content.

```

<oxy:front-page xmlns:oxy="http://www.oxygenxml.com/extensions/author">
    <oxy:front-page-title>
        <title class="- topic/title ">Publication Title</title>
    </oxy:front-page-title>
</oxy:front-page>

```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```

<div class=" front-page/front-page front-page">
    <div class=" front-page-title/front-page-title front-page-title">
        <div class="- topic/title title ">Publication Title</div>
    </div>
</div>

```

The main content is organized as follows:

```

<map xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/" ...>
    ...
    <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
        ...
    </opentopic:map>

    <topic is-chapter="true" oid="dcpv_overview">
        <title class="- topic/title ">Overview</title>
        <body class="- topic/body ">
            ...
        </body>
        <topic class="- topic/topic " id="unique_2" oid="dcpv_resources">
            <title class="- topic/title ">Resources</title>
            ...
        </topic>

```

```

<topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
  <title class="- topic/title ">Parameters</title>
  ...
</topic>
</topic>

```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```

<div class=" map/map map" ...>
  ...
  <div class=" toc/toc toc">
    ...
  </div>

  <div is-chapter="true" oid="dcpp_overview" class="- topic/topic topic">
    <div class="- topic/title title">Overview</div>
    <div class="- topic/body body">
      ...
    </div>
    <div class="- topic/topic topic" id="unique_2" oid="dcpp_resources">
      <div class="- topic/title title">Resources</div>
      ...
    </div>
    <div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
      <div class="- topic/title title">Parameters</div>
      ...
    </div>
  </div>
</div>

```

Note:

The topic content comes after the `<opentopic:map>` element.

Note:

The child topics are the elements that have the class `- topic/topic` included in the parents.

Note:

The ones identified as chapters have the `@is-chapter` attribute set.

The Titles of Chapters

The titles from the content are children of the topics:

```
<topic class="- topic/topic " id="unique_2" oid="dcpp_parameters">
  <title class="- topic/title ">Parameters</title>
  ...
</topic>
```

For the **DITA Map PDF - based on HTML5 & CSS** transformations:

```
<div class="- topic/topic topic" id="unique_2" oid="dcpp_parameters">
  <div class="- topic/title title ">Parameters</div>
  ...
</div>
```

Note:

The title elements have the class: `- topic/title`. The actual element name can be different.

Numbering Types

The type of numbering that appears in your publication is controlled by the `args.css.param.numbering` parameter.

This parameter activates various sets of CSS rules from the built-in CSS. By default, only the first-level topics (the chapters) are numbered (`shallow` numbering). The following values are accepted:

Table 41. Types of Numbering

Value	Sections/ Nested Topics		Figures & Tables	Pages
	Chapters			
shallow	num-bered	no	counted from the start of the publi-cation	from the start of the publi-cation
deep	num-bered	numbered	counted from the start of the publi-cation	from the start of the publi-cation
deep-chapter-scope	num-bered	numbered	numbering is restarted at the be-ginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list of tables and list of figures sec-tions	restarted at the beginning of each chapter
deep-chap-ter-scope-no-page-reset	num-bered	numbered	numbering is restarted at the be-ginning of each chapter, adds the chapter number in their titles (and in the links to them), and in the list	from the start of the publi-cation

Table 41. Types of Numbering (continued)

Value	Chapters	Sections/ Nested Topics	Figures & Tables	Pages
			of tables and list of figures sections	

**Note:**

When using any of the deep numbering types, no distinction is made between sections and nested topics. For example, if a topic contains two sections, followed by another nested topic, the sections will be numbered with 1 and 2, and the nested topic with 3.

**Notice:**

The `deep-chapter-scope` and `deep-chapter-scope-no-page-reset` values are only available for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Examples**Shallow**

Each chapter (or first-level topic) is numbered, but sections/nested topics are not numbered. Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

```
Chapter 1. First Chapter
  Page 1
    Topic
      Section
        Table 1
        Table 2
      Topic
        Section
  Page 2
    Table 3
Chapter 2. Second Chapter
  Page 3
    Topic
      Table 4
      Table 5
    Topic
  Page 4
```

It will result in the following content inside the PDF:

```

Chapter 1. Introduction.....1
Chapter 2. Care and Preparation.....2
    Pruning.....2
    Garden Preparation.....3
Chapter 3. Flowers by Season.....4
    Spring Flowers.....4
        Iris.....4
        Snowdrop.....6
    ...

List of Figures
    Figure 1: Iris

List of Tables
    Table 1: Flowers
    
```

Deep

All chapters (or first-level topics) and sections/nested topics are numbered (these are also prefixed with the chapter number). Figures, tables, and pages are numbered sequentially from the start of the publication and they do not reset.

```

1. First Chapter
    Page 1
        Topic 1.1
            Table 1
        Topic 1.2
            Table 2
    Page 2
        Table 3
2. Second Chapter
    Page 3
        Topic 2.1
            Table 4
            Table 5
        Topic 2.2
    Page 4
    
```

It will result in the following content inside the PDF:

```

1. Introduction.....1
2. Care and Preparation.....2
    2.1. Pruning.....2
    2.2. Garden Preparation.....3
3. Flowers by Season.....4
    
```

3.1. Spring Flowers.....	4
3.1.1. Iris.....	4
3.1.2. Snowdrop.....	6
...	
List of Figures	
Figure 1: Iris	
List of Tables	
Table 1: Flowers	

Deep Chapter Scope

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, pages, figures, and table counters (and links to them) restart at each chapter. The general cross reference links also display the chapter number before the page number to clearly specify the target.

1. First Chapter	
Page 1.1	
Topic 1.1	
Table 1-1	
Link to page 2.2	
Topic 1.2	
Page 1.2	
Table 1-2	
2. Second Chapter	
Page 2.1	
Topic 2.1	
Table 2-1	
Table 2-2	
Table 2-3	
Topic 2.2	
Table 2-4	
Page 2.2	
Link to page 1.1	

It will result in the following content inside the PDF:

1. Introduction.....	1
2. Care and Preparation.....	1
2.1. Pruning.....	1
2.2. Garden Preparation.....	2
3. Flowers by Season.....	1
3.1. Spring Flowers.....	1

```

    3.1.1. Iris.....1
    3.1.2. Snowdrop.....3
    ...

List of Figures
    Figure 3-1: Iris

List of Tables
    Table 2-1: Flowers
    
```

Deep Chapter Scope No Page Reset

Each chapter (or first-level topic) is independent (so it can be read separately, as a separate part of your publication). The sections/nested topics, figures, and table counters (and links to them) restart at each chapter, but the page numbers do not reset. The generic cross reference links contain only the page number.

```

1. First Chapter
    Page 1
        Topic 1.1
            Table 1-1
            Link to page 4
        Topic 1.2
    Page 2
        Table 1-2
2. Second Chapter
    Page 3
        Topic 2.1
            Table 2-1
            Table 2-2
            Table 2-3
        Topic 2.2
            Table 2-4
    Page 4
        Link to page 1
    
```

It will result in the following content inside the PDF:

```

1. Introduction.....1
2. Care and Preparation.....2
    2.1. Pruning.....2
    2.2. Garden Preparation.....3
3. Flowers by Season.....4
    3.1. Spring Flowers.....4
        3.1.1. Iris.....4
    
```

```

3.1.2. Snowdrop.....6
...

List of Figures
Figure 3-1: Iris

List of Tables
Table 2-1: Flowers

```

**Tip:**

When using deep numbering, if you want to exclude sections from being numbered, see [How to Include Topic Sections in TOC \(on page 1653\)](#).

How to Reset Page Numbering at First Chapter/Part

By default, pages are numbered from the start of the publication, but in some cases, you may need to restart the page numbering at the first chapter of your publication.

**Warning:**

The following sections do not apply for `args.css.param.numbering="deep-chapter-scope"` because it already define a specific numbering scheme that resets the page number at each chapter.

Reset Page Numbering in Shallow Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="shallow"` parameter value is set, use the following rules in your [customization CSS \(on page 1567\)](#):

```

*[class ~= "map/map"] > *:not([class ~= "topic/topic"][is-chapter]) + *[class
  ~= "topic/topic"][is-chapter] {
  counter-reset: page 1;
}

*[class ~= "map/map"] > *:not([class ~= "topic/topic"][is-part]) + *[class
  ~= "topic/topic"][is-part] {
  counter-reset: page 1 chapter;
}

```

Reset Page Numbering in Deep Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep"` parameter value is set, use the following rules in your [customization CSS \(on page 1567\)](#):

```

*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-chapter]) + *[class
  ~= "topic/topic"][is-chapter] {
  counter-reset: page 1 section1;
}

```

```

}
*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-part]) + *[class
~= "topic/topic"][is-part] {
    counter-reset: page 1 chapter chapter-and-sections;
}

```

Reset Page Numbering in Deep Chapter Scope No Page Reset Context

To reset the page counter at the first part/chapter when the `args.css.param.numbering="deep-chapter-scope-no-page-reset"` parameter value is set, use the following rules in your [customization CSS \(on page 1567\)](#):

```

*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-chapter]) + *[class
~= "topic/topic"][is-chapter] {
    counter-reset: page 1 section1 tablecount figcount !important;
}
*[class ~= "map/map"][numbering ^= 'deep'] > *:not([class ~= "topic/topic"][is-part]) + *[class
~= "topic/topic"][is-part] {
    counter-reset: page 1 chapter chapter-and-sections section1 tablecount figcount !important;
}

```

How to Use Part, Chapter, and Subtopics Numbers in Links

This topic is applicable if you have enabled [deep numbering \(on page 1646\)](#). Suppose you have a link in the third chapter that points to a paragraph in the second subtopic of the first chapter and you need this structural information (1.2) presented to the user, just after the link text. To do this, you can use the `target-counters` CSS function to extract the entire context of the counters from the target. The `chapter-and-sections` built-in counter is already updated with both the chapter number and the nested topics:

```

*[class ~= "topic/xref"]:after {
    content: target-counters(attr(href), chapter-and-sections, ".") !important;
}

```

This counter does not include the part number, so be careful when linking between parts (consider adding the target part number explicitly):

```

*[class ~= "topic/xref"]:after {
    content: "[" target-counter(attr(href), part, upper-roman) "/" target-counters(attr(href),
chapter-and-sections, ".") "]" !important;
    color:blue;
}

```

Related Information:

[Numbering Types \(on page 1646\)](#)

How to Include Topic Sections in TOC

To include topic sections in the table of contents, set the `args.css.param.numbering-sections` transformation parameter (on page 1543) to **yes**. In this case, they are numbered according the numbering scheme set by the `args.css.param.numbering` parameter (on page 1646).

If you want to prevent topic sections from being numbered in your output, set the value of the `args.css.param.numbering-sections` parameter to **no**.

Table of Contents

The table of contents is a hierarchy of topic titles with links to the topic content.

For plain maps, the TOC is automatically generated. For DITA bookmaps, you will need to add a `<toc>` element in the `<booklists>` element (inside the `<frontmatter>`):

```
<bookmap>
...
<frontmatter>
  <booklists>
    <toc/>
    <figurelist/>
    <tablelist/>
  </booklists>
</frontmatter>
...
...
```

Related Information:

[Table of Contents on a Page \(Mini TOC\) \(on page 1660\)](#)

[List of Tables/Figures \(on page 1665\)](#)

[Index \(on page 1674\)](#)

Table of Contents - XML Fragment

In the merged map file (on page 1569), the `<opentopic:map>` contains a hierarchy of `<topicref>` elements, or other elements (such as `<chapter>` or `<part>`) that are specializations of `<topicref>`.

Each of the `<topicref>` elements include a *metadata* section that includes the topic title.

```
<bookmap ...>

<oxy:front-page> ... </oxy:front-page>
<oxy:front-matter> ... </oxy:front-matter>

<opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic" class="- toc/toc ">
```

```

<oxy:toc-title xmlns:oxy="http://www.oxygenxml.com/extensions/author" empty="true"
  class="- toc/title "/>

<booktitle class="- topic/title bookmap/booktitle ">
  <booklibrary class="- topic/ph bookmap/booklibrary ">Retro Tools</booklibrary>
  <mainbooktitle class="- topic/ph bookmap/mainbooktitle ">Tasks</mainbooktitle>
  <booktitlealt class="- topic/ph bookmap/booktitlealt ">Product Tasks</booktitlealt>
</booktitle>

<chapter is-chapter="true"
  class="- map/topicref bookmap/chapter " href="#unique_5" type="topic">
  <topicmeta class="- map/topicmeta " data-topic-id="installing">
    <navtitle href="#unique_5" class="- topic/navtitle ">Installing</navtitle>
    ...
  </topicmeta>

  <topicref class="- map/topicref " href="#unique_6" type="task">
    <topicmeta class="- map/topicmeta " data-topic-id="installstorage">
      <navtitle href="#unique_6" class="- topic/navtitle ">Installing</navtitle>
      ...
    </topicmeta>
    ...
  </topicref>
  ...
</chapter>

```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- bookmap/bookmap map/map map bookmap" ...>

<div class="- front-page/front-page front-page"> ... </div>
<div class="- bookmap/frontmatter frontmatter"> ... </div>

<div class=" toc/toc toc">

  <div class="toc/toc-title toc-title" empty="true"/>

  <div class="- topic/title bookmap/booktitle booktitle">
    <div class="- topic/ph bookmap/booklibrary booklibrary">Retro Tools</div>

```

```

<div class="- topic/ph bookmap/mainbooktitle mainbooktitle">Tasks</div>
<div class="- topic/ph bookmap/booktitlealt booktitlealt">Product Tasks</div>
</div>

<div is-chapter="true"
class="- map/topicref bookmap/chapter topicref chapter " href="#unique_5" type="topic">
<div class="- map/topicmeta topicmeta" data-topic-id="installing">
<div href="#unique_5" class="- topic/navtitle navtitle">Installing</div>
...
</div>

<div class="- map/topicref topicref chapter " href="#unique_6" type="task">
<div class="- map/topicmeta topicmeta" data-topic-id="installstorage">
<div href="#unique_6" class="- topic/navtitle navtitle">Installing</div>
...
</div>
...
</div>
...
</div>

```

**Note:**

The `<oxy:toc-title>` element is used as a placeholder for the name of the TOC. For instance, you can use the string "Contents", specified on a pseudo-element, in the CSS.

Table of Contents - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-toc.css`.

Related Information:

[Page Headers and Footers \(on page 1582\)](#)

How to Increase TOC Depth

By default, only the first three levels of topics are displayed in the Table of Contents of the PDF output.

The CSS rule (see [Table of Contents - Built-in CSS \(on page 1655\)](#)) that hides topics on higher levels is:

```

/* Hide sections below level 3. */
*[class ~="map/topicref"][is-chapter] >
*[class ~="map/topicref"]:not([is-chapter]) >
*[class ~="map/topicref"] >
*[class ~="map/topicref"] {

```

```

display: none;
}

```

If you want to increase the TOC depth so that topic references on level 3 or higher are visible, you can overwrite this rule in your customization CSS like this:

```

*[class ~= "map/topicref"][is-chapter] >
*[class ~= "map/topicref"]:not([is-chapter]) >
*[class ~= "map/topicref"] >
*[class ~= "map/topicref"]{
  display:block;
}

```

If the `args.css.param.numbering` parameter is set to a value other than `shallow`, you also need to add the following rules in your customization CSS:

```

*[class ~= "map/map"][numbering ^= 'deep']
*[class ~= "map/topicref"][is-chapter]:not([is-part]) >
*[class ~= "map/topicref"] >
*[class ~= "map/topicref"]
*[class ~= "map/topicref"] {
  counter-increment: toc-chapter-and-sections;
}

*[class ~= "map/map"][numbering ^= 'deep']
*[class ~= "map/topicref"][is-chapter]:not([is-part]) >
*[class ~= "map/topicref"] >
*[class ~= "map/topicref"]
*[class ~= "map/topicref"] >
*[class ~= "map/topicmeta"] + *[class ~= "map/topicref"] {
  counter-reset: toc-chapter-and-sections;
}

*[class ~= "map/map"][numbering ^= 'deep']
*[class ~= "map/topicref"][is-chapter]:not([is-part]) >
*[class ~= "map/topicref"] >
*[class ~= "map/topicref"] >
*[class ~= "map/topicref"]
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before {
  content: counters(toc-chapter-and-sections, ".") ". ";
}

```

How to Style the Table of Contents Entries

Note:

Each of the items from the table of contents is an element that has the `map/topicref` class.

The following example uses the italic font for the label and changes the color and style of the connecting line between the title and the page number.

In your [customization CSS \(on page 1567\)](#), add the following two selectors:

```
/* The toc item label - the topic title */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"] {
    font-style:italic;
    color: navy;
}

/* The dotted line between the topic name and the page number. */
*[class ~= "map/topicref"] *[class ~= "topic/navtitle"]:after {
    content: leader('-') target-counter(attr(href), page);
    color: navy;
}
```

And if you need to alter the indent of the nested table of content items, use the following selector:

```
*[class ~= "map/topicref"] *[class ~= "map/topicref"] {
    margin-left: 1em;
}
```

The numbers can be styled like this:

```
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"]:before,
*[class ~= "map/topicref"]
    > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before{
    color:blue;
}
```

The following is an example of customizing the font size for the items representing chapters. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

```
*[class ~= "map/topicref"][is-chapter = "true"] > *[class ~= "map/topicmeta"] > *[class
    ~= "topic/navtitle"]{
    font-size:2em;
}
```

How to Change the Header of the Table of Contents

In the built-in CSS, there is a page named *table-of-contents*. The default is to have the word 'Contents' in its header (this is localized, using the `toc-header` string defined in the `p-18n.css`) alternating in the left or right side of the header:

```
@page table-of-contents:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
@page table-of-contents:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
    font-size: 8pt;
  }
}
```

If you need to change this string, or change the color, you should use the following `@page` selectors as a starting point in your [customization CSS \(on page 1567\)](#):

```
@page table-of-contents:left {
  @top-left {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
@page table-of-contents:right {
  @top-right {
    content: "My publication table of contents | " counter(page, lower-roman);
    color:red;
  }
}
```

Important:

The first page from the table of contents does not have any content displayed in the header. The default CSS contains rules that disable the content. If you need to also display the numerals on the first page, use the following:

```
@page table-of-contents:first:left {
  @top-left {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}
```

```
@page table-of-contents:first:right {
  @top-right {
    content: string(toc-header) " | " counter(page, lower-roman);
  }
}
```

Related information[Localization \(on page 1794\)](#)

How to Make the Table of Contents Start on an Odd Page

In your [customization CSS \(on page 1567\)](#), add the following snippet for the *table-of-contents* page:

```
@page table-of-contents{
  -oxy-initial-page-number: auto-odd;
}
```

Related Information:[Double Side Pagination \(on page 1667\)](#)

How to Display a Topic Before the Table of Contents

To display a topic before the *table-of-contents* page, follow these steps:

1. Make sure the topic is referenced on the first level in the DITA map.
2. Set the `@outputclass` to `before-toc` on the `<topicref>`.

```
<topicref href="pathToMyTopic" outputclass="before-toc">
```

Result: When the PDF is processed, the topic will automatically appear before the table of contents.

Related Information:[Controlling the Publication Content \(on page 1755\)](#)

How to Display Short Descriptions in the TOC

To display the short descriptions from the topics in the table of contents, you need to make the `<shortdesc>` element visible.

The following example only makes the short descriptions associated with the chapters visible. The chapters are level one topics and are marked in the merged DITA document TOC with the attribute `@is-chapter`.

In your [customization CSS \(on page 1567\)](#), add the following CSS selector:

```
*[class ~= "map/topicref"][is-chapter = "true"] > *[class ~= "map/topicmeta"] > *[class
  ~= "map/shortdesc"] {
```

```
display:block; /* The default is none - the shortdesc is hidden. */
color:gray;
}
```

**Note:**

If you need all the TOC item short descriptions to be visible, remove the `[is-chapter]` condition.

How to Remove Entries from the TOC

To remove entries from the table of contents, set the `@toc="no"` attribute on the topicrefs from the map that need to be removed. This is sometimes desirable for the topics listed in the frontmatter or backmatter when using a bookmap.

How to Hide the TOC

To hide the TOC, you have multiple options:

- [Recommended] Use a DITA `<bookmap>` instead of a `<map>`, and omit the `<toc>` element from the `<booklists>`. An example bookmap can be found in the [DITA 1.3 Spec](#).
- Use the transformation parameter: **hide.frontpage.toc.index.glossary** (*on page 1549*).
- Use a `display:none` property to hide the element that contains the TOC structure, and also remove it from the PDF bookmarks tree:

```
*[class ~= "map/map"] > *[class ~= "toc/toc"] {
  display:none;
}

*[class ~= "map/map"] > *[class ~= "toc/toc"] > *[class ~= "toc/title"]{
  bookmark-label: none;
  -ah-bookmark-label: none;
}
```

Related Information:

[Transformation Parameters](#) (*on page 1543*)

Table of Contents on a Page (Mini TOC)

To add a mini table of contents for each chapter, you need to:

- Use DITA bookmaps instead of regular maps.
- Set the `args.chapter.layout` transformation parameter to either of the following values: **MINITOC** or **MINITOC-BOTTOM-LINKS**.

**Note:**

If the chapter does not have child topics, it will not have a mini TOC in the PDF output.

Layout for MINITOC

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a list of links pointing to the child topics, positioned in the left side of the page, and a description in the right side. This content is collected from the topic file referenced by the chapter `<topicref>` in the map.

Chapter 1. Introduction	
Topics: About this framework. Description	DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.
About this framework. The framework is DITA.	
Description The framework is composed by a large set of modules.	

Layout for MINITOC-BOTTOM-LINKS

This table of contents is positioned between the chapter title and the chapter child topics. It consists of a chapter description and list of links pointing to the child topics, under the description. This description is collected from the topic file referenced by the chapter `<topicref>` in the map.

Chapter 1. Introduction

DITA Open Toolkit, or DITA-OT for short, is a set of Java-based, open-source tools that provide processing for content authored in the Darwin Information Typing Architecture

The DITA Open Toolkit documentation provides information about installing, running, configuring and extending the toolkit.

Topics:

[About this framework.](#)

[Description](#)

About this framework.

The framework is DITA.

Description

The framework is composed by a large set of modules.

The above chapter example has the following DITA map fragment:

```
<chapter href="topics/chapter-introduction.dita">
  <topicref href="topics/introduction-about.dita" />
  <topicref href="topics/introduction-description.dita" />
</chapter>
```

The `chapter-introduction.dita` file provides the description content that is in the right side of the page.

The children `<topicref>` elements generate the mini TOC links.

Table of Contents for Chapters (Mini TOC) - XML Fragment

In the merged XML file, the mini TOC is built from a related links section and some `<div>` elements that wrap the entire mini TOC and the description area.

chapter/minitoc

Wraps the entire structure, including the content of the chapter `<topicref>`.

chapter/minitoc-links

Wraps the `<related-links>` element. Note that the label of the related links list is internationalized.

chapter/minitoc-desc

Contains the entire content of the topic file referenced by the chapter `<topicref>` element in the map.

```
<div class="- topic/div chapter/minitoc ">
  <div class="- topic/div chapter/minitoc-links ">
    <related-links class="- topic/related-links ">
      <linklist class="- topic/linklist ">
        <desc class="- topic/desc ">
          <ph class="- topic/ph chapter/minitoc-label ">Topics: </ph>
        </desc>
        <link class="- topic/link " href="#unique_2" type="topic" role="child">
          <linktext class="- topic/linktext ">About this framework.</linktext>
        </link>
        <link class="- topic/link " href="#unique_3" type="topic" role="child">
          <linktext class="- topic/linktext ">Description</linktext>
        </link>
      </linklist>
    </related-links>
  </div>
  <div class="- topic/div chapter/minitoc-desc ">
    <shortdesc class="- topic/shortdesc ">DITA Open Toolkit, or DITA-OT for
      short, is a set of Java-based, open-source tools that provide processing
      for content authored in the Darwin Information Typing
      Architecture</shortdesc>
    <body class="- topic/body ">
      <p class="- topic/p ">The DITA Open Toolkit documentation provides information about
        installing, running, configuring and extending the toolkit.</p>
    </body>
  </div>
</div>
```

When using the `pdf-css-html5` transformation, this structure is converted to a set of HTML elements, preserving the class values:

```
<div class="- topic/div chapter/minitoc div minitoc">
  <div class="- topic/div chapter/minitoc-links div minitoc-links">
    <div class="wh_related_links">
      <nav role="navigation" class="- topic/related-links related-links">
        <div class="- topic/linklist linklist linklistwithchild">
          <div class="- topic/desc desc">
            <span class="- topic/ph chapter/minitoc-label ph minitoc-label">Topics: </span>
          </div>
        </div>
      </nav>
    </div>
  </div>
```

```

<ul class="linklist">
  <li class="- topic/link link ulchildlink" href="#unique_2"
    type="topic" role="child">
    <strong>
      <a href="#unique_2">About this framework.</a>
    </strong>
    <br/>
  </li>
  <li class="- topic/link link ulchildlink" href="#unique_3"
    type="topic" role="child">
    <strong>
      <a href="#unique_3">Description</a>
    </strong>
    <br/>
  </li>
</ul>
</div>
</nav>
</div>
</div>
<div class="- topic/div chapter/minitoc-desc div minitoc-desc">
  <div class="- topic/body body">
    <p class="- topic/shortdesc shortdesc">DITA Open Toolkit, or DITA-OT for short,
      is a set of Java-based, open-source tools that provide processing for content
      authored in the Darwin Information Typing Architecture</p>
    <p class="- topic/p p">The DITA Open Toolkit documentation provides information
      about installing, running, configuring and extending the toolkit.</p>
  </div>
</div>
</div>

```

Table of Contents for Chapters (Mini TOC) - Built-in CSS

The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-chapters-minitoc.css`.

How to Style the Table of Contents for Chapters (Mini TOC)

Suppose that you do not want the links and the chapter description to be side by side, but instead place the links above the description. Also, you may choose to remove the label above the links and put all the links in a colored rectangle with decimal numbers before them.

In your *customization CSS* (*on page 1567*), add the following selectors:

```

/* Change from inline to blocks to stack them one over the other. */

*[class~="chapter/minitoc-desc"],
*[class~="chapter/minitoc-links"] {
  display: block;
  width: 100%;
}

/* No need for the 'Topics:' label. */
*[class~="chapter/minitoc-links"] *[class~="topic/desc"] {
  display:none;
}

/* Add background for the links list. */
*[class~="chapter/minitoc-links"] {
  background-color:silver;
  padding:0.5em;
}

/* Remove the border and the padding from the description. We do not need that separator. */
*[class~="chapter/minitoc-desc"] {
  border-left:none;
  padding-left:0;
}

/* Add a number before each of the links. */
*[class~="chapter/minitoc-links"] *[class~="topic/link"] {
  display:list-item;
  list-style-type:decimal;
  margin-left:1em;
}

```

Related Information:

[How to Speed up CSS Development and Debugging \(on page 1572\)](#)

List of Tables/Figures

To activate these:

1. The map must be a DITA bookmap.
2. There must be a `<figurelist>` or `<tablelist>` in the *frontmatter* or *backmatter*. In the following example, both of the lists are added just after the table of contents (the `<toc>` element is the placeholder where the table of contents will be created):

```

<frontmatter>
  <booklists>
    <toc/>
    <figurelist/>
    <tablelist/>
  </booklists>
</frontmatter>

```

How to Set a Header for a List of Tables/Figures

Suppose you want to set the headline "Figure List" on the second and subsequent pages associated to a list of figures and something similar for a list of tables.

Start by associating pages to the list of figures and tables from the merged file:

```

*[class~="placeholder/tablelist"] {
  page:tablelist;
  color:green;
}
*[class~="placeholder/figurelist"]{
  page:figurelist;
  color:green;
}

```

Note:

The "placeholder/tablelist" is the class name of the output generated from the `<tablelist>` bookmap element.

Then define the pages:

```

@page figurelist {
  @top-left { content: none; }
  @top-center { content: "Figure List"; }
  @top-right { content: none; }
}

@page figurelist:first {
  @top-left { content: none; }
  @top-center { content: none; }
  @top-right { content: none; }
}

@page tablelist {

```

```

@top-left { content: none; }
@top-center { content: "Table List"; }
@top-right { content: none; }
}

@page tablelist:first {
@top-left { content: none; }
@top-center { content: none; }
@top-right { content: none; }
}

```

How to Remove the Numbers Before a List of Tables or Figures

Suppose you need to remove the "Figure NN" prefix before each entry of a list of figures.

An entry in the generated list of figures from the merged map looks like this:

```

<entry class="- listentry/entry " href="#unique_6_Connect_42_fig_rjy_spn_xgb">
  <prefix class="- listentry/prefix ">Figure</prefix>
  <number class="- listentry/number ">4</number>
  <title class="- topic/title ">This is another figure</title>
</entry>

```

For the HTML merged map, the element names are all `<div>` elements but they have the same class.

So, to hide the label and the number, use:

```

*[class~="listentry/prefix"],
*[class~="listentry/number"] {
  display:none;
}

```

This works for both a list of tables and list of figures since the structure of each entry is the same.

To make it more specific (for example, to apply it only for the list of figures), you can add the selector:

```

*[class~="placeholder/figurelist"] *[class~="listentry/prefix"],
*[class~="placeholder/figurelist"] *[class~="listentry/number"] {
  display:none;
}

```

Double Side Pagination

By default, the processor generates pages that are mirror images (the right page has the header on the right side, the left pages have the header on the left side). The chapters follow one another with no constraint on the page side.

**Note:**

For a plain DITA map, the chapters are the `<topicref>` elements that are placed on the first level. For bookmaps, the chapters are the topics referenced by a `<chapter>` element.

This section contains information about how to position the start of the chapters on an odd folio number. Some of the CSS rules given here as examples are already listed in: [\[INSTALLATION_DIRECTORY\]/css/print/p-optional-double-side-pagination.css](#). You may choose to import this file from your customization CSS (*on page 1567*).

How to Start Chapters on Odd Pages

A common use case is to arrange the chapters of the publication to start on an odd page number.

In your customization CSS (*on page 1567*), add the following:

```
@page chapter {
  -oxy-initial-page-number: auto-odd;
}
@page table-of-contents {
  -oxy-initial-page-number: auto-odd;
}
```

Supported values for `-oxy-initial-page-number` include: **auto**, **auto-even**, **auto-odd**, or a number.

How to Style the Empty (Blank) Pages

By making the chapters start on an odd page, the CSS processor might add blank pages to the previous page sequence as padding.

To style those blank pages add the following code in your customization CSS (*on page 1567*):

```
@page chapter:blank, table-of-contents:blank {
  @top-left      { content: none; }
  @top-center    { content: none; }
  @top-right     { content: none; }
  @bottom-left   { content: none; }
  @bottom-center { content: none; }
  @bottom-right  { content: none; }
}
```

**Note:**

This just removes the headers and footers, but you can use a background image or a header with "Intentionally left blank" text.

Related Information:

[How to Add a Background Image for the Cover \(on page 1609\)](#)

How to Force an Odd or Even Number of Pages in a Chapter

Another use case is to specify a number of pages for a section. Suppose that you have a table of contents that follows the cover page and you need to have an even number of pages. Hence, the next chapter would start on an even page.

In your [customization CSS \(on page 1567\)](#), use the `-oxy-force-page-count` property with an even value:

```
@page table-of-contents {
  -oxy-force-page-count: even;
}
```

Supported values for `-oxy-force-page-count` include: **even, odd, end-on-even, end-on-odd, auto, no-force**.

How to Style the First page of a Chapter

You can use the `:first` page rule selector to control how the first page of a chapter looks. Suppose that you have defined the following layout for your default page and you want to put the publication title (the `maptitle` string) on the header of the first page (instead of the chapter name that is displayed on this page):

In your [customization CSS \(on page 1567\)](#), add the following:

```
@page chapter:first {
  @top-right-corner { content: string(maptitle); }
  @top-left { content: none; }
}
```

Multiple Column Pages

This section contains information about how to handle pages that have multiple columns.

How to Use a Two Column Layout

Change Layout for Predefined Pages

First, you need to identify which of the pages need to be changed. Pages are already defined for the cover page, table of contents, chapter content, and others. The complete list is here: [Default Page Definitions \(on page 1575\)](#).

Next, add the `column-count` and `column-gap` properties to that page. For example:

```
@page chapter{
  column-count:2;
  column-gap:1in;
}
```

If you need some of the elements to expand on all the columns, use the `column-span:all` CSS property. The next snippet makes the chapter titles span both columns:

```
*[class ~= "topic/topic"][is-chapter] > *[class ~= "topic/title"] {
  column-span:all;
}
```

Limitation:

You cannot use multiple column configurations on the same page. Oxygen XML Editor Eclipse plugin only takes the `column-count` and `column-gap` properties into account if they are set on `@page` rules, not on elements from the content.

Change Layout for a Specific Topic

If you need to have a different column layout for just one topic, you can use the following technique:

1. Define an `outputclass` on the topic root element.

```
<topic outputclass="two_columns" ...
```

2. Define a CSS rule that changes the `page` property for the matching element.

```
*[class ~= "two_columns"],
*[outputclass ~= "two_columns"]{
  page: two_column_page !important;
}
```

Tip:

In the selector, use the `class` attribute for the HTML transformation, or `outputclass` for the direct transformation, or leave them both if you are not sure.

Note:

The topics from the first level use the `chapter` page. You must use `!important` because the built-in rules are more specific and you need to override the `page` property.

3. Define a page layout.

```
@page two_column_page {
  column-count: 2;
}
```

Note that the topic will be separated from other sibling topics with different page layouts by page breaks.

Change Column Breaks for Headings

If you need to start each topic on a new column, you can use the following technique:

Suppose you have the following map:

```
<map>
  <title>Map</title>
  <topicref href="first.dita">
    <topicref href="second.dita"/>
  </topicref>
  <topichead navtitle="Topichead">
    <topicref href="second.dita"/>
  </topichead>
</map>
```

You can use the following rules to get the chapter on the new column display:

```
@page {
  column-count: 2;
}
*[class ~= "topic/topic"] *[class ~= "topic/topic"] > *[class ~= "topic/title"] {
  -oxy-column-break-before: always;
}
*[class ~= "topic/title"] + *[class ~= "topic/topic"] > *[class ~= "topic/title"] {
  -oxy-column-break-before: auto;
}
```

Each topic will be displayed on a new column except for topics that only have a title and no content.

[Page Formatting in Oxygen PDF Chemistry](#)

[Multiple Page Formatting in Oxygen PDF Chemistry](#)

Bookmarks

The PDF Bookmarks are used to generate a hierarchical structure similar to a table of contents in a specialized view of your PDF Reader.

By default, the titles defined in the topics are used as bookmark labels.

PDF Bookmarks - Built-in CSS

The PDF bookmarks are generated by matching the titles from the topics in the content. The built-in CSS rules are in: `[PLUGIN_DIR]/css/print/p-bookmarks.css`.

How to Change the Bookmark Labels using the Navigation Title

To change the bookmark labels, you can specify a navigation title in a DITA map or topic.

This will be used as the bookmark label instead of the topic title in the table of contents and the bookmark views. There are two possibilities to do specify it:

1. Place a `<navtitle>` element in the topic reference in the DITA map:

```
...
<topicref href="topics/my_topic.dita" locktitle="yes">
  <topicmeta>
    <navtitle>Introduction</navtitle>
  </topicmeta>
</topicref>
...
```

Note:

As a best practice, a `@locktitle` attribute with the value 'yes' is needed to activate the navigation title. The plugin applies the navigation title even if the attribute is missing.

2. Place a `<navtitle>` element in the topic, as a title alternative.

```
<topic id="other_topic" xml:lang="en-us">
  <title>Normal Title</title>
  <titlealts>
    <navtitle>Navigation Title</navtitle>
  </titlealts>
  <body>
  ...
```

How to Control Bookmarks Depth and Sections Display in PDF.

By default, the PDF bookmarks are generated for up to 7 levels. If you need to limit them (for example, to 2 levels), you can use the following CSS rules in your [customization CSS \(on page 1567\)](#):

```
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] >
*[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
*[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
*[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"]
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"]
{
  bookmark-label:none;
}
```

These rules clear the labels generated by the titles starting with the depth of 3 (the topic nesting level is given by the selectors `*[class~="topic/topic"]`).

By default, the PDF bookmarks also include the sections. If you need to remove them, you can use the following CSS rule in your [customization CSS \(on page 1567\)](#):

```
*[class ~="topic/topic"] *[class ~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/section"] > *[class
 ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
 ~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
 ~="topic/topic"] *[class ~="topic/section"] > *[class ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
 ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/section"] > *[class
 ~="topic/title"],
*[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class
 ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/topic"] *[class ~="topic/section"
 > *[class ~="topic/title"] {
    bookmark-label: none;
}
```

How to Specify the Open/Closed PDF Bookmark State

If you want to specify the initial state for the bookmarks (opened/expanded or closed/collapsed), you can use the `bookmark-state` property in your [customization CSS \(on page 1567\)](#).

For example, to specify that all bookmarks for the first three levels are opened (expanded) in the initial state, use:

```
*[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"],
*[class~="topic/topic"] *[class~="topic/topic"] *[class~="topic/topic"] > *[class~="topic/title"] {
    bookmark-state:open;
}
```

How to Remove the Numbering From the PDF Bookmarks

By default, the PDF bookmark labels are generated while taking the text set before the chapters titles into account. Since this usually contains the part, chapter, or section numbers, the PDF Bookmarks will make use of them.

The solution is to remove the `content(before)` from the `bookmark-label`, leaving just the `content(text)`.

In your [customization CSS \(on page 1567\)](#), add the following CSS rules:

```
*[class~="topic/topic"] > *[class~="topic/title"] {
  bookmark-label: content(text);
  -ah-bookmark-label: content();
}
```

Important:

This is a simple example that does not use the possible navigation titles, just the content of the `<title>` element. Copy and modify the built-in CSS for the full CSS rule that matches the `<title>` and `<titlealts>` elements:

```
*[class~="topic/topic"]:has(*[class~="topic/titlealts"]) > *[class~="topic/title"] {...}
```

Related Information:

[Numbering \(on page 1642\)](#)

Index

The content of an `<indexterm>` element is used to produce an index entry in the generated index. You can nest `<indexterm>` elements to create multi-level indexes. The content is not output as part of the topic content, only as part of the index tree.

To add an index to your publication, you just need to add `<indexterm>` elements inside the `<prolog>` section (inside a `<metadata>` element):

```
<title>The topic title.</title>
<prolog>
  <metadata>
    <keywords>
      <indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
    </keywords>
  </metadata>
</prolog>
<body>
  .....
```

or in the content itself:

```
...
<p>Open the lid then turn the body pump to the right.
<indexterm>Installing <indexterm>Water Pump</indexterm></indexterm>
</p>
...
```

If you are using a bookmap, you need to specify where the index list should be presented (for instance in the *backmatter* of the book. Technically, it is possible to also add it to the *frontmatter*, but this is unusual). This is done using an `<indexlist>` element in the `<booklists>` element (inside the `<backmatter>`):

```
<bookmap>
  ...
  <chapter href="tasks/troubleshooting.dita">
    ...
  </chapter>
  <backmatter>
    <booklists>
      <indexlist/>
    </booklists>
  </backmatter>
</bookmap>
```

For plain maps, the index list is automatically added at the end of the publication, with no need to modify the map.

Index - XML Fragment

In the merged map file ([on page 1569](#)), the structure that holds the index tree is the `<opentopic-index:index.groups>` element.

```
<map class="- map/map " >
  <oxy:front-page>
    ...
  </oxy:front-page>
  <opentopic:map xmlns:opentopic="http://www.idiominc.com/opentopic">
    ...
  </opentopic:map>
  <topic class="- topic/topic ">
    <title class="- topic/title ">Request Support</title>
    ...
  </topic>
  <opentopic-index:index.groups id="d16e5548">
    ...
  </opentopic-index:index.groups>
</map>
```

Each of the groups contain:

- A label, the starting letter ("T" in the following example).
- A tree of `<opentopic-index:index.entry>` elements.

```

<opentopic-index:index.group>

<opentopic-index:label>T</opentopic-index:label>

<opentopic-index:index.entry value="table of contents">
  <opentopic-index:formatted-value>table of contents</opentopic-index:formatted-value>
  <opentopic-index:refID value="table of contents:">
    <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
      href="#d16e3988"> [d16e3988]
    </oxy:index-link>
  </opentopic-index:refID>
</opentopic-index:index.entry value="change header">
  <opentopic-index:formatted-value>change header</opentopic-index:formatted-value>
  <opentopic-index:refID value="table of contents:change header:">
    <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
      href="#d16e4176">
      [d16e4176] </oxy:index-link>
    </opentopic-index:refID>
</opentopic-index:index.entry>
<opentopic-index:index.entry value="style">
  <opentopic-index:formatted-value>style</opentopic-index:formatted-value>
  <opentopic-index:refID value="table of contents:style:">
    <oxy:index-link xmlns:oxy="http://www.oxygenxml.com/extensions/author"
      href="#d16e4120">
      [d16e4120] </oxy:index-link>
    </opentopic-index:refID>
  </opentopic-index:index.entry>
</opentopic-index:index.entry>
</opentopic-index:index.group>

```

Each of the entries contain:

- The formatted value (`<opentopic-index:formatted-value>`).
- A link to the publication content (`<opentopic-index:refID>/<oxy:index-link>`).
- Possibly other child entries.

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the merged map is further processed resulting in a collection of HTML5 `<div>` elements. These elements preserve the original DITA `@class` attribute values and add a new value derived from the DITA element name.

```

<div class="- map/map map" >
  <div class="front-page/front-page">
    ...
  </div>

```

```

<div class="toc/toc toc">
    ...
</div>
<div class="- topic/topic topic">
    <div class="- topic/title title">Request Support</title>
    ...
</div>
<div class=" index/groups groups">
    ...
</div>
</map>

```

The index group content becomes:

```

<div class=" index/group group">
    <div class=" index/label label">T</div>

    <div class=" index/entry entry">
        <div class=" index/formatted-value formatted-value">table of contents</div>
        <div class=" index/refid refid">
            <div class=" index/link link"
                href="#d16e3988"> [d16e3988]
            </div>
        </div>
    </div>
    <div class=" index/entry entry">
        <div class=" index/formatted-value formatted-value">change header</div>
        <div class=" index/refid refid">
            <div class=" index/link link"
                href="#d16e4176"> [d16e4176] </div>
        </div>
    </div>
    <div class=" index/entry entry">
        <div class=" index/formatted-value formatted-value">style</div>
        <div class=" index/refid refid">
            <div class=" index/link link"
                href="#d16e4120"> [d16e4120] </div>
        </div>
    </div>
</div>
</div>
</div>

```

Index - Built-in CSS

All index styling is found in: `[PLUGIN_DIR]css/print/p-index.css`.

How to Style the Index Page Title and the Grouping Letters

In your [customization CSS \(on page 1567\)](#), add the following CSS rules:

```
*[class ~="index/groups"] *[class ~="index/group"] *[class ~="index/label"] {  
    font-size:1.5em;  
    color:navy;  
}  
  
*[class ~="index/groups"]:before {  
    content: "- Index - ";  
    color:navy;  
    font-size: 4em;  
}
```

The result is:

- Index -

F
 footer 37
H
 header 37
T
 table of contents 32
 change header 35
 style 34

How to Style the Index Terms Labels

In your [customization CSS \(on page 1567\)](#), add the following CSS rule:

```
*[class ~="index/groups"] *[class ~="index/formatted-value"] {  
    font-style:oblique;  
    color:gray;  
}
```

The result is:

Index

F

footer 37

H

header 37

T

table of contents 32

change header 35

style 34

How to Add Filling Dots Between the Index Labels and the Page Numbers

Suppose you want the leader CSS content to generate a row of dots. It is necessary that the parent entry has the text justified.

In your [customization CSS \(on page 1567\)](#), add the following CSS rule:

```
*[class~="index/formatted-value"],
*[class~="index/refid"] {
    display:inline;
}

/* Hide the sequences of links that actually do not contain links. */
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]{
    display:none;
}
*[class~="index/group"] *[class ~="index/entry"] >
*[class~="index/refid"]:has(*[class~="index/link"]){
    display:inline;
}

*[class~="index/group"] *[class~="index/entry"] {
    text-align:justify;
}
*[class~="index/group"] *[class ~="index/entry"] > *[class~="index/refid"]:before{
    content:leader('.');
}
```

The output now contains the dots:

Index

F		
	footer.....	37
H		
	header.....	37
T		
	table of contents.....	32
	change header.....	35
	style.....	34

How to Change the Index Page Number Format and Reset its Value

The page number is reset at the beginning of the index page by the built-in CSS rule:

```
*[class ~= "index/groups"] {
    counter-reset: page 1;
}
```

If you want to start the page counter from a different initial number, just change the value of this counter. For example, to continue the normal page counting, use:

```
*[class ~= "index/groups"] {
    counter-reset: none;
}
```

If you need to style the page number differently (for example, using decimals), add the following CSS rule in your [customization CSS \(on page 1567\)](#):

```
@page index {
    @bottom-center {
        content: counter(page, decimal) }
}
```

How to Impose a Table-like Index Layout

In case you need to place the index labels and links on the same line but with some extra alignment constraints, you can use inline blocks to give the index a table-like appearance:

Index

C

Close programs	8
Computer cover	7,8
configure	10, 10,10

D

database	8, 8, 8, 9, 10, 11,12
----------	-----------------------

H

hard drive	7, 7, 7, 8, 10, 11,12
------------	-----------------------

I

install	7, 8,9
---------	--------

M

maintain	11,11
hdd	
drive	11

You need to place the elements that have the following class on the same line:

index/formatted-value

This is the text of the index term.

index/refid

This element contains a list of links.

A fixed width is used for the formatted value and the links container (almost half of the available width). To achieve the index hierarchical layout, set progressive padding to the formatted value text.

In your [customization CSS \(on page 1567\)](#), add the following CSS rule:

```
*[class~="index/formatted-value"],
*[class~="index/refid"]{
    display:inline-block;
}

*[class~="index/formatted-value"]{
    width:45%;
}

*[class~="index/refid"] {
    width:45%;
}
```

```

/* Hide the sequences of links that actually do not contain links. */
*[class ~= "index/groups"] *[class ~= "index/entry"] > *[class~="index/refid"]{
    display:none;
}
*[class ~= "index/groups"] *[class ~= "index/entry"] >
*[class~="index/refid"]:has(*[class~="index/link"]){
    display:inline-block;
}

/* Move the nesting of indexterms from margin to padding */
*[class ~= "index/groups"] *[class ~= "index/entry"] {
    margin-left: 0;
}
*[class ~= "index/groups"]
*[class ~= "index/entry"]
*[class~="index/formatted-value"]{
    padding-left: 0.2em;
}
*[class ~= "index/groups"]
*[class ~= "index/entry"]
*[class ~= "index/entry"]
*[class~="index/formatted-value"]{
    padding-left: 0.4em;
}
*[class ~= "index/groups"]
*[class ~= "index/entry"]
*[class ~= "index/entry"]
*[class ~= "index/entry"]
*[class~="index/formatted-value"]{
    padding-left: 0.6em;
}
}

/* Some styling */
*[class~="index/formatted-value"],
*[class~="index/refid"]{
    padding:0.2em;
    background-color:#EEEEEE;
}

```

To avoid bleeding of the index term label, you may need to mark it as being hyphenated:

```
*[class~="index/formatted-value"] {
    hyphens:auto;
}
```

To activate hyphenation, see: [How to Enable Hyphenation for Entire Map \(on page 1692\)](#).

Appendices

The `<appendices>` element that is available in the DITA bookmap has a special behavior (based on its sibling nodes):

1. If the bookmap contains `<part>` elements, the `<appendices>` will behave as a part.
2. If the bookmap contains `<chapter>` (and no `<part>`) elements, the `<appendices>` will behave as a chapter.

Note:

The behavior includes page-break, numbering, and title rendering.

For example, if I define a bookmap with a `<part>` element, I will obtain:

```
<part>
  <chapter/>
  <topicref/>
  <chapter/>
</part>
<appendices> <!-- Appendices behaves like a Part -->
  <appendix/> <!-- Appendix behaves like a Chapter -->
  <appendix/>
</appendices>
```

For another example, if I define a bookmap with a `<chapter>` element only, I will obtain:

```
<chapter/>
  <topicref/>
<chapter/>
<appendices> <!-- Appendices behaves like a Chapter -->
  <appendix/> <!-- Appendix behaves like a TopicRef -->
  <appendix/>
</appendices>
```

Warning:

If the `<appendices>` element is not defined and the `<appendix>` is used directly instead, then it will behave like a *Part* or *Chapter* using the same pattern as for `<appendices>`.

How To Control Page Break Within Appendices

If you define a bookmap with `<appendices>` and some `<appendix>` elements, you may want the parent `<appendices>` to be on a separate page than its children. This is done automatically if the bookmap contains `<part>` elements. Otherwise, you may need to use the following in your CSS:

```
*[topicrefclass ~= "bookmap/appendix"]:first-of-type {
  page-break-before: always;
}
```

Footnotes

Footnotes are pieces of information that have several purposes, including citations, additional information (copyright, background), outside sources, and more. They are divided as follows:

- **The footnote call** - The number that remains in the content, usually superscripted.
- **The footnote marker** - The number displayed at the bottom of the page (the value matches the footnote call).
- **The footnote text** - The value of the `<fn>` element, also displayed at the bottom of the page.

Footnotes - Built-in CSS

Footnote properties are defined in `[PLUGIN_DIR]/css/print/p-foot-notes.css`.

How to Change Style of the Footnote Markers and Footnote Calls

To bold the footnotes numbers, use some colors, and change the footnote marker, add the following rules to your [customization CSS \(on page 1567\)](#):

```
*[class ~= "topic/fn"]:footnote-call {
  font-weight: bold;
  color:red;
}

*[class ~= "topic/fn"]:footnote-marker {
  content: counter(footnote) " / ";
  font-weight: bold;
  color:red;
}
```

To indent the footnote content displayed at the end of the page, add the following rules to your [customization CSS \(on page 1567\)](#):

```
*[class ~= "topic/entry"] > *[class ~= "topic/fn"] {
  padding-left: 1in;
}
```

```
*[class ~= "topic/entry"] > *[class ~= "topic/fn"]:footnote-marker {
  margin-left: 1in;
}
```

Related Information:

https://www.oxygenxml.com/doc/ug-chemistry/topics/ch_footnotes.html

How to Add a Separator Above the Footnotes

The `@footnote` part of a `@page` declaration controls the style of the separator between the page content and the footnotes. For the content, you should set a `leader`. The leader uses a letter or a line style to fill the entire width of the page.

```
@page {
  margin: 0.5in;
  ...
  @footnote {
    content: leader(solid);
    color: silver;
  }
}
```

To create a dotted line, you can use the dot character: `leader('')`. Other commonly used characters are: "-" (dash) and "_" (underscore).

How to Reset the Footnotes Counter

It is possible to reset the footnote counter. For example, if you want to reset the counter at the beginning of each chapter, add one of the following rules to your [customization CSS \(on page 1567\)](#):

```
@page chapter {
  counter-reset: footnote 1;
}

*[class ~= "bookmap/chapter"],
*[class ~= "topic/topic"][is-chapter] {
  counter-reset: footnote 1;
}
```

In a deep numbering context, you need to use the following rule instead:

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) {
  counter-reset: section1 0 footnote 1;
}
```

or can mark any element with an `@outputclass` value, match that value, and reset the counter at any point in your counter:

```
<p outputclass="reset-footnotes"/>

*[outputclass ~= "reset-footnotes"] {
    counter-reset: footnote 1;
}

```

How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    xmlns:opentopic-func="http://www.idiominc.com/opentopic/exsl/function"
    exclude-result-prefixes="xs opentopic-func"
    version="2.0">

    <!--
        Match only top level tables (i.e tables that are not nested in other tables),
        that contains some footnotes.
    -->

    <xsl:template match="*[contains(@class, 'topic/table')]"
        [not(ancestor::*[contains(@class, 'topic/table')])]
        [//*[contains(@class, 'topic/fn')]]">
        <xsl:next-match>
            <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
        </xsl:next-match>

        <!-- Create a list with all the footnotes from the current table. -->
        <ol class="- topic/ol " outputclass="table-fn-container">
            <xsl:for-each select="//*[contains(@class, 'topic/fn')]">
                <!--
                    Try to preserve the footnote ID, if available, so that the xrefs will have a
                    target.
                -->
            </xsl:for-each>
        </ol>
    </template>

```

```

<li class="- topic/li " id="{if(@id) then @id else generate-id(.)}"
    outputclass="table-fn">
    <xsl:copy-of select="@callout"/>
    <xsl:apply-templates select="node()"/>
</li>
</xsl:for-each>
</ol>
</xsl:template>

<!--
    The footnotes that have an ID must be ignored, they are accessible only
    through existing xrefs (already present in the merged.xml file).

    The above template already made a copy of these footnotes in the OL element
    so it is not a problem if markup is not generated for them in the cell.
-->

<xsl:template
    match="*[contains(@class, 'topic/entry')]/*[contains(@class, 'topic/fn')][@id]"/>

<!--
    The xrefs to footnotes with IDs inside table-cells. We need to recalculate
    their indexes if their referenced footnote is also in the table.
-->

<xsl:template match="*[contains(@class, 'topic/xref')][@type='fn']
    [ancestor::*[contains(@class, 'topic/entry')]]">
    <xsl:param name="top-level-table" tunnel="yes"/>
    <xsl:variable name="destination" select="opentopic-func:getDestinationId(@href)"/>
    <xsl:variable name="fn" select="
        $top-level-table/*[contains(@class, 'topic/fn')][@id = $destination]"/>
    <xsl:choose>
        <xsl:when test="$fn">
            <!-- There is a reference in the table, recalculate index. -->
            <xsl:variable name="fn-number" select="
                index-of($top-level-table/*[contains(@class, 'topic/fn')], $fn)"/>
            <xsl:copy>
                <xsl:apply-templates select="@*" />
                <xsl:apply-templates select="$fn/@callout" />
                <xsl:apply-templates select="node()
                    except (text(), *[contains(@class, 'hi-d/sup')])" />
                <sup class="+ topic/ph hi-d/sup ">
                    <xsl:apply-templates select="child::*[contains(@class, 'hi-d/sup')]/@*" />
                    <xsl:value-of select="$fn-number" />

```

```

        </sup>
    </xsl:copy>
</xsl:when>
<xsl:otherwise>
    <!-- There is no reference in the table, keep original index. -->
    <xsl:next-match/>
</xsl:otherwise>
</xsl:choose>
</xsl:template>

<!--
    The footnotes without ID inside table-cells. They are copied in the OL element, but have
    no xrefs pointing to them (because they have no ID), so xrefs are generated.
-->
<xsl:template
    match="*[contains(@class, 'topic/entry')][*[contains(@class, 'topic/fn')][not(@id)]]">
    <!-- Determine the footnote index in the document order. -->
    <xsl:param name="top-level-table" tunnel="yes" />
    <xsl:variable name="fn-number" select="
        index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"/>
    <xref type="fn" class="- topic/xref "
        href="{generate-id(.)}" outputclass="table-fn-call">
    <xsl:copy-of select="@callout"/>
    <!-- Generate an extra <sup>, identical to what DITA-OT generates for other xrefs. -->
    <sup class="+ topic/ph hi-d/sup ">
        <xsl:value-of select="$fn-number"/>
    </sup>
    </xref>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the .opt file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
    <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"

```

```
file="xslt/merged2mergedExtension.xsl"/>
</xslt>
```

6. Create a **css** folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```
/* Customize footnote calls, inside the table. */
*[outputclass ~= 'table-fn-call'] {
    line-height: none;
}
*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'][callout] *[class
~= "hi-d/sup"] {
    content: oxy_xpath("ancestor::*[contains(@class, 'topic/xref')]/@callout");
}

/* Customize the list containing all the table footnotes. */
*[outputclass ~= 'table-fn-container'] {
    border-top: 1pt solid black;
    counter-reset: table-footnote;
}

/* Customize footnotes display, below the table. */
*[outputclass ~= 'table-fn'] {
    font-size: smaller;
    counter-increment: table-footnote;
}
*[outputclass ~= 'table-fn']::marker {
    font-size: smaller;
    content: "(" counter(table-footnote) ")";
}
*[outputclass ~= 'table-fn'][callout]::marker {
    content: "(" attr(callout) ")";
}

/* Customize xrefs pointing to footnotes, inside the table. */
*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] {
    color: unset;
    text-decoration: none;
}
*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn']:after {
    content: none;
}
*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:before
{
```

```

content: "(";
}
*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:after
{
content: ")";
}

```

- Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

Hyphenation

Hyphenation specifies how words should be hyphenated when text wraps across multiple lines.

The transformation plugin uses the capabilities of the **PDF Chemistry** processor to perform hyphenation.

Hyphenation Dictionaries

The Oxygen XML Editor Eclipse plugin provides built-in hyphenation patterns for the following languages:

Code	Language
da	Danish
de	German
de_CH	German (Switzerland)
en	English
en-GB	English (Great Britain)
es	Spanish
fr	French
it	Italian
nb	Norwegian Bokmål

Code	Language
nl	Dutch
ro	Romanian
ru	Russian
sv	Swedish
th	Thai
pt	Portuguese
da	Danish

The built-in hyphenation pattern license terms are listed in the XML files in the `[CHEMISTRY_INSTALL_DIR]/config/hyph` folder. Most of them comply with the *LaTeX* distribution policy.

Installing New Hyphenation Dictionaries

Oxygen XML Editor Eclipse plugin uses the *TeX* hyphenation dictionaries converted to XML by the *OFFO* project: <https://sourceforge.net/projects/offo/>.

The `.xml` files allow you to access the licensing terms and you can use them as a starting point to create customized dictionaries (see [How to Alter a Hyphenation Dictionary \(on page 1691\)](#)).

The `.hyp` files are the compiled dictionaries that the Oxygen XML Editor Eclipse plugin actually uses.

One simple way to add more dictionaries:

1. Download and extract the `offo-hyphenation-compiled.zip` file. This file is a bundle of many dictionary files.
2. Copy the `fop-hyph.jar` file to the `[OXYGEN_INSTALL_DIR]/lib` directory.
3. If you just need a single dictionary, place the `.hyp` or `.xml` file in the `[OXYGEN_INSTALL_DIR]/config/hyph` directory (create that directory if it is missing).

How to Alter a Hyphenation Dictionary

You can copy the dictionaries you need to change in another directory, then use the `-hyph-dir` parameter to refer them inside your transformation.

Each file is named with the language code and has the following structure:

```
<hyphenation-info>

<hyphen-min before="2" after="3"/>
```

```

<exceptions>
o-mni-bus
...
</exceptions>

<patterns>
préémi3nent.
proémi3nent.
surémi3nent.
....
</patterns>

</hyphenation-info>

```

To change the behavior of the hyphenation, you can modify either the patterns or the exceptions sections:

exceptions

Contains the list of words that are not processed using the patterns, each on a single line. Each of the words should indicate the hyphenation points using the hyphen ("-") character. If a word does not contain this character, it will not be hyphenated.

For example, `o-mni-bus` will match the `omnibus` word and will indicate two possible hyphenation points.

Note:

Compound words (i.e. e-mail) cannot be controlled by exception words.

patterns

Contains the list of patterns, each on a single line. A pattern is a word fragment, not a word. The numbers from the patterns indicate how desirable a hyphen is at that position.

For example, `tran3s2act` indicates that the possible hyphenation points are "*tran-s-act*" and the preferable point is the first one, having the higher score of "3".

How to Enable Hyphenation for Entire Map

To enable hyphenation for your entire map:

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. In your [customization CSS \(on page 1567\)](#), add:

```

:root {
  hyphens: auto;
}

```

3. To except certain elements from being hyphenated, use `hyphens:none`. The following example excludes the `<keyword>` elements from being hyphenated:

```
*[class ~= "topic/keyword"] {
  hyphens: none;
}
```

How to Enable/Disable Hyphenation for an Element

1. Make sure you set an `@xml:lang` attribute on the root of your map, or set the `default.language` parameter in the transformation.
2. You have two options to control hyphenation inside an XML element:

CSS Approach

Use the `hyphens` property.

For example, if you want to enable hyphenation in codeblocks:

```
*[class~="pr-d/codeblock"] {
  hyphens: auto;
}
```

If you want to disable hyphenation inside tables:

```
*[class~="topic/table"] {
  hyphens: none;
}
```

Attribute Approach

Use the `@outputclass="hyphens"` or `@outputclass="no-hyphens"` attributes/values.

For example, if you want to enable hyphenation in codeblocks:

```
<codeblock outputclass="hyphens">
  ...
</codeblock>
```

If you want to disable hyphenation inside tables:

```
<table outputclass="no-hyphens" ...>
  ...
</table>
```

Note:

The default built-in CSS enables hyphenation for tables:

```
*[class ~= "topic/table"] {
    hyphens: auto;
}
```

Related information[How to Enable Line Wrap in Code Phrases \(on page 1748\)](#)[How to Disable Hyphenation for a Word](#)

How to Define Hyphenation for a Specific Word

1. Create a new hyphenation dictionary (on page 1691).
2. Add the word under the `<exceptions>` section using hard hyphen symbols between its segments.
3. To make sure the words from your document match against the ones from the "exceptions", make sure that you add capitalized/lower case variants as well.

Related information[How to Disable Hyphenation for a Word](#)[How to Alter a Hyphenation Dictionary \(on page 1691\)](#)[How to Enable/Disable Hyphenation for an Element \(on page 1693\)](#)

How to Force or Avoid Line Breaks at Hyphens

It is possible to force or avoid line breaks inside words with hyphens (U+2010). This can be useful, for example, inside tables that have product references if you want the display to remain on a single line (or to split it on multiple lines). To achieve this, you can use the `-oxy-break-line-at-hyphens` property:

The accepted values are:

auto

Words are hyphenated automatically according to an algorithm that is driven by a hyphenation dictionary. This can lead to line breaks at hyphens.

avoid

Words are still hyphenated automatically except no line break will occur on hyphens.

always

Words are still hyphenated automatically except line breaks will be forced on hyphens.

Example:

Suppose you have a products table like this:

```
<table>
  <row>
```

```

<cell>Product-1233-55-88</cell>
<cell>120</cell>
<row>
<row>
<cell>Product-1244-66-99</cell>
<cell>112</cell>
<row>
</table>

```

and the following rule in a CSS stylesheet:

```

table {
  -oxy-break-line-at-hyphens: avoid;
}

```

In the output, the list of product references will be displayed in a single line. On the contrary, setting the property value to `always`, will force a break after each hyphen.

Accessibility

By default, the PDF documents produced using this plugin are partially accessible in the sense that most of the paragraphs, tables, lists, headers, and footers are tagged automatically so a PDF reader can use this information to present the content.

Related Information:

[Oxygen PDF Chemistry: Accessibility](#)

Accessibility - Built-in CSS

Accessibility properties are defined in `[PLUGIN_DIR]css/print/p-accessibility.css`.

How to Create Fully Accessible Documents

To make your documents fully accessible (**PDF/UA1** compliant), do the following:

1. The accessibility standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your [customization CSS \(on page 1567\)](#). For instance, you can use:

```

body { font-family: Arial }

@page {
  @top-left {font-family: Arial }
  @top-right {font-family: Arial }
  @top-center {font-family: Arial }
  @top-left-corner {font-family: Arial }
}

```

```

@top-right-corner {font-family: Arial }

@bottom-left {font-family: Arial }
@bottom-right {font-family: Arial }
@bottom-center {font-family: Arial }
@bottom-left-corner {font-family: Arial }
@bottom-right-corner {font-family: Arial }
}

```

2. Create a new transformation scenario (based on the **DITA Map PDF - based on HTML5 & CSS** or the **DITA PDF - based on HTML5 & CSS** built-in scenario).
3. In the **Parameters** tab, change the value of the `pdf.accessibility` parameter to **yes**.
4. Run the transformation.

Archiving

Your PDF files may need to be archived for security or legal reasons. In this case, the generated file must be compliant to the PDF/A ISO standard.

Related Information:

[Oxygen PDF Chemistry: Archiving](#)

How to Allow Document Archiving

To make your documents archive-able (PDF/A compliant), do the following:

1. The archiving standard requires that all the fonts be embedded in the PDF. To force font embedding, you have to specify fonts for all elements and for all page margin boxes in your **customization CSS** (*on page 1567*). For instance, you can use:

```

body { font-family: Arial }

@page {
  @top-left {font-family: Arial }
  @top-right {font-family: Arial }
  @top-center {font-family: Arial }
  @top-left-corner {font-family: Arial }
  @top-right-corner {font-family: Arial }

  @bottom-left {font-family: Arial }
  @bottom-right {font-family: Arial }
  @bottom-center {font-family: Arial }
  @bottom-left-corner {font-family: Arial }
  @bottom-right-corner {font-family: Arial }
}

```

2. Create a new transformation scenario, based on the **DITA Map PDF - based on HTML5 & CSS** built-in scenario.
3. In the **Parameters** tab, select a value for the `pdf.archiving.mode` parameter from the list.
4. Run the transformation.

Fonts

Fonts are an important part of the publication. Your font selection should take into consideration both design and the targeted ranges of characters.

Notes:

- Before using a font, make sure you have the permissions to use it and make sure you comply with all the license terms.
- When installing a font on Windows, make sure you select the **Install for all users** option.

To use them in the [customization CSS \(on page 1567\)](#):

- You can place the font files in the same folder as your CSS and use a `@font-face` definition to reference them.
- You can use web fonts (for example, Google Fonts), and import the CSS snippet into your CSS.
- You can use system fonts.

All these techniques are explained in: [Oxygen PDF Chemistry User Manual: Fonts](#).

How to Avoid Characters Being Rendered as

When the processor renders text with a font that does not include certain characters, those characters are replaced with the # symbol. This can easily be seen from **Oxygen's Results** view. For example:

```
[CH] Glyph "?" (0x7ae0) not available in font "Roboto-Regular".
```

To prevent this, make sure you use the proper font.

As an example, suppose the right arrow character is used in a definition list like this:

```
<dlentry>
  <dt>&#8594;</dt>
  <dd><ph>This is the right arrow.</ph></dd>
</dlentry>
```

If the font does not include this character, the output will look something like this:

```
#
  This is the right arrow.
```

To fix this you can either:

1. Install Arial Unicode MS font on your system. This is one of the PDF processor fallback fonts. Starting with version 24 there are additional fonts used as fallback as `SimSun`, `Malgun Gothic` and more, so if on of these are found on the system they will be used directly.
2. Specify the fallback font in your customization.

For the second case, if you use *Times New Roman* for the entire publication, you could add *Symbol* as the fallback font. In your [customization CSS \(on page 1567\)](#), add:

```
*[class ~= "topic/dlentry"] {
  font-family: "Times New Roman", Symbol;
}
```

To change the font for the entire publication, not just an element, you can use:

```
:root {font-family: "Times New Roman", Symbol !important; }

@page {
  @top-left {font-family: "Times New Roman", Symbol !important; }
  @top-right {font-family: "Times New Roman", Symbol !important; }
  @top-center {font-family: "Times New Roman", Symbol !important; }
  @top-left-corner {font-family: "Times New Roman", Symbol !important; }
  @top-right-corner {font-family: "Times New Roman", Symbol !important; }

  @bottom-left {font-family: "Times New Roman", Symbol !important; }
  @bottom-right {font-family: "Times New Roman", Symbol !important; }
  @bottom-center {font-family: "Times New Roman", Symbol !important; }
  @bottom-left-corner {font-family: "Times New Roman", Symbol !important; }
  @bottom-right-corner {font-family: "Times New Roman", Symbol !important; }
}
```

Tip:

On Windows, one simple way to determine the font needed to display the text is to copy the text fragment that has rendering problems from the DITA source document and paste it into Microsoft WordPad or Word. It will automatically select a font capable of rendering the text. Simply click on the text to see the name of the font from the "Font" ribbon toolbar. Then you can use it as a fallback font in the CSS. Make sure there are no licensing restrictions on that particular font.

Note:

It is also possible to use a generic family name as fallback, like `serif`, `sans-serif` or `monospace`, like this you will call upon the processor default [fallback fonts system](#).

**Warning:**

Even if the message is a warning, sometimes it can lead to a failed transformation. This usually occurs for really special characters (different from letters or common characters).

How to Set Fonts in Titles and Content

Suppose that in your [customization CSS \(on page 1567\)](#), you have defined your font (for example, *Roboto*) using a Google web font:

```
https://fonts.googleapis.com/css2?family=Roboto:ital,wght@0,400;0,700;1,400;1,700&display=swap
```

You can force a font on all elements, then style the ones that need to be different. The advantage of this method is that you do not need to trace all elements that have a font family defined in the built-in CSS files, you just reset them all.

In your [customization CSS \(on page 1567\)](#), add an `!important` rule that associates a font to all the elements from the document:

```
* {
  font-family: "Roboto", sans-serif !important;
}
```

**Note:**

If you want to use the `:root` selector instead of the `*` selector, without the `!important` qualifier, the elements that have a predefined font specified in the built-in CSS will keep that font. If your content uses non-Latin glyphs, it is possible that the built-in fonts do not render them.

Next, if you want to use another font for the document headings, your [customization CSS \(on page 1567\)](#) should contain the following rule:

```
*[class ~="front-page/front-page-title"],
*[class ~="topic/title"] {
  font-family: "Roboto", sans-serif !important;
  font-weight: bold;
}
```

Then, identify the selectors for the elements that need to be styled with a different font than the one associated above. For information on how to do this, see: [Debugging the CSS \(on page 1569\)](#).

For example, if you want the titles or the pre-formatted text to have a different font from the rest, matched by the above `*` selector, you need to use more specific CSS selectors:

```
*[class~="pr-d/codeph"],
*[class~="topic/pre"] {
```

```
font-family: monospace !important;
}
```

**Important:**

These settings do not apply to page margin boxes, only to the text inside the page. If you also want to change the font used in headers and footers, see: [How to Change the Font of the Headers and Footers \(on page 1583\)](#).

Related information

[How to Change the Font of the Headers and Footers \(on page 1583\)](#)

How to Use Fonts for Asian Languages

For Asian languages, you must use a font or a sequence of fonts that cover the needed character ranges. If the characters are not found, the # symbol is used.

When you specify a sequence of fonts, if the glyphs are not found in the first font, the next font is selected, and so on until one is found that includes all the glyphs. A common font sequence for Asian languages is as follows:

```
font-family: Calibri, SimSun, "Malgun Gothic", "Microsoft JhengHei";
```

To apply this font sequence, see: [How to Set Fonts in Titles and Content \(on page 1699\)](#).

Some of the Asian fonts do not have italic, bold, or bold-italic variants. In this case, you may use the regular font file with multiple font face definitions to simulate (synthesize) the missing variants. You need to use the `-oxy-simulate-style:yes` CSS property in the font face definition as explained in: [Using Simulated/Synthetic Styles in Oxygen Chemistry](#).

How to Use Asian Fonts in Linux

For Asian languages on Linux distributions, **PDF Chemistry** automatically uses `DejaVu` and `Noto CJK` as fallback fonts for Serif, Sans-Serif, and Monospace content.

**Warning:**

On some distributions, the `Noto CJK` fonts are not available. In this case, you need to install them using the system package manager:

- `fonts-noto-cjk` on Debian family distributions (e.g. Ubuntu).
- `google-noto-cjk-fonts` on Red Hat family distributions (e.g. CentOS).

How to Add a New Asian Font

If you want to add a specific font for Asian languages, you need to declare it inside your [customization CSS \(on page 1567\)](#). The following example uses the [Noto Sans Tamil](#) font-family:

```
/* Font Declaration */
@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 400;
    src: url(../fonts/ttf/notosanstamil/NotoSansTamil-Regular.ttf);
}

@font-face {
    font-family: "Noto Sans Tamil";
    font-style: normal;
    font-weight: 700;
    src: url(../fonts/ttf/notosanstamil/NotoSansTamil-Bold.ttf);
}

/* Font Usage */
* {
    font-family: sans-serif, "Noto Sans Tamil";
}
```

How to Set Fonts for Displaying Music

Music is rendered as normal text in most fonts, but some of them will render them as musical glyphs. For example, the *MusGlyphs* font converts the text to music and adjusts it to the surrounding text.

This font is divided in two sub-fonts that act for each of the following categories:

- **MusGlyphs** - Converts all characters that match a musical pattern into music glyphs. It should be used inside the elements that contain only music.
- **MusGlyphs-Text** - Converts only the text prefixed with the @ symbol into music glyphs. The remaining text is displayed normally.

To use this font, you simply need to declare each sub-font then use them in appropriate elements:

```
@font-face {
    font-family: MusGlyphs;
    font-style: normal;
    font-weight: 400;
    src: url(../fonts/otf/musglyphs/MusGlyphs.otf);
}
```

```

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: 400;
  src: url(../fonts/otf/musglyphs/MusGlyphs-Text.otf);
}

@font-face {
  font-family: MusGlyphs-Text;
  font-style: normal;
  font-weight: bold;
  src: url(../fonts/otf/musglyphs/MusGlyphs-TextBold.otf);
}

/*
 * All the elements are displayed with the MusGlyphs-Text.
 * If a text is prefixed with @, music will be displayed.
 */

body {
  font-family: MusGlyphs-Text, serif;
}

/* Elements with @outputclass="music" contain only music. */
*[outputclass ~= "music"] {
  font-family: MusGlyphs, serif;
}

```

Comments, Highlights, and Tracked Changes

The comments and tracked changes can be made visible in the PDF output by setting the `show.changes.and.comments` transformation parameter to `yes`.

Figure 457. Chemistry Annotations in Acrobat Reader

The image shows a document with a list of steps. The first step is highlighted in yellow. A comment box is open over the second step, showing a reply from 'dan' with a red strikethrough comment. A red box highlights a specific part of the text in the second step, with a red arrow pointing to the comment box.

(Follow these simple steps):

1. Begin by cutting out all the dead branches.
2. Remove all tangled or crossed over branches. **(+)** allows **fungi infestation.**
3. Take your time! Work comfortably and do not make shortcuts. Use quality, sharp tools.
4. Clean up the area. **(Burn all pest infested branches).**

dan Reply X

"This will be discussed in a next topic."
~~This allows air to circulate and reduces bug and..~~

9/5/2018 2:40 PM **Post**

By default, they are shown as PDF text annotations (sticky notes). These are graphical markers in the document content and are also listed in the **Comments** section when opening the output file in Acrobat Reader.

**Note:**

Comments with the **Mark as Done** flag selected appear with a check mark in the **Comments** section and with a **Completed** label (✓ John Doe Completed).

To avoid rendering the elements as PDF annotations and show them as footnotes instead, you can use the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter set to `no`.

The comments and changes are included in the [merged map file \(on page 1569\)](#) either as XML elements (`<oxy-insert>`, `<oxy-delete>`, `<oxy-comment>`, `<oxy-attributes>`) in the case of the XML merged map, or as HTML elements with similar classes (`oxy-insert`, `oxy-delete`, `oxy-comment`, `oxy-attributes`) in the case of the HTML merged map. Sub-elements contain meta-information about each change.

**Tip:**

These elements are automatically recognized and transformed in PDF annotations when using Chemistry as PDF processor.

**Note:**

The inserted text, deleted text, and deleted markup are included in the sticky notes, you can change this behavior by using the `show.changed.text.in.pdf.sticky.notes.content` parameter ([on page 1550](#)).

Related Information:

[Transformation Parameters \(on page 1543\)](#)

[Debugging the CSS \(on page 1569\)](#)

Comments and Tracked Changes - Built-in CSS

The built-in CSS that controls the way tracked changes and comments are displayed is found in:

`[PLUGIN_DIR]css/print/p-side-notes.css`.

Comments and Tracked Changes - HTML Fragment

This section contains information about how each type of tracked change is structured in the [merged map HTML file \(on page 1569\)](#).

Insertions

For an insertion type of tracked change, the structure that defines the insertion details is inside a *range* (`oxy-range-start` to `oxy-range-end`), the inserted text is highlighted by a `` element with the class `oxy-insert-hl`, and the details are stored in a `` element with the `oxy-insert` class.

```
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-insert" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-content">insert</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:38:29</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-insert-hl">This is an insert!!</span>

<span class="oxy-range-end" hr_id="1"/>
```

Comments

Similar to insertions, comments are defined in a *range* (`oxy-range-start` to `oxy-range-end`), the comment details in an element with the class `oxy-comment`, and the highlighted content is wrapped in the `oxy-comment-hl` element.

```
<span class="oxy-range-start" id="sc_1" hr_id="1"/>

<span class="oxy-comment" href="#sc_1" hr_id="1">
  <span class="oxy-author">dan</span>
  <span class="oxy-comment-text">This is a comment.</span>
  <span class="oxy-date">2018/03/15</span>
  <span class="oxy-hour">09:56:59</span>
  <span class="oxy-tz">+02:00</span>
</span>

<span class="oxy-comment-hl">The commented text.</span>

<span class="oxy-range-end" hr_id="1"/>
```

Note:

Comments that are marked as done have a `flag="done"` attribute:

```
<span class="oxy-comment" href="#sc_6" hr_id="6" flag="done">
```

Attribute changes

The attribute changes are more complex. The range is empty, and is directly above the affected element (the one that has modified attributes). The element with the class `oxy-attributes` contains details about multiple attribute changes, each stored in an element with the class `oxy-attribute-change`.

```
<element>

  <span class="oxy-range-start" id="sc_3" hr_id="3" />
  <span class="oxy-range-end" hr_id="3" />

  <span class="oxy-attributes" href="#sc_3" hr_id="3">

    <span class="oxy-attribute-change" type="inserted" name="platform">
      <span class="oxy-author">dan</span>
      <span class="oxy-current-value">windows</span>
      <span class="oxy-date">2018/03/15</span>
      <span class="oxy-hour">10:05:04</span>
      <span class="oxy-tz">+02:00</span>
    </span>
    ....
    <span class="oxy-attribute-change" type="removed" name="audience">
      ....
    </span>
  </span>
</element>
```

Deletions

For a deletion, there are some elements that define the start and end of the deletion, and the highlighted text is wrapped in an element with the class `oxy-delete-hl`.

```
<span class="oxy-range-start" id="sc_2" hr_id="2" />
<span class="oxy-delete-hl"> This is a deleted text. </span>
<span class="oxy-range-end" hr_id="2" />
```

There is a structure that offers details about the deletion change, using the element with the class `oxy-delete`. This is linked to the above deletion range by the same ID value:

```
<span class="oxy-delete" href="#sc_2" hr_id="2">
  <span class="oxy-author">dan</span>
  <span class="oxy-content"><img href="../img/ex.gif"></span>
  <span class="oxy-date">2018/03/14</span>
  <span class="oxy-hour">11:38:06</span>
```

```
<span class="oxy-tz">+02:00</span>
</span>
```

Colored Highlights

To show some text as highlighted with a background color:

```
<span class="oxy-color-h1" color="rgba(140,255,140,50)">Some colored text.</span>
```

How to Style Tracked Changes or Comments

Here are some examples showing how to customize tracked changes and highlighted text:

- If you want to change the highlighted text color from the document content, use the `@class="oxy-comment-h1"` attribute (or `@class="oxy-delete-h1"`, `@class="oxy-insert-h1"`):

```
.oxy-comment-h1 {
  color:magenta;
}
```

- If you want to change the range labels indicating the start or the end of a change (by default, formatted like this: "[n]...[/n]" where n is the change number), you can use the following selectors:

```
.oxy-range-start:before {
  content: '[START]';
  color:red;
}
.oxy-range-end:before {
  content: '[END]';
  color:red;
}
```

- If you want to only show the changes and comments highlights

```
.oxy-range-start,
.oxy-range-end {
  display: none;
}
.oxy-insert,
.oxy-delete {
  display: none;
}
```

Note:

No comments will be displayed in the PDF Viewer Comments view after this modification.

How to Style Tracked Changes Shown as Footnotes

Important:

This topic is relevant if you have set the `show.changes.and.comments.as.pdf.sticky.notes` transformation parameter to `no`, and therefore the changes are shown as footnotes instead of PDF annotations.

Here are some examples showing how to customize footnotes:

- If you want to change the background color and the border of the comment footnote, add the following snippet in your [customization CSS \(on page 1567\)](#):

```
.oxy-comment {
  background-color: inherit;
  border: 2pt solid yellow;
}
```

Similarly, you can style the other footnotes for `@class="oxy-attributes"`, `@class="oxy-delete"`, and `@class="oxy-insert"`.

- If you want to hide some footnotes (for example, the footnotes associated with the insertions, deletions, or attribute changes when your document contains a lot of tracked changes), add something like this in your [customization CSS \(on page 1567\)](#) (the following example results in the deletions and insertions being hidden, but the comments remain visible):

```
.oxy-attributes,
.oxy-delete,
.oxy-insert{
  float: none;
  display: none;
}
```

How to Show Only Change Bars on Tracked Changes

It is possible to only display the change bars for tracked changes (inserted or deleted content) in the PDF document while hiding the other styling for the tracked changes. This is helpful if you want to see the document in a final version while still seeing change bars where content was inserted or deleted.

To achieve this, follow these steps:

1. Set the `show.changes.and.comments` parameter to `yes` and the `show.changes.and.comments.as.pdf.sticky.notes` parameter to `no`.

Step Result: The first parameter causes tracked changes to be visible in your document and styled (e.g. insertions are blue and underlined, while deletions are red with a strike-through). Changing the second parameter to `no` causes the tracked changes to be displayed as a footnote instead of a PDF annotation.

2. Hide the footnotes by adding the following in your [customization CSS \(on page 1567\)](#):

```
.oxy-attributes,
.oxy-comment,
.oxy-delete,
.oxy-insert {
    float: initial;
    display: none;
}
```

3. Remove the change range markers (the { and } symbols):

```
.oxy-range-start:before,
.oxy-range-end:before {
    content: none;
}
```

4. Remove the styling for the insertions and deletions:

```
.oxy-insert-hl{
    color:unset;
    text-decoration:none;
}
.oxy-delete-hl {
    content: "\200b";
    text-decoration:none;
}
.oxy-comment-hl{
    background-color:unset;
}
.oxy-color-hl[color]{
    background-color:unset;
}
```

5. **[Optional]** You can improve the visibility of the change bars with this construct:

```
.oxy-range-start[is-changebar]:before(100) {
    -oxy-changebar-color: red;
    -oxy-changebar-width: 3pt;
}
```

Draft Watermarks

A *watermark* is an image displayed as the background of a printed document and it is faded enough to keep the publication text readable. *Draft watermarks* are used to indicate that a document is under construction or has not yet been approved.

How to Add a Draft Watermark on All Pages

To add a draft watermark to all of your publication pages, you can use the following page selector in your customization CSS (*on page 1567*):

```
@page {
  background-image: url("draft.svg");
  background-position:center;
  background-repeat:no-repeat;
  background-size: 100% 100%;
}
```

If you have already set a background image for other pages (for example, the `front-page` or `table-of-contents`), the above selector won't change them, as they are more specific.

The best practice is to use a different `draft.css` CSS file that imports the customization CSS where the rest of the style changes reside. If you need to publish the content as a draft, use the `draft.css` in your transformation scenario, otherwise directly reference the *customization CSS (on page 1567)*.

Related Information:

[Images and Figures \(on page 1723\)](#)

How to Add a Draft Watermark in the Foreground

If you want the watermark to be displayed above the text (in the foreground), instead of using the standard `background-image` property, you can use the `-oxy-foreground-image` property:

```
@page {
  -oxy-foreground-image: url("draft.svg");
}
```

You can set a more specific selector if you just need to display the foreground in a subset group of pages (for example, `chapter`). In this case, the above selector will not change it since it is more specific.

Note:

The usage of SVG images is preferred because other image types suffer from *pixelation* and because foreground images are stretched to the full page size.

How to Add a Draft Watermark Depending on Metadata

Suppose you want to apply a *Draft watermark* until your DITA bookmap is approved and the map is approved when an `<approved>` element has been added to the metadata section (for example, in the `bookmeta/bookchangehistory` element).

```
<bookmeta>
  <author>John</author>
```

```

<critdates>
  <created date="1/1/2015"/>
  <revised modified="3/4/2016"/>
  <revised modified="3/5/2016"/>
</critdates>
<bookchangehistory>
  <approved/>
</bookchangehistory>
...

```

Use `oxy_xpath` every time you need to probe the value from an element other than the one matched by the CSS selector, and test the expression on the merged HTML file using the **Oxygen XPath Builder** view.

You can either use a page selector that imposes the draft watermark on the entire page surface (recommended):

```

@page {
  background-image: url(oxy_xpath("if(//*[contains(@class, 'bookmap/approved')]) then '' else 'draft-watermark.png'"));
  background-position: center;
  background-repeat: no-repeat;
}

```

or use an element selector that restricts the watermark image only to the page area covered by that element:

```

:root, body{
  ... /* same as properties above */
}

```

Note:

You can use another element selector to target a specific part of your publication (for example, marking only the tables as drafts).

Related information

[Metadata \(on page 1625\)](#)

[How to Debug XPath Expressions \(on page 1574\)](#)

Flagging Content

In DITA, you can mark certain content to flag it or draw attention to it. This is done by defining a flag in a DITAVAL file.

You can attach the DITAVAL file to the DITA map using the `<ditavalref>` element in the map, or by specifying it in the `args.filter` transformation parameter.

In the following example, all the elements that have the attribute `@product` set to `YourProd` is flagged to have a purple background:

```
<val>
...
  <prop action="flag" att="product" val="YourProd" bgcolor="purple"/>
...
</val>
```

Related Information:

[Change Bars](#)

[DITAVAL Elements](#)

How to Flag Content Using Change Bars

As an example, to add a *change bar* (revision mark) for particular content, you can use the following in the DITAVAL file:

```
<val>
  <revprop action="flag"
    changebar="color:blue;style:solid;width:2pt;offset:1.25mm;placement:start" val="new"/>
</val>
```

This would result in any content that is marked with `@rev="new"` having a blue change bar.

How to Flag Content Using Images

You can mark the elements that match a specific profiling condition using images (one for the start, one for the end). The image references are relative to the DITAVAL file.

```
<val>
  <prop action="flag"
    att="product" val="MyProd"
    bgcolor="blue"
    color="yellow" >

    <startflag imageref="startflag.jpg">
      <alt-text>This is the start of my product info</alt-text>
    </startflag>

    <endflag imageref="endflag.jpg">
      <alt-text>This is the end of my product info</alt-text>
    </endflag>
  </prop>
</val>
```

Styling the Content

If you need to change the styles of the elements from the topic contents, you should create a [customization CSS \(on page 1567\)](#) and then add CSS rules. To create the CSS rules, you can use the development tools described in [Debugging the CSS \(on page 1569\)](#).

Reusing the Styling for WebHelp and PDF Output

If you are using the `pdf-css-html5` transformation type, then the generated HTML5 document that is later converted to PDF is very similar to the generated HTML5 pages from the WebHelp Responsive output.

This is an output example from the WebHelp transformation:

```
<h1 class="title topictitle1" id="ariaid-title2">Care and Preparation</h1>
<div class="body">
  <p class="shortdesc">When caring ...</p>
  <p class="p">When caring for your flower garden you want ... </p>
```

And the same example from the PDF transformation (note the additional emphasized class values):

```
<h1 class="- topic/title title topictitle1" id="ariaid-title2">Care andPreparation</h1>
<div class="- topic/body body">
  <p class="- topic/shortdesc shortdesc">When caring ... </p>
  <p class="- topic/p p">When caring for your flower garden you want ... </p>
```

It makes sense to reuse the same CSS rules you developed for one transformation type to the other. The main rule is to use the short class names instead of the long ones. For example, to style the short descriptions with italic font, use:

```
.shortdesc {
  font-style: italic;
}
```

The rule of thumb is that if you have a CSS rule that successfully styles an element in WebHelp, it should apply without any modification in the PDF output.

Titles

Titles in PDF can be classified into two categories:

- Table of contents titles, identified by the `map/topicref` and `topic/navtitle` class attributes.
- Content titles, that can be styled by matching the `topic/title` class attribute.

How to Control Titles Layout

By default, titles are rendered on a single line (with both the chapter/section number and title text). If the title is too long, the text wraps to the next line without any indentation.

```
4.5.5 This is a long title
text that wraps.
```

If you want each line of the title to start at the same location (and indented), you need to set the value of the `args.css.param.title.layout` transformation parameter to **table**. This means that the chapter/section number is placed in one cell and title text is placed in another cell (resulting and indented text):

```
4.5.5 This is a long title
    text that wraps.
```

How to Change Chapters Title Prefix

Changing Prefixes in Shallow Numbering

In shallow numbering (default), to replace the "Chapter N." prefix, use the following rules in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] > *[class
  ~= "topic/navtitle"]:before{
  content: "Module " counter(toc-chapter, decimal-leading-zero) " - ";
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before {
  content: "Module " counter(chapter, decimal-leading-zero) "\A";
}
```

Changing Prefixes in Deep Numbering

In deep numbering, to replace the "N." prefix, use the following rules in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part]) >
  *[class ~= "topic/title"]:before,
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "topic/topic"][is-chapter]:not([is-part])
  *[class ~= "topic/topic"] > *[class ~= "topic/title"]:before {
  content: counters(chapter-and-sections, ".") "\A";
}
```

How to Remove Parts and Chapter Title Prefixes

Removing Prefixes in Shallow Numbering

In shallow numbering (default), to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "map/topicref"] > *[class ~= "map/topicmeta"] > *[class ~= "topic/navtitle"]:before {
  display: none !important;
}
```

```
*[class ~= "topic/topic"] > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

You can also choose to remove only the "Part N" prefix:

```
*[class ~= "map/topicref"][is-part] > *[class ~= "map/topicmeta"] > *[class
  ~= "topic/navtitle"]:before {
  display: none !important;
}
*[class ~= "topic/topic"][is-part] > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

Or to remove only the "Chapter NN" prefix:

```
*[class ~= "map/topicref"][is-chapter]:not([is-part]) > *[class ~= "map/topicmeta"] > *[class
  ~= "topic/navtitle"]:before {
  display: none !important;
}
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

Removing Prefixes in Deep Numbering

In deep numbering, to hide the "Part N" and "Chapter NN" prefixes, use the following rules in your customization CSS ([on page 1567](#)):

```
*[class ~= "map/map"][numbering ^= 'deep'] *[class ~= "map/topicref"] > *[class
  ~= "map/topicmeta"]:before {
  display: none !important;
}
*[class ~= "topic/topic"] > *[class ~= "topic/title"]:before {
  display: none !important;
}
```

How to Display Chapters Title on a Separate Page

You may want to display the chapters title on a separate page (for example, with a background). To do this, a new page should be defined in your customization CSS ([on page 1567](#)):

```
@page chapter-title-page {
  background-image: url("resources/title-bg.png");
  background-repeat: no-repeat;
  background-size: 100% 100%;
}
```

```
background-position: center;
}
```

After that, you need to replace the default "chapter" page definition with the one created before:

```
*[class ~= "topic/topic"][is-chapter] {
  page: chapter-title-page;
}
```

Then, you need to set it back on the content following the title:

```
*[class ~= "topic/topic"][is-chapter] > *[class ~= "topic/title"] ~ *:not([class ~= "topic/title"])
{
  page: chapter;
}
```

Finally, you can customize the title color, size, and more:

```
*[class ~= "topic/topic"][is-chapter]:not([is-part]) > *[class ~= "topic/title"] {
  color: white;
  font-size: 32pt;
}
```

Related information

[Default Chapter Page Definition \(on page 1576\)](#)

Equations

This processor supports MathML equations.

How to Change the Font of MathML Equations

Suppose that you need to change the font of MathML equations from the documentation, and also add some padding. The MathML fragments are wrapped in elements that have the class `equation-d/equation-block` or `equation-d/equation-inline`, so you can match them with:

```
*[class ~= "equation-d/equation-block"],
*[class ~= "equation-d/equation-inline"]{
  font-family: "courier new";
  font-size: 1.5em;
  padding: 1em;
}
```

Note:

An equation can be rendered using multiple classes of fonts (e.g. the *serif*, *sans serif*, *monospace*, *fraktur*, and *doublestruck* classes). Depending on each of the equation symbols, a class is selected for it. The font specified in the CSS rule (as in the preceding example), applies only to the *serif* class.

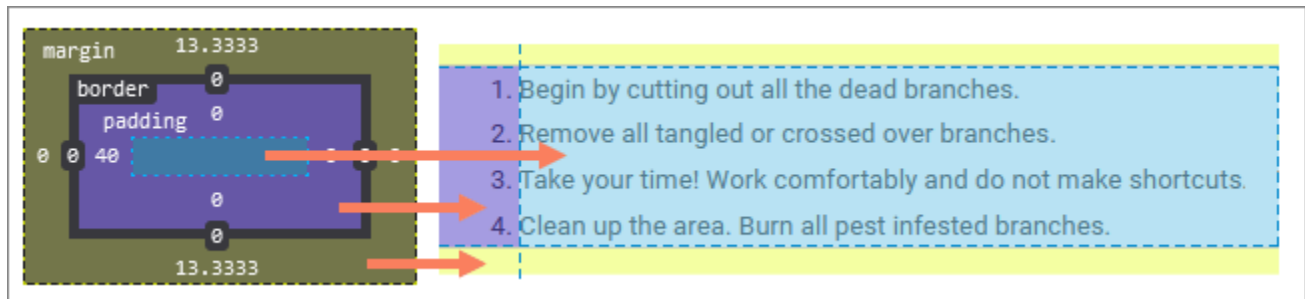

However, if a symbol codepoint is not covered by the currently selected class fonts, it falls back to the font specified in the CSS.

**Attention:**

Some of the fonts may not be supported. In that case, a default *serif* font is used.

Lists

This is the default layout for lists (both ordered and unordered lists - values are in **px**):

Markers are displayed in the padding area, so they are not included in the principal block box.

The lists are treated differently than ordinary block elements in the sense that their margins are not collapsed with the margins of the neighboring blocks or lists. This is also visible for nested lists. To summarize:

- Setting the `padding-left` or `margin-left` properties on lists will move the whole list.
- Setting the `margin-left` property on list items will move the whole list.
- Setting the `padding-left` property on list items will only move the list item content (not the marker).

**Note:**

If the `padding-left` property is set on lists and the `margin-left` property is set on list items, the result will move the whole list with a combination of both padding and margin values.

How to Style Lists

Some common use-cases for styling lists require you to change each list level separately. For example, for an ordered list:

```
*[class ~= "topic/ol"] > *[class ~= "topic/li"] /* First Level */ {
  font-size: 15pt;
}
*[class ~= "topic/ol"] *[class ~= "topic/ol"] > *[class ~= "topic/li"] /* Second Level */ {
  font-size: 13pt;
}
*[class ~= "topic/ol"] *[class ~= "topic/ol"] *[class ~= "topic/ol"] > *[class ~= "topic/li"] /*
Third Level */ {
```

```
font-size: 11pt;
}
/* Etc. */
```

Similarly, for an unordered list:

```
*[class ~= "topic/ul"] > *[class ~= "topic/li"]::marker /* First Level */ {
    color: red;
    content: "\2022";
}
*[class ~= "topic/ul"] *[class ~= "topic/ul"] > *[class ~= "topic/li"]::marker /* Second Level */ {
    color: orange;
    content: "\2022";
}
*[class ~= "topic/ul"] *[class ~= "topic/ul"] *[class ~= "topic/ul"] > *[class
~= "topic/li"]::marker /* Third Level */ {
    color: green;
    content: "\2022";
}
/* Etc. */
```

Note:

It is possible to mix lists type simply by mixing `*[class ~= "topic/ol"]` and `*[class ~= "topic/ul"]` in the CSS selector.

How to Align Lists with Page Margins

It is possible to reposition the lists to align them with the rest of the text from the body.

The default CSS rules for the lists are as follows:

```
ol {
    display:block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type:decimal;
    padding-left: 40px;
}
ul {
    display:block;
    margin-top: 1.33em;
    margin-bottom: 1.33em;
    list-style-type:disc;
```

```
padding-left: 40px;
}
```

To align the lists, the following rules are sufficient in the [customization CSS \(on page 1567\)](#):

```
*[class~="topic/ol"],
*[class~="topic/ul"] {
padding-left: 0;
list-style-position: inside;
}
```

Note:

By default, the `list-style-position` property is set to **outside**.

How to Continue List Numbering

It is possible to continue the numbering of an ordered list even when the content is split in multiple `` elements.

You need to define an `@outputclass` attribute on the lists where numbering should continue:

```
<ol>
  <li>First Item</li>
  <li>Second Item</li>
</ol>
<p>A paragraph</p>
<ol outputclass="continue">
  <li>Third Item</li>
</ol>
```

Then set the following content inside your CSS customization:

```
*[class ~= "topic/ol"] {
  counter-reset: item-count;
}

*[class ~= "topic/ol"][outputclass ~= "continue"] {
  counter-reset: none;
}

/* Add counter marker for each list level */
*[class ~= "topic/ol"] > *[class ~= "topic/li"]::marker {
  counter-increment: item-count;
  content: counter(item-count, decimal) ". ";
}
```

```

*[class ~= "topic/ol"][type=a] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, lower-alpha) ". ";
}
*[class ~= "topic/ol"][type=A] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, upper-alpha) ". ";
}
*[class ~= "topic/ol"][type=i] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, lower-roman) ". ";
}
*[class ~= "topic/ol"][type=I] > *[class ~= "topic/li"]::marker{
    content: counter(item-count, upper-roman) ". ";
}

```

If the lists do not have the same parent, it is possible to start the numbering directly at a given number by setting the `@outputclass` attribute of the following list to `start-X` (where X is the number you want the list to start with):

```

<table frame="all">
  <title>Table with nested order lists</title>
  <tgroup cols="1">
    <tbody>
      <row>
        <entry>
          <ol>
            <li>First Item</li>
            <li>Second Item</li>
          </ol>
        </entry>
      </row>
      <row>
        <entry>
          <ol outputclass="start-3">
            <li>Third Item</li>
            <li>Fourth Item</li>
          </ol>
        </entry>
      </row>
    </tbody>
  </tgroup>
</table>

```

Then the following content should be added into the previous CSS customization:

```
*[class ~= "topic/ol"][outputclass *= "start-"] {
    counter-reset: item-count oxy_xpath("xs:integer(substring-after(@class, 'start-')) - 1");
}
```

How to Change the Numbering System of Ordered Lists

It is possible to change all lists to have a different numbering system and there are several methods that can be used to achieve this.

Use the `list-style-type` CSS Property.

The **Chemistry** engine supports the following types: `decimal`, `decimal-leading-zero`, `lower-roman`, `upper-roman`, `lower-latin`, `upper-latin`, `lower-alpha`, `upper-alpha`.

```
*[class ~= "topic/ol"] {
    list-style-type: lower-roman;
}
```

Change the Content of the `:marker` CSS Pseudo-Element.

The following example emulates the Cyrillic numbering for the list items for an ordered list that has the `@outputclass` attribute set to `cyrillic`:

Important:

This example will work only for lists up to 28 items. You will have to extend it for longer lists!

```
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class ~= "topic/li"]:marker {
    width: 3em;
}

*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(1):marker{ content: "a" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(2):marker{ content: "б" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(3):marker{ content: "в" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(4):marker{ content: "г" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(5):marker{ content: "д" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(6):marker{ content: "е" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(7):marker{ content: "ж" }
```

```
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(8):marker{ content:"з" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(9):marker{ content:"и" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(10):marker{ content:"к" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(11):marker{ content:"л" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(12):marker{ content:"м" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(13):marker{ content:"н" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(14):marker{ content:"о" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(15):marker{ content:"п" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(16):marker{ content:"р" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(17):marker{ content:"с" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(18):marker{ content:"т" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(19):marker{ content:"у" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(20):marker{ content:"ф" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(21):marker{ content:"х" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(22):marker{ content:"ц" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(23):marker{ content:"ч" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(24):marker{ content:"ш" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(25):marker{ content:"щ" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(26):marker{ content:"э" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(27):marker{ content:"ю" }
*[class ~= "topic/ol"][outputclass ~= "cyrillic"] > *[class
  ~= "topic/li"]:nth-of-type(28):marker{ content:"я" }
```

Links

Links allow the users to navigate through the documentation.

How to Change 'on page NNN' Link Label

For printed material, it is usually desirable for the links to display a label after the text content (such as "on page 54"). This makes it easier the user to identify the target page. However, if the produced PDF is not printed and is intended only for electronic use, this label may create clutter and make the document harder to read. To eliminate this label, add the following in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    content: none !important;
}
```

**Note:**

A variant is to remove the "on page" label only and keep the page number:

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    content: " (" target-counter(attr(href), page) ")" !important;
}
```

Another use-case is to remove the labels only from links shown in tables cells, and leave the others as they are. For this, you could use a more specific selector:

```
*[class ~= "topic/entry"] *[class ~= "topic/xref"][href]:after{
    content: none !important;
}
```

How to Change Link Styles

Suppose you want the links to be bold and with an underline. In your [customization CSS \(on page 1567\)](#), add this snippet:

```
*[class ~= "topic/xref"][href]:after,
*[class ~= "topic/link"][href]:after {
    font-weight: bold;
    text-decoration: underline;
}
```

How to Hide Descriptions in Related Links Sections

The link descriptions that come from DITA relationship tables or related link elements within topics, are structured in the [merged map \(on page 1569\)](#) like this:

```
<related-links class="- topic/related-links ">
  <linkpool class="- topic/linkpool ">
    <link class="- topic/link "
      ...
      role="friend" scope="local" type="topic">
      <linktext class="- topic/linktext ">Salvia</linktext>
      <desc class="- topic/desc ">The salvia plant</desc>
    </link>
  </linkpool>
  ...
</related-links>
```

If you need to hide these descriptions, add the following code in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "topic/link"] > *[class ~= "topic/desc"] {
  display: none;
}
```

How to Group Related Links by Type

By default, all links from DITA relationship tables or related link elements within topics are grouped under one "Related information" heading:

```
Related information
  Target Topic
  Target Concept
  Target Task
```

It is possible to group the links by target type (topic type) by setting the `args.rellinks.group.mode=group-by-type` parameter. The output will look like this:

```
Related concepts
  Target Concept
Related tasks
  Target Task
Related information
  Target Topic
```

Images and Figures

Images are an important part of a publication.

**Note:**

You can use raster image formats (such as PNG or JPEG), but it is best to use vector images (such as SVG or PDF). They scale very well and produce better results when printed. In addition, the text from these images is searchable and can be selected (if the glyphs have not been converted to shapes) in the PDF viewer.

Images - Built-in CSS

Image properties are defined in `[PLUGIN_DIR]css/print/p-figures-images.css`.

```
*[class ~= "topic/image"] {
    prince-image-resolution: 96dpi;
    -ah-image-resolution: 96dpi;
    image-resolution: 96dpi;
    max-width: 100%;
}
```

How to Fix Image Bleeding - Control Image Size

Sometimes the images may be too big for the page. The built-in CSS rules specify a maximum size for images, limiting to the width of the parent block. But if the parent block is itself too wide and bleeds out of page, you might consider specifying a length.

In your [customization CSS \(on page 1567\)](#), add the following snippet:

```
*[class ~= "topic/image"] {
    ...
    /* The US-letter page size minus page margins. See p-page-size.css for the current page
    size. */
    max-width: 6.5in;
}
```

Pay attention to images that have an [image map \(on page 1729\)](#) associated. The built-in rules set the `max-width: auto` for them to avoid scaling. Otherwise, it would cause a misalignment between the image and its clickable areas. These images are best to have a `@width` and `@height` attribute.

How to Change Image Resolution

How to Change the Resolution for Raster Images

This technique changes the size of all **raster** images from your documentation. It will not work for *vector* images, such as PDF or SVG.

The default resolution is 96 dpi (same as in web browsers). You can change it by adding the following in your [customization CSS \(on page 1567\)](#):

```
*[class ~= "topic/image"] {
    prince-image-resolution: 300dpi;
    -ah-image-resolution: 300dpi;
    image-resolution: 300dpi;
}
```

Important:

The above selector does not apply to images from the `<imagemap>` element. You can use the following selector for that purpose:

```
*[class ~= "ut-d/imagemap"] > *[class ~= "topic/image"] {
    ...
}
```

Make sure you verify the area shapes to match the new image boundaries. The pixels specified in the image map area coordinates are always 1/96 in. For more details, see: [How to Use Image Maps \(on page 1729\)](#).

How to Change the Resolution for Vector Images

This technique will change the size of all **vector** images (such as PDF or SVG) and will not affect *raster* images.

Vector images are rendered with a default resolution of 96 dpi. You can change this default value by setting the `image.resolution` transformation parameter (on page 1543) to another value (from 72, 120, 300 and 600).

How to Place Big Images on Rotated Pages

Wide images may bleed out of the page. One solution for this is to use landscape pages for these wide images.

In your customization CSS (on page 1567), add:

```
*[class~="topic/image"][outputclass='land'] {
    page: landscape-page;
}
```

Setting the `@outputclass = 'land'` attribute on the `<image>` element forces the image to be displayed on a new landscape page.

If you want to rotate the entire topic that contains the image, use:

```
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/image"][outputclass="land"]),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * >
    *[class~="topic/image"][outputclass="land"]),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
    *[class~="topic/image"][outputclass="land"]) {
```

```
page: landscape-page;
}
```

How to Place a Text and Image Side by Side

If you need to align text and an image side-by-side, you can use the following technique:

1. Organize your text and image inside a `<div>` element like this:

```
...
<div outputclass="side-by-side">
  <p> This will be in the left side, the next figure in the right. </p>
  <fig>
    <image href="cactus.jpeg"/>
  </fig>
</div>
...
```

Note:

You can use the `@outputclass` attribute to mark the `<div>` elements that have this special layout.

2. In your customization CSS (on page 1567), add:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  display:inline-block;
  width: 45%;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
  display:inline-block;
  width: 45%;
}
```

The image should fill the entire width of the parent `<fig>` element:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] > *[class ~= "topic/image"] {
  width:100%;
}
```

By default, the bottom of the image is on the same line as the text baseline. If you want the text and the image to be aligned at the top, add these lines:

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/p"] {
  vertical-align:top;
}

*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
```

```
vertical-align:top;
}
```

**Note:**

If your figure does not have a title, you can also set `font-size:0pt` to remove the font ascent and descent around the image rectangle.

```
*[outputclass ~= "side-by-side"] > *[class ~= "topic/fig"] {
    vertical-align:top;
    font-size:0pt;
}
```

How to Control the Image Size in Complex Static Content

It is common to have text and images mixed together in a `:before` or `:after` pseudo-element. For example, for notes you may have both artwork and text:

```
*[class ~= "topic/note"]::before {
    content: url('note.png') "Some text";
}
```

If you want to change the size of the image, you have two options:

- Use the `image-resolution` CSS property:

```
*[class ~= "topic/note"] {
    image-resolution:300dpi;
}
```

- Separate the image from the text and apply the width and height CSS properties only on the image, using the width and height properties. You could use multiple `:before` pseudo-elements for that, considering that the farthest content presented before the actual content of an element is matched by the `:before` with the highest number in the brackets:

```
*[class ~= "topic/note"]:before(2) {
    content: url('note.png') ;
    width:0.5in;
}

*[class ~= "topic/note"]:before(1) {
    content: "Some text";
}
```

How to Center Images

DITA defines a `@placement` attribute for the `<image>` elements. The implicit value is `inline`. Suppose that you need to center the images that have the placement set to `break` (for example, they are not on the same line with other content and the images from the `<fig>` element).

In your customization CSS (*on page 1567*), add:

```
*[class ~= "topic/fig"] {
  text-align:center;
}

/* Other images, with break placement. */
*[class ~= "topic/image"][placement='break']{
  display:block;
  text-align:center;
}

/*
  Scaled images are getting a computed width attribute, so we can use the auto margins.
  Auto margins function only if the block they apply to has a width.
*/
*[class ~= "topic/image"][placement='break'][width] {
  margin-left:auto;
  margin-right:auto;
  border: 2pt solid red;
}
```

How to Change/Reset the Figure Numbering

Note:

This topic is applicable for the *DITA Map PDF - based on HTML5 & CSS DITA PDF - based on HTML5 & CSS* transformation types.

There are cases when you need to change the aspect of the figure counter that is shown before the figure titles. By default, the figure titles are formatted like this:

```
Figure NN. Lore Ipsum Title
```

NN is the number of the figure that starts being counted from the beginning of the publication.

One use-case is to have the NN counter be incremented only within one chapter (for example, the first chapter contains "Figure 1" and "Figure 2", and the second chapter starts over with "Figure 1" instead of incrementing to "Figure 3").

You should reset the figure counter on each topic marked as chapter, then hide the label from the figure `<figcaption>` (this is an HTML element generated by the XSL transformation), and create another label using a `:before` selector on the `<figcaption>`.

```
*[class ~= "topic/topic"][is-chapter] {
  counter-reset: figcount;
}

.fig--title-label {
  display: none;
}

*[class ~= "topic/fig"] > .figcap:before {
  display: inline;
  content: "Figure " counter(chapter) "-" counter(figcount) " ";
}
```

Of course you will need to update the links to these figures to show the same number:

```
.fig--title-label-number,
.fig--title-label-punctuation {
  display: none;
}

.fig--title-label-number-placeholder {
  content: target-counter(attr(href), chapter) "-" target-counter(attr(href), figcount) " ";
}
```

How to Fix Missing Images

If your images are not accessible, you may receive an error message in the transformation console like this:

```
Image not found. URI:file:/path/to/my/image
```

This is usually because they are in a folder that is not in the folder subtree of the transformed map or topic.

To solve this, you can set the following transformation parameter: `fix.external.refs.com.oxygenxml=true`.

How to Use Image Maps

To use the DITA `<imagemap>` element in a PDF transformation, follow this procedure:

1. Start by determining the width and height of your image in CSS *pixels* and specify it on the `<image>` element using the `@width` and `@height` attributes.

**Notes:**

- A CSS *pixel* is $1/96$ in, so if the image is created at a `96dpi` resolution, one dot from the image is one pixel in the CSS space. If your image is displayed at [another resolution \(on page 1724\)](#), then it is adjusted accordingly (for example, `192dpi` results in two dots from the image being equal to one pixel in the CSS space).
- You can use other CSS units, including percentages. The percentages are solved relative to the image size and represent a way of creating *responsive* image maps.

**Warning:**

If you publish the content for both PDF and HTML web output, make sure you only use *pixels*, as some browsers only support these units.

Example:

Suppose you have a large image that is 6400x4800 dots, but you want to make it fit in a box of 640x480 CSS *pixels*. In the following snippet, this is done by specifying the width and height attributes. The areas must use coordinates relative to these values.

```
<imagemap>
  <image href="../images/Gear_pump_exploded.png"
    id="gear_pump_exploded"
    width="640"
    height="480">
    <alt>Gear Pump</alt>
  </image>
</imagemap>
```

2. In the map element, add areas (each with a shape and a set of coordinates):

```
<imagemap>
  <image ...> ... </image>
  <area>
    <shape>circle</shape>
    <coords>172, 265, 14</coords>
    <xref
      href="parts/bushings.dita#bushings_topic/bushings"
      format="dita">Bushings</xref>
  </area>
  <area>
    <shape>poly</shape>
    <coords>568, 81, 576, 103, 468, 152, 455, 130</coords>
```

```

<xref
  href="parts/drive-shaft.dita#drive_shaft_topic/drive_shaft"
  format="dita">Drive Shaft</xref>

</area>
...
</imagemap>

```

The type of areas are the ones defined in the HTML standard: `circle`, `poly`, `rect`, `default`. For more details, see: <https://html.spec.whatwg.org/multipage/image-maps.html#the-area-element>.

Warning:

Areas coordinates are relative the image box and are not affected by the image resizing (change in image width/height or scaling), accordingly to the HTML specs:

“For historical reasons, the coordinates must be interpreted relative to the displayed image after any stretching caused by the CSS 'width' and 'height' properties (or, for non-CSS browsers, the image element's width and height attributes - CSS browsers map those attributes to the aforementioned CSS properties).”

Tip:

Adding the `@scale` attribute on the `<imagemap>` element will scale both the image and areas.

3. Verify how the shapes look in the output. You can make the shapes visible by one of the following methods:

- Using the `show.image.map.area.numbers` and `show.image.map.area.shapes` transformation parameters.
- Adding a CSS snippet to your customization. The shapes have the `image-map-shape` class, the bullet around the image map number (`image-map-number`), and the text inside the bullet (`image-map-number-text`). To make them translucent yellow:

```

.image-map-shape{
  fill: yellow;
  fill-opacity: 0.5;
  stroke-opacity: 0.5;
}
.image-map-number-text {
  visibility: visible;
}
.image-map-number {
  fill: yellow;
  fill-opacity: 0.4;
}

```

```
stroke-opacity: 0.7;
}
```

**Tip:**

An SVG with links can be used as an alternative to the DITA `<imagemap>` element. Make sure that each link is a relative URI to an ID inside the publication content.

How to Hide the Image Map Links List

Below every image map, a list of links that point to the image map targets is displayed. This list can be hidden from the final output by using the following CSS selector:

```
.imagemap--areas {
  display: none;
}
```

How to Use SVG Syntax Diagrams

The DITA `<syntaxdiagram>` element is supported by the PDF transformation. To use SVG syntax diagrams, follow this procedure:

1. Download the latest version of the [svg-syntaxdiagrams](#) plugin, unzip it, and copy all the folders into your `DITA-OT-DIR\plugins` folder (they all start with "com. ").
2. Open a command prompt inside `DITA-OT-DIR\bin` and run the dita install command.
3. You can now add your custom `<syntaxdiagram>` element in your topic, as in the following example:

```
<syntaxdiagram id="syntaxdiagram_ok4_clk_xnb">
  <title>CopyFile</title>
  <groupseq><kwd>COPYF</kwd></groupseq>
  <groupcomp><var>input-filename</var><kwd>*INFILE</kwd></groupcomp>
  <groupseq><var>output-filename</var><kwd>*OUTFILE</kwd></groupseq>
  <groupchoice> <var>input-filename</var> <kwd>*INFILE</kwd></groupchoice>
  <groupchoice> <var>output-filename</var> <kwd>*OUTFILE</kwd></groupchoice>
</syntaxdiagram>
```

4. Run the DITA Map PDF - based on HTML5 & CSS (or DITA PDF - based on HTML5 & CSS) transformation.

**Warning:**

If you are not publishing the content for the first time, you may need to delete the `out/` and `temp/` folders to see the syntax diagram correctly in the `.merged.html` file.

Result: The PDF is generated and the syntax diagram is displayed as a referenced SVG file like this:

Videos

Videos can be referenced in a DITA topic by using the `<object>` element:

```
<object data="path/to/video.mp4" outputclass="video" />
```

Related information

[Oxygen PDF Chemistry User Guide: Videos](#)

How to Reference a Video Using a Key

Videos can also be referenced in DITA topics by using a key.

The key must be defined in the DITA map like this:

```
<keydef keys="video" href="path/to/video.mp4" format="mp4" />
```

The key is referenced in the topic with the `@datakeyref` attribute within the `<object>` element:

```
<object datakeyref="video" outputclass="video" width="480" height="270" />
```

How to Change Video Size

It is possible to set the size for your videos directly from a [custom CSS stylesheet \(on page 1567\)](#):

```
.video {
  width: 480px;
  height: 270px;
}
```

Related information

[Oxygen PDF Chemistry User Guide: Change the Video Size](#)

How to Change the Videos Cover

By default, a placeholder is displayed in place of the video. When clicked, this placeholder launches the video. A popup is presented in Acrobat Reader to enable the Multimedia content (the document must be trusted for the video to launch).

It is possible to change this placeholder with a custom one by using the `-oxy-video-cover` property:

```
.video {
  -oxy-video-cover: url("files/cover.png");
}
```

How to Center Videos

It is possible to center the videos by centering their containers like this:

```
.video-container {  
  text-align: center;  
}
```

Tables

Tables are widely used in technical documentation. This section contains information about the CSS rules that are used to style them and how to fix some problems.

Tables - Built-in CSS

There is a combination of CSS files that address tables:

- `[PLUGIN_DIR]/css/core/-table-html-cals.css`
- `[PLUGIN_DIR]/css/print/p-tables.css`

How to Avoid a Table Exceeding the Page Width

The DITA specification indicates that tables should have a fixed layout. This can be done in two different ways:

1. **Using proportional or relative measures** - It includes percent values and shares values (i.e. "3*" or "12*").
2. **Using fixed measures** - It includes all the values followed by units (i.e. *in*, *pt*, *px*, and others).

Important:

- Although the specification allows you to combine these values, it is **highly recommend** that you only use one method at a time. Combining both methods could lead to a table exceeding the page width and will make the content unreadable.
- If all of the column width values are not declared in the table, the shares values (e.g. "2.5*") will not be used.

How to Handle Wide Tables - Page Rotation

Some of the tables can have a large number of columns. In this case, the table may bleed out of the page. One solution is to use landscape pages for these tables.

Setting the attribute `orient = 'land'` attribute on the table element will force the table to be on a new landscape page.

Another solution is to use automatic detection of wide tables (5 or more columns):

```

*[class~="topic/table"][data-cols='5'],
*[class~="topic/table"][data-cols='6'],
*[class~="topic/table"][data-cols='7'],
*[class~="topic/table"][data-cols='8'],
*[class~="topic/table"][data-cols='9'],
*[class~="topic/table"][data-cols='10'] {
    page: landscape-page;
    max-width: 100%;
    max-height: 100%;
    width: 100%;
    page-break-before: avoid;
}

```

**Note:**

The `landscape-page` page layout is defined in the `[PLUGIN_DIR]/css/print/p-pages-and-headers.css` file.

If you want to rotate the entire topic that contains the big table, use:

```

*[class~="topic/table"][data-cols='5'],
*[class~="topic/table"][data-cols='6'],
*[class~="topic/table"][data-cols='7'],
*[class~="topic/table"][data-cols='8'],
*[class~="topic/table"][data-cols='9'],
*[class~="topic/table"][data-cols='10'] {
    max-width: 100%;
    table-layout: auto;
}

*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='5']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='6']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='7']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='8']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='9']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > *[class~="topic/table"][data-cols='10']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='5']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='6']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='7']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='8']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='9']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > *[class~="topic/table"][data-cols='10']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
*[class~="topic/table"][data-cols='5']),

```

```

*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
  *[class~="topic/table"][data-cols='6']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
  *[class~="topic/table"][data-cols='7']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
  *[class~="topic/table"][data-cols='8']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
  *[class~="topic/table"][data-cols='9']),
*[class~="topic/topic"]:has(*[class~="topic/body"] > * > * >
  *[class~="topic/table"][data-cols='10']) {
  page: landscape-page;
}

```

**Tip:**

It is also possible to import the `[PLUGIN_DIR]/css/print/p-optional-auto-rotate-wide-tables.css` stylesheet into your custom CSS.

How to Fix Text Bleeding From Table Cells

Slim tables or tables that have many columns make the text from the cells be confined to a small horizontal space. Sometimes this causes long words to bleed outside the cell boundaries.

By default, the built-in CSS automatically activates the hyphenation for the text inside tables as long as your topics have the language specified.

In case the text is still bleeding outside the boundaries, you can also use the `overflow-wrap` property to force the word to break:

```

*[class ~="topic/table"] {
  overflow-wrap: break-word;
}

```

Related Information:

[Hyphenation \(on page 1690\)](#)

[How to Enable/Disable Hyphenation for an Element \(on page 1693\)](#)

How to Fix Small Images in Table

Tables contained in the output of DITA Map PDF - based on HTML5 & CSS (and DITA PDF - based on HTML5 & CSS) transformations have an automatic layout by default. This means that DITA-OT defines a preferred size on them, optimizing their width/height inside the content to make them as small as possible.

If, for example, you have a two-column table **without defined column widths** and one column contains images while the other column contains text, the table in the generated PDF will have its first column shrunk with smaller images and an enlarged second column (to occupy the least amount of space in the output).

To avoid this, you must *unset* the default image `max-width` so that the original size of the image will be used instead:

```
*[class ~= "topic/image"] {
    max-width: unset;
}
```

How to Center Tables

You can center the tables by using margins `auto`, while the table caption (title) can be centered using the `text-align` property:

```
*[class ~= "topic/table"] {
    margin-left:auto;
    margin-right:auto;
    width: 50%;
    border: 1pt solid blue;
}
*[class ~= "topic/table"] *[class ~= "topic/title"]{
    text-align:center;
}
```

How to Remove the Table NN Label

For the **DITA Map PDF - based on HTML5 & CSS** transformation scenario, the label for a table's title is wrapped in a span element with the class: `table--title-label`.

```
<table ... >
...
<caption class="- topic/title title tablecap">
    <span class="table--title-label">Table
        <span class="table--title-label-number">1. </span></span>
    <span class="table--title">The title of the table</span>
</caption>
...
```

To hide it, set its display to none:

```
.table--title-label {
    display:none;
}
```

For the direct transformation, use:

```
*[class ~= "topic/table"] > *[class ~= "topic/title"]:before {
    content: none;
}
```

How to Customize Rows, Columns and Cells

Common Use-Cases

Here are some common table use-cases and the CSS selectors for customizing table rows, columns, and cells. These example uses the `background-color` CSS property but any CSS property can be used (border, margin, padding, etc.).

- Select all non-header cells:

```
*[class ~= "topic/tbody"] *[class ~= "topic/entry"] {
    background-color: lightgray;
}
```

- Select some table rows (using `:nth-of-type()` pseudo-class):

```
/* Select all even rows. */
*[class ~= "topic/tbody"] *[class ~= "topic/row"]:nth-of-type(even) {
    background-color: lightgray;
}
/* Select the fourth row. */
*[class ~= "topic/tbody"] *[class ~= "topic/row"]:nth-of-type(4) {
    background-color: yellow;
}
```

- Select specific table columns (using `:nth-of-type()` pseudo-class):

```
/* Select all odd columns. */
*[class ~= "topic/tbody"] *[class ~= "topic/entry"]:nth-of-type(odd) {
    background-color: lightgray;
}
/* Select the second column. */
*[class ~= "topic/tbody"] *[class ~= "topic/entry"]:nth-of-type(2) {
    background-color: yellow;
}
```

Applying Properties to Specific Elements

If you need to apply some properties to specific elements, you can use the DITA `@outputclass` attribute:

```
<table frame="none">
  <title>Flowers</title>
  <tgroup cols="3">
    <colspec colname="c1" colnum="1" colwidth="171pt" />
    <colspec colname="c2" colnum="2" colwidth="99pt" />
    <colspec colname="c3" colnum="3" colwidth="150pt" />
    <thead>
      <row>
```

```

        <entry>Flower</entry>
        <entry>Type</entry>
        <entry>Soil</entry>
    </row>
</thead>
<tbody>
    <row>
        <entry>Chrysanthemum</entry>
        <entry outputclass="colored">perennial</entry>
        <entry>well drained</entry>
    </row>
    <row>
        <entry>Gardenia</entry>
        <entry>perennial</entry>
        <entry>acidic</entry>
    </row>
    <row outputclass="colored">
        <entry>Gerbera</entry>
        <entry>annual</entry>
        <entry>sandy, well-drained</entry>
    </row>
</tbody>
</tgroup>
</table>

```

In this case, the selector will be based on this `outputclass`:

```

*[class ~= "topic/table"] *[outputclass ~= "colored"] {
    background-color: yellow;
}

```

How to Add Stripes to a Table

To create a striped look for your tables, you can use the following CSS rules:

```

/* Header background and foreground */
*[class ~= "topic/table"][outputclass ~= "stripes"] > *[class ~= "topic/thead"] > *[class
  ~= "topic/row"] {
    background-color: blue;
    color:white;
}

/* A default background for the entire table body */
*[class ~= "topic/table"][outputclass ~= "stripes"] > *[class ~= "topic/tbody"] {
    background-color: #eeeeee;
}

```

```

}

/* Color for the stripes */
*[class ~= "topic/table"][outputclass ~= "stripes"] > *[class ~= "topic/tbody"] > *[class
  ~= "topic/row"]:nth-child(odd) {
  background-color: cyan;
}

/* Border for the cells */
*[class ~= "topic/table"][outputclass ~= "stripes"] *[class ~= "topic/entry"] {
  border: blue;
}

```

The above rules assume that tables that are to be painted with stripes are marked with an `@outputclass` attribute:

```
<table outputclass="stripes">...</table>
```

If you want to make all tables look the same, you can ignore this attribute and remove the `[outputclass ~= "stripes"]` simple selector from the above rules.

CAUTION:

Applying stripes and thin cell borders can cause rendering issues in the PDF renderer on screen display devices. For more information, see [Disappearing Thin Lines or Cell Borders \(on page 1800\)](#).

How to Display Borders on a Split Cell

By default, if a cell extends onto a second page, its bottom and top borders are discarded. To display these borders, you need to add the following property in your CSS customization:

```

*[class ~= "topic/entry"] {
  -oxy-borders-conditionality: retain;
}

```

How to Rotate Content from a Table Cell

In DITA CALS tables, you can rotate the content of a cell by setting the `@rotate` attribute to `1`.

In the following example, the `Sport`, `All terrain`, and `Family` header cells are rotated.

```

<table frame="all" rowsep="1" colsep="1" id="table_d1p_flb_crb">
  <title>Car Features</title>
  <tgroup cols="4">
    <colspec colname="c1" colnum="1" colwidth="14*" />
    <colspec colname="c2" colnum="2" colwidth="1*" align="center" />
    <colspec colname="c3" colnum="3" colwidth="1*" align="center" />

```

```

<colspec colname="c4" colnum="4" colwidth="1*" align="center"/>
<thead>
  <row>
    <entry morerows="1">Car Name</entry>
    <entry namest="c2" nameend="c4">Features</entry>
  </row>
  <row>
    <entry rotate="1">Sport</entry>
    <entry rotate="1">All terrain</entry>
    <entry rotate="1">Family</entry>
  </row>
</thead>
<tbody>
  <row>
    <entry>Tesla Model S</entry>
    <entry>X</entry>
    <entry/>
    <entry>X</entry>
  </row>
  ...

```

Table 42. Car Features

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X

The resulting output will be:

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X
Nissan Leaf			X
Dacia Duster		X	X

The built-in CSS matches the cells with this attribute and applies the following properties:

```

*[class~="topic/entry"][rotate='1'] {
  transform: rotate(270deg);

  /* Avoid wrapping, including hyphenation */
  white-space:pre;
  hyphens:manual;

  /* The rotated content will start from the lower side of the cell */
  vertical-align:bottom;
}

```

To change the vertical alignment of the content (for example, to move it to the middle of the cell), use the following in your CSS customization:

```

*[class~="topic/entry"][rotate='1'] {
  vertical-align:middle;
}

```

The resulting output will be:

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X
Nissan Leaf			X
Dacia Duster		X	X

To make the text wrap (for instance, the "All terrain" could be split on two lines), you need to inhibit the whitespace preservation from the built-in CSS. In this case, all spaces will create a line break in the rotated layout. Thus, you can add this in your customization:

```

*[class~="topic/entry"][rotate='1'] {
  vertical-align:middle;
  white-space:normal;
}

```

The resulting output will be:

Car Name	Features		
	Sport	All terrain	Family
Tesla Model S	X		X
Nissan Leaf			X
Dacia Duster		X	X

**Note:**

The padding and borders set on the table cells are not rotated (only the content of the cell is rotated). You can use `padding-left` (for instance) to move the labels to the horizontal axis.

```
*[class~="topic/entry"][rotate='1'] {
  padding-left: 2em;
}
```

How to Add Horizontal Lines to a Choice Table

To add horizontal lines that separate the options within a `<choicetable>`, you can use borders set on each of the rows. The following CSS styles the top header and the first column with some background colors. In a choice table, the first column represents the choice labels.

```
*[class~="task/choptionhd"],
*[class~="task/choptionhd"],
*[class~="task/chdeschd"],
*[class~="task/choption"] {
  background-color: #EEEEEE;
  text-align: left;
}

*[class~="task/choicetable"] {
  border: 2pt solid #EEEEEE;
}

*[class~="task/choicetable"] *[class~="task/chrow"],
*[class~="task/choicetable"] *[class~="task/chhead"]{
  border-bottom: 2pt solid #EEEEEE;
}

*[class~="task/choicetable"] *[class~="topic/stentry"] {
```

```
border-bottom: none;  
border-right: none;  
}
```

**Note:**

Using the frame attribute on the choice table will make these selectors apply partially. Please make sure you are designing your customization CSS taking into account all possible values for the frame attribute.

Programming Elements

Programming Elements are used to render lines of programming code. These elements have preserved line endings and use a monospace font in the output.

How to Change Font in Code Blocks

You can change fonts in code blocks to make them easier to read or compliant with your company fonts. To do so, add the following rule to your *customization CSS (on page 1567)*:

```
*[class ~= 'pr-d/codeblock'],  
*[class ~= "pr-d/codeblock"] > code {  
  font-family: 'Consolas', monospace;  
}
```

Related information

[Using Web Fonts](#)

[Using Local Font Files](#)

How to Enable Syntax Highlight in Code Blocks

**Note:**

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can use syntax highlighting to make it easier to read your code snippets by displaying each type of code in different colors and fonts. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to one of these values:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp

- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby
- language-sql
- language-xquery

For example, for a java snippet:

```
<codeblock outputclass="language-java">
  for (int i=0; i <100; i++) {
    // do something
  }
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```
<pre class="+ topic/pre pr-d/codeblock pre codeblock language-java"
  xml:space="preserve">
  <strong class="hl-keyword" style="color:#7f0055">for</strong>
    (<strong class="hl-keyword" style="color:#7f0055">int</strong>
      i=<span class="hl-number">0</span>; i
        <<span class="hl-number">100</span>; i++) {
      <em class="hl-comment" style="color:#006400">// do something</em>
    }
</pre>
```

And in the output, it is rendered as:

```
for (int i=0; i <100; i++) {
  // do something
}
```

Changing the Colors for the Syntax Highlighting

As you can see in the above example, the HTML elements `` and `` are used to color the content. Since they have a `@style` attribute set, the overriding properties need to be marked with `!important`.

Suppose you want to color the keywords in red and the comments in blue. To do so, add the following to your customization CSS (on page 1567):

```
.hl-keyword {
  color: red !important;
}
.hl-comment {
  color: blue !important;
}
```

How to Add Line Numbering in Code Blocks

Note:

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can add line numbering to make your code snippets easier to read. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-line-numbers` value.

Note:

It is possible to use the `@outputclass="show-line-numbers"` together with any of the `language @outputclass` value (e.g. `@outputclass="language-java show-line-numbers"`).

For example, for a java snippet:

```
<codeblock outputclass="show-line-numbers">
public void convert(String systemId, InputStream is) {
  return new FileInputStream();
}
</codeblock>
```

The resulting HTML fragment in the merged HTML5 document is:

```
<pre class="+ topic/pre pr-d/codeblock pre codeblock show-line-numbers"
outputclass="show-line-numbers" xml:space="preserve">
<span class="+ topic/pre-new-line pre-new-line"></span>
<span class="+ topic/pre-new-line pre-new-line">
</span>public void convert(String systemId, InputStream is) {
<span class="+ topic/pre-new-line pre-new-line"></span> return new FileInputStream();
<span class="+ topic/pre-new-line pre-new-line"></span>}
<span class="+ topic/pre-new-line pre-new-line"></span></pre>
```

And in the output, it is rendered as:

```

1
2 public void convert(String systemId, InputStream is) {
3     return new FileInputStream();
4 }
5

```

How to Display Whitespaces in Code Blocks

Note:

This topic refers only to the **DITA Map PDF - based on HTML5 & CSS** transformation type.

You can display whitespace characters in code blocks to visualize indentation in the PDF. In the DITA topics, set the `@outputclass` attribute on the `<codeblock>` elements to the `show-whitespace` value.

Note:

It is possible to use the `@outputclass="show-whitespace"` together with any of the `language` or `show-line-numbers` `@outputclass` values (e.g. `@outputclass="language-java show-line-numbers show-whitespace"`).

For example, for a java snippet:

```

<codeblock outputclass="show-whitespace">
public void convert(String systemId, InputStream is) {
    return new FileInputStream();
}
</codeblock>

```

The resulting HTML fragment in the merged HTML5 document is:

```

<pre class="+ topic/pre pr-d/codeblock pre codeblock show-whitespaces"
outputclass="show-whitespaces" xml:space="preserve">
public·void·convert(String·systemId,·InputStream·is)·{
··return·new·FileInputStream();
}
</pre>

```

And in the output, it is rendered as:

```

public·void·convert (String·systemId, ·InputStream·is) ·{
··return·new·FileInputStream();
}

```

How to Disable Line Wrapping in Code Blocks

By default, code blocks have the content wrapped to avoid the bleeding of long lines out of the page. To avoid wrapping, add the following in your [customization CSS \(on page 1567\)](#):

```
*[class~="pr-d/codeblock"] {
  white-space: pre;
}
```

For the **DITA Map PDF - based on HTML5 & CSS** transformation type, the best solution to distinguish between lines is to leave them wrapped, but color each line with a different background (zebra coloring). An example is provided here: [XSLT Extensions for PDF Transformations \(on page 1757\)](#).

How to Enable Line Wrap in Code Phrases

By default, line wrapping does not apply on inline elements, which could cause some lines of code to bleed out of the page. To allow line wrapping, the property should be set on the parent block with the following rule in your [customization CSS \(on page 1567\)](#):

```
*:has(*[class ~="pr-d/codeph"]) {
  overflow-wrap: break-word;
}
```

Notes:

- It is possible to use `hyphens: auto` instead of `overflow-wrap: break-word`.
- It is possible to use the same rule for software domain elements (e.g. `<filepath>` or `<cmdname>`).

How to Deal with Unwanted Returns in Code Blocks

There are cases where the source file contains long lines of code that need to continue onto the next line in the rendered PDF (to wrap visually).

When the user copies the block from the PDF reader, they get two separated lines. This means that the command fails when users copy it from the PDF to the command-line terminal (because it comes in as two commands).

For example, the command:

```
$gist = ls -l * | count -n | some more
```

May be rendered in the PDF on two lines:

```
$gist = ls -l * | count -n
| some more
```

And this is invalid when used in the terminal.

There is no CSS workaround for this, but to manually format the command line, add a line continuation character like this:

```
$gist = ls -l * | count -n \  
| some more
```

Note:

For Linux/macOSX, the continuation character is the backslash `\`. For Windows, this is the shift character `^`.

The command-line processor will now recognize that the first line is continuing on to the next one.

Notes

Notes contain an additional piece of information that calls attention to particular content. They may have various types (note, tip, fastpath, restriction, important, remember, attention, caution, danger, other).

For information on how to add and manage mixed content before the note icons and labels, see [How to Control the Image Size in Complex Static Content \(on page 1727\)](#).

How to Change Note Icons

Remember:

- The recommended icon format is SVG.
- The default size of the note icons is 24x24px.

To change the default icon for notes that do not have a `@type` attribute, add the following rule to your customization CSS (on page 1567):

```
div.note {  
  background-image: url("../img/note.svg");  
}
```

For a note with a `@type` attribute set to *warning*, *caution*, or *trouble*, add the following corresponding CSS rule:

```
div.warning {  
  background-image: url("../img/warning.svg");  
}  
div.caution {  
  background-image: url("../img/caution.svg");  
}  
div.trouble {
```

```
background-image: url("../img/troubleshooting.svg");
}
```

For a note with `@type` attribute set to *other* and `@othertype` attribute set to *Safety*, add the following CSS rule:

```
div.note[type="other"][othertype=Safety] {
background-image: url("../img/life-preserver.svg");
}
```

How to Change Note Colors

To change the background-color for notes that do not have a `@type` attribute, add the following rule to your customization CSS (on page 1567):

```
*[class~="topic/note"]:not([class~="hazard-d/hazardstatement"]) {
background-color: #50bbff;
}
```

For a note with a `@type` attribute set to *restriction*, add the following CSS rule:

```
*[class~="topic/note"].note_restriction {
background-color: #ff5566;
}
```

For a note with `@type` attribute set to *other* and `@othertype` attribute set to *Safety*, add the following CSS rule:

```
*[class~="topic/note"][type = "other"][othertype = Safety] {
background-color: #ffaa00;
}
```

Hazard

Hazards (embodied by the `<hazardstatement>` element) contain warning information. They are based on ANSI Z535 and ISO 3864 standards and may have various values set for the type (`note`, `tip`, `fastpath`, `restriction`, `important`, `remember`, `attention`, `caution`, `notice`, `danger`, `warning`, `other`).

How to Customize Other Type Hazards

It is possible to create custom hazard types by using the `@type` and `@othertype` attributes. For example, to add a high voltage hazard in a microwave manual:

```
<hazardstatement id="hazardstatement_vzy_zdc_syb" type="other" othertype="HIGH_VOLTAGE">
  <messagepanel id="messagepanel_wzy_zdc_syb">
    <typeofhazard>Electrical Shock</typeofhazard>
    <howtoavoid>Do not disassemble or repair the microwave yourself.</howtoavoid>
  </messagepanel>
  <hazardsymbol id="hazardsymbol_z4t_gjc_syb" href="electricity_icon.svg" />
</hazardstatement>
```

**Tip:**

SVG images are preferred for the `<hazardsymbol>` and you should set both `@height="1em"` and `@width="1em"` to obtain a rendering that is similar to default hazards.

To customize the hazard, add the following rules to your [customization CSS](#) (on page 1567):

```

/* Change the header color. */
*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--other {
  content: "HIGH VOLTAGE"; /* Change the hazard text */
  background-color: #d84b20;
  color: unset;
}

/* Show logo in the header. */
*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--other::before {
  padding: .5rem;
  content: url("electricity_icon.svg");
}

/* Show logo in the left cell. */
*[othertype ~= "HIGH_VOLTAGE"] th {
  table-column-span: 2 !important;
}
*[othertype ~= "HIGH_VOLTAGE"] .hazardstatement--logo-col {
  display: table-column !important;
}
*[othertype ~= "HIGH_VOLTAGE"] td:first-of-type {
  display: table-cell !important;
}
*[othertype ~= "HIGH_VOLTAGE"] .hazardsymbol {
  height: 4em; /* Change the symbol dimension */
}

```

The result in the PDF output would look like this:

Tasks

Tasks provide step-by-step instructions that enable a user to perform an operation.

How to Add Requirements Labels

It is possible to add tasks headings by setting the `args.gen.task.lbl` parameter in the transformation. However, **Machinery Tasks** have some extra required elements. It is possible to add labels for these requirements by adding the following rules to your [customization CSS \(on page 1567\)](#):

```
*[class ~= "taskreq-d/reqconds"]:before,
*[class ~= "taskreq-d/reqpers"]:before,
*[class ~= "taskreq-d/supequip"]:before,
*[class ~= "taskreq-d/supplies"]:before,
*[class ~= "taskreq-d/spares"]:before,
*[class ~= "taskreq-d/safety"]:before {
    font-weight: bold;
    padding-left: 20px;
}

*[class ~= "taskreq-d/reqconds"]:before {
    content: "Conditions: ";
}

*[class ~= "taskreq-d/reqpers"]:before {
    content: "Personnel: ";
}

*[class ~= "taskreq-d/personnel"]:before {
    content: "Number of workers: " !important;
}

*[class ~= "taskreq-d/perscat"]:before {
    content: "Category: " !important;
}

*[class ~= "taskreq-d/perskill"]:before {
    content: "Skill level: " !important;
}

*[class ~= "taskreq-d/esttime"]:before {
    content: "Time estimate: " !important;
}

*[class ~= "taskreq-d/supequip"]:before {
    content: "Equipment: " !important;
}

*[class ~= "taskreq-d/supplies"]:before {
    content: "Supplies: " !important;
}
}
```

```
*[class ~= "taskreq-d/spares"]:before {
  content: "Spares: ";
}
*[class ~= "taskreq-d/safety"]:before {
  content: " Safety: ";
}
```

Abbreviated Forms

When using the `<abbreviated-form>` element in your content, it is possible to style the subsequent occurrences differently than the first occurrence. To achieve this, add something similar to the following rule in your customization CSS (*on page 1567*):

```
a:has(dfn[class ~= "abbreviated-form"]) {
  color: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref]) then
'black' else 'red'");
  text-decoration: oxy_xpath("let $cdf:= dfn return if (preceding::dfn[@keyref = $cdf/@keyref])
then 'none' else 'underline'");
}
```

This example would render the first occurrence with a red color and an underline, while the subsequent occurrences would be rendered with a black color and no underline.

Trademarks

Trademarks are used to specify legally registered words and they are often used in technical documentation. To specify a trademark, your DITA content could use a structure similar to this:

```
<tm tmttype="tm">My Product Name</tm>
```

Depending on the value of the `@tmttype` attribute, a different symbol is appended to the text: (®, ™, or ℠).

The structure of the merged HTML document the CSS will apply to is:

```
<span class="- topic/tm tm" tmttype="tm">My Product Name<span
class="- topic/tmmark tmmark ">™</span></span>
```

How to Style the Trademark Element Text

To change the style of the entire trademark text, you can match the `topic/tm` class like this:

```
*[class ~= "topic/tm"] {
  font-weight:bold;
}
```

How to Style the Trademark Symbol

To change the aspect of the trademark symbol, you can use the `topic/tmmark` class. Usually, common fonts already render these symbols smaller and with superscript by default. The following example does it from the CSS:

```
*[class ~= "topic/tmmark"] {
  vertical-align: super;
  font-size: smaller;
}
```

Styling Through Custom Parameters

You can activate parts of your CSS by using custom transformation parameters that start with the `args.css.param.` prefix.

These parameters are recognized by the publishing pipeline and are forwarded as synthetic attributes on the root element of the merged map. The last part of the parameter name will become the attribute name, while the value of the parameter will become the attribute value. The namespace of these synthetic attributes is:

`http://www.oxygenxml.com/extensions/publishing/dita/css/params.`

When using the **DITA Map PDF - based on HTML5 & CSS** or the **DITA PDF - based on HTML5 & CSS** transformations, the generated attribute will be in no namespace.

Notes:

- Make sure the name of your custom parameter does not conflict with an attribute name that may already exist on the root element.
- Use only Latin alphanumeric characters for parameter names.
- You can set multiple styling parameters at the same time.

How to Limit the Depth of the TOC Using a Parameter

In the following example, a custom parameter is used to switch from a full depth table of contents to a flat one that shows only the titles of the first-level topics (such as chapters, notices, or the preface).

The custom parameter is:

```
args.css.param.only-chapters-in-toc="yes"
```

The CSS that hides the *topicrefs* at level 2 or more:

```
:root[only-chapters-in-toc='yes'] *[class ~= "toc/toc"]
  > *[class ~= "map/topicref"]> *[class ~= "map/topicref"] {
  display:none;
}
```

The `:root[a|only-chapters-in-toc='yes']` selector makes the rule activate only when the attribute is set.

How to Change the Page Size Using a Parameter

In the following example, a custom parameter is used to modify the page size. The parameter is defined in the transformation scenario as:

```
args.css.param.page-size="A4"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page {
  size: oxy_xpath( '/*/@*[local-name()="page-size"][1]' );
}
```

How to Change the Cover Page Using a Parameter

In the following example, a custom parameter is used to set the path of the cover page. The parameter points to an image by using its URL and is defined in the transformation scenario as:

```
args.css.param.cover-page="file:/path/to/cover-page.svg"
```

Then in the CSS, the attribute value is extracted and used as follows:

```
@page front-page {
  background-image: url(oxy_xpath( '/*/@*[local-name()="cover-page"][1]' ));
}
```

Controlling the Publication Content

Using a plain DITA map, the transformation will produce a publication with a front page, a table of contents, chapters with content, and an index at the end. This is appropriate for most cases, but there are use cases where some adjustments are necessary. For example, if you want to do one of the following:

- Remove the TOC or index.
- Add a glossary.
- Change the position of the TOC or the index relative to the sibling topics.
- Add a *preface*, *frontmatter*, or *backmatter* with copyright notices, abstracts, list of tables, list of figures, etc.

All of these can be achieved using a DITA `<bookmap>` element.

A bookmap has a more elaborate structure than a regular map. You should start by defining the title structure, with a main title and alternative title:

```
<!DOCTYPE bookmap PUBLIC "-//OASIS//DTD DITA BookMap//EN" "bookmap.dtd">
<bookmap id="taskbook">
  <booktitle>
    <mainbooktitle>Publication Title</mainbooktitle>
```

```
<booktitlealt>A very short description of the publication</booktitlealt>
</booktitle>
```

Then you may define a *frontmatter*. For this, you can link the topics that need to appear before the main content. You can also define the location where the table of contents will be placed. In the example below, it appears between the `abstract.dita` and `foreword.dita` topics:

```
<frontmatter>
  <topicref href="topics/abstract.dita" />
  <booklists>
    <toc/>
  </booklists>
  <topicref href="topics/foreword.dita" />
</frontmatter>
```

**Note:**

To remove the TOC from the publication, just omit the `<toc>` element from the `<booklists>` element.

Next, the topics are grouped into chapters:

```
...
<chapter href="topics/installation.dita" />
...
```

At the end, you could define the structure of the *backmatter*. Just like for the *frontmatter*, you can include some topics and some generated content (such as the index). In the example below, the glossary is defined to come after the index, followed by a list of figures and list of tables. At the very end, there is a topic with some thank you notes.

```
<backmatter>
  <topicref href="topics/conclusion.dita" />
  <booklists>
    <indexlist/>

    <glossarylist>
      <topicref href="topics/xp.dita" keys="xp" print="yes" />
      <topicref href="topics/anti_lock_braking_system.dita" keys="abs" print="yes" />
    </glossarylist>

    <figurelist/>
    <tablelist/>
  </booklists>
  <topicref href="topics/thanks.dita" />
</backmatter>
```

As you can see, the bookmap offers much better control over the final content of the publication. It also offers more options in controlling the metadata that will go into the PDF (see the [Metadata \(on page 1625\)](#) topic).

How to Omit the Front Page, TOC, Glossary, Index for a Plain DITA Map

For a plain DITA map, there are no elements that allow you to control if and where to place the generated content such as the title page, table of contents, list of tables, glossary, or index. For the most common use-case, when you want to hide them all and just keep the content, you can use the transformation parameter `hide.frontpage.toc.index.glossary`. See: [Transformation Parameters \(on page 1543\)](#).

Related Information:

[How to Remove Entries from the TOC \(on page 1660\)](#)

[How to Hide the TOC \(on page 1660\)](#)

How to Make Chapters Look Like Individual Publications

Note:

This topic is only applicable for the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Sometimes you want to make each chapter independent (i.e. it can be read separately, as a separate part of your publication). For this, you need the page counter, figure, and table counters to restart at each chapter. You can control this by using the `args.css.param.numbering` ([on page 1642](#)) command-line parameter.

In addition to numbering, you can force the creation of a [chapter TOC \(on page 1660\)](#).

XSLT Extensions for PDF Transformations

Since PDF output is primarily obtained by running XSLT transformations over the DITA input files, one customization method would be to override the default XSLT templates that are used by the PDF transformation.

The `pdf-css-html5` transformation type uses two stages to transform the merged DITA map (the one that aggregates all the topics) to HTML5:

1. **Stage 1:** Makes some changes on the [merged map \(on page 1569\)](#) and the result is a modified merged map. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2merged`.

Note:

Use this when you need to filter DITA content.

2. **Stage 2:** Transforms the [merged map \(on page 1569\)](#) to HTML5 and the result is a single HTML document. This stage can be altered by implementing the `com.oxygenxml.pdf.css.xsl.merged2html5`

XSLT extension point. This extension overrides the stylesheets found in the following folder: `DITA-OT-DIR\plugins\com.oxygenxml.pdf.css\xsl\merged2html5`.

**Note:**

Use this when you need to change the HTML structures generated for a specific DITA element.

These extension points can be used either from a *Publishing Template* or a DITA-OT extension plugin.

How to Use XSLT Extension Points for PDF Output from a Publishing Template

This section contains some common examples of customizations using both XSLT and CSS stylesheets. These stylesheets must be used as CSS resources and XSLT extension points inside an *Oxygen Publishing Template*.

**Tip:**

The XSLT extension points are called on specific files during two different phases of the process: `merged2merged` ([on page 1540](#)) and `merged2html5` ([on page 1541](#)).

How to Style Codeblocks with a Zebra Effect

A possible requirement for your `<codeblock>` elements could be to alternate the background color on each line. Some advantages of this technique is that you can clearly see when text from the `<codeblock>` is wrapped.

**Note:**

Adding this styling will remove syntax highlights on codeblocks.

This effect can be done by altering the HTML5 output, creating a `div` for each line from the code block, then styling them.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
```

```

version="2.0">

<xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
  <xsl:variable name="nm">
    <xsl:next-match/>
  </xsl:variable>
  <xsl:apply-templates select="$nm" mode="zebra"/>
</xsl:template>

<xsl:template match="node() | @" mode="zebra">
  <xsl:copy>
    <xsl:apply-templates select="node() | @" mode="#current"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="*[contains(@class, ' pr-d/codeblock ')]" mode="zebra">
  <xsl:element name="{name()}">
    <xsl:copy-of select="@" />
    <xsl:attribute name="class" select="concat(@class, ' zebra')"/>
    <xsl:analyze-string regex="\n" select=".">
      <xsl:matching-substring/>
      <xsl:non-matching-substring>
        <div>
          <xsl:value-of select="." />
        </div>
      </xsl:non-matching-substring>
    </xsl:analyze-string>
  </xsl:element>
</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the

`com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"

```

```
file="xslt/merged2html5Extension.xsl" />
</xslt>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the `<codeblock>` structure. For example:

```
.zebra {
  padding: 0;
}

.zebra > *:nth-of-type(odd) {
  background-color: lightgray;
}
```

7. Open the *template descriptor file (on page 1557)* associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css" />
</resources>
```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

How to Remove the Related Links Section

Suppose that you want the *related links* sections to be removed from the PDF output.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
```

```

<xsl:template match="*[contains(@class, ' topic/related-links ')]">
  <!-- Remove. -->
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl" />
    </xslt>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Wrap Words in Markup

Suppose you want compound words that contain hyphens (or any other criteria) to be wrapped with inline elements (such as the HTML `<code>` element).

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2htmlExtension.xsl`) with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
  <xsl:template match="text()">

```

```

<xsl:variable name="txt">
  <xsl:next-match/>
</xsl:variable>

<xsl:analyze-string regex="(\w|\-)+" select="$txt">
  <xsl:matching-substring>
    <!-- A word -->
    <xsl:choose>
      <xsl:when test="contains(., '-')">
        <!-- A compound word -->
        <code class="compound-word">
          <xsl:value-of select="."/>
        </code>
      </xsl:when>
      <xsl:otherwise>
        <!-- A simple word -->
        <xsl:value-of select="."/>
      </xsl:otherwise>
    </xsl:choose>
  </xsl:matching-substring>
  <xsl:non-matching-substring>
    <!-- Not a word -->
    <xsl:value-of select="."/>
  </xsl:non-matching-substring>
</xsl:analyze-string>

</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Convert Definition Lists into Tables

Suppose you want your definitions lists (`<dl>`) to be displayed as tables in your PDF output.

To add this functionality using an *Oxygen Publishing Template*, follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In this folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:template match="*[contains(@class, ' topic/dl ')]">
    <xsl:call-template name="setaname"/>
    <xsl:apply-templates select="
      *[contains(@class,
        ' ditaot-d/ditaval-startprop ')]" mode="out-of-line"/>
    <!-- Wrap in a table -->
    <table>
      <xsl:call-template name="commonattributes"/>
      <xsl:call-template name="setid"/>
      <xsl:apply-templates/>
    </table>
    <xsl:apply-templates select="
      *[contains(@class,
        ' ditaot-d/ditaval-endprop ')]" mode="out-of-line"/>
  </xsl:template>

  <xsl:template match="*[contains(@class, ' topic/dlentry ')]">
    <!-- Wrap in a table row -->
    <tr>
      <xsl:call-template name="commonattributes"/>
```

```

        <xsl:call-template name="setidaname" />
        <xsl:apply-templates />
    </tr>
</xsl:template>

<xsl:template match="
    *[contains(@class, ' topic/dd ')] |
    *[contains(@class, ' topic/dt ')]">
    <!-- Wrap in a cell -->
    <td>
        <xsl:call-template name="commonattributes" />
        <xsl:call-template name="setidaname" />
        <xsl:apply-templates select="
            ../*[contains(@class,
                ' ditaot-d/ditaval-startprop ')]" mode="out-of-line" />
        <xsl:apply-templates />
        <xsl:apply-templates select="
            ../*[contains(@class,
                ' ditaot-d/ditaval-endprop ')]" mode="out-of-line" />
    </td>
</xsl:template>
</xsl:stylesheet>

```

- Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2html5"
                file="xslt/merged2html5Extension.xsl" />
        </xslt>
    </pdf>
</publishing-template>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Display Footnotes Below Tables

In your PDF output, you may want to group all the footnotes contained in a table just below it instead of having them displayed at the bottom of the page.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:opentopic-func="http://www.idiominc.com/opentopic/exsl/function"
  exclude-result-prefixes="xs opentopic-func"
  version="2.0">

  <!--
    Match only top level tables (i.e tables that are not nested in other tables),
    that contains some footnotes.
  -->

  <xsl:template match="*[contains(@class, 'topic/table')][
    not(ancestor::*[contains(@class, 'topic/table')])][
    /**[contains(@class, 'topic/fn')]]">
    <xsl:next-match>
      <xsl:with-param name="top-level-table" select="." tunnel="yes"/>
    </xsl:next-match>
    <!-- Create a list with all the footnotes from the current table. -->
    <ol class="- topic/ol " outputclass="table-fn-container">
      <xsl:for-each select="//*[@contains(@class, 'topic/fn')]">
        <!--
          Try to preserve the footnote ID, if available, so that the xrefs will have a
          target.
        -->
        <li class="- topic/li " id="{if(@id) then @id else generate-id(.)}"
          outputclass="table-fn">
          <xsl:copy-of select="@callout" />
          <xsl:apply-templates select="node()" />
        </li>
```

```

    </xsl:for-each>
  </ol>
</xsl:template>

<!--
  The footnotes that have an ID must be ignored, they are accessible only
  through existing xrefs (already present in the merged.xml file).

  The above template already made a copy of these footnotes in the OL element
  so it is not a problem if markup is not generated for them in the cell.
-->
<xsl:template
  match="*[contains(@class, 'topic/entry')]//*[contains(@class, 'topic/fn')][@id]"/>

<!--
  The xrefs to footnotes with IDs inside table-cells. We need to recalculate
  their indexes if their referenced footnote is also in the table.
-->
<xsl:template match="*[contains(@class, 'topic/xref')][@type='fn']
  [ancestor::*[contains(@class, 'topic/entry')]]">
  <xsl:param name="top-level-table" tunnel="yes"/>
  <xsl:variable name="destination" select="opentopic-func:getDestinationId(@href)"/>
  <xsl:variable name="fn" select="
    $top-level-table//*[contains(@class, 'topic/fn')][@id = $destination]"/>
  <xsl:choose>
    <xsl:when test="$fn">
      <!-- There is a reference in the table, recalculate index. -->
      <xsl:variable name="fn-number" select="
        index-of($top-level-table//*[contains(@class, 'topic/fn')], $fn)"/>
      <xsl:copy>
        <xsl:apply-templates select="@*" />
        <xsl:apply-templates select="$fn/@callout" />
        <xsl:apply-templates select="node()
          except (text(), *[contains(@class, 'hi-d/sup')])" />
        <sup class="+ topic/ph hi-d/sup ">
          <xsl:apply-templates select="child::*[contains(@class, 'hi-d/sup')]/@" />
          <xsl:value-of select="$fn-number" />
        </sup>
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <!-- There is no reference in the table, keep original index. -->

```

```

        <xsl:next-match/>
    </xsl:otherwise>
</xsl:choose>
</xsl:template>

<!--
    The footnotes without ID inside table-cells. They are copied in the OL element, but have
    no xrefs pointing to them (because they have no ID), so xrefs are generated.
-->
<xsl:template
    match="*[contains(@class, 'topic/entry')]/*[contains(@class, 'topic/fn')][not(@id)]">
    <!-- Determine the footnote index in the document order. -->
    <xsl:param name="top-level-table" tunnel="yes" />
    <xsl:variable name="fn-number" select="
        index-of($top-level-table//*[contains(@class, 'topic/fn')], .)"/>
    <xref type="fn" class="- topic/xref "
        href="#{generate-id(.)}" outputclass="table-fn-call">
        <xsl:copy-of select="@callout"/>
    <!-- Generate an extra <sup>, identical to what DITA-OT generates for other xrefs. -->
    <sup class="+ topic/ph hi-d/sup ">
        <xsl:value-of select="$fn-number"/>
    </sup>
    </xref>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
    <extension
        id="com.oxygenxml.pdf.css.xsl.merged2merged"
        file="xslt/merged2mergedExtension.xsl"/>
    </xslt>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

/* Customize footnote calls, inside the table. */
*[outputclass ~= 'table-fn-call'] {
    line-height: none;
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'][callout] *[class
~= "hi-d/sup"] {
    content: oxy_xpath("ancestor::*[contains(@class, 'topic/xref')]/@callout");
}

/* Customize the list containing all the table footnotes. */
*[outputclass ~= 'table-fn-container'] {
    border-top: 1pt solid black;
    counter-reset: table-footnote;
}

/* Customize footnotes display, below the table. */
*[outputclass ~= 'table-fn'] {
    font-size: smaller;
    counter-increment: table-footnote;
}

*[outputclass ~= 'table-fn']::marker {
    font-size: smaller;
    content: "(" counter(table-footnote) ")";
}

*[outputclass ~= 'table-fn'][callout]::marker {
    content: "(" attr(callout) ")";
}

/* Customize xrefs pointing to footnotes, inside the table. */
*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] {
    color: unset;
    text-decoration: none;
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn']:after {
    content: none;
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:before
{
    content: "(";
}

*[class ~= "topic/table"] *[class ~= "topic/xref"][type = 'fn'] *[class ~= "hi-d/sup"]:after
{

```

```
content: " )";
}
```

- Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>
```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Wrap Scientific Numbers in Tables Cells

In your PDF output, you may need to wrap scientific numbers on two lines when they are included in table cells.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template](#) (on page 1562).
- Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
- Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
- In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
  <!-- Matches text from table cells. -->
  <xsl:template match="*[contains(@class, ' topic/entry ')]/text()">
    <xsl:analyze-string select="." regex="[0-9]\.[0-9]{{2}}e-[0-9]{{2}}">
      <!-- The cell contains a scientific number like 1.23e-08. -->
      <xsl:matching-substring>
        <xsl:variable name="text" select="concat(substring-before(., 'e'),
          'e#8203;', substring-after(., 'e'))"/>
```

```

        <xsl:value-of select="$text" />
    </xsl:matching-substring>
    <xsl:non-matching-substring>
        <xsl:value-of select="." />
    </xsl:non-matching-substring>
</xsl:analyze-string>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
    <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl" />
</xslt>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

How to Use a Bullet for Tasks that Contain a Single Step

If a DITA *Task* document only contains one list item (a single `<step>` element), you probably want it to be rendered the same as an unordered list (displayed with a bullet instead of a number), as in the following example:

```

...
<steps>
    <step>
        <cmd>My single step</cmd>
    </step>
</steps>
...

```

Normally, the output will be rendered as:

```
1. The step
```

instead of:

- o The step

To change the default rendering so that a single step will be rendered with a bullet instead of a number, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:template match="*[contains(@class, ' task/step ')] [count(../*[contains
(@class, ' task/step ')] = 1)]">
    <xsl:copy>
      <xsl:copy-of select="@*" />
      <xsl:attribute name="outputclass" select="concat(@outputclass, ' single ')" />
      <xsl:apply-templates/>
    </xsl:copy>
  </xsl:template>

</xsl:stylesheet>
```

5. Open the *template descriptor file (on page 1557)* associated with your *publishing template* (the `.opt` file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl" />
</xslt>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```
*[outputclass ~= "single"] {
  list-style-type:circle !important;
  margin-left:2em;
}
```

- Open the *template descriptor file (on page 1557)* associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>
```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Change the Critical Dates Format

By default, the dates are entered in a `YYYY-MM-DD` format (where `YYYY` is the year, `MM` is the number of the month, and `DD` is the number of the day). You can change the format (for example, to something like *January 1, 2020*) using an XSLT extension.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
- Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
- Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
- In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
  <xsl:template match="
    *[contains(@class, 'topic/created')]/@date |
    *[contains(@class, 'topic/revised')]/@modified">
    <xsl:attribute name="{name()}">
```

```

        <xsl:value-of select="format-date(., '[MNn] [D01], [Y0001]')"/>
    </xsl:attribute>
</xsl:template>

</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```

<publishing-template>
    ...
    <pdf>
        ...
        <xslt>
            <extension
                id="com.oxygenxml.pdf.css.xsl.merged2merged"
                file="xslt/merged2mergedExtension.xsl" />
        </xslt>
    </pdf>
</publishing-template>

```

6. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
7. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
8. Click **OK** to save the changes and run the transformation scenario.

[Formatting Dates and Times in XSLT](#)

How to Remove Links from Terms

Your topics might contain multiple references to the same `<term>`. These terms can further be explained in the glossary. In this case, you may want to only keep the first occurrence of this term to be a link to the glossary and display the other terms as text.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"

```

```

version="2.0">

<xsl:template match="*[contains(@class, ' topic/term ')]" name="topic.term">
  <!-- Save the current @href value -->
  <xsl:variable name="current-href" select="@href"/>
  <!-- Get the closest parent topic -->
  <xsl:variable name="closest-parent"
    select="ancestor::*[contains(@class, ' topic/topic ')] [1]"/>
  <!-- Get the first <term> having the same href -->
  <xsl:variable name="first-term-with-same-href" select="($closest-parent//
    *[contains(@class, ' topic/term ')][@href=$current-href])[1]"/>

  <!-- Call the HTML5 default template -->
  <xsl:variable name="result">
    <xsl:next-match/>
  </xsl:variable>

  <!-- Call the copy template that will remove the links -->
  <xsl:apply-templates select="$result" mode="remove-extra-links">
    <xsl:with-param name="is-first-term-with-same-href"
      select="generate-id(.) = generate-id($first-term-with-same-href)" tunnel="yes"/>
  </xsl:apply-templates>
</xsl:template>

<xsl:template match="node() | @" mode="remove-extra-links">
  <xsl:copy>
    <xsl:apply-templates select="node() | @" mode="#current"/>
  </xsl:copy>
</xsl:template>

<xsl:template match="a" mode="remove-extra-links">
  <xsl:param name="is-first-term-with-same-href" tunnel="yes"/>
  <xsl:choose>
    <!-- Process the first term as a link -->
    <xsl:when test="$is-first-term-with-same-href">
      <xsl:next-match/>
    </xsl:when>
    <xsl:otherwise>
      <!-- Process the other terms as text -->
      <xsl:copy-of select="child::*"/>
    </xsl:otherwise>
  </xsl:choose>

```

```

</xsl:template>

</xsl:stylesheet>

```

- Open the *template descriptor file (on page 1557)* associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Display Glossary as a Table

Suppose you want to display the content of your Glossary as a table, to condense the information for one entry on a single line.

Remember:

Make sure all the glossary is contained within a single `<glossgroup>` element.

To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
- Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
- Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
- In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:dita2html="http://dita-ot.sourceforge.net/ns/200801/dita2html"
  exclude-result-prefixes="xs dita2html" version="2.0">

  <!-- Create a table that will contain all the glossentries contained in the glossgroup. -->

```

```

<xsl:template name="gen-topic">
  <xsl:param name="nestlevel" as="xs:integer">
    <xsl:choose>
      <!-- Limit depth for historical reasons, could allow any depth. -->
      <!-- Previously limit was 5. -->
      <xsl:when
        test="count(ancestor::*[contains(@class, ' topic/topic ')]) > 9"
      >9</xsl:when>
      <xsl:otherwise>
        <xsl:sequence
          select="count(ancestor::*[contains(@class, ' topic/topic ')])"/>
        </xsl:otherwise>
      </xsl:choose>
    </xsl:param>
    <xsl:choose>
      <xsl:when test="parent::dita and not(preceding-sibling::*)">
        <!-- Do not reset xml:lang if it is already set on <html> -->
        <!-- Moved outputclass to the body tag -->
        <!-- Keep ditaval based styling at this point -->
        <!-- (replace DITA-OT 1.6 and earlier call to gen-style) -->
        <xsl:apply-templates
          select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]/@style"
          mode="add-ditaval-style"/>
        </xsl:when>
      <xsl:otherwise>
        <xsl:call-template name="commonattributes">
          <xsl:with-param name="default-output-class"
            select="concat('nested', $nestlevel)"/>
        </xsl:call-template>
      </xsl:otherwise>
    </xsl:choose>
    <xsl:call-template name="gen-toc-id"/>
    <xsl:call-template name="setidaname"/>
    <xsl:choose>
      <xsl:when test="contains(@class, 'glossgroup/glossgroup')">
        <!-- Custom processing for glossgroup. -->
        <xsl:apply-templates select="*[contains(@class, 'topic/title')]" />
        <table class="- glossgroup/table table">
          <thead class="- glossgroup/thead thead">
            <tr class="- glossgroup/row row">
              <th class="- glossgroup/entry entry">Acronym</th>
              <th class="- glossgroup/entry entry">Term</th>
            </tr>
          </thead>
        </table>
      </xsl:when>
    </xsl:choose>
  </xsl:template>

```

```

        <th class="- glossgroup/entry entry">Full Term</th>
        <xsl:if
            test="exists(//*[contains(@class, 'glossentry/glossdef')])">
            <th class="- glossgroup/entry entry">Definition</th>
        </xsl:if>
    </tr>
</thead>
<xsl:apply-templates
    select="*[contains(@class, 'glossentry/glossentry')]" />
</table>
<xsl:apply-templates select="
    * except (*[contains(@class, 'topic/title')]
    | *[contains(@class, 'glossentry/glossentry')])" />
</xsl:when>
<xsl:otherwise>
    <!-- Default processing. -->
    <xsl:apply-templates/>
</xsl:otherwise>
</xsl:choose>
</xsl:template>

<!-- Create a row for each glossentry. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossentry')]
    [parent::*[contains(@class, 'glossgroup/glossgroup')]]">
    <xsl:variable name="glossentry" as="node()">
        <xsl:next-match/>
    </xsl:variable>
    <tr>
        <xsl:copy-of select="$glossentry/*" />
        <xsl:copy-of
            select="$glossentry/*[contains(@class, 'glossentry/glossAlt')]" />
        <xsl:copy-of
            select="$glossentry/*[contains(@class, 'glossentry/glossterm')]" />
        <xsl:copy-of
            select="$glossentry/*[contains(@class, 'glossentry/glossSurfaceForm')]" />
        <xsl:copy-of
            select="$glossentry/*[contains(@class, 'glossentry/glossdef')]" />
        <xsl:copy-of select="
            $glossentry/* except $glossentry/*[contains(@class, 'glossentry/glossAlt')
            or contains(@class, 'glossentry/glossterm')
            or contains(@class, 'glossentry/glossSurfaceForm')]

```

```

        or contains(@class, 'glossentry/glossdef')]"/>
    </tr>
</xsl:template>

<!-- Process only glossBody's children nodes. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossBody')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <xsl:apply-templates/>
</xsl:template>

<!-- Create a cell for each glossterm, glossSurfaceForm and glossAlt. -->
<xsl:template match="
    *[contains(@class, 'glossentry/glossterm')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] |
    *[contains(@class, 'glossentry/glossSurfaceForm')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]] |
    *[contains(@class, 'glossentry/glossAlt')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <xsl:variable name="glossContent" as="node()">
        <xsl:next-match/>
    </xsl:variable>
    <td>
        <xsl:copy-of select="$glossContent/*" />
        <xsl:copy-of select="normalize-space(string-join($glossContent//text()))"
        />
    </td>
</xsl:template>

<!-- Create a cell for each glossdef. -->
<xsl:template
    match="*[contains(@class, 'glossentry/glossdef')]
    [ancestor::*[contains(@class, 'glossgroup/glossgroup')]]">
    <td>
        <xsl:call-template name="commonattributes" />
        <xsl:apply-templates/>
    </td>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the

`com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
  </xslt>
```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```
*[class ~= "glossgroup/table"] {
  width: 100%;
  border: 1px solid black;
  border-collapse: collapse;
}

*[class ~= "glossgroup/table"] th {
  background-color: lightgray;
}

*[class ~= "glossgroup/table"] th,
*[class ~= "glossgroup/table"] td {
  border: 1px solid black;
  padding: 0.3em !important;
  vertical-align: inherit !important;
}

/* Remove glossSurfaceForm */
th:nth-of-type(3),
*[class ~= "glossentry/glossSurfaceForm"] {
  display: none;
}

/* Discard the default glossterm layout */
*[class ~= "glossentry/glossterm"] {
  font-size: unset;
}
```

```
font-weight: unset;
}
```

**Note:**

The `<glossSurfaceForm>` removal part is optional. It is present as an example of how to fully remove a column.

- Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```
<publishing-template>
...
<pdf>
...
<resources>
  <css file="css/custom.css"/>
</resources>
```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Include Sections in the Mini TOC

By default, the *Mini TOC* only displays the child topics of a given chapter topic. To add the possibility of also displaying the child sections, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template](#) (on page 1562).
- Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
- Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
- In the newly created folder, create an XSL file (for example, named `merged2mergedExtension.xsl`) with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
  xmlns:ditaarch="http://dita.oasis-open.org/architecture/2005/"
  xmlns:opentopic-index="http://www.idiominc.com/opentopic/index"
  xmlns:opentopic="http://www.idiominc.com/opentopic"
  xmlns:oxy="http://www.oxygenxml.com/extensions/author" xmlns:saxon="http://saxon.sf.net/"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="#all">
  <xsl:template match="*[contains(@class, ' topic/topic ')]">
    <xsl:choose>
      <xsl:when test="
        ($args.chapter.layout = 'MINITOC' or
```

```

    $args.chapter.layout = 'MINITOC-BOTTOM-LINKS') and
    oxy:is-chapter(/, oxy:get-topicref-for-topic(/, @id)) and
    *[contains(@class, ' topic/topic ')]">
<!-- Minitoc. -->
<xsl:copy>
  <xsl:apply-templates select="@*" />
  <xsl:apply-templates select="*[contains(@class, ' topic/title ')]" />
  <xsl:apply-templates select="*[contains(@class, ' topic/prolog ')]" />
  <xsl:apply-templates select="*[contains(@class, ' topic/titlealts ')]" />
  <div>
    <xsl:choose>
      <xsl:when test="$args.chapter.layout = 'MINITOC'">
        <xsl:attribute name="class">- topic/div chapter/minitoc </xsl:attribute>
        <xsl:call-template name="generate-minitoc-links" />
        <xsl:call-template name="generate-minitoc-desc" />
      </xsl:when>
      <xsl:when test="$args.chapter.layout = 'MINITOC-BOTTOM-LINKS'">
<xsl:attribute name="class">- topic/div chapter/minitoc
chapter/minitoc-bottom </xsl:attribute>
        <xsl:call-template name="generate-minitoc-desc" />
        <xsl:call-template name="generate-minitoc-links" />
      </xsl:when>
    </xsl:choose>
  </div>
  <xsl:apply-templates select="*[contains(@class, ' topic/topic ')]" />
</xsl:copy>
</xsl:when>
<xsl:otherwise>
  <!-- No minitoc. -->
  <xsl:next-match />
</xsl:otherwise>
</xsl:choose>
</xsl:template>
<!--
  The chapter topic content. This has the role of describing the chapter.
-->
<xsl:template name="generate-minitoc-desc">
  <div class="- topic/div chapter/minitoc-desc ">
    <xsl:apply-templates select="
      *[not(contains(@class, ' topic/title ')) and
      not(contains(@class, ' topic/prolog ')) and
      not(contains(@class, ' topic/titlealts ')) and

```

```

        not(contains(@class, ' topic/topic ')) and
        not(contains(@class, ' topic/section '))
    ]"/>
</div>
</xsl:template>
<!--
    Child links.
-->
<xsl:template name="generate-minitoc-links">
    <div class="- topic/div chapter/minitoc-links ">
        <related-links class="- topic/related-links ">
            <linklist class="- topic/linklist ">
                <desc class="- topic/desc ">
                    <ph class="- topic/ph chapter/minitoc-label ">
                        <xsl:call-template name="getVariable">
                            <xsl:with-param name="id" select="'Mini Toc'"/>
                        </xsl:call-template>
                    </ph>
                </desc>
                <xsl:apply-templates select="
                    *[contains(@class, ' topic/topic ')] |
                    descendant-or-self::*[contains(@class, ' topic/section ')]"
                    mode="in-this-chapter-list"/>
            </linklist>
        </related-links>
    </div>
</xsl:template>
<xsl:template match="
    *[contains(@class, ' topic/topic ')
    or contains(@class, ' topic/section ')]" mode="in-this-chapter-list">
    <xsl:variable name="link-type" select="
        if (contains(@class, ' topic/section ')) then
            'section'
        else
            'topic'"/>
    <link class="- topic/link " href="#{@id}" type="{\$link-type}" role="child">
        <linktext class="- topic/linktext ">
            <xsl:value-of select="*[contains(@class, ' topic/title ')]"/>
        </linktext>
    </link>
</xsl:template>
</xsl:stylesheet>

```

- Open the *template descriptor file (on page 1557)* associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the

`com.oxygenxml.pdf.css.xsl.merged2merged` XSLT extension point:

```
<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.mergedmerged"
    file="xslt/merged2mergedExtension.xsl"/>
</xslt>
<parameters>
  <parameter name="args.chapter.layout" value="MINITOC"/>
</parameters>
```

Note:

This solution works also with `args.chapter.layout` set to `MINITOC-BOTTOM-LINKS`.

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Add a Link to the TOC

For making the navigation easier in the PDF, you may want to add a link that sends the reader back to the table of contents. To add this link, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
- Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
- Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
- In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
<!-- Add an anchor after the TOC title. -->
```

```

<xsl:template match="*[contains(@class, 'toc/title')]" mode="div-it">
  <div>
    <xsl:attribute name="class" select="'- toc/anchor anchor'"/>
    <xsl:attribute name="id" select="'toc-anchor'"/>
  </div>
  <xsl:next-match/>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
  <extension
    id="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="xslt/merged2html5Extension.xsl"/>
</xslt>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

@page chapter:first:left:right {
  @top-right {
    content: "Back to Table of Contents";
    -oxy-link: "#toc-anchor";
    color: #337ab7;
  }
}

@page chapter:left:right {
  @top-right {
    content: "Back to Table of Contents";
    -oxy-link: "#toc-anchor";
    color: #337ab7;
  }
}

```

7. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
  ...
  <pdf>
    ...
    <resources>
      <css file="css/custom.css" />
    </resources>
  </pdf>
</publishing-template>

```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

How to Repeat Note Titles After a Page Break

Suppose that you have large notes that split between pages or columns and you want the note icon and title to be displayed on the next page/column. To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

1. If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
2. Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
3. Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
4. In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
  <!-- Display notes titles and content in table cells. -->
  <xsl:template match="*" mode="process.note.common-processing">
    <xsl:param name="type" select="@type"/>
    <xsl:param name="title">
      <xsl:call-template name="getVariable">
        <xsl:with-param name="id" select="concat(upper-case(substring($type, 1, 1)),
substring($type, 2))"/>
      </xsl:call-template>
    </xsl:param>
    <table>
      <xsl:call-template name="commonattributes">
        <xsl:with-param name="default-output-class"

```

```

select="string-join(($type, concat('note_', $type)), ' ')" />
</xsl:call-template>
<xsl:call-template name="setidaname" />
<!-- Normal flags go before the generated title; revision flags only go on the content. -->
<xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]" />
/prop" mode="ditaval-outputflag" />
<thead>
<tr>
<th class="note__title">
<xsl:copy-of select="$title" />
<xsl:call-template name="getVariable">
<xsl:with-param name="id" select="'ColonSymbol'" />
</xsl:call-template>
</th>
</tr>
</thead>
<tbody>
<tr>
<td>
<xsl:text> </xsl:text>
<xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-startprop ')]" />
/revprop" mode="ditaval-outputflag" />
<xsl:apply-templates />
<!-- Normal end flags and revision end flags both go out after the content. -->
<xsl:apply-templates select="*[contains(@class, ' ditaot-d/ditaval-endprop ')]" />
mode="out-of-line" />
</td>
</tr>
</tbody>
</table>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
...
<pdf>
...
<xslt>
<extension

```

```

        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
</xslt>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the *glossary* structure. For example:

```

table.note th,
table.note td {
    text-align: left;
    padding: .75em .5em .75em 3em;
}

table.note {
    background-repeat: no-repeat;
    background-image: url("../img/note.svg");
    background-position: .5em .5em;
    border: 1px solid;
}

table.note.note_other { background-image: none; }
table.warning { background-image: url("../img/warning.svg"); }
table.caution { background-image: url("../img/caution.svg"); }
table.trouble { background-image: url("../img/troubleshooting.svg"); }
table.important { background-image: url("../img/important.svg"); }
table.attention { background-image: url("../img/attention.svg"); }
table.notice { background-image: url("../img/notice.svg"); }
table.remember { background-image: url("../img/remember.svg"); }
table.fastpath { background-image: url("../img/fastpath.svg"); }
table.restriction { background-image: url("../img/restriction.svg"); }
table.danger { background-image: url("../img/danger.svg"); }
table.tip { background-image: url("../img/tip.svg"); }

table.note {
    background-color: rgba(0, 120, 160, 0.09);
    border-color: #0078A0;
}

table.note_danger,
table.note_caution {
    background-color: rgba(255, 202, 45, 0.1);
    border-color: #606060;
}

table.note_warning,
table.note_attention,

```

```

table.note_important {
    background-color: rgba(255, 202, 45, 0.1);
    border-color: #FFCA2D;
}
table.note_restriction {
    background-color: rgba(255, 226, 225, 0.32);
    border-color: #FF342D;
}

```

- Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the `.opt` file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
...
<pdf>
...
<resources>
    <css file="css/custom.css"/>
</resources>

```

- Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
- In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
- Click **OK** to save the changes and run the transformation scenario.

How to Create a Custom Code Block Highlighter

You may want to add additional highlighters in your `<codeblock>` elements (for example, to highlight method names or arguments). To add this functionality, use an *Oxygen Publishing Template* and follow these steps:

- If you have not already created a Publishing Template, you need to create one. For details, see [How to Create a Publishing Template \(on page 1562\)](#).
- Link the folder associated with the publishing template to your current project in the **Project Explorer** view.
- Using the **Project Explorer** view, create an `xslt` folder inside the project root folder.
- In the newly created folder, create an XSL file (for example, named `merged2html5Extension.xsl`) with a custom template matching the codeblock for a given language (based on the `@outputclass`):

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
    xmlns:xs="http://www.w3.org/2001/XMLSchema"
    exclude-result-prefixes="xs"
    version="2.0">

    <xsl:template match="*[contains(@class, 'pr-d/codeblock')]"
        [ @outputclass='language-python' ]/text() ">

        <xsl:analyze-string select="." regex="\(([\\w,\\s]+)\\):">

```

```

<xsl:matching-substring>
  <xsl:text>(</xsl:text>
  <span>
    <xsl:attribute name="class" select="'hl-arguments'"/>
    <xsl:value-of select="regex-group(1)"/>
  </span>
  <xsl:text>):</xsl:text>
</xsl:matching-substring>
<xsl:non-matching-substring>
  <xsl:next-match/>
</xsl:non-matching-substring>
</xsl:analyze-string>
</xsl:template>
</xsl:stylesheet>

```

5. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and set the XSLT stylesheet created in the previous step with the `com.oxygenxml.pdf.css.xsl.merged2html5` XSLT extension point:

```

<publishing-template>
  ...
  <pdf>
    ...
    <xslt>
      <extension
        id="com.oxygenxml.pdf.css.xsl.merged2html5"
        file="xslt/merged2html5Extension.xsl"/>
    </xslt>

```

6. Create a `css` folder in the publishing template directory. In this directory, save a custom CSS file with rules that style the highlight span. For example:

```

.hl-arguments {
  color: orange;
}

```

7. Open the *template descriptor file* (on page 1557) associated with your *publishing template* (the *.opt* file) and reference your custom CSS file in the `resources` element:

```

<publishing-template>
  ...
  <pdf>
    ...
    <resources>

```

```
<css file="css/custom.css" />
</resources>
```

8. Edit the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
9. In the **Templates** tab, click the **Choose Custom Publishing Template** link and select your template.
10. Click **OK** to save the changes and run the transformation scenario.

How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin

The examples in this section demonstrate how to use XSLT extension points from a [DITA-OT plugin](#).

Instead of directly adding plugins inside the embedded DITA-OT, it is highly recommended to use an external [Oxygen Publishing Engine](#) so that you will not lose any of your customizations anytime you upgrade the product in the future.

You just need to follow these steps before starting your custom DITA-OT plugins:

1. Download the [Oxygen Publishing Engine](#) and unzip it inside a folder where you have full write access.
2. Create your custom plugin(s) inside the `DITA-OT-DIR\plugins\` folder.
3. Go to **Options > Preferences > DITA**, set the **DITA Open Toolkit** option to **Custom**, and specify the path to the unzipped folder.

Warning:

The path must end with: `oxygen-publishing-engine`.

How to Style Codeblocks with a Zebra Effect

Suppose you want your *codeblocks* to have a particular background color for one line, and another color for the next line. One advantage of this coloring technique is that you can clearly see when text from the *codeblock* is wrapped.

This effect can be done by altering the HTML5 output, creating a `<div>` for each line from the code block, then styling them.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.codeblocks">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5"
    file="custom_codeblocks.xsl" />
</plugin>
```

3. Create your customization stylesheet (for example, `custom_codeblocks.xsl`) with the following content:

```

<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:template match="*[contains(@class, ' pr-d/codeblock ')]">
    <div class='zebra'>
      <xsl:analyze-string regex="\n" select=".">
        <xsl:matching-substring/>
        <xsl:non-matching-substring>
          <div><xsl:value-of select="."/></div>
        </xsl:non-matching-substring>
      </xsl:analyze-string>
    </div>
  </xsl:template>
</xsl:stylesheet>

```

4. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (*on page 1197*) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Create a custom CSS file with rules that style the *codeblock* structure. For example:

```

div.zebra {
  font-family:courier, fixed, monospace;
  white-space:pre-wrap;
}

div.zebra > *:nth-of-type(odd){
  background-color: silver;
}

```

6. Edit a **DITA Map PDF - based on HTML5 & CSS** transformation scenario and reference your custom CSS file (using the `args.css` parameter).
7. Run the transformation scenario.

How to Remove the Related Links Section

Suppose you want the *related links* sections to be removed from the PDF output.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.custom.codeblocks`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension point and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.custom.related.links">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2merged"
    file="custom_related_links.xsl"/>
</plugin>
```

3. Create your customization stylesheet (for example, **custom_related_links.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">

  <xsl:template match="*[contains(@class, ' topic/related-links ')]">
    <!-- Remove. -->
  </xsl:template>
</xsl:stylesheet>
```

4. Use the [Integrate/Install DITA-OT Plugins](#) transformation scenario (on page 1197) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
5. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

How to Use Custom Parameters in XSLT Stylesheets

Suppose you want to add an attribute with a custom value inside a `<div>` element.

To add this functionality using a DITA-OT plugin, follow these steps:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.param`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.css.param">
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5.parameters" file="params.xml"/>
  <feature extension="com.oxygenxml.pdf.css.xsl.merged2html5" file="custom.xsl"/>
</plugin>
```

Note:

The `com.oxygenxml.pdf.css.xsl.merged2html5` extension point can also be called from a Publishing Template.

3. Create a **params.xml** file that specifies the name of the custom attribute with the following content:

```
<dummy xmlns:if="ant:if">
  <param name="custom-param" expression="{custom.param}" if:set="custom.param"/>
</dummy>
```

4. Create your customization stylesheet (for example, **custom.xsl**) with the following content:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="2.0">
  <xsl:param name="custom-param"/>

  <xsl:template match="*[contains(@class, ' topic/div ')]">
    <div>
      <xsl:call-template name="commonattributes"/>
      <xsl:call-template name="setid"/>
      <xsl:if test="$custom-param">
        <xsl:attribute name="custom" select="$custom-param"/>
      </xsl:if>
      <xsl:apply-templates/>
    </div>
  </xsl:template>
</xsl:stylesheet>
```

5. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 1197) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Duplicate the **DITA Map PDF - based on HTML5 & CSS** transformation scenario, then in the **Parameters** tab click **New** to create a new parameter (e.g. named *custom.param* with the value of **customValue**).
7. Run the transformation scenario.

Related information

DITA-OT Extension Points

The **DITA-OT CSS-based PDF Publishing Plugin** supports DITA-OT extension points that can be used to expand the functionality of the transformation. The extension points are defined in the `plugin.xml` file. For more information, see [DITA Open Toolkit Extension Points](#).

Related Information:

[XSLT Extensions for PDF Transformations \(on page 1757\)](#)

How to Contribute a Custom CSS to the Transformation from a DITA-OT Plugin

This topic is intended for publishing architects/developers that need to deploy a customized DITA-OT.

Usually, the CSS styles can be passed to the transformation by referencing the CSS files using the `args.css` parameter. However, there are cases where you want to add some sort of "built-in" CSS that is applied in conjunction with the publishing template or CSS files referenced in the transformation.

For this, you need to use the `com.oxygenxml.pdf.css.init` extension point and set the value of the `extension.css` ANT property to the path of the custom CSS file:

1. In your `plugin.xml` file, add:

```
<feature extension="com.oxygenxml.pdf.css.init" file="init.xml" />
```

2. Create a file named `init.xml` with the following ANT content:

```
<root>  
  <property name="extension.css"  
    value="${dita.plugin.[com.my.plugin.id].dir}/css/my-custom.css" />  
  <!-- add here more init stuff if needed -->  
</root>
```

Note:

The name of the root element does not matter. The content of this element will be copied in an initialization template.

Important:

Make sure all file references begin with the ANT variable that is expanded to the base directory of your plugin.

Related Information:

[How to Use XSLT Extension Points for PDF Output from a DITA-OT Plugin \(on page 1790\)](#)

Localization

DITA-OT supports more than 40 languages. The full list of supported languages (and their codes) is available here: <https://www.dita-ot.org/dev/topics/globalization-languages>.

There are two ways to switch the labels to a specific language:

- Set the `@xml:lang` attribute on the DITA maps and/or topics root element with one of the supported values (e.g. `de`, `fr-FR`, `ru`, `zh-CN`).
- Set the `default.language` parameter in the transformation dialog box to the desired language code.

You can create language-dependent CSS rules in your [customization CSS \(on page 1567\)](#) by adding rules using the `:lang` pseudo-class (see <https://developer.mozilla.org/en-US/docs/Web/CSS/:lang>).

Tip:

It is recommended that you do this customization on a DITA-OT distribution deployed outside of the **Oxygen** installation. Otherwise, you will lose the customization when upgrading **Oxygen**. You can [contact the Oxygen support team](#) to ask for the **Oxygen Publishing Engine** package.

Related information

[Webinar: Transforming DITA documents to PDF using CSS, Part 4 – Advanced CSS Rules](#)

How to Customize CSS Strings

Some of the labels come from CSS files located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n` directory. These strings can be overridden directly from a custom CSS stylesheet. Simply identify (by debugging the CSS) and copy the rules that apply on your content and change their values. For example:

```
*[class ~= "toc/title"][empty]:before {
  content: "Agenda";
}
```

```
/* Title of the TOC page */
*[class ~= "toc/title"][empty]:lang(es):before {
  content: "Contenidos";
}
```

Note:

If you want to use a language without a corresponding `p-i18n-xx.css` stylesheet, follow these instructions:

1. Copy one of the available stylesheets (located in the `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/css/print/i18n` directory) into your CSS customization (other than the English one because it does not have the `:lang` pseudo-class since it is the default language).
2. For each rules, replace the `:lang(xx)` pseudo-class with your expected language code, then replace each property value with the expected label.

Related information

[Debugging the CSS \(on page 1569\)](#)

How to Modify Existing Strings

If the label you want to modify is not available from the CSS, you need to modify the XML strings. The default XML strings are available at the following two locations:

- `DITA-OT-DIR/plugins/org.dita.base/xsl/common`
- `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/resources/localization`

To modify the generated text, you need to create a DITA-OT extension plugin that uses the `dita.xsl.strings` extension point. The following example uses English, but you can adapt it for any language:

1. In the `DITA-OT-DIR\plugins\` folder, create a folder for this plugin (for example, `com.oxygenxml.pdf.css.localization`).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css" />

  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml" />
</plugin>
```

3. Create a `pdf-extension-strings.xml` file with the following content:

```
<langlist>
  <lang xml:lang="en" filename="strings-en-us.xml" />
  <lang xml:lang="en-us" filename="strings-en-us.xml" />
</langlist>
```

4. Copy the strings you want to change from the default files to the `strings-en-us.xml` file, then replace their values:

```
<strings xml:lang="en-US">
  <str name="Figure">Fig</str>
  <str name="Table">Array</str>
</strings>
```

Warning:

Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (*on page 1197*) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

How to Add New Strings

Some strings are not translated in all languages. In this case, they will appear in English. To add a new language for a given string, you need to create a DITA-OT extension plugin that uses the *dita.xsl.strings* extension point. The following example uses Polish, but you can adapt it for any language:

1. In the *DITA-OT-DIR\plugins* folder, create a folder for this plugin (for example, *com.oxygenxml.pdf.css.localization*).
2. Create a **plugin.xml** file (in the folder you created in step 1) that specifies the extension points, your parameter file, and your customization stylesheet. For example:

```
<plugin id="com.oxygenxml.pdf.css.localization">
  <require plugin="com.oxygenxml.pdf.css" />

  <feature extension="dita.xsl.strings" file="pdf-extension-strings.xml" />
</plugin>
```

3. Create a *pdf-extension-strings.xml* file with the following content:

```
<langlist>
  <lang xml:lang="pl"      filename="strings-pl-pl.xml" />
  <lang xml:lang="pl-pl"  filename="strings-pl-pl.xml" />
</langlist>
```

4. Copy the strings you want to change from the default files to the *strings-pl-pl.xml* file, then replace their values:

```
<strings xml:lang="pl-PL">
  <str name="Continued">(ciąg dalszy)</str>
</strings>
```

Warning:

Make sure the string `@name` attribute remains the same, it is used by the process as a key to retrieve the strings text.

5. Use the **Integrate/Install DITA-OT Plugins** transformation scenario (*on page 1197*) found in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box.
6. Run the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.

Security

You can restrict the use of the PDF files by specifying a set of permissions. For example, you may want to set a password on the document, restrict the available actions inside the PDF reader, or encrypt the PDF content.

The `pdf.security.*` parameters listed in the [Transformation Parameters \(on page 1543\)](#) section can be used for this purpose.

How to Protect PDF Files by Setting Security Permissions

For example, to permit only the users that have a password to access the document and also to restrict their printing and copying capability, you can use the following parameter combination:

Parameter	Value	Description
pdf.security.owner.password	<OWNER PASSWORD>	People using this password will be able to open the document, with full permissions.
pdf.security.user.password	<USER PASSWORD>	People using this password will be able to open the document, but they will not be able to print.
pdf.security.restrict.print	yes	Restricts users from printing.
pdf.security.restrict.copy	yes	Restricts users from copying content.

Important:

If you specify just the user password (without an owner password), then the people using it will be considered owners, and no restrictions will apply to them.

Troubleshooting

There are cases when the PDF CSS-based processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Damaged PDF File

Problem

It is possible to get a PDF that cannot be opened in the PDF viewer. In this case, you might get an error similar to:

```
Error: PDF file is damaged - attempting to reconstruct xref table...
Error: Couldn't find trailer dictionary
Error: Couldn't read xref table
```

Cause

This usually means that your PDF viewer does not support a PDF version greater than 1.4. The main difference with newer PDF versions is that the xref table is compressed in a stream and is not available as a table.

Solution

You need to re-run the PDF transformation with the `pdf.version` parameter set to `1.4`.

Error Parsing CSS File - Caused by a Networking Problem

Problem

My custom styles are not applied and in the transformation results console, I get an error containing one of the following: `I/O exception, Unknown host, Error parsing`.

Cause

One of the CSS files contains references to resources from another website that is currently inaccessible. These resources may include:

- Fonts
- Images
- Other CSS files

Note:

If you exported one of the built-in publishing templates from the transformation scenario dialog, it is possible that the associated CSS files use an imported Google Font.

Remedy

1. Check your proxy settings (ask the system administrator for help).
2. If the server is still inaccessible from the transformation process, download the remote resources using a web browser, save them in the customization CSS file folder, and refer them directly from your CSS.

Note:

If the problem is caused by a remote font, see [Using Local Fonts](#).

Failed to Run Pipeline: The Entity Cannot Be Resolved Through Catalogs

Problem

You can get a *Failed to run pipeline* error message that looks something like this:

```
Failed to run pipeline: The entity SOME_ENTITY cannot not be resolved through catalogs.  
For security reasons files that are not listed in the DITA-OT catalogs and are not  
located in the DITA-OT directory are not read
```

Cause

This happens when the security checks that are implemented in the default transformation have blocked the reading of files that are not part of the DITA-OT (**Oxygen Publishing Engine**) installation directory and not part of the transformed DITA map.

Solution

If the origin of the transformed content is known and trusted, you can disable these checks by setting the `args.disable.security.checks` transformation parameter to **yes**.

Disappearing Thin Lines or Cell Borders

Problem

There are cases where thin lines disappear from the PDF viewer at certain zoom levels.

Cause

This is caused by the limited resolution of the display, while a printer has a superior resolution and there should be no problem printing thin lines on paper.

Solution

If the primary PDF target is the display, then you have to use thicker lines in your CSS customization (for example, avoid using 1px and use 1pt or larger instead).

If you are using Adobe Acrobat Reader, then you can enhance the display of thin lines. This behavior can be changed by going to **Edit > Preferences > Page Display > Enhance Thin Lines**. Deselecting this option makes thin lines displayed as a row of gray pixels (through antialiasing) and they do not disappear. You can experiment by selecting and deselecting the option.

Glossary Entries Referenced Using 'glossref' are not Displayed

Problem

I have a `<glossgroup>` that contains multiple `<glossentry>` elements and all the entries are referenced using `<glossref>` elements inside my map. When I add an `<abbreviated-form>` element linked to one of my `<glossentry>` elements (using a `@keyref`), the entry is not resolved in the PDF output.

Solution

Make sure every `<glossentry>` has an `@id`. Then, for each `<glossentry>`, declare a `<glossref>` element like this:

```
<glossref href="concepts/glossary.dita#flowers.genus" print="yes" keys="genus"/>
```

Important:

For bookmaps, the `<glossref>` elements should be declared in a separate ditamap.

The format-date() XPath Function Does Not Respect the Specified Locale

Problem

Formatting a date using another language code, as in this example:

```
title:before {
  content: oxy_xpath('format-date(current-date(), "[Mn] [Y]", "ru", (), ())');
}
```

results in an output like: `[Language: en]september 2019`, with the date being formatted in English.

Cause

The XPath expressions are evaluated using the Saxon HE processor. This processor does not support languages other than English.

Solution

As a solution, you can either switch to a more language-neutral format that avoids the months names:

```
title:before{
  content: oxy_xpath('format-date( current-date(), "[M] [Y]", "en", (), ())');
}
```

or you can use a more complex XPath expression like this:

```
title:before{
  content: oxy_xpath("let $cm:= format-date(current-date(), '[MNn]') \
return concat( \
if ($cm= 'January') then 'JAN' else \
if ($cm= 'February') then 'FEB' else \
if ($cm= 'March') then 'MAR' else \
if ($cm= 'April') then 'APR' else \
if ($cm= 'May') then 'MAY' else \
if ($cm= 'June') then 'JUNE' else \
if ($cm= 'July') then 'JUL' else \
if ($cm= 'August') then 'AUG' else \
if ($cm= 'September') then 'SEPT' else \
if ($cm= 'October') then 'OCT' else \
```

```

if ($cm= 'November') then 'NOV' else '' \

, \

' ', \

format-date(current-date(), '[Y0001]') \

) " );

}

```

Make sure the entire expression is rendered blue in the CSS editor. Replace the capitalized month names with the translation in the desired language.

Highlights Span Unexpectedly to the End of the Page

Problem

Tracked changes and highlights span beyond what is expected.

Cause

If the change tracking insertions, comments, or highlights span over an area that is larger than expected, the markup that signals their end is missing.

Solution

To fix this, open the topic where the highlights start and check if the XML processing instructions that define the end of the highlighted interval are correct (it is easiest to see them in **Text** mode). The intervals are defined as follows:

For highlights:

```

<?oxy_custom_start type="oxy_content_highlight" color="140,255,140"?>
<?oxy_custom_end?>

```

For comments:

```

<?oxy_comment_start author="dan" timestamp="20201102T092905+0200" comment="Test"?>
<?oxy_comment_end?>

```

For inserted text:

```

<?oxy_insert_start author="dan" timestamp="20201102T093034+0200"?>
<?oxy_insert_end?>

```

Make sure all the ending processing instructions are located before the root element end tag.

Unexpected Page Break Before or After an Element

Problem

A page break occurs before or after an element that has `page-break-before` or `page-break-after` (`break-before` or `break-after`) property set to *avoid*. For example, after a topic/section title (set by default):

```
*[class ~= "topic/title"] {
  page-break-after: avoid;
}
```

Cause

An empty element (for example, `<p>` or `<shortdesc>`) is present before or after the element with the break set to *avoid*. The page-break actually occurs at this element level.

Solution

Either remove the empty element from the DITA source topic (preferable) or set the display to *none* using the following CSS rule:

```
*[class ~= "topic/shortdesc"]:empty {
  display: none;
}
```

Error When Processing Topics With Chunk and Copy-To Attribute

Problem

A topic marked with both the `@chunk` and `@copy-to` attributes is missing from the PDF output and the following error appears in the **Results** view:

```
[DOTX008E] File 'file:/D:/path/to/file.dita' does not exist or cannot be loaded.
```

Cause

The chunk processing is skipped by default and must be enabled.

Solution

Set the `enable.chunk.processing` parameter to the value of **true** and re-run the transformation scenario.

XSL FO-based DITA to PDF Customization

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps (on page 2678)* to PDF output. Oxygen XML Editor Eclipse plugin includes a built-in

DITA Map PDF - based on XSL-FO transformation scenario (*on page 1191*) that converts DITA maps to PDF using an *xsl:fo* processor.

There are several methods that can be used to customize DITA to PDF output:

- Create a customization directory that contains your customized files and reference that directory in the PDF transformation scenario (using the `customization.dir` parameter).
- Creating a DITA Open Toolkit plugin that adds extensions to the PDF output. More details can be found in the [DITA Open Toolkit Documentation](#).

**Tip:**

Some sample plugins are available on GitHub that could help you to get started with creating a plugin:

- [Sample Plugin: DITA-OT PDF Customization Plugin for Oxygen User Manual](#)
- [Sample Plugin: DITA-OT PDF2 - Generate Numbers Before Topic's Title](#)

Using a Customization Directory

One way to customize the PDF output generated by the **DITA Map PDF - based on XSL-FO transformation scenario** (*on page 1191*) is to create a dedicated folder to store customized files. With this approach, you will copy the contents of the built-in customization directory to a new directory where you can customize the files according to your needs and reference the new directory using the `customization.dir` parameter in the transformation scenario. The biggest advantage of this method is that the contents of your customization directory will remain unaffected when the DITA-OT is upgraded.

How to Create a Customization Directory

Follow this procedure to create a customization directory:

1. Copy all the entire `DITA-OT-DIR\plugins\org.dita.pdf2\Customization` directory to another location where you have write access.
2. Modify any of the files in whatever way necessary to achieve your specific goal. For inspiration, see [Embedding a Company Logo](#) (*on page 1805*) for a specific example of how you can modify contents of the directory to embed a logo in the output.

**Tip:**

For other specific examples, see [DITA-OT Documentation - PDF Customization Plugin](#).

3. Edit the **DITA Map PDF - based on XSL-FO transformation scenario** (*on page 1191*), go to the **Parameters** tab, and set the `customization.dir` parameter to point to the location of your customization directory.

Related information

[Automatic PDF plugin customization generator by Jarno Elovirta.](#)

[DITA-OT Documentation - PDF Customization Plugin](#)

Embedding a Company Logo

The following procedure explains how to embed a company logo image in the front matter of the book for the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1191*).

1. Create a customization directory (*on page 1804*) (if you have not already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your logo to that directory (for example, `[C:\Customization\common\artwork\logo.png]`).

**Important:**

Make sure that your logo image is named: **logo.png**.

3. Rename `Customization\catalog.xml.orig` to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor Eclipse plugin and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
```

It now looks like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file `Customization\fo\xsl\custom.xsl.orig` to: `C:\Customization\fo\xsl\custom.xsl`
6. Open the `custom.xsl` file in Oxygen XML Editor Eclipse plugin and create the template called `createFrontCoverContents` for DITA-OT 4.1.2.

**Tip:**

You can copy the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl` and modify it in whatever way necessary to achieve your specific goal.

This new template in the `custom.xsl` file will override the same template from `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\front-matter.xsl`.

Example:

For example, the `custom.xsl` could look like this:

```
<?xml version='1.0'?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:fo="http://www.w3.org/1999/XSL/Format "
  version="2.0">
```

```

<xsl:template name="createFrontCoverContents">
  <!-- set the title -->
  <fo:block xsl:use-attribute-sets="__frontmatter__title">
    <xsl:choose>
      <xsl:when test="$map/*[contains(@class,' topic/title ')]][1]">
        <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')]][1]">
        </xsl:when>
      <xsl:when test="$map//*[contains(@class,' bookmap/mainbooktitle ')]][1]">
        <xsl:apply-templates select="$map//*[contains
          (@class,' bookmap/mainbooktitle ')]][1]">
        </xsl:when>
      <xsl:when test="//*[contains(@class,' map/map ')]/@title">
        <xsl:value-of select="//*[contains(@class,' map/map ')]/@title"/>
        </xsl:when>
      <xsl:otherwise>
        <xsl:value-of select="/descendant::*[contains
          (@class,' topic/topic ')]][1]/*[contains(@class,' topic/title ')]"/>
        </xsl:otherwise>
      </xsl:choose>
    </fo:block>

    <!-- set the subtitle -->
    <xsl:apply-templates select="$map//*[contains
      (@class,' bookmap/booktitlealt ')]"/>
    <fo:block xsl:use-attribute-sets="__frontmatter__owner">
      <xsl:apply-templates select="$map//*[contains(@class,' bookmap/bookmeta ')]"/>
    </fo:block>

    <!-- Load the image logo -->
    <fo:block text-align="center" width="100%">
      <fo:external-graphic
        src="url({concat($artworkPrefix,
          'Customization/OpenTopic/common/artwork/logo.png')})"
      />
    </fo:block>
  </xsl:template>
</xsl:stylesheet>

```

7. Edit the **DITA Map PDF - based on XSL-FO transformation scenario** (on page 1191), go to the **Parameters** tab, and set the `customization.dir` parameter to point to the location of your customization directory.

**Tip:**

For other specific examples, see [DITA-OT Documentation - Customizing PDF Output](#).

Related Information:

[Using a Customization Directory \(on page 1804\)](#)

Customizing the Header and Footer in PDF Output

This procedure should only be used for the **DITA Map PDF - based on XSL-FO** transformation scenario ([on page 1191](#)).

The XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/static-content.xsl` contains templates that output the static header and footers for various parts of the PDF such as the prolog, table of contents, front matter, or body.

The templates for generating a footer for pages in the body are called `insertBodyOddFooter` or `insertBodyEvenFooter`.

These templates get the static content from resource files that depend on the language used for generating the PDF. The default resource file is `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/common/vars/en.xml`. These resource files contain variables (such as *Body odd footer*) that can be set to specific user values.

Instead of modifying these resource files directly, they can be overwritten with modified versions of the resources in a PDF customization directory.

1. [Create a customization directory \(on page 1804\)](#) (if you have not already done so).
2. Locate the stylesheets and templates listed above in your customization directory and modify them in whatever way necessary to achieve your specific goal.

**Tip:**

For more information and examples, see the [Oxygen PDF Customization Plugin project on GitHub](#).

3. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario ([on page 1191](#)), go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Related Information:

<https://github.com/oxygenxml/com.oxygenxml.pdf2.ug/wiki>

[Using a Customization Directory \(on page 1804\)](#)

Adding a Watermark to PDF Output

To add a watermark to the PDF output of a **DITA Map PDF - based on XSL-FO** transformation scenario (on page 1191), follow this procedure:

1. Create a customization directory (on page 1804) (if you have not already done so).
2. Create a `cfg\common\artwork` directory structure in your customization directory and copy your watermark image to that directory (for example, `C:\Customization\cfg\common\artwork\watermark.png`).
3. Rename the `Customization\catalog.xml.orig` file to: `Customization\catalog.xml`.
4. Open the `catalog.xml` in Oxygen XML Editor Eclipse plugin and *uncomment* this line:

```
<!--uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/-->
```

The uncommented line should look like this:

```
<uri name="cfg:fo/xsl/custom.xsl" uri="fo/xsl/custom.xsl"/>
```

5. Rename the file: `Customization\fo\xsl\custom.xsl.orig` to: `Customization\fo\xsl\custom.xsl`.
6. Open the `Customization\fo\xsl\custom.xsl` file in Oxygen XML Editor Eclipse plugin to overwrite two XSLT templates:
 - The first template is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\static-content.xsl`. Override by copying the original template content in the `custom.xsl` and specifying a watermark image for every page in the PDF content, using a `block-container` element that references the watermark image file:

```
<fo:static-content flow-name="odd-body-header">
  <fo:block-container absolute-position="absolute"
    top="-2cm" left="-3cm" width="21cm" height="29.7cm"
    background-image="{concat($artworkPrefix,
'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
    <fo:block/>
  </fo:block-container>
  <fo:block xsl:use-attribute-sets="__body__odd__header">
    <xsl:call-template name="insertVariable">
      <xsl:with-param name="theVariableID" select="'Body odd header'"/>
      <xsl:with-param name="theParameters">
        <prodname>
          <xsl:value-of select="$productName"/>
        </prodname>
        <heading>
          <fo:inline xsl:use-attribute-sets="__body__odd__header__heading">
            <fo:retrieve-marker retrieve-class-name="current-header"/>
          </fo:inline>
        </heading>
      </xsl:with-param>
    </xsl:call-template>
  </fo:block>
</fo:static-content>
```

```

        </heading>

        <pagenum>

        <fo:inline xsl:use-attribute-sets="__body__odd__header__pagenum">

            <fo:page-number/>

        </fo:inline>

        </pagenum>

    </xsl:with-param>

</xsl:call-template>

</fo:block>

</fo:static-content>

</xsl:template>

```

- The second template to override is located in the XSLT stylesheet `DITA-OT-DIR\plugins\org.dita.pdf2\xsl\fo\commons.xml` and is used for styling the first page of the output. Override it by copying the original template content in the `custom.xml` and adding the `block-container` element that references the watermark image file:

```

<xsl:template name="createFrontMatter_1.0">
    <fo:page-sequence master-reference="front-matter"
xsl:use-attribute-sets="__force__page__count">
        <xsl:call-template name="insertFrontMatterStaticContents"/>
        <fo:flow flow-name="xsl-region-body">
            <fo:block-container absolute-position="absolute"
                top="-2cm" left="-3cm" width="21cm" height="29.7cm"
                background-image="{concat($artworkPrefix,
'Configuration/OpenTopic/cfg/common/artwork/watermark.png')}">
                <fo:block/>
            </fo:block-container>
            <fo:block xsl:use-attribute-sets="__frontmatter">
                <!-- set the title -->
                <fo:block xsl:use-attribute-sets="__frontmatter__title">
                    <xsl:choose>
                        <xsl:when test="$map/*[contains(@class,' topic/title ')] [1]">
                            <xsl:apply-templates select="$map/*[contains(@class,' topic/title ')] [1]" />
                        </xsl:when>
                        <xsl:when test="$map/*[contains(@class,' bookmap/mainbooktitle ')] [1]">
                            <xsl:apply-templates select="$map/*[contains
(@class,' bookmap/mainbooktitle ')] [1]" />
                        </xsl:when>
                        <xsl:when test="//*[contains(@class, ' map/map ')]/@title">
                            <xsl:value-of select="//*[contains(@class, ' map/map ')]/@title" />
                        </xsl:when>
                        <xsl:otherwise>

```

```

        <xsl:value-of select="/descendant::*[contains
(@class, ' topic/topic ')]][1]/*[contains(@class, ' topic/title ')]"/>
        </xsl:otherwise>
    </xsl:choose>
</fo:block>

<!-- set the subtitle -->
<xsl:apply-templates select="$map//*[contains
(@class,' bookmap/booktitlealt ')]"/>

<fo:block xsl:use-attribute-sets="__frontmatter__owner">
    <xsl:apply-templates select="$map//*[contains
(@class,' bookmap/bookmeta ')]"/>
</fo:block>

</fo:block>

<!--<xsl:call-template name="createPreface"/>-->

</fo:flow>
</fo:page-sequence>
<xsl:if test="not($retain-bookmap-order)">
    <xsl:call-template name="createNotices"/>
</xsl:if>
</xsl:template>

```

7. Edit the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1191*), go to the **Parameters** tab, and set the **customization.dir** parameter to point to the location of your customization directory.

Related Information:

[Adding a Watermark in DITA Map to XHTML Output \(on page 2568\)](#)

Adding an Edit Link in PDF Output to Launch Oxygen XML Web Author

You can embed *Edit* links in the **DITA Map PDF - based on XSL-FO** transformation scenario (*on page 1191*) output that will automatically launch a particular document in **Oxygen XML Web Author**. A reviewer can then simply click the link and they will be redirected to the Oxygen XML Web Author editing page with that particular file open and editable.

To embed an *Edit* link in the DITA Map PDF output, follow these steps:

1. Edit a [DITA Map PDF - based on XSL-FO transformation scenario \(on page 1191\)](#) and open the **Parameters** tab.
2. Set values for the following parameters:
 - **editlink.ditamap.edit.url** - The URL of the DITA map used to publish your content. The easiest way to obtain the URL is to open the map in Web Author and copy the URL from the browser's address bar.
 - **editlink.additional.query.parameters** - Optional query parameters to be appended to each generated edit link. Each parameter must start with & (e.g. *&tags-mode=no-tags*).
3. Run the transformation scenario.

Result: In the PDF output, all topics will have an **Edit** link to the right side of the title and clicking the link will launch that particular document in Oxygen XML Web Author.

Force Page Breaks Between Two Block Elements in PDF Output

The following procedure works for the [DITA Map PDF - based on XSL-FO transformation scenario \(on page 1191\)](#).

Suppose that in your DITA content you have two *block elements (on page 2676)*, such as two paragraphs:

```
<p>First para</p>
<p>Second para</p>
```

and you want to force a page break between them in the PDF output.

Here is how you can implement a DITA Open Toolkit *plugin (on page 2681)* that would achieve this:

1. Define your custom processing instruction that marks the place where a page break should be inserted in the PDF, for example:

```
<p>First para</p>
  <?pagebreak?>
<p>Second para</p>
```

2. Locate the **DITA Open Toolkit** distribution and in the `plugins` directory create a new *plugin* folder (for example, `DITA-OT-DIR/plugins/pdf-page-break`).
3. In this new folder, create a new `plugin.xml` file with the following content:

```
<plugin id="com.yourpackage.pagebreak">
  <feature extension="package.support.name" value="Force Page Break Plugin"/>
  <feature extension="package.support.email" value="support@youremail.com"/>
  <feature extension="package.version" value="1.0.0"/>
  <feature extension="dita.xsl.xslfo" value="pageBreak.xsl" type="file"/>
</plugin>
```

The most important feature in the *plugin* is that it will add a new XSLT stylesheet to the XSL processing that produces the PDF content.

4. In the same folder, create an XSLT stylesheet named `pageBreak.xsl` with the following content:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
                xmlns:fo="http://www.w3.org/1999/XSL/Format" version="1.0">
  <xsl:template match="processing-instruction('pagebreak')">
    <fo:block break-after="page"/>
  </xsl:template>
</xsl:stylesheet>
```

5. Install your *plugin* in the DITA Open Toolkit. (*on page 2611*)

The source code for the plugin can be found on GitHub here: <https://github.com/dita-community/org.dita-community.pdf-page-break>.

Show Comments and Tracked Changes in PDF Output

To include comments and *tracked changes* (stored within your DITA topics) in the **DITA Map PDF - based on XSL-FO transformation scenario** (*on page 1191*) output, follow these steps:

1. Edit a **DITA Map PDF - based on XSL-FO** transformation scenario.
2. In the **Parameters** tab, set the value of the **show.changes.and.comments** parameter to `yes`. If you also want to display change bars for inserted or deleted content in the PDF, set the **show.changebars** parameter to `yes`. If you want to only show the *changebars*, without other styling of the changes, you should set both the **show.changes.and.comments** and **show.changes.and.comments.as.changebars.only** parameters to `yes`.
3. Optionally, you can configure any of these other parameters to adjust the colors of the comments and tracked changes:
 - **ct.insert.color** - Specifies the color for insertion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'blue'.
 - **ct.delete.color** - Specifies the color for deletion type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'red'.
 - **ct.comment.bg.color** - Specifies the background color for comment type tracked changes, as a plain color (e.g. red, yellow, blue), or with a hexadecimal equivalent (e.g. #FFFFFF). The default value is 'yellow'.
4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Result: Comment threads and tracked changes will now appear in the PDF output. Details about each comment or change will be available in the footer section for each page.

Set a Font for PDF Output Generated with FO Processor

When a *DITA map* (*on page 2678*) is transformed using the **DITA Map PDF - based on XSL-FO transformation scenario** (*on page 1191*) and it contains some Unicode characters that cannot be rendered by the default PDF fonts, a font that is capable of rendering these characters must be configured and embedded in the PDF result.

The settings that must be modified for configuring a font for the built-in FO processor are detailed in [Add a Font to the Built-in FO Processor - Advanced Version \(on page 1275\)](#).

DITA-OT PDF Font Mapping

The DITA-OT contains a file `DITA-OT-DIR/plugins/org.dita.pdf2/cfg/fo/font-mappings.xml` that maps logical fonts used in the XSLT stylesheets to physical fonts that will be used by the FO processor to generate the PDF output.

The XSLT stylesheets used to generate the XSL-FO output contain code like this:

```
<xsl:attribute name="font-family">monospace</xsl:attribute>
```

The font-family is defined to be *monospace*, but *monospace* is just an alias. It is not a physical font name. Therefore, another stage in the PDF generation takes this *monospace* alias and looks in the `font-mappings.xml`.

If it finds a mapping like this:

```
<aliases>
  <alias name="monospace">Monospaced</alias>
</aliases>
```

then it looks to see if the *monospace* has a *logical-font* definition and if so, it will use the *physical-font* specified there:

```
<logical-font name="Monospaced">
  <physical-font char-set="default">
    <font-face>Courier New, Courier</font-face>
  </physical-font>
  .....
</logical-font>
```

Important:

If no alias mapping is found for a font-family specified in the XSLT stylesheets, the processing defaults to **Helvetica**.

Related information

<http://www.elovirta.com/2016/02/18/font-configuration-in-pdf2.html>

Adding Libraries to the Built-in FO Processor (DITA-OT)

Starting with Oxygen XML Editor Eclipse plugin version 20.0, both hyphenation and PDF image support are enabled by default in the built-in **DITA Map PDF - based on XSL-FO** transformation scenario (on page 1191). For older version of Oxygen XML Editor Eclipse plugin, use the following procedures to enable such support.

Adding Hyphenation Support for DITA-OT Transformation Scenarios

1. Download the pre-compiled *JAR* (on page 2679) from [OFFO](#).
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the `fop-hyph.jar` library.

Adding Support for PDF Images

1. Download the *fop-pdf-images* JAR libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the libraries.

Adding Support for CGM Images

1. Go to the [JCGM page](#) and download the `jcgm-image-0.1.1.jar` and `jcgm-core-0.2.0.jar` libraries.
2. Edit the DITA-OT transformation scenario and switch to the **Advanced** tab.
3. Click the **Libraries** button and add the path to the libraries.

Debugging DITA PDF Transformations

To debug the **DITA Map PDF - based on XSL-FO** transformation scenario (on page 1191), follow these steps:

1. Open the **Preferences** dialog box (on page 70), go to **XML > XML Catalog**, click **Add**, and select the file located at `DITA-OT-DIR\plugins\org.dita.pdf2\cfg\catalog.xml`. If there are other custom DITA-OT PDF customization plugins that contain XML catalogs, references to those XML catalogs might need to be added as well.
2. Open the map in the **DITA Maps Manager** (on page 2337) and create a **DITA Map PDF - based on XSL-FO** transformation scenario.
3. Edit the scenario, go to the **Parameters** tab and change the value of the `clean.temp` parameter to **no**.
4. Run the transformation scenario.
5. Open the `stage1.xml` file located in the temporary directory and **format and indent** (on page 338) it.
6. Create a transformation scenario for this XML file by associating the `topic2fo_shell_fop.xsl` stylesheet located at `DITA-OT-DIR\plugins\org.dita.pdf2.fop\xsl\fo\topic2fo_shell_fop.xsl`. If you are specifically using the RenderX XEP or Antenna House FO processors to build the PDF output, you should use the XSL stylesheets `topic2fo_shell_xep.xsl` or `topic2fo_shell_axf.xsl` located in the corresponding plugin folders.

Note:

For validation purposes, you need to add the main debugged stylesheet (usually `topic2fo_shell_fop.xsl`) to the **Main Files folder** (on page 281) in the **Project Explorer** view.

7. In the transformer drop-down menu, select the Saxon EE XSLT processor (the same processor used when the DITA-OT transformation is executed).

8. Click the **Parameters** button:

- a. Set the `locale` parameter (e.g. with the value of `en_GB`).
- b. Set the `work.dir.url` parameter with the value `${cfdu}`.
- c. Set the `customizationDir.url` parameter to point to either your customization directory or to the default DITA-OT customization directory. Its value should have a URL syntax like this:

```
file:///c:/path/to/<term keyref="glossentry_dita_ot_dir"/>/plugins/org.dita.pdf2/cfg
```

9. You need to reference the extra commonly used JAR libraries by clicking the **Extensions** button and using wildcards to add a reference to all libraries in this folder: `DITA-OT\plugins\com.oxygenxml.common\lib*`.
10. Apply the transformation to continue the debugging process.

Note:

For externally configured DITA Open Toolkit installations or when using custom plugins based on the base PDF2 plugin, the paths to resources described above may need to be adjusted accordingly.

[How to Enable Debugging for FO Processor Transformations \(on page 1276\)](#)

DocBook to PDF Output Customization

When the default layout and output of the DocBook to PDF transformation needs to be customized, follow these steps:

1. Create a custom version of the DocBook title spec file.

You could start from a copy of the file `[DocBook XSL directory]/fo/titlepage.templates.xml` (for example, `[OXYGEN-INSTALL-DIR]/frameworks/docbook/xsl/fo/titlepage.templates.xml`) and customize it. More information about the spec file can be found [here](#).

2. Generate a new XSLT stylesheet from the title spec file from the previous step.

Apply `[DocBook XSL directory]/template/titlepage.xsl` to the title spec file. The result is an XSLT stylesheet (for example, `mytitlepages.xsl`).

3. Import `mytitlepages.xsl` in a [DocBook customization layer](#).

The customization layer is the stylesheet that will be applied to the XML document. The `mytitlepages.xsl` should be imported with an element like this:

```
<xsl:import href="dir-name/mytitlepages.xsl"/>
```

4. Insert a logo image in the XML document.

The path to the logo image must be inserted in the `book/info/mediaobject` structure of the XML document.

5. Apply the customization layer to the XML document.

A quick way is to duplicate the transformation scenario **DocBook PDF** that is included with Oxygen XML Editor Eclipse plugin and set the customization layer in the **XSL URL** property of the scenario (*on page 1207*).

Related Information:

The book **DocBook XSL: The Complete Guide** by Bob Stayton contains more details about customizing the PDF output.

[Video demonstration for creating a DocBook customization layer in Oxygen XML Editor Eclipse plugin.](#)

12.

Working with XPath Expressions

XPath is a language for addressing specific parts of a document. XPath models an XML document as a tree of nodes. An XPath expression is a mechanism for navigating through and selecting nodes from the document. An XPath expression is, in a way, analogous to an SQL query used to select records from a database.

Note:

If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

There are various types of nodes, including element nodes, attribute nodes, and text nodes. XPath defines a way to compute a string-value for each type of node.

XPath defines a library of standard functions for working with strings, numbers and boolean expressions.

Examples:

- **child::*** - Selects all children of the root node.
- **./name** - Selects all `<name>` elements and descendants of the current node.
- **/catalog/cd[price>10.80]** - Selects all the `<cd>` elements that have a `<price>` element with a value larger than 10.80.
- **//prolog** - Finds all `<prolog>` elements.
- **//prolog[@platform='mac']** - Finds all `<prolog>` elements that have the `@platform` attribute value set to **mac**.
- **//child::prolog** - Selects all `@prolog` elements and the child content.
- **/*[count(//accountNumber) > 5]** - Searches for instances where more than 5 `<accountNumber>` elements are found.
- **collection('file:/C:/path/to/folder/?select=*.xml')/*[not(//prolog)]** - Finds a list of all XML files that do not contain any `<prolog>` elements.

To find out more about XPath, see <http://www.w3.org/TR/xpath>.

Related Information:

[Content Completion in XPath Expressions \(on page 661\)](#)

XPath Builder View

The **XPath/XQuery Builder** view allows you to compose complex XPath expressions and execute them over the currently edited XML document. For XPath 2.0 / 3.1, you can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed

over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor Eclipse plugin executes the expressions over the XML document in the associated scenario.

**Note:**

If an XPath expression is run over a JSON document, it is converted to XML and the XPath is executed over the converted XML document.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:**

The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:**

Oxygen XML Editor Eclipse plugin uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Editor Eclipse plugin returns a compilation error.

**Execute XPath button**

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view** ([on page 335](#)) view.

**Favorites button**

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor Eclipse plugin automatically groups favorites in folders named after the method of execution.

**History drop-down menu**

Keeps a list of the last 15 executed XPath expressions. Use the  **Clear history** action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

Update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

Evaluate as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note:

This option and the automatic validation are disabled when the scope is other than **Current file**.

Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Editor Eclipse plugin allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Currently selected file only.
-  **Enclosing project** - All the files of the project that encloses the currently edited file.
-  **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (**Project Explorer** (on page 269) or **Package Explorer**).
-  **All opened files** - All files that are opened in the application.
-  **Current DITA Map hierarchy** - All resources referenced in the currently selected *DITA map* that is open in the **DITA Maps Manager view** (on page 2337).
-  **Opened archive** - Files that are opened in the **Archive Browser view** (on page 1825).
-  **Working sets** - The selected *working sets* (on page 2683).

At the bottom of the scope menu the following scope configuration actions are available:

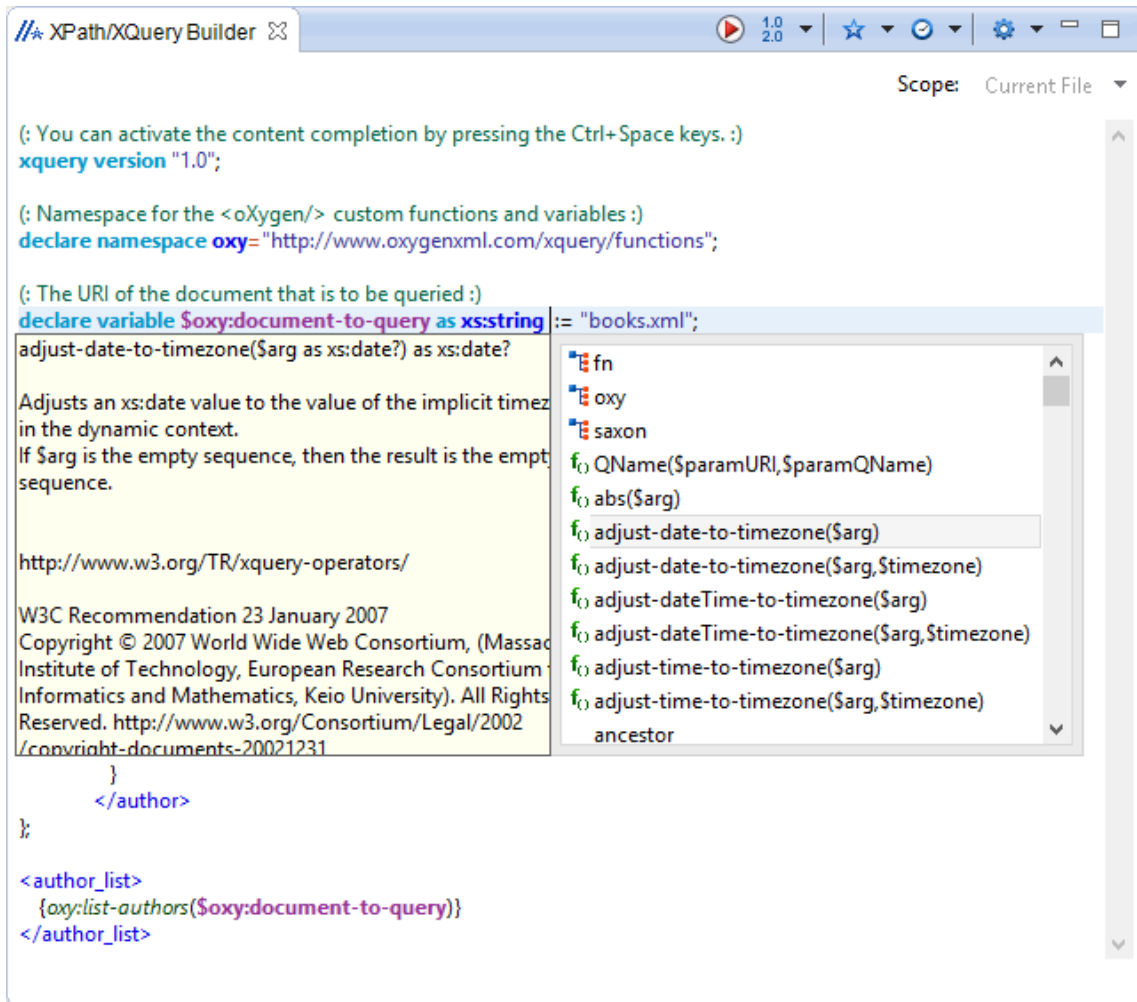

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets (on page 2683)*.
-  **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.

Figure 458. XPath/XQuery Builder View

When you hover your cursor over the version icon ^{1.0}_{2.0}, a tooltip is displayed to let you know what engine Oxygen XML Editor Eclipse plugin currently uses.

While you edit an XPath or XQuery expression, Oxygen XML Editor Eclipse plugin assists you with the following features:

- *Content Completion Assistant (on page 2677)* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the *Content Completion Assistant* also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.

- **Syntax Highlighting** - Allows you to identify the components of an expression. To customize the colors of the components of the expression, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Syntax Highlight (on page 176)**.
- Automatic validation of the expression as you type.

**Note:**

When you type invalid syntax, a red serrated line underlines the invalid fragments.

- Function signature and documentation balloon, when the cursor is located inside a function.

Related Information:

[XPath Expression Results View \(on page 1821\)](#)

XPath Expression Results View

When you run an XPath expression, Oxygen XML Editor Eclipse plugin displays the results of its execution in the **XPath Results** view.

This view contains the following columns:

- **Description** - The result that Oxygen XML Editor Eclipse plugin displays when you run an XPath expression.
- **XPath location** - The path to the matched node.
- **Resource** - The name of the document that you run the XPath expression on.
- **System ID** - The path to the document itself.
- **Location** - The location of the result in the document.

To arrange the results depending on a column, click its header. If no information regarding location is available, Oxygen XML Editor Eclipse plugin displays **Not available** in the **Location** column. Oxygen XML Editor Eclipse plugin displays the results in a valid XPath expression format.

```
- /node[value]/node[value]/node[value] -
```

XPath Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Select All

Extends the selection to all the messages from the view.

**Copy**

Copies information associated with the selected messages in case you want to paste it elsewhere.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy** action (*on page 1821*).

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy** action (*on page 1821*).

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy** action (*on page 1821*).

Example:

The following snippets are taken from a DocBook book based on the DocBook XML DTD. The book contains a number of chapters. To return all the chapter nodes of the book, enter `//chapter` in the XPath expression field and press **Enter**. This action returns all the `chapter` nodes of the DocBook book in the **Results View**. Click a record in the **Results View** to locate and highlight its corresponding chapter element and all its children nodes in the document you are editing.

To find all `example` nodes contained in the `sect2` nodes of a DocBook XML document, use the following XPath expression: `//chapter/sect1/sect2/example`. Oxygen XML Editor Eclipse plugin adds a result in the **Results View** for each `example` node found in any `sect2` node.

For example, if the result of the above XPath expression is:

```
- /chapter[1]/sect1[3]/sect2[7]/example[1]
```

it means that in the edited file, the `example` node is located in the first chapter, third section level one, seventh section level 2.

Figure 459. XPath Results Highlighted in Editor Panel with Character Precision

XPath and XML Catalogs

The evaluation of the XPath expression tries to resolve the locations of documents referenced in the expression through *XML Catalogs* (on page 2683). These catalogs are configured in the **XML Catalog preferences** (on page 189) pages and the **XML Parser preferences** (on page 192).

Example:

As an example, consider the evaluation of the `collection(uriOfCollection)` function (XPath 2.0). To resolve the references from the files returned by the `collection()` function with an *XML catalog*, specify the class name of the catalog-enabled parser for parsing these collection files. The class name is `ro.sync.xml.parser.CatalogEnabledXMLReader`. Specify it as it follows:

```

let $docs := collection(iri-to-uri(
  "file:///D:/temp/test/XQuery-catalog/mydocsdir?recurse=yes;select=*.xml";
  parser=ro.sync.xml.parser.CatalogEnabledXMLReader"))

```

XPath Prefix Mapping

To define default mappings between prefixes and namespace URIs go to the **XPath preferences page** (on page 203) and enter the mappings in the **Default prefix-namespace mappings** table. The same preferences panel allows you to configure the default namespace used in XPath 2.0 expressions.

**Important:**

If you define a default namespace, Oxygen XML Editor Eclipse plugin binds this namespace to the first free prefix from the list: `default`, `default1`, `default2`, and so on. For example, if you define the default namespace `xmlns="something"` and the prefix `default` is not associated with another namespace, you can match tags without prefix in an XPath expression typed in the XPath toolbar by using the prefix `default`. To find all the `<level>` elements when you define a default namespace in the root element, use this expression: `//default:level` in the XPath toolbar.

13.

Working with Archives

Oxygen XML Editor Eclipse plugin includes a useful **Archive Browser view** (*on page 1825*) that offers the means to work with files directly from various types of archives (for example, opening and saving files directly in archives, or browsing and modifying archive structures). The archive support is available for all ZIP-type archives, including:

- ZIP archives
- EPUB books
- *JAR archives (on page 2679)*
- Office Open XML (OOXML) files
- Open Document Format (ODF) files
- *IDML files (on page 2679)*

You can transform, validate, and perform many other operations on files directly from an archive. For instance, you can transform, or validate files directly from OOXML or ODF packages, and the structure and content of the ZIP archives can be opened, edited, and saved, similar to any other ZIP archive browsing tool. Also, when browsing for a URL in various dialog boxes, you can use the  **Browse for archived file** action to browse and select files from a particular archive.

Resources

For more information about working with an EPUB archive in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

<https://www.youtube.com/embed/OIGTNQwOCi8>

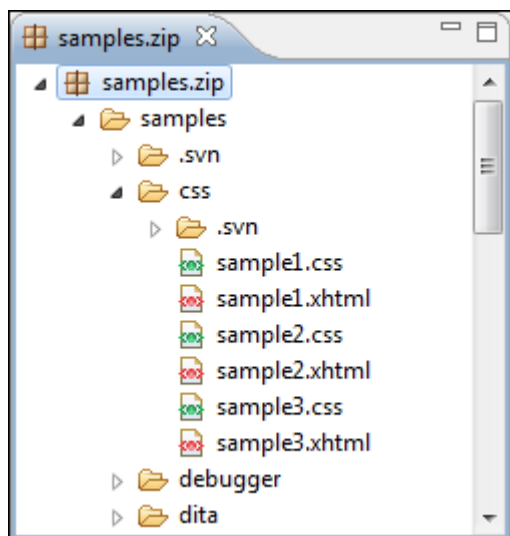

Browsing Archives

To view the contents and structure of an archive, use one of the following methods:

- Open an archive from the **Project Explorer view** (*on page 269*). This opens the archive in the main editing pane. The archive is unmounted when the editor is closed.
- Use the Eclipse File System (EFS) by right-clicking the archive in the **Project Explorer** view and choosing **Expand Zip Archive**. This expands the archive. All the standard actions are available on the mounted archive. To close the archive, you can use the **Collapse ZIP Archive** action and any file opened from the expanded archive is closed when the archive is unmounted.

**Tip:**

If a file is not recognized by Oxygen XML Editor Eclipse plugin as a supported archive type, you can add it in the [Archive preferences page](#) (*on page 71*).

Figure 460. Browsing an Archive**Archive Contextual Menu Actions**

The following additional actions are available from the contextual menu for archives:

Open

Opens a resource from the archive in the editor.

Extract

Extracts a resource from the archive in a specified folder.

New folder

Creates a folder as child of the selected folder in the browsed archive.

New file

Creates a file as child of the selected folder in the browsed archive.

Add files

Adds existing files as children of the selected folder in the browsed archive.

**Note:**

On macOS, the **Add file** action is also available and it allows you to add one file at a time.

Rename

Renames a resource in the archive.

**Cut**

Cuts the selected archive resource.

**Copy**

Copies the selected archive resource.

**Paste**

Pastes a file or folder into the archive.

**Delete**

Removes a file or folder from archive.

Copy location

Copies the URL location of the selected resource.

**Refresh**

Refreshes the selected resource.

Properties

Shows the properties of the selected resource.

Resources

For more information, watch our video demonstration about working with an EPUB in the **Archive Browser** view:

<https://www.youtube.com/embed/OIGTNQwOCi8>

Working with Archive Files

Oxygen XML Editor Eclipse plugin includes support for working with various types of archives, including the following:

- **EPUB** - An e-book file format that can be used on many types of devices, such as smart phones, tablets, e-readers, or computers.
- **OOXML** - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.

When these types of files are opened in the **Project Explorer** view or the main editing pane, their internal components are expanded:

- Document content (XHTML and image files).
- Packaging files.
- Container files.

Figure 461. EPUB File Displayed in Eclipse

When an archive is expanded, you can add or delete files that compose the archive structure. All changes made to the structure of an archive are saved immediately. You can open files from within the archive to edit them in the main editing pane and save changes back to the archive. You can also use the  **Open in System Application** action to open the archive in the default system application that is associated with that type of file.

EPUB-Specific Validation

When working with EPUB archives, Eclipse includes a  **Validate** action on the toolbar that checks the EPUB archive to make sure the structure and content are valid. Oxygen XML Editor Eclipse plugin uses the open-source *EpubCheck* validator to perform the validation. This validator detects many types of errors, including OCF container structure, OPF and OPS mark-up, as well as internal reference consistency.

Resources

For more information about working with an EPUB archive in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

<https://www.youtube.com/embed/OIGTNQwOCi8>

Related information

[The Archive Browser View \(on page 1825\)](#)

[EPUB Document Type \(Framework\) \(on page 1163\)](#)

Creating an Archive

To create an archive from scratch, follow these steps:

1. Go to **File > New > New from Templates**.
2. Choose your particular type of archive template. For example, select one of the **ODF**, **OOXML**, or **EPUB** templates.
3. Click **Next** and choose the name and location of the file.
4. Click **Finish**.

A skeleton archive is saved on disk and open in Eclipse.

Tip:

Use toolbar and contextual menu actions to edit, add, and remove resources from the archive.

For EPUB archives, you can use the **Validate** action to verify the integrity of the EPUB archive.

Editing and Saving Files Inside an Archive

You can open files directly from an archive and then edit them in the main editor pane. To open a file, simply double-click it or select **Open** from the contextual menu.

When saving the file back to the archive, you are prompted to choose if you want the application to make a backup copy of the archive before saving the new content. If you choose **Never ask me again**, you will not be asked again to make backup copies. You can re-enable the pop-up message from the [Archive preferences page \(on page 71\)](#).

Migrating Archives to DITA or TEI

Certain types of archives can be converted to DITA or TEI. For example, OOXML (Office Open XML) archive files with the DOCX file extension can be migrated to DITA or TEI.

To migrate DOCX files to DITA or TEI, follow these steps:

1. Open and expand the archive in Eclipse.
2. Open the **document.xml** file contained in the archive.
3. Run one of the following built-in transformation scenarios:
 - a. **DOCX DITA** to migrate to DITA.
 - b. **DOCX TEI P5** to migrate to TEI.

4. You may need to do some manual reconfiguring to map DOCX styles to DITA or TEI content.

Tip:

Oxygen XML Editor Eclipse plugin also includes a built-in transformation scenario called **ODT TEI P5** for converting ODF archive files with the ODT file extension to TEI and a similar process can be used to migrate ODT files to TEI.

14.

Databases and SharePoint

Oxygen XML Editor Eclipse plugin provides support for connecting and integrating with various databases and Microsoft SharePoint. This section includes information about the database-related features in Oxygen XML Editor Eclipse plugin. It explains how to connect with the supported databases, presents the actions that are available for each type, and includes information about SharePoint integration.

Working with Databases

XML is a storage and interchange format for structured data and is supported by all major database systems. Oxygen XML Editor Eclipse plugin offers the means for managing the interaction with some of the most commonly used databases (both *Relational* and *Native XML* databases). Through this interaction, Oxygen XML Editor Eclipse plugin helps users with browsing, content editing, importing from databases, using XQuery with databases, SQL execution, and generating XML Schema from a database structure.

The types of connections that are supported in Oxygen XML Editor Eclipse plugin include:

- [IBM DB2 \(Deprecated\) \(on page 1875\)](#)
- [Microsoft SQL Server \(Deprecated\) \(on page 1836\)](#)
- [Oracle Database \(Deprecated\) \(on page 1841\)](#)
- [PostgreSQL \(Deprecated\) \(on page 1846\)](#)
- [eXist \(on page 1851\)](#)
- [MarkLogic \(Deprecated\) \(on page 1856\)](#)
- [MySQL \(Deprecated\) \(on page 1866\)](#)
- [Generic JDBC \(on page 1868\)](#)
- [JDBC-ODBC \(on page 1869\)](#)
- [BaseX \(on page 1871\)](#)
- [WebDAV \(on page 1879\)](#)
- [Microsoft SharePoint \(on page 1892\)](#)

Related information

[Integration with Microsoft SharePoint \(on page 1892\)](#)

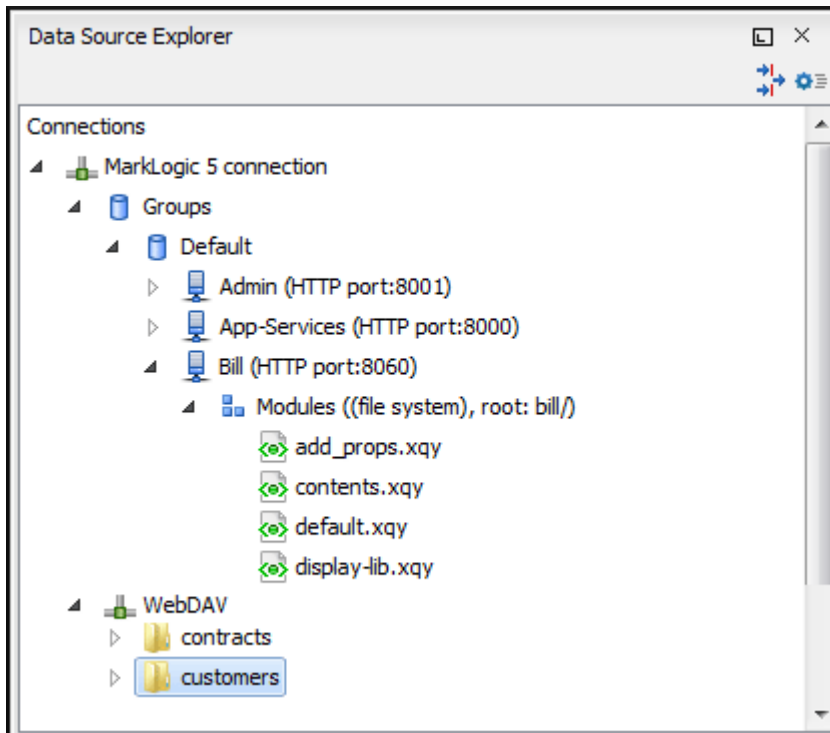

Data Source Explorer View

The **Data Source Explorer** view displays your database connections. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

You can connect to a database simply by expanding the connection node (click the  connection). The database structure can be expanded to resource level, or even all the way to column level for tables inside

relational databases. Oxygen XML Editor Eclipse plugin supports multiple simultaneous database connections and the connection tree in the **Data Source Explorer** view provides an easy method for browsing them.

Figure 462. Data Source Explorer View

The objects (nodes) that are displayed in the **Data Source Explorer** view depend on the connection type and structure of the database. Various contextual menu actions are available for each hierarchical level and for some connections you can add or move resources in a container by simply dragging them from the **Project Explorer** view (*on page 269*), a file browsing application, or another database.

Toolbar Actions

The following actions are available in the toolbar of this view:

Filters

Opens the **Data Sources / Table Filters** preferences page (*on page 79*), allowing you to decide which table types are displayed in the **Data Source Explorer** view.

Configure Database Sources

Opens the **Data Sources** preferences page (*on page 74*) where you can configure both data sources and connections.

Database-Specific Contextual Menu Actions

Each specific type of database will also include its own specific contextual menu actions in the **Data Source Explorer** view. The actions depend on the type of database, the type of node, or the hierarchical level of the node where the contextual menu is invoked.

For more information on the specific actions that are available, see the topics in this section for each specific type of database.

Related Information:

[Data Sources Preferences \(on page 74\)](#)

Table Explorer View

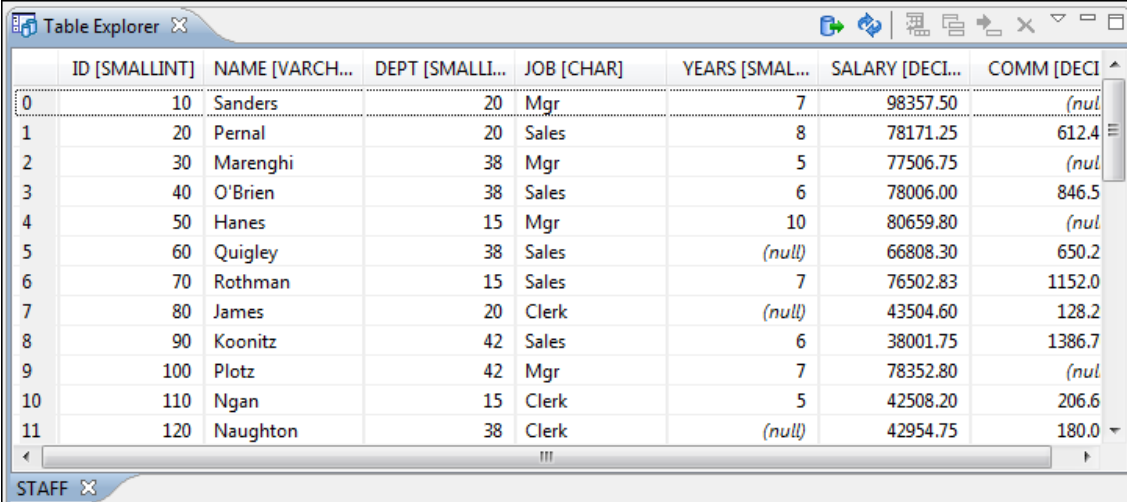

Relational databases tables in the [Data Source Explorer view \(on page 1831\)](#) can be displayed and edited in the **Table Explorer** view by selecting the **Edit** action from the contextual menu of a  **Table** node or by double-clicking one of its fields. To modify the content of a cell, double-click it and start typing. When editing is complete, Oxygen XML Editor Eclipse plugin attempts to update the database with the new cell content.

Figure 463. Table Explorer View

	ID [SMALLINT]	NAME [VARCHAR...]	DEPT [SMALL...]	JOB [CHAR]	YEARS [SMAL...]	SALARY [DECI...]	COMM [DECI...]
0	10	Sanders	20	Mgr	7	98357.50	(nul
1	20	Pernal	20	Sales	8	78171.25	612.4
2	30	Marenghi	38	Mgr	5	77506.75	(nul
3	40	O'Brien	38	Sales	6	78006.00	846.5
4	50	Hanes	15	Mgr	10	80659.80	(nul
5	60	Quigley	38	Sales	(null)	66808.30	650.2
6	70	Rothman	15	Sales	7	76502.83	1152.0
7	80	James	20	Clerk	(null)	43504.60	128.2
8	90	Koonitz	42	Sales	6	38001.75	1386.7
9	100	Plotz	42	Mgr	7	78352.80	(nul
10	110	Ngan	15	Clerk	5	42508.20	206.6
11	120	Naughton	38	Clerk	(null)	42954.75	180.0

You can sort the content of a table by one of its columns by clicking its column header.

Note the following:

- The first column is an index (not part of the table structure).
- Every column header contains the field name and its data type.
- The primary key columns are marked with this symbol:  .
- Multiple tables are presented in a tabbed manner.

For performance issues, you can set the maximum number of cells that are displayed in the **Table Explorer** view (using the [Limit the number of cells](#) option in the [Data Sources Preferences page \(on page 78\)](#)). If a table that has more cells than the value set in the options is displayed in the **Table Explorer** view, a warning dialog box informs you that the table is only partially shown.

You are notified if the value you have entered in a cell is not valid (and thus cannot be updated).

- If the content of the edited cell does not belong to the data type of the column, an information dialog box appears, notifying you that the value you have inserted cannot be converted to the SQL type of that field. For example, if you have a column that contains `LONG` (numerical) values, and a character or string is inserted into one of its cells, you would get the error message that a string value cannot be converted to the requested SQL type (NUMBER).
- If the constraints of the database are not met (for instance, primary key constraints), an information dialog box will appear, notifying you of the reason the database has not been updated. For example, in the table below, trying to set the second record in the primary key `propID` column to 8, results in a duplicate entry error since that value has already been used in the first record:

Figure 464. Duplicate Entry for Primary Key

Table Explorer Contextual Menu Actions

Common editing actions (**Cut**, **Copy**, **Paste**, **Select All**, **Undo**, **Redo**) are available in the contextual menu of an edited cell.

The contextual menu, available on every cell in the **Table Explorer** view, also includes the following actions:

Set NULL

Sets the content of the cell to **null**. This action is not available for columns that cannot have a value of **null**.

Insert row

Inserts an empty row in the table.

Duplicate row

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

Commit row

Commits the selected row.

 **Delete row**

Deletes the selected row.

 **Copy**

Copies the content of the cell.

 **Paste**

Pastes copied content into the selected cell.

Table Explorer Toolbar Actions

The toolbar of the **Table Explorer** view also includes the following actions:

 **Export to XML**

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the [Import from database \(on page 1906\)](#) chapter).

 **Refresh**

Performs a refresh for the sub-tree of the selected node.

 **Insert row**

Inserts an empty row in the table.

 **Duplicate row**

Makes a copy of the selected row and adds it in the **Table Explorer** view. Note that the new row will not be inserted in the database table until all conflicts are resolved.

 **Commit row**

Commits the selected row.

 **Delete row**

Deletes the selected row.

Related Information:

[Data Source Explorer View \(on page 1831\)](#)

Database Connection Support

Oxygen XML Editor Eclipse plugin offers support for a variety of *Relational* and *Native XML* database connections. The database drivers and connections for various types of database are configured in the **Data Sources preferences page (on page 74)** and once configured, the database connections can be viewed and managed in the **Data Source Explorer view (on page 1831)**. Oxygen XML Editor Eclipse plugin also includes a **Database perspective (on page 238)** that helps you to manage databases.

The database support in Oxygen XML Editor Eclipse plugin offers a variety of capabilities, including:

- Browsing the structure of databases in the **Data Source Explorer** view (*on page 1831*).
- Viewing relational tables in the **Table Explorer** view (*on page 1833*).
- Executing SQL queries against databases.
- Calling stored procedures with input and output parameters.
- XQuery execution with databases.
- Exporting data from databases to XML.

Relational Database Support

Relational databases use a relational model and are based on tables linked by a common key. Oxygen XML Editor Eclipse plugin offers support for the most commonly used relational databases, including:

- IBM DB2 (Deprecated)
- Oracle 11g (Deprecated)
- Microsoft SQL Server (Deprecated)
- PostgreSQL (Deprecated)
- MySQL (Deprecated)

Oxygen XML Editor Eclipse plugin also offers generic support (table browsing and execution of SQL queries) for any JDBC-compliant database (for example, *MariaDB*).

Native XML Database Support

Native XML databases have an XML-based internal model and their fundamental unit of storage is XML. They use XML as an interface to specify documents as tree structured data that may contain unstructured text, but on disk the data is stored as optimized binary files. This makes query and retrieval processes faster. Oxygen XML Editor Eclipse plugin offers support for the most commonly used native XML databases, including:

- eXist
- MarkLogic (Deprecated)
- Oracle XML DB (Deprecated)
- Base X

Related information

[WebDAV Connections](#) (*on page 1879*)

[Integration with Microsoft SharePoint](#) (*on page 1892*)

Microsoft SQL Server Database Connections (Deprecated)

Oxygen XML Editor Eclipse plugin includes support for Microsoft SQL Server database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a SQL Server database in the **Data Source Explorer** view (*on page 1831*), open tables in the **Table Explorer** view (*on page 1833*), and perform various operations on the resources in the repository.

Configuring a Microsoft SQL Server Connection

To configure the support for a Microsoft SQL Server database, follow this procedure:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website: <https://docs.microsoft.com/en-us/sql/connect/jdbc/release-notes-for-the-jdbc-driver?view=sql-server-ver16#102>.
2. Configure MS SQL Server *Data Source* drivers (on page 1837).
3. Configure a MS SQL Server *Connection* (on page 1838).
4. To view your connection, go to the **Data Source Explorer** view (on page 1831) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2680).

How to Configure Microsoft SQL Server Data Source Drivers

**Note:**

Available in the Enterprise edition only.

To configure a data source for connecting to a Microsoft SQL server, follow these steps:

1. Download the appropriate MS SQL JDBC driver from the Microsoft website: <https://docs.microsoft.com/en-us/sql/connect/jdbc/release-notes-for-the-jdbc-driver?view=sql-server-ver16#102>.
2. Open the **Preferences** dialog box (on page 70) and go to **Data Sources**.
3. Click the **+** **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 465. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select **SQLServer** in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Microsoft SQL Server driver file that you downloaded.
The SQL Server driver file is called `sqljdbc.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Microsoft SQL Server connection \(on page 1838\)](#).

How to Configure a Microsoft SQL Server Connection

Note:

The support to configure a Microsoft SQL Server connection is available in the Enterprise edition only.

To configure a connection to a Microsoft SQL Server, follow these steps:

1. Open the **Preferences** dialog box [\(on page 70\)](#) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 466. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *SQL Server* data source in the **Data Source** drop-down menu.
5. Enter the connection details.

- a. Enter the URL of the SQL Server server.

If you want to connect to the server using Windows integrated authentication, you must add **;integratedSecurity=true** to the end of the URL. The URL will look like this:

```
jdbc:sqlserver://localhost;instanceName=SQLEXPRESS;integratedSecurity=true;
```

**Note:**

For integrated authentication, leave the **User** and **Password** fields empty.

- b. Enter the user name for the connection to the SQL Server.
 - c. Enter the password for the connection to the SQL Server.
6. Click the **OK** button to finish the connection configuration.
 7. To view your connection, go to the **Data Source Explorer view** (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

Microsoft SQL Server Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1831*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on Connection nodes)

Opens the **Data Sources preferences page** (*on page 74*) where you can configure both data sources and connections.

Edit (available on Table nodes)

Opens the selected table in the **Table Explorer view** (*on page 1833*).

Export to XML (available on Table nodes)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the *Import from Database* (*on page 1906*) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** (*on page 1831*), the resource level nodes in Microsoft SQL Server connections include the following additional contextual menu action:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

Schema Level Nodes

Add

Adds a new schema to the XML Schema files.

Unregister

Removes the selected schema from the XML Schema Repository.

View

Opens the selected schema in Oxygen XML Editor Eclipse plugin.

Oracle Database Connections (Deprecated)

The Oracle database is a common relational type of database system. Oxygen XML Editor Eclipse plugin comes with built-in support for the 11g version of the database system. The Oracle database also includes a Oracle XML DB component that adds native XML support. Oxygen XML Editor Eclipse plugin allows you to browse Oracle repositories in the **Data Source Explorer** view (*on page 1831*), open tables in the **Table Explorer** view (*on page 1833*), and perform various operations on the resources in the repository.

Figure 467. Oracle Database Connection

Related Information:

[Using XQuery with Oracle XML DB](#)

Configuring an Oracle 11g Database Connection

To configure the support for a Oracle 11g database, follow this procedure:

1. Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Configure Oracle 11g *Data Source* drivers (*on page 1841*).
3. Configure an Oracle 11g *Connection* (*on page 1843*).
4. To view your connection, go to the **Data Source Explorer** view (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the *Database perspective* (*on page 2680*).

How to Configure Oracle 11g Data Source Drivers

Note:

Available in the Enterprise edition only.

To configure a data source for connecting to an Oracle 11g server, follow these steps:

1. Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
2. Open the **Preferences** dialog box (on page 70) and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 468. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *Oracle* in the driver **Type** drop-down menu.
6. Click the **Add Files** button and select the Oracle driver file that you downloaded.
The Oracle driver file is called `ojdbc5.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your Oracle connection \(on page 1843\)](#).

How to Configure an Oracle 11g Connection

**Note:**

Available in the Enterprise edition only.

To configure a connection to an Oracle 11g server, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 469. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *Oracle 11g* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL of the Oracle server.
 - b. Enter the user name for the connection to the Oracle server.
 - c. Enter the password for the connection to the Oracle server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

Oracle Database Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1831*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on **Connection nodes**)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

Configure Database Sources (available on **Connection nodes**)

Opens the **Data Sources preferences page** (*on page 74*) where you can configure both data sources and connections.

Edit (available on **Table nodes**)

Opens the selected table in the **Table Explorer view** (*on page 1833*).

Export to XML (available on **Table nodes**)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the *Import from Database* (*on page 1906*) chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view** (*on page 1831*), the various nodes in Oracle database connections include the following additional contextual menu actions:

XML Schema Repository Level Nodes

Register

Opens a dialog box for adding a new schema file in the XML repository. To add an XML Schema, enter the schema URI and location on your file system. *Local* scope means that the schema is visible only to the user who registers it. *Global* scope means that the schema is public.

Note:

Registering a schema may involve dropping/creating types. Hence you need type-related privileges such as DROP TYPE, CREATE TYPE, and ALTER TYPE. You need privileges to delete and register the XML schemas involved in the registering process. You need all privileges on XMLType tables that conform to the registered schemas. For XMLType columns, the ALTER TABLE privilege is needed on corresponding tables. If there are

schema-based XMLType tables or columns in other database schemas, you need privileges such as the following:

- **CREATE ANY TABLE**
- **CREATE ANY INDEX**
- **SELECT ANY TABLE**
- **UPDATE ANY TABLE**
- **INSERT ANY TABLE**
- **DELETE ANY TABLE**
- **DROP ANY TABLE**
- **ALTER ANY TABLE**
- **DROP ANY INDEX**

To avoid having to grant all these privileges to the schema owner, Oracle recommends that the registration be performed by a DBA if there are XML schema-based XMLType table or columns in other user database schemas.

XML Repository Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Container Level Nodes

Add container

Adds a new child container to the current one.

Add resource

Adds a new resource to the folder.

Delete

Deletes the current container.

Properties

Shows various properties of the current container.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Rename

Renames the current resource

Move

Moves the current resource to a new container (also available through drag and drop).

Delete

Deletes the current container.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Properties

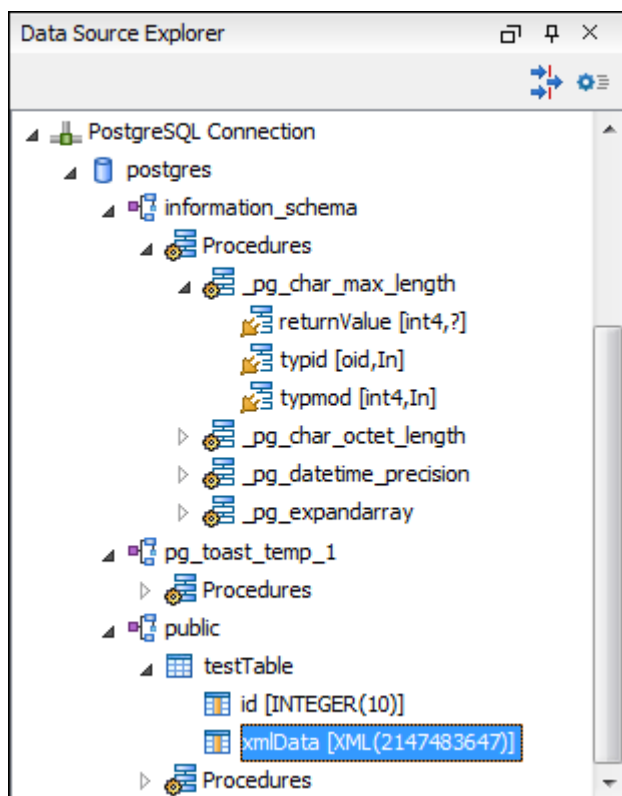

Shows various properties of the current container.

Compare

Compares two selected resources.

PostgreSQL Database Connections (Deprecated)

Oxygen XML Editor Eclipse plugin includes support for PostgreSQL database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a PostgreSQL database in the **Data Source Explorer** view (*on page 1831*), open tables in the **Table Explorer** view (*on page 1833*), and perform various operations on the resources in the repository.

Figure 470. PostgreSQL Database Connection

Configuring a PostgreSQL Database Connection

To configure the support for a PostgreSQL database, follow this procedure:

1. Go to <https://jdbc.postgresql.org/download/> and download the PostgreSQL JDBC driver specific for your server version.
2. *Configure PostgreSQL Data Source drivers (on page 1847).*
3. *Configure a PostgreSQL Connection (on page 1849).*
4. To view your connection, go to the **Data Source Explorer** view (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2680)**.

How to Configure PostgreSQL Data Source Drivers

To configure a data source for connecting to a PostgreSQL server, follow these steps:

1. Go to <https://jdbc.postgresql.org/download/> and download the PostgreSQL JDBC3 driver specific for your server version.
2. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 471. Data Source Drivers Configuration Dialog Box

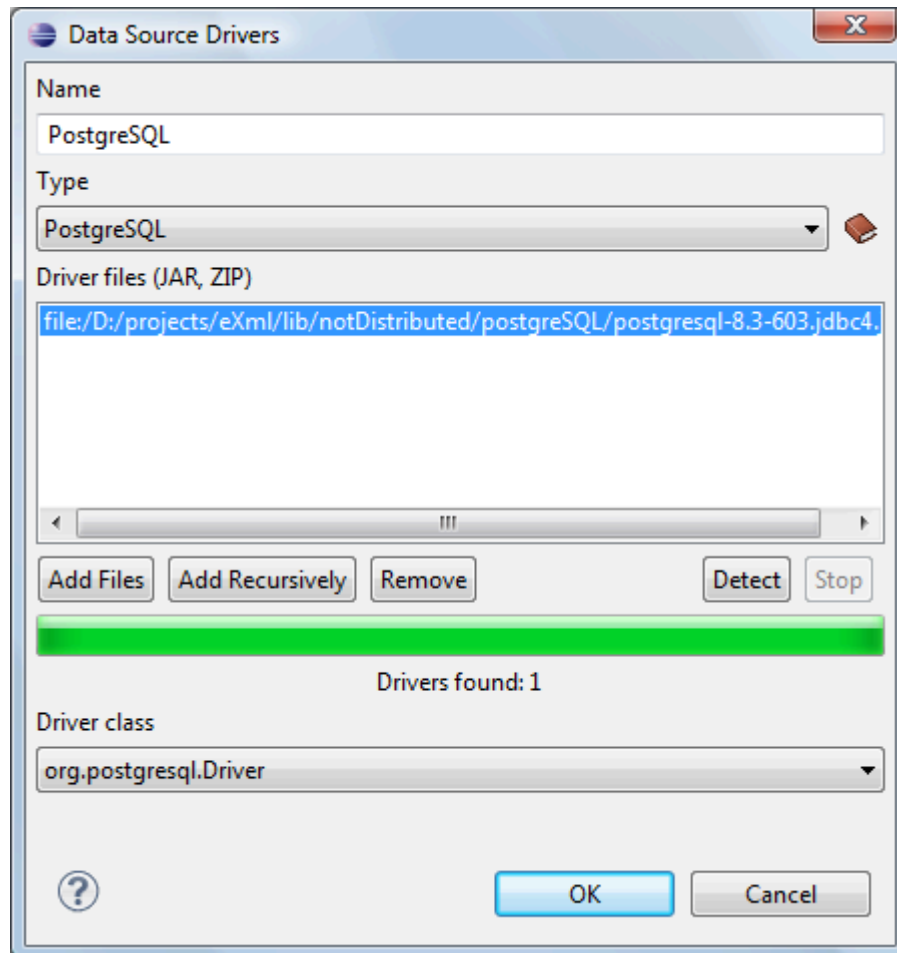

Figure 472. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *PostgreSQL* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the PostgreSQL driver file that you downloaded.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue to [configure your PostgreSQL connection \(on page 1849\)](#).

How to Configure a PostgreSQL Connection

To configure a connection to a PostgreSQL server, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 473. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *PostgreSQL* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL of the PostgreSQL server.
 - b. Enter the user name for the connection to the PostgreSQL server.
 - c. Enter the password for the connection to the PostgreSQL server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

PostgreSQL Contextual Menu Actions

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer view** (*on page 1831*), depending on the node where it is invoked:

Refresh

Performs a refresh on the selected node.

Disconnect (available on Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

 **Configure Database Sources** (available on  **Connection nodes**)

Opens the **Data Sources** preferences page (*on page 74*) where you can configure both data sources and connections.

Edit (available on  **Table nodes**)

Opens the selected table in the **Table Explorer** view (*on page 1833*).

 **Export to XML** (available on  **Table nodes**)

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the *Import from Database (on page 1906)* chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer** view (*on page 1831*), the resource level nodes in PostgreSQL connections include the following additional contextual menu action:

 **Resource Level Nodes**

Compare

Compares two selected resources.

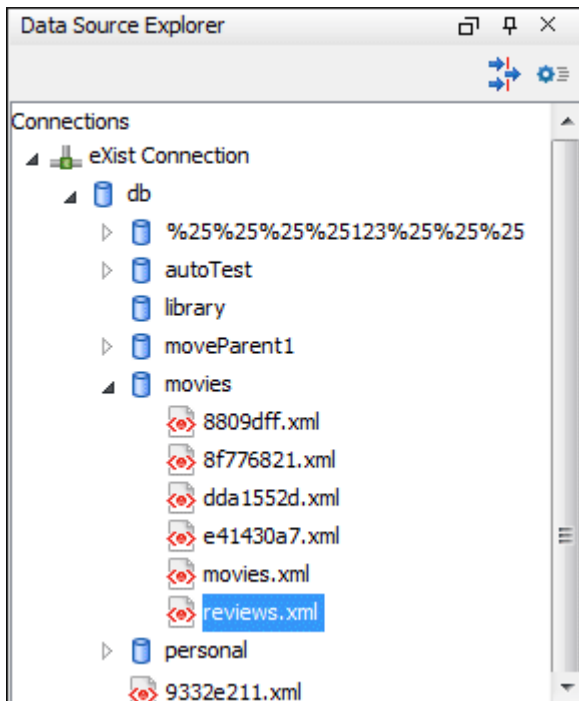

eXist Database Connections

Attention:

Oxygen XML Editor Eclipse plugin has been tested to work with the latest stable *eXist* version (version 6). It might work with previous *eXist* versions, but they have not been tested and cannot be guaranteed to be compatible.

Oxygen XML Editor Eclipse plugin includes support for *eXist* database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a *eXist* database in the **Data Source Explorer** view (*on page 1831*) and perform various operations on the resources in the repository.

Figure 474. eXist Database Connection

Configuring an eXist Database Connection

There are two ways to configure the support for an *eXist* database:

- Use the dedicated **Create eXist-db XML connection** wizard.
- Use the **Data Sources** preferences page to manually configure your connection.

How to Configure an eXist Connection Using the Built-in Wizard

To configure a connection for an *eXist* database using the dedicated **Create eXist-db XML connection** wizard, follow these steps:

1. Open the **Preferences** dialog box (on page 70), go to **Data Sources** and click the **Create eXist-db XML connection** link.
2. Enter your connection details in the connection wizard and click **OK**.

Important:

To create an *eXist* connection using this wizard, Oxygen XML Editor Eclipse plugin expects the `exist/webstart/exist.jnlp` path to be accessible at the provided **Host** and **Port**.

Attention:

The connection details dialog box has a **Libraries** path where it will download JAR libraries from the *eXist* server. If you are using Oxygen XML Editor Eclipse plugin version 25.0 or older with *eXist* version 6.2.0 or newer and the final connection to the server does not work, you need

 to remove all libraries with the pattern `log4j-*.jar` from the folder of downloaded libraries because they may interfere with the logging in Oxygen XML Editor Eclipse plugin.

3. To view your connection, go to the **Data Source Explorer view** (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

**Attention:**

Oxygen XML Editor Eclipse plugin has been tested to work with the latest stable *eXist* version (version 6). It might work with previous *eXist* versions, but they have not been tested and cannot be guaranteed to be compatible.

How to Configure an eXist Connection Manually

**Attention:**

For this manual procedure, you need to already have an *eXist* database server installed. Also, Oxygen XML Editor Eclipse plugin has been tested to work with the latest stable *eXist* version (version 6). It might work with previous *eXist* versions, but they have not been tested and cannot be guaranteed to be compatible.

**Tip:**

There is an easier way to configure an *eXist* database connection using a built-in wizard. For more information, see [How to Configure an eXist Connection Using the Built-in Wizard](#) (*on page 1852*).

Step 1: Configure eXist Data Source Drivers

Oxygen XML Editor Eclipse plugin supports *eXist* database server versions up to and including version 5.0. To configure a data source for an *eXist* database, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
2. Click the **+ New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *eXist* from the driver **Type** drop-down menu.
5. Click the **Add Files** button to add the *eXist* driver files. The following driver files should be added and they are found in the installation directory of the *eXist* database server. Make sure you copy the files from the installation of the *eXist* server where you want to connect from Oxygen XML Editor Eclipse plugin.

- The `exist.jar` file located in the base directory (if present, depending on the server version).
 - All JAR files in the `lib/core/` directory (if present) or all JAR files located in the `lib` directory except for the JAR libraries with the pattern `log4j-*.jar`, which may interfere with the logging in Oxygen XML Editor Eclipse plugin.
6. Click the **OK** button to finish the data source configuration.

Step 2: Configure an eXist Connection

To configure a connection to an *eXist* database, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured *eXist* data source from the **Data Source** drop-down menu.
5. Enter the connection details:
 - a. Set the URI to the installed *eXist* engine in the **XML DB URI** field.
 - b. Set the user name in the **User** field.
 - c. Set the password in the **Password** field.
 - d. Enter the start collection in the **Collection** field.

eXist organizes all documents in hierarchical collections. Collections are like directories. They are used to group related documents together. This text field allows the user to set the default collection name.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

Resources

For more information about running XQuery against an *eXist* XML database, watch our video demonstration:

<https://www.youtube.com/embed/Yoc5h1zSddA>

eXist Contextual Menu Actions

While browsing *eXist* database connections in the **Data Source Explorer view** (*on page 1831*), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources preferences page** (*on page 74*) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

 **Refresh**

Performs a refresh on the selected node.

 **Container Level Nodes****New File**

Creates a new file on the connection, in the current folder.

New Collection

Creates a new collection on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Paste**

Pastes the copied selection.

 **Refresh**

Performs a refresh on the selected node.

 **Properties**

Shows various properties of the current container.

 **Resource Level Nodes****Open**

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse

plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Save As

Allows you to save the selected resource as a file on disk.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Properties

Shows various properties of the current container.

Compare

Compares two selected resources.

MarkLogic Database Connections (Deprecated)

Oxygen XML Editor Eclipse plugin Enterprise edition includes support for MarkLogic database connections. Once you [configure a MarkLogic connection \(on page 1858\)](#), you can use the **Data Source Explorer** view [\(on page 1831\)](#) to display all the application servers that are configured on the MarkLogic server. You can expand each application server and view all of its configured modules, and the **Data Source Explorer** view [\(on page 1831\)](#) allows you to open and edit these modules.

Note:

To browse modules located in a database, directory properties must be associated with them. These directory properties are generated automatically if the *directory creation* property of the database is set to automatic. If this property is set to **manual** or **manual-enforced**, add the directory properties of the modules manually, using the XQuery function `xdmp:directory-create()`. For example, for two

documents with the `/code/modules/main.xqy` and `/code/modules/imports/import.xqy` IDs, run the following query:

```
(xdmp:directory-create('/code/modules/'), xdmp:directory-create('/code/modules/imports/'))
```

For more information about directory properties, go to: <http://blakeley.com/blogfile/2012/03/19/directory-assistance/>.

MarkLogic and XQuery

MarkLogic connections can be used in conjunction with XQuery scripts to debug and solve problems with XQuery transformations. XQuery modules can also be validated using a MarkLogic server to allow you to spot possible issues without the need of actually executing the XQuery script.

When debugging XQuery files with MarkLogic (*on page 1861*), you can use the **Data Source Explorer view** (*on page 1831*) to open the files from the application server that is involved in the debugging process. By using the **Data Source Explorer view** (*on page 1831*), any imported modules are better identified by the MarkLogic server. You can also use *step actions and breakpoints* (*on page 1863*) in the modules to help identify problems.

Modules Container

For each Application server (for example: *Bill (HTTP port:8060)*), you have access to the XQuery modules that are visible to that server. When editing, executing, or debugging XQuery it is recommended to open the XQuery files from this  **Modules** container.

Note:

You can also manage resources for a MarkLogic database through a WebDAV connection, although it is not recommended if you work with XQuery files since imported modules may not be resolved correctly.

Requests Container

Each MarkLogic application server includes a  **Requests** container. In this container, Oxygen XML Editor Eclipse plugin displays both queries that are stopped for debugging purposes and queries that are still running. To clean up the entire **Requests** container at the end of your session, right-click it and use the **Cancel all requests** action (*on page 1865*).

Figure 475. MarkLogic Connection in Data Source Explorer

Configuring a MarkLogic Database Connection

Note that this feature is available in Oxygen XML Editor Eclipse plugin Enterprise edition only.

Follow this procedure to configure the support for a MarkLogic database connection:

1. Download the MarkLogic driver from [MarkLogic Community site](#).
2. [Configure MarkLogic Data Source drivers \(on page 1858\)](#).
3. [Configure a MarkLogic Connection \(on page 1859\)](#).
4. To view your connection, go to the **Data Source Explorer** view [\(on page 1831\)](#) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2680)**.

Related Information:

[MarkLogic Development in Oxygen XML Editor Eclipse plugin \(on page 1860\)](#)

How to Configure MarkLogic Data Source Drivers

Notes:

- Available in the Enterprise edition only.
- Oxygen XML Editor Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a data source for MarkLogic, follow this procedure:

1. Download the **XCC Java distribution** zip file from: <http://developer.marklogic.com/products/xcc>.
2. Unzip the downloaded archive.

3. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
4. Click the **+** **New** button in the **Data Sources** panel.
5. Enter a unique name for the data source.
6. Select *MarkLogic* from the driver **Type** drop-down list.
7. Click the **Add Files** button and select the MarkLogic driver file from the *lib* folder of the archive that you downloaded and unzipped. The driver file name is `marklogic-xcc-{server_version}.jar`, where *{server_version}* is the MarkLogic server version.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MarkLogic Connection \(on page 1859\)](#).

How to Configure a MarkLogic Connection

Notes:

- Available in the Enterprise edition only.
- Oxygen XML Editor Eclipse plugin supports MarkLogic version 4.0 or later.

To configure a connection to a MarkLogic database, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select a previously configured MarkLogic data source from the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. The host name or IP address of the installed MarkLogic engine in the **XDBC Host** field.

Oxygen XML Editor Eclipse plugin uses XCC connector to interact with MarkLogic XDBC server and requires the basic authentication schema to be set. Starting with version MarkLogic 4.0 the default authentication method when you create an HTTP or WebDAV Server is *digest*, so make sure to change it to *basic*.
 - b. Set the port number of the MarkLogic engine in the **Port** field. A MarkLogic XDBC application server must be configured on the server on this port. This XDBC server will be used to process XQuery expressions against the server. Later, if you want to change the XDBC server, instead of editing the configuration just use the **Use it to execute queries** action (*on page 1865*) from Data Source Explorer.
 - c. Set the user name to access the MarkLogic engine in the **User** field.
 - d. Set the password to access the MarkLogic engine in the **Password** field.

- e. Optionally, in the **WebDAV URL** field, set the URL used for browsing the MarkLogic database in the **Data Source Explorer** view ([on page 1831](#)).

The **Database** field specifies the database that will have the XQuery expressions executed. If you set this option to default, the database associated to the application server of the configured port is used.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view ([on page 1831](#)) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database** *perspective* ([on page 2680](#)).

MarkLogic Development in Oxygen XML Editor Eclipse plugin

The Oxygen XML Editor Eclipse plugin support for MarkLogic includes features designed for developers, such as debugging XQuery transformations, remote and collaborative debugging, XQuery editing and validation, and an **XQuery builder** ([on page 790](#)) that helps to improve productivity.

Working with XQuery Files

MarkLogic supports working with XQuery files to create queries over stored XML content. You can open an XQuery file, configure a transformation scenario to match your MarkLogic connection, write the XQuery, and then execute it.

When editing XQuery modules stored on the MarkLogic server, the **Outline view** ([on page 788](#)) collects and displays all the functions from all imported modules. The **Content Completion Assistant** ([on page 2677](#)) also presents all of these functions along with the latest built-in XQuery functions in accordance with the server version.

When developing queries for MarkLogic, it is best to open the resources from the **Data Source Explorer** view ([on page 1831](#)). When you execute or debug XQuery files opened from this view, imported modules can be resolved better by the MarkLogic server. Another advantage is that validation is automatically performed on the MarkLogic server, including any imported modules.

XQuery Debugging

Oxygen XML Editor Eclipse plugin allows you to use MarkLogic connections to debug real applications that use XQuery (for example, web applications that trigger XQuery executions). By setting the server in debug mode, you can intercept all the XQuery scripts that run on that server. Oxygen XML Editor Eclipse plugin connects to the MarkLogic server, shows you the running XQuery scripts, and allows you to debug them. The remote debugging support also allows you to debug collaboratively. Multiple users can participate in the same debugging session. You can start a debugging session and another user can continue it, and vice versa.

Working with Modules

MarkLogic has a concept of two types of XQuery modules, *library* and *main* modules. A *library* module is used to define functions. Library modules cannot be evaluated directly. They are imported, either from other library

modules or from main modules. A *main* module is used as an entry point that can be executed as an XQuery program. For more information on these types of modules, see [XQuery Library Modules and Main Modules](#).

When working with *library* modules, you need to create a validation scenario and associate it with the module. In the validation scenario you need to specify a main module as the entry point for validation. The modules need to be deployed on a MarkLogic server because Oxygen XML Editor Eclipse plugin will request the server to validate the modules.

To validate *library* modules stored on a MarkLogic server, follow these steps:

1. [Configure a MarkLogic database connection \(on page 1858\)](#).
2. Expand the MarkLogic connection in the **Data Source Explorer** view ([on page 1831](#)) and open the *library* modules. The *main* module must also be opened from the **Data Source Explorer** view ([on page 1831](#)).
3. [Configure a validation scenario \(on page 558\)](#) for each *library* module. Specify the *main* module in the **URL of the file to validate** field.

Result: Validation is done on the server that contains the *main* module. The *main* module and all other *library* modules involved in the validation must be saved. Otherwise, the server will validate what was saved on the server, without the uncommitted changes. Also, the [Content Completion Assistant \(on page 2677\)](#) and the **Outline** view ([on page 788](#)) should now present the functions from all the modules.

Related Information:

[Debugging with MarkLogic \(on page 1861\)](#)

[Configuring a MarkLogic Database Connection \(on page 1858\)](#)

Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a [MarkLogic data source \(on page 1858\)](#) and a [MarkLogic connection \(on page 1859\)](#).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor Eclipse plugin accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

Note:

An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor Eclipse plugin uses to process XQuery

expressions by selecting the **Use it to execute queries** action ([on page 1865](#)) from the contextual menu in the **Data Source Explorer** view ([on page 1831](#)).

3. Open the XQuery file and start the debugging process.

- If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the **Data Source Explorer** view ([on page 1831](#)) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
- The MarkLogic XQuery debugger integrates seamlessly into the *XQuery Debugger perspective* ([on page 237](#)). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to *debug the scenario* ([on page 1931](#)) directly.
- Otherwise, switch to the **XQuery Debugger perspective** ([on page 2680](#)), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the **debug control toolbar** ([on page 1915](#)).

For general information about how a debugging session is started and controlled, see the *Working with the Debugger* ([on page 1931](#)) section.

Note:

Before starting a debugging session, it is recommended that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view ([on page 1831](#)) and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can *add breakpoints* ([on page 1934](#)) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse **Project Explorer** view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and *breakpoints* ([on page 1934](#)) to help identify problems. When you *add a breakpoint* ([on page 1934](#)) on a line where the debugger never stops, Oxygen XML Editor Eclipse plugin displays a warning message. These warnings are displayed for *breakpoints* you add either in the main XQuery (which you can open locally or from the server) or for *breakpoints* you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see *Using Breakpoints for Debugging Queries that Import Modules with MarkLogic* ([on page 1863](#)).

Remote Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor Eclipse plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor Eclipse plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:**

When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

Resources

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

<https://www.youtube.com/embed/eQ4ThDZq1bk>

Related Information:

[MarkLogic Development in Oxygen XML Editor Eclipse plugin \(on page 1860\)](#)

[Configuring a MarkLogic Database Connection \(on page 1858\)](#)

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* (on page 1934) in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view (on page 1831), open all the modules from the  **Modules** container of the XDBC application server (on page 1859) that performs the debugging.
2. Set *breakpoints* (on page 1934) in the module as needed.
3. Continue debugging (on page 1931) the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view (on page 1919) and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

[MarkLogic Database Connections \(Deprecated\) \(on page 1856\)](#)

[MarkLogic Development in Oxygen XML Editor Eclipse plugin \(on page 1860\)](#)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view (on page 1929) and pasting it in the **XWatch** view (on page 1921).
- There is no support for [output to source mapping](#) (on page 1932).
- There is no support for [showing the trace](#) (on page 1926).
- You can only set [breakpoints](#) (on page 1919) in imported modules in one of the following cases:
 - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view (on page 1831).
 - When the debugger automatically opens the modules in the Editor.
- No [breakpoints](#) (on page 1934) are set in modules from the same server that are not involved in the current debugging session.
- No support for [profiling](#) (on page 1935) when an XQuery transformation is executed in the debugger.

MarkLogic Contextual Menu Actions

While browsing MarkLogic connections in the **Data Source Explorer** view (on page 1831), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources** preferences page (on page 74) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

Link to Project

Links the connection to a project. This is helpful for [MarkLogic debugging sessions](#) (on page 1861).

Refresh

Performs a refresh on the selected node.

Container Level Nodes

Enable Debug Mode

Switches the server to a debugging mode. For more information, see [MarkLogic debugging sessions \(on page 1861\)](#).

Use it to Execute Queries

The server will be used to process XQuery expressions against it.

Refresh

Performs a refresh on the selected node.

Module or Folder Level Nodes

Export

Allows you to export the folder on the remote connection to a local folder.

Refresh

Performs a refresh on the selected node.

Requests Level Nodes

Refresh

Performs a refresh on the selected node.

Cancel all requests

Cancels all queries that are either running or stopped on the application server. You can use this action to clean up the entire **Requests** container at the end of your sessions.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources.

Related Information:

[Configuring a MarkLogic Database Connection \(on page 1858\)](#)

[MarkLogic Development in Oxygen XML Editor Eclipse plugin \(on page 1860\)](#)

[Debugging with MarkLogic \(on page 1861\)](#)

MySQL Database Connections (Deprecated)

Oxygen XML Editor Eclipse plugin includes support for MySQL database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a SQL Server database in the [Data Source Explorer view \(on page 1831\)](#), open tables in the [Table Explorer view \(on page 1833\)](#), and perform various operations on the resources in the repository.

Configuring a MySQL Database Connection

To configure the support for a MySQL database, follow this procedure:

1. [Configure MySQL Data Source drivers \(on page 1866\)](#).
2. [Configure a MySQL Connection. \(on page 1867\)](#)
3. To view your connection, go to the [Data Source Explorer view \(on page 1831\)](#) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the [Database perspective \(on page 2680\)](#).

How to Configure MySQL Data Source Drivers

To connect to a MySQL server, you need to create a generic JDBC type data source based on [the MySQL JDBC driver available on the MySQL website](#).

To configure this data source, follow these steps:

1. Go to https://www.oxygenxml.com/database_drivers.html and download the appropriate MySQL driver.
2. Open the [Preferences dialog box \(on page 70\)](#) and go to **Data Sources**.
3. Click the **+** **New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 476. Data Source Drivers Configuration Dialog Box

4. Enter a unique name for the data source.
5. Select *Generic JDBC* in the driver **Type** drop-down list.
6. Click the **Add Files** button and select the MySQL driver file that you downloaded.
The driver file for the MySQL server is called `mysql-com.jar`.
7. Select the most appropriate **Driver class**.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure your MySQL connection \(on page 1867\)](#).

How to Configure a MySQL Connection

To configure a connection to a MySQL server, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 477. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select the *MySQL* data source in the **Data Source** drop-down list.
5. Enter the connection details.
 - a. Enter the URL of the MySQL server.
 - b. Enter the user name for the connection to the MySQL server.
 - c. Enter the password for the connection to the MySQL server.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

Generic JDBC Database Connections

Oxygen XML Editor Eclipse plugin includes support for Generic JDBC database connections.

Configuring a Generic JDBC Database Connection

To configure the support for a generic JDBC database, follow this procedure:

1. Configure Generic JDBC *Data Source* drivers (on page 1869).
2. Configure a Generic JDBC *Connection* (on page 1869).
3. To view your connection, go to the **Data Source Explorer** view (on page 1831) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2680).

How to Configure Generic JDBC Data Source Drivers

Starting with version 17, Oxygen XML Editor Eclipse plugin comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor Eclipse plugin along with a Java VM version 7 or 6.

To configure a generic JDBC data source, follow these steps:

1. Open the **Preferences** dialog box (on page 70) and go to **Data Sources**.
2. Click the **+** **New** button in the **Data Sources** panel.
3. Enter a unique name for the data source.
4. Select *Generic JDBC* in the driver **Type** drop-down list.
5. Add the driver file(s) using the **Add Files** button.
6. Select the most appropriate **Driver class**.
7. Click the **OK** button to finish the data source configuration.
8. Continue on to [configure a generic JDBC connection \(on page 1869\)](#).

How to Configure a Generic JDBC Connection

To configure a connection to a generic JDBC database, follow these steps:

1. Open the **Preferences** dialog box (on page 70) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select the *Generic JDBC* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL of the generic JDBC database, with the following format: `jdbc: <subprotocol>: <subname>`.
 - b. Enter the user name for the connection to the generic JDBC database.
 - c. Enter the password for the connection to the generic JDBC database.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (on page 1831) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (on page 2680).

JDBC-ODBC Database Connections

Oxygen XML Editor Eclipse plugin includes support for JDBC-ODBC database connections.

How to Configure a JDBC-ODBC Connection

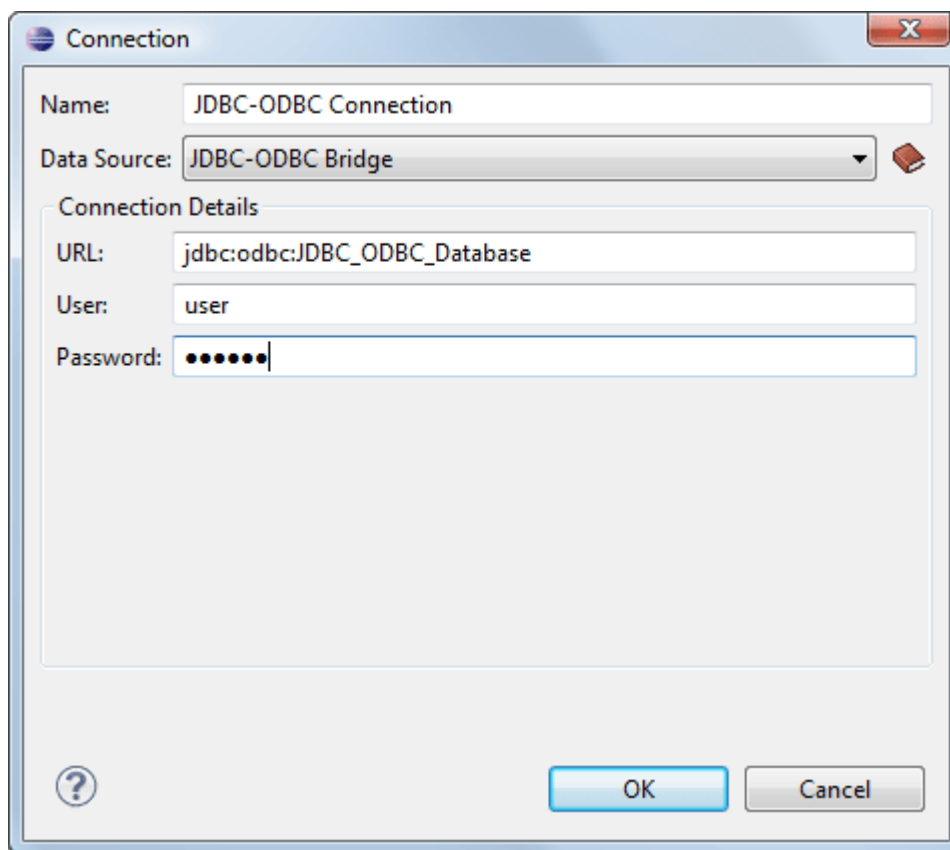

Starting with version 17, Oxygen XML Editor Eclipse plugin comes bundled with Java 11, which does not provide built-in access to JDBC-ODBC data sources. To access such sources, you need to find an alternative JDBC-ODBC bridge or use a platform-independent distribution of Oxygen XML Editor Eclipse plugin along with a Java VM version 7 or 6.

To configure a connection to an ODBC data source, follow these steps:

1. Open the **Preferences** dialog box (on page 70) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 478. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select *JDBC-ODBC Bridge* in the **Data Source** drop-down list.
5. Enter the connection details.
 - a. Enter the URL of the ODBC source.
 - b. Enter the user name of the ODBC source.
 - c. Enter the password of the ODBC source.

6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

BaseX Database Connections

Oxygen XML Editor Eclipse plugin includes support for BaseX database connections using a WebDAV connection. BaseX is a light-weight XML database engine and XQuery processor. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a BaseX database in the **Data Source Explorer view** (*on page 1831*) and perform XQuery executions.

How to Configure a BaseX Connection

To configure a BaseX connection, follow these steps:

1. First of all, make sure the BaseX HTTP Server is started. For details about starting the BaseX HTTP server, go to http://docs.basex.org/wiki/Startup#BaseX_HTTP_Server. The configuration file for the HTTP server is named `.basex` and is located in the BaseX installation directory. This file helps you to find out which port the HTTP server using. The default port for BaseX WebDAV is 8984.
2. To ensure that everything is functioning, open a WebDAV URL inside a browser and check to see if it works. For example, the following URL retrieves a document from a database named TEST: `http://localhost:8984/webdav/TEST/etc/factbook.xml`.
3. Once you are sure that the BaseX WebDAV service is working, you can configure the WebDAV connection in Oxygen XML Editor Eclipse plugin as described in [How to Configure a WebDAV Connection](#) (*on page 1880*). The WebDAV URL should resemble this: `http://{hostname}:{port}/webdav/`. If the BaseX server is running on your own machine and it has the default configuration, the data required by the WebDAV connection is:
 - WebDAV URL: `http://localhost:8984/webdav`
 - User: `admin`
 - Password: `admin`
4. Once the WebDAV connection is created, to view your connection, go to the **Data Source Explorer view** (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

BaseX Contextual Menu Actions

While browsing BaseX connections in the **Data Source Explorer view** (*on page 1831*), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources preferences page** (*on page 74*) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

Cut

Removes the current selection and places it in the clipboard.

Copy

Copies the current selection into the clipboard.

Paste

Pastes the copied selection.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Copy**

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

 **Delete**

Deletes the current container.

 **Refresh**

Performs a refresh on the selected node.

 **Properties**

Shows various properties of the current container.

Compare

Compares two selected resources.

Base X XQJ Connection

XQuery execution is possible in a BaseX connection through an XQJ connection.

**Important:**

The XQJ connector is only capable of running XQuery 1.0 scripts, therefore XQuery 3.0 and 3.1 scripts are not supported.

BaseX XQJ Data Source

First of all, create an XQJ data source as described in [How to Configure an XQJ Data Source \(on page 1874\)](#). The BaseX XQJ API-specific files that must be added in the configuration dialog box are `xqj-api-1.0.jar`, `xqj2-0.1.0.jar` and `basex-xqj-1.2.3.jar` (the version names of the *JAR* file may differ). These libraries can be downloaded from xqj.net/basex/basex-xqj-1.2.3.zip. As an alternative, you can also find the libraries in the BaseX installation directory, in the **lib** sub-directory.

BaseX XQJ Connection

The next step is to create an [XQJ connection \(on page 1875\)](#).

For a default BaseX configuration, the following connection details apply (you can modify them when necessary):

- **Port:** 1984
- **serverName:** localhost
- **user:** admin
- **password:** admin

XQuery Execution

Now that the XQJ connection is configured, open the XQuery file you want to execute in Oxygen XML Editor Eclipse plugin and create an [XQuery Transformation \(on page 1288\)](#). In the **Transformer** drop-down menu, select the name of the XQJ connection you created. Apply the transformation scenario and the XQuery will be executed.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is [Zorba](#).

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on macOS. Restart Oxygen XML Editor Eclipse plugin after configuring the environment variables.
2. Open the [Preferences dialog box \(on page 70\)](#) and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Click the **Add** button to add XQJ API-specific files.

You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.

Oxygen XML Editor Eclipse plugin detects any implementation of `javax.xml.xquery.XQDataSource` and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.

8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure the XQJ connection \(on page 1875\)](#).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

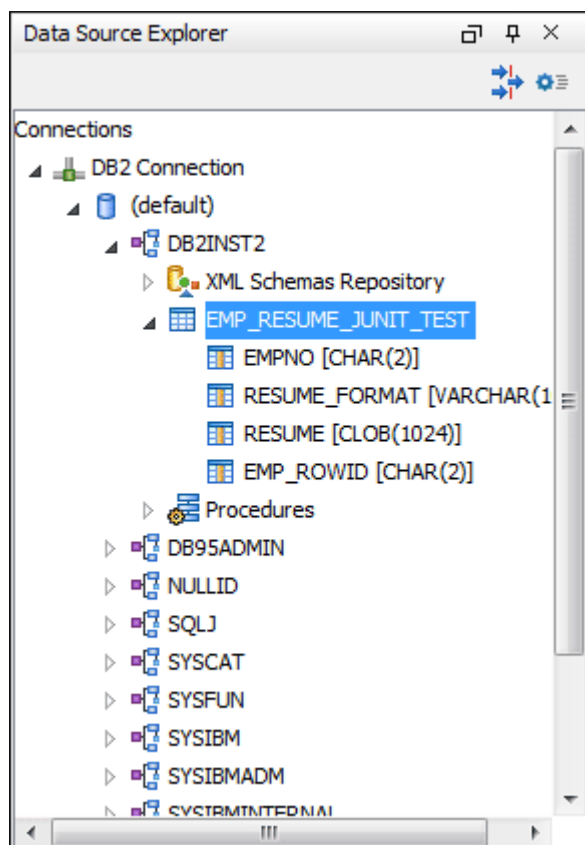

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured **XQJ data sources (on page 1874)** in the **Data Source** combo box.
5. Fill-in the connection details.

The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

IBM DB2 Database Connections (Deprecated)

Oxygen XML Editor Eclipse plugin includes support for IBM DB2 database connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of an IBM DB2 database in the **Data Source Explorer** view ([on page 1831](#)), open tables in the **Table Explorer** view ([on page 1833](#)), and perform various operations on the resources in the repository.

Figure 479. IBM DB2 Database Connection

Configuring an IBM DB2 Database Connection (Deprecated)

To configure the support for the IBM DB2 database, follow this procedure:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor Eclipse plugin for [configuring a DB2 data source \(on page 1876\)](#).
2. [Configure IBM DB2 Data Source drivers \(on page 1876\)](#).
3. [Configure an IBM DB2 Server Connection \(on page 1877\)](#).
4. To view your connection, go to the **Data Source Explorer** view [\(on page 1831\)](#) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2680)**.

How to Configure IBM DB2 Data Source Drivers (Deprecated)

Note:

Available in the Enterprise edition only.

To configure a data source for connecting to an IBM DB2 server, follow these steps:

1. Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file.
2. Unzip the downloaded archive.
3. [Open the Preferences dialog box \(on page 70\)](#) and go to **Data Sources**.
4. Click the **+ New** button in the **Data Sources** panel.

The dialog box for configuring a data source is opened.

Figure 480. Data Source Drivers Configuration Dialog Box

5. Enter a unique name for the data source.
6. Select *DB2* in the driver **Type** drop-down menu.
7. Click the **Add Files** button and select the IBM DB2 driver files from the archive that you downloaded and unzipped.

The IBM DB2 driver files are:

- `db2jcc.jar`
- `db2jcc_license_cisuz.jar`
- `db2jcc_license_cu.jar`

8. Select the most appropriate **Driver class**.
9. Click the **OK** button to finish the data source configuration.
10. Continue on to [configure your IBM DB2 connection \(on page 1877\)](#).

How to Configure an IBM DB2 Connection (Deprecated)

Note:

The support to create an IBM DB2 connection is available in the Enterprise edition only.

To configure a connection to an IBM DB2 server, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.

The dialog box for configuring a database connection is displayed.

Figure 481. Connection Configuration Dialog Box

3. Enter a unique name for the connection.
4. Select an *IBM DB2* data source in the **Data Source** drop-down menu.
5. Enter the connection details.
 - a. Enter the URL to the installed IBM DB2 engine.
 - b. Enter the user name to access the IBM DB2 engine.
 - c. Enter the password to access the IBM DB2 engine.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer** view (*on page 1831*) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** (*on page 2680*).

IBM DB2 Contextual Menu Actions (Deprecated)

General Contextual Menu Actions

For relational databases, the following general actions are available in the contextual menu of the **Data Source Explorer** view (*on page 1831*), depending on the node where it is invoked:

 **Refresh**

Performs a refresh on the selected node.

Disconnect (available on  Connection nodes)

Closes the current database connection. If a table is already open, you are warned to close it before proceeding.

 **Configure Database Sources (available on  Connection nodes)**

Opens the **Data Sources preferences page (on page 74)** where you can configure both data sources and connections.

Edit (available on  Table nodes)

Opens the selected table in the **Table Explorer view (on page 1833)**.

 **Export to XML (available on  Table nodes)**

Opens the **Export Criteria** dialog box (a thorough description of this dialog box can be found in the **Import from Database (on page 1906)** chapter).

Database-Specific Contextual Menu Actions

In addition to the general contextual menu actions in the **Data Source Explorer view (on page 1831)**, the various nodes in IBM DB2 connections include the following additional contextual menu actions:

 **XML Schema Repository Level Nodes****Register**

Opens a dialog box for adding a new schema file in the DB XML repository. In this dialog box, you enter a collection name and the necessary schema files. Schema dependencies management can be done by using the **Add** and **Remove** buttons.

 **Schema Level Nodes****Unregister**

Removes the selected schema from the XML Schema Repository.

 **View**

Opens the selected schema in Oxygen XML Editor Eclipse plugin.

WebDAV Connections

Oxygen XML Editor Eclipse plugin includes support for WebDAV server connections. Oxygen XML Editor Eclipse plugin allows you to browse the structure of a WebDAV connection in the **Data Source Explorer view (on page 1831)** and perform various operations on the resources in the repository.

How to Configure a WebDAV Connection

By default, Oxygen XML Editor Eclipse plugin contains built-in data source drivers for **WebDAV** connections. Based on this data source, you can create a WebDAV connection for browsing and editing data from a database that provides a WebDAV interface. The connection is available in the **Data Source Explorer view** ([on page 1831](#)).

To configure a WebDAV connection, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Data Sources**.
2. Click the **+** **New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the WebDAV data sources in the **Data Source** drop-down menu.
5. Enter the connection details:
 - a. Set the URL to the WebDAV repository in the field **WebDAV URL**.
 - b. Set the user name that is used to access the WebDAV repository in the **User** field.
 - c. Set the password that is used to access the WebDAV repository in the **Password** field.
6. Click the **OK** button to finish the connection configuration.
7. To view your connection, go to the **Data Source Explorer view** ([on page 1831](#)) (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective** ([on page 2680](#)).

For more information about the WebDAV support in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

<https://www.youtube.com/embed/vDXO36CqbmM>

WebDAV Contextual Menu Actions

While browsing WebDAV connections in the **Data Source Explorer view** ([on page 1831](#)), the various nodes include the following contextual menu actions:

Connection Level Nodes

Configure Database Sources

Opens the **Data Sources preferences page** ([on page 74](#)) where you can configure both data sources and connections.

Disconnect (when connected)

Stops the connection.

New Folder

Creates a new folder on the connection.

Import Files

Allows you to add a new file on the connection, in the current folder.

 **Refresh**

Performs a refresh on the selected node.

 **Folder Level Nodes****New File**

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Export

Allows you to export the folder on the remote connection to a local folder.

 **Cut**

Removes the current selection and places it in the clipboard.

 **Copy**

Copies the current selection into the clipboard.

 **Paste**

Pastes the copied selection.

Rename

Renames the current resource

 **Delete**

Deletes the current container.

 **Refresh**

Performs a refresh on the selected node.

 **Resource Level Nodes****Open**

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated

with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

**Cut**

Removes the current selection and places it in the clipboard.

**Copy**

Copies the current selection into the clipboard.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Rename

Renames the current resource

**Delete**

Deletes the current container.

**Refresh**

Performs a refresh on the selected node.

**Properties**

Shows various properties of the current container.

Compare

Compares two selected resources.

SQL Execution Support

The database support in Oxygen XML Editor Eclipse plugin includes support for writing SQL statements, syntax highlighting, *folding* ([on page 2679](#)), and dragging and dropping from the **Data Source Explorer** view ([on page 1831](#)). It also includes transformation scenarios for executing the statements, and the results are displayed in the **Table Explorer** view ([on page 1833](#)).

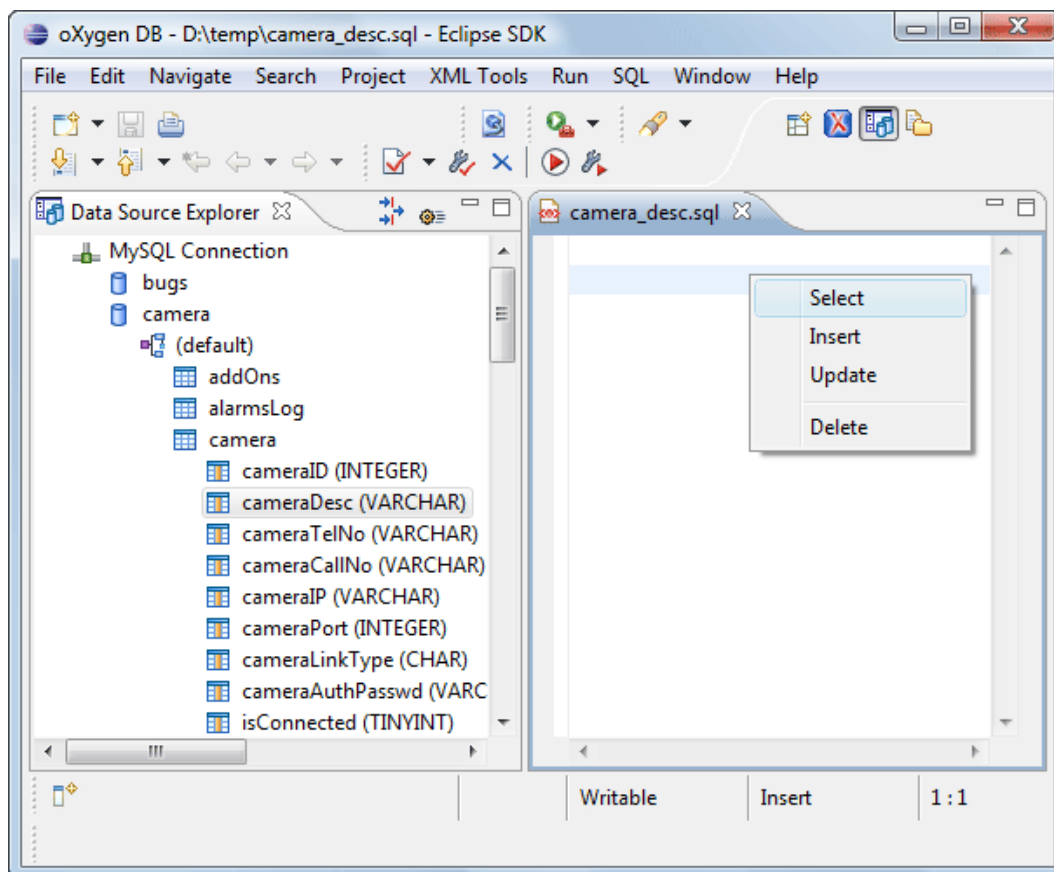

Drag and Drop from Data Source Explorer View

Dragging operations from the **Data Source Explorer** view ([on page 1831](#)) and dropping them in the SQL Editor allows you to create SQL statements quickly by inserting the names of tables and columns in the SQL statements.

1. Configure a database connection (see the specific procedure for your database server in the [Database Connection Support \(on page 1835\)](#) section).
2. Browse to the table you will use in your statement.
3. Drag the table or a column of the table into the editor where a SQL file is open.

Drag and drop actions are available both on the table and on its fields. A pop-up menu is displayed in the SQL editor.

Figure 482. SQL Statement Editing with Drag and Drop

4. Select the type of statement from the pop-up menu.

Depending on your choice, dragging a table results in one of the following statements being inserted into the document:

- **SELECT** ``field1`,`field2`, FROM `catalog`.`table`` (for example: `SELECT `DEPT`,`DEPTNAME`,`LOCATION` FROM `camera`.`cameraDesc``)
- **UPDATE** ``catalog`.`table` SET `field1`=, `field2`=,....` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT`=, `DEPTNAME`=, `LOCATION`=)`
- **INSERT INTO** ``catalog`.`table` (`field1`, `field2`,) VALUES (, ,)` (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`,`DEPTNAME`,`LOCATION`) VALUES (, ,)`)
- **DELETE FROM** ``catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc``)

Depending on your choice, dragging a column results in one of the following statements being inserted into the document:

- **SELECT** ``field` FROM `catalog`.`table`` (for example: `SELECT `DEPT` FROM `camera`.`cameraDesc``)
- **UPDATE** ``catalog`.`table` SET `field` =` (for example: `UPDATE `camera`.`cameraDesc` SET `DEPT` =`)
- **INSERT INTO** ``catalog`.`table` (`field1) VALUES ()` (for example: `INSERT INTO `camera`.`cameraDesc` (`DEPT`) VALUES ()`)
- **DELETE FROM** ``catalog`.`table`` (for example: `DELETE FROM `camera`.`cameraDesc` WHERE `DEPT` =`)

SQL Validation

SQL validation support is offered for IBM DB2. Note that if you choose a connection that does not support SQL validation, you will receive a warning when trying to validate. The SQL document is validated using the connection from the associated transformation scenario.

Executing SQL Statements

The steps for executing an SQL statement on a relational database are as follows:

1. Configure a [transformation scenario \(on page 1171\)](#) using the  **Configure Transformation Scenario(s)** action from the toolbar or the **XML** menu.
A SQL transformation scenario needs a database connection. You can configure a connection using the  **Preferences** button from the SQL transformation dialog box.
The dialog box contains the list of existing scenarios that apply to SQL documents.
2. Set parameter values for SQL placeholders using the **Parameters** button from the SQL transformation dialog box.

For example, in `SELECT * FROM `test`.`department` where DEPT = ? or DEPTNAME = ?` the two parameters can be configured for the place holders (?) in the transformation scenario.

When the SQL statement is executed, the first placeholder is replaced with the value set for the first parameter in the scenario, the second placeholder is replaced by the second parameter value, and so on.

Restriction:

When a stored procedure is called in an SQL statement executed on an SQL Server database, mixing inline parameter values with values specified using the **Parameters** button of the scenario dialog box is not recommended. This is due to a limitation of the SQL Server driver for Java applications. An example of stored procedure that is not recommended: `call dbo.Test (22, ?).`

3. Execute the SQL scenario by clicking the **OK** or **Apply associated** button.

The result of a SQL transformation is [displayed in a view \(on page 335\)](#) at the bottom of the Oxygen XML Editor Eclipse plugin window.

4. View more complex return values of the SQL transformation in a separate editor panel.

A more complex value returned by the SQL query (for example, an *XMLTYPE* or *CLOB* value) cannot be displayed entirely in the result table.

a. Right-click the cell containing the complex value.

b. Select the action **Copy cell** from the contextual menu.

The action copies the value in the clipboard.

c. Paste the value into an appropriate editor.

For example, you can paste the value in an opened XQuery editor panel of Oxygen XML Editor Eclipse plugin.

XQuery and Databases

XQuery is a native XML query language that is useful for querying XML views of relational data to create XML results. It also provides the mechanism to efficiently and easily extract information from Native XML Databases (NXD) and relational data. The following database systems supported in Oxygen XML Editor Eclipse plugin offer XQuery support:

- *Native XML Databases:*
 - eXist
 - MarkLogic (validation support available starting with version 5)
- *Relational Databases:*
 - IBM DB2
 - Microsoft SQL Server (validation support not available)
 - Oracle (validation support not available)

Related information

[Editing XQuery Documents \(on page 784\)](#)

Build Queries with Drag and Drop from the Data Source Explorer View

When a query is edited in the XQuery editor, the XPath expressions can be composed quickly by dragging them from the **Data Source Explorer** view ([on page 1831](#)) and dropping them into the editor panel.

1. [Configure the data source drivers \(on page 1835\)](#) for the particular relational database in the **Data Sources** preferences page ([on page 74](#)).
2. [Configure the connection \(on page 1835\)](#) for the particular relational database in the **Data Sources** preferences page ([on page 74](#)).
3. Browse the connection in the **Data Source Explorer** view ([on page 1831](#)), expanded to the table or column that you want to insert in the query.
4. Drag the table or column name to the XQuery editor panel.
5. Drop the table or column name where the XPath expression is needed.

An XPath expression that selects the dragged name is inserted in the XQuery document at the cursor position.

XQuery Validation When Connected to a Database

With Oxygen XML Editor Eclipse plugin, you can validate your XQuery documents when connected to a database. When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor Eclipse plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Related Information:

[XQuery Validation \(on page 785\)](#)

XQuery Transformation for Databases

XQuery is designed to retrieve and interpret XML data from any source, whether it is a database or document. Data is stored in relational databases but it is often required that the data be extracted and transformed as XML when interfacing to other components and services. Also, it is an XPath-based querying language supported by most NXD vendors. To perform a query, you need an XQuery transformation scenario.

1. [Configure the data source drivers and the connection \(on page 1835\)](#) for the particular database.
2. Configure an XQuery transformation scenario.

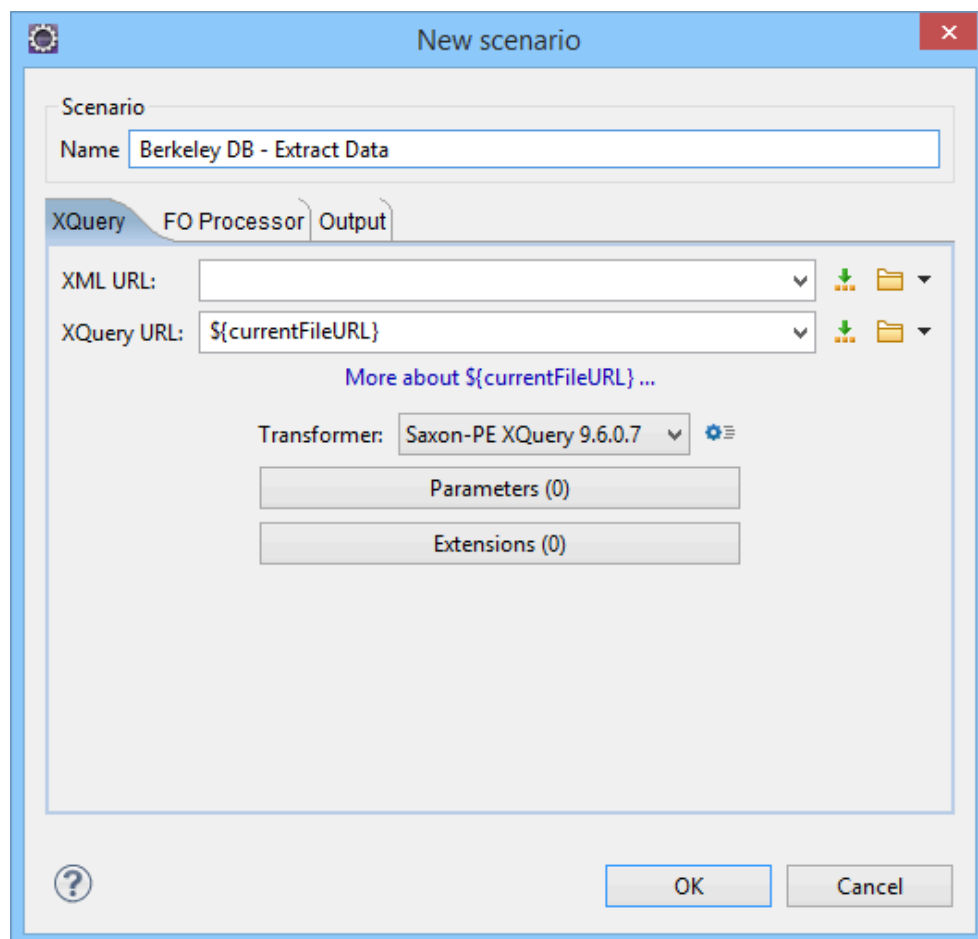

- a. Click the  **Configure Transformation Scenario** toolbar button or go to menu **Document > Transformation > Configure Transformation Scenario**.

The **Configure Transformation Scenario** dialog box [\(on page 1300\)](#) is opened.

- b. Click the **New** button toward the bottom of the dialog box.
- c. Select **XML Transformation with XQUERY** [\(on page 1223\)](#).

The **New Scenario** dialog box for configuring an XQuery scenario is opened.

Figure 483. New Scenario Dialog Box

d. Insert the scenario name in the dialog box for editing the scenario.

e. Choose the database connection in the **Transformer** drop-down list.

f. Configure any other parameters as needed.

For an XQuery transformation, the output tab has an option called **Sequence** that allows you to run an XQuery in lazy mode. The amount of data extracted from the database is controlled from the **Size limit on Sequence view option** (*on page 203*) in the **XQuery** preferences page. If you choose **Perform FO Processing** in the **FO Processor** tab, the **Sequence** option is ignored.

g. Click the **OK** button to finish editing the scenario.

Once the scenario is associated with the XQuery file, the query can include calls to specific XQuery functions that are implemented by that engine. The available functions depend on the target database engine selected in the scenario. For example, for eXist, the *Content Completion Assistant* (*on page 2677*) lists the functions supported by that database engine. This is useful for only inserting calls to the supported functions (standard XQuery functions or extension ones) into the query .

3. Run the transformation scenario.

To view a more complex value returned by the query that cannot be entirely displayed in the XQuery query result table at the bottom of the Oxygen XML Editor Eclipse plugin window (for example, an XMLTYPE or CLOB value), do the following:

- Right-click that table cell.
- Select the **Copy cell** action from the contextual menu to copy the value into the clipboard.
- Paste the value wherever you need it (for example, in an open XQuery editor panel of Oxygen XML Editor Eclipse plugin).

Related information

[XML Transformation with XQuery \(on page 1223\)](#)

[XQuery XQJ Transformation \(on page 1888\)](#)

XQuery XQJ Transformation

XQuery API for Java (XQJ) refers to the common Java API for the XQuery 1.0 specification. The XQJ API enables you to execute XQuery against an XML data source.

Important:

The XQJ connector is only capable of running XQuery 1.0 scrips, therefore XQuery 3.0 and 3.1 scripts are not supported.

Oxygen XML Editor Eclipse plugin supports any transformer that offers an XQJ API implementation and it be used for validating XQuery or transforming XML documents.

To configure the support for XQJ, do the following:

1. [Configure an XQJ Data Source \(on page 1874\)](#).
2. [Configure an XQJ Connection \(on page 1875\)](#).
3. To view your connection, go to the **Data Source Explorer view (on page 1831)** (if the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu) or switch to the **Database perspective (on page 2680)**.

How to Configure an XQJ Data Source

Any transformer that offers an XQJ API implementation can be used when validating XQuery or transforming XML documents. An example of an XQuery engine that implements the XQJ API is [Zorba](#).

1. If your XQJ Implementation is native, make sure the directory containing the native libraries of the engine is added to your system environment variables: to **PATH** - on Windows, to **LD_LIBRARY_PATH** - on Linux, or to **DYLD_LIBRARY_PATH** - on macOS. Restart Oxygen XML Editor Eclipse plugin after configuring the environment variables.
2. Open the **Preferences dialog box (on page 70)** and go to **Data Sources**.
3. Click the **+ New** button in the **Data Sources** panel.
4. Enter a unique name for the data source.
5. Select **XQuery API for Java (XQJ)** in the **Type** combo box.
6. Click the **Add** button to add XQJ API-specific files.

You can manage the driver files using the **Add**, **Remove**, **Detect**, and **Stop** buttons.

Oxygen XML Editor Eclipse plugin detects any implementation of *javax.xml.xquery.XQDataSource* and presents it in **Driver class** field.

7. Select the most suited driver in the **Driver class** combo box.
8. Click the **OK** button to finish the data source configuration.
9. Continue on to [configure the XQJ connection \(on page 1875\)](#).

How to Configure an XQJ Connection

The steps for configuring an XQJ connection are the following:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Data Sources**.
2. Click the **+ New** button in the **Connections** panel.
3. Enter a unique name for the connection.
4. Select one of the previously configured **XQJ data sources** ([on page 1874](#)) in the **Data Source** combo box.
5. Fill-in the connection details.
The properties presented in the connection details table are automatically detected depending on the selected data source.
6. Click the **OK** button to finish the connection configuration.

XQuery Database Debugging

Oxygen XML Editor Eclipse plugin includes a debugging interface that helps you to detect and solve problems with XQuery transformations that are executed against MarkLogic databases.

For more information about the debugging support in Oxygen XML Editor Eclipse plugin, see [Debugging XSLT Stylesheets and XQuery Documents \(on page 1913\)](#).

Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin includes support for debugging XQuery transformations that are executed against a MarkLogic database.

To use a debugging session against the MarkLogic engine, follow these steps:

1. Configure a **MarkLogic data source** ([on page 1858](#)) and a **MarkLogic connection** ([on page 1859](#)).
2. Make sure that the debugging support is enabled in the MarkLogic server that Oxygen XML Editor Eclipse plugin accesses. On the server side, debugging must be activated in the XDBC server and in the *Task Server* section of the server control console (the switch *debug allow*). If the debugging is not activated, the MarkLogic server reports a **DBG-TASKDEBUGALLOW** error.

Note:

An XDBC application server must be running to connect to the MarkLogic server and this XDBC server will be used to process XQuery expressions against the server. You can change the XDBC application server that Oxygen XML Editor Eclipse plugin uses to process XQuery

expressions by selecting the **Use it to execute queries** action ([on page 1865](#)) from the contextual menu in the **Data Source Explorer** view ([on page 1831](#)).

3. Open the XQuery file and start the debugging process.

- If you want to debug an XQuery file stored on the MarkLogic server, it is recommended to use the **Data Source Explorer** view ([on page 1831](#)) and open the file from the application server that is involved in the debugging process. This improves the resolving of any imported modules.
- The MarkLogic XQuery debugger integrates seamlessly into the **XQuery Debugger perspective** ([on page 237](#)). If you have a MarkLogic validation scenario configured for the XQuery file, you can choose to **debug the scenario** ([on page 1931](#)) directly.
- Otherwise, switch to the **XQuery Debugger perspective** ([on page 2680](#)), open the XQuery file in the editor, and select the MarkLogic connection in the XQuery engine selector from the **debug control toolbar** ([on page 1915](#)).

For general information about how a debugging session is started and controlled, see the [Working with the Debugger](#) ([on page 1931](#)) section.

Note:

Before starting a debugging session, it is recommended that you link the MarkLogic connection with an Eclipse project. To do this, go to the **Data Source Explorer** view ([on page 1831](#)) and select **Link to project** in the contextual menu of the MarkLogic connection. The major benefit of linking a debugging session with a project is that you can **add breakpoints** ([on page 1934](#)) in the XQuery modules stored on the server. You are also able to access these modules from the Eclipse **Project Explorer** view and run debugging sessions from them.

In a MarkLogic debugging session, you can use step actions and **breakpoints** ([on page 1934](#)) to help identify problems. When you **add a breakpoint** ([on page 1934](#)) on a line where the debugger never stops, Oxygen XML Editor Eclipse plugin displays a warning message. These warnings are displayed for **breakpoints** you add either in the main XQuery (which you can open locally or from the server) or for **breakpoints** you add in any XQuery that is opened from the connection that participates in the debugging session. For more information, see [Using Breakpoints for Debugging Queries that Import Modules with MarkLogic](#) ([on page 1863](#)).

Remote Debugging with MarkLogic

Oxygen XML Editor Eclipse plugin allows you to debug remote applications that use XQuery (for example, web applications that trigger XQuery executions). Oxygen XML Editor Eclipse plugin connects to a MarkLogic server, shows you the running XQuery scripts and allows you to debug them. You can even pause the scripts so that you can start the debugging queries in the exact context of the application. You can also switch a server to debug mode to intercept all XQuery scripts.

Oxygen XML Editor Eclipse plugin also supports collaborative debugging. This feature allows multiple users to participate in the same debugging session. You can start a debugging session and at a certain point, another user can continue it.

**Important:**

When using the remote debugging feature, the HTTP and the XDBC servers involved in the debugging session must have the same module configuration.

Resources

For more information about the XQuery debugger for MarkLogic, watch our video demonstration:

<https://www.youtube.com/embed/eQ4ThDZq1bk>

Related Information:

[MarkLogic Development in Oxygen XML Editor Eclipse plugin \(on page 1860\)](#)

[Configuring a MarkLogic Database Connection \(on page 1858\)](#)

Using Breakpoints for Debugging Queries that Import Modules with MarkLogic

When debugging queries that imports modules stored in the database, it is recommended to place *breakpoints* (on page 1934) in the modules. When starting a new debugging session, make sure that the modules that you will debug are already opened in the editor. This is necessary so that the *breakpoints* in all the modules will be considered. Also, make sure that there are no other open modules that are not involved in the current debugging session.

To place *breakpoints* in the modules, use the following procedure:

1. In the **Data Source Explorer** view (on page 1831), open all the modules from the  **Modules** container of the XDBC application server (on page 1859) that performs the debugging.
2. Set *breakpoints* (on page 1934) in the module as needed.
3. Continue debugging (on page 1931) the query.

If you get a warning that the *breakpoints* failed to initialize, try the following solutions:

- Check the **Breakpoints** view (on page 1919) and make sure there are no older *breakpoints* (set on resources that are not part of the current debugging context).
- Make sure you open the modules from the context of the application server that does the debugging and place *breakpoints* there.

Related Information:[MarkLogic Database Connections \(Deprecated\) \(on page 1856\)](#)[MarkLogic Development in Oxygen XML Editor Eclipse plugin \(on page 1860\)](#)

Peculiarities and Limitations of the MarkLogic Debugger

MarkLogic debugger has the following peculiarities and limitations:

- Debugging support is only available for MarkLogic server versions 4.0 or newer.
- For MarkLogic server versions 4.0 or newer, there are three XQuery syntaxes that are supported: '0.9-ml' (inherited from MarkLogic 3.2), '1.0-ml', and '1.0'.
- All declared variables are presented as strings. The **Value** column of the **Variables** view contains the expression from the variable declaration. It can be evaluated by copying the expression with the **Copy value** action from the contextual menu of the **Variables** view (on page 1929) and pasting it in the **XWatch** view (on page 1921).
- There is no support for [output to source mapping](#) (on page 1932).
- There is no support for [showing the trace](#) (on page 1926).
- You can only set [breakpoints](#) (on page 1919) in imported modules in one of the following cases:
 - When you open the module from the context of the application server involved in the debugging, using the **Data Source Explorer** view (on page 1831).
 - When the debugger automatically opens the modules in the Editor.
- No [breakpoints](#) (on page 1934) are set in modules from the same server that are not involved in the current debugging session.
- No support for [profiling](#) (on page 1935) when an XQuery transformation is executed in the debugger.

Integration with Microsoft SharePoint

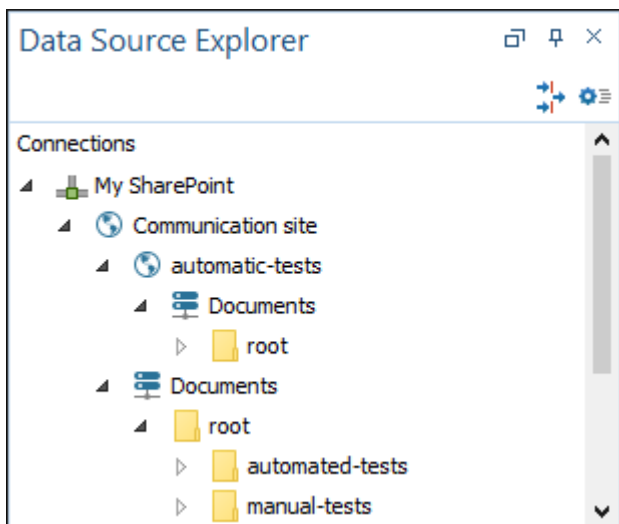

**Restriction:**

The SharePoint integration is only available in the Enterprise edition of Oxygen XML Editor Eclipse plugin.

Oxygen XML Editor Eclipse plugin provides support for browsing and managing SharePoint connections in the **Data Source Explorer** view (on page 1831). You can easily create new resources on the repository, copy and move them using contextual actions or the drag and drop support, or edit and transform the documents in the editor.

There are two types of integrations that are possible:

- **SharePoint Online** - A new implementation that uses the [SharePoint REST API v.2](#) and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

Figure 484. SharePoint Connection in Data Source Explorer View**Related Information:**

[Working with Databases \(on page 1831\)](#)

How to Configure a SharePoint Connection

By default, Oxygen XML Editor Eclipse plugin contains built-in data source drivers for **SharePoint**. Use this data source to create a connection to a SharePoint server that will be available in the **Data Source Explorer** view.

There are two types of possible SharePoint connections:

- **SharePoint Online** - A new implementation that uses the [SharePoint REST API v.2](#) and it supports OAuth credentials (access tokens). If you need authentication, you must use this type of integration.
- **SharePoint** - The older implementation that was implemented using SharePoint Web Services (now deprecated) and it does NOT support OAuth credentials (access tokens).

SharePoint Online Connection

To configure a SharePoint connection, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)), go to **Data Sources**. Select **SharePoint Online** in the **Data Sources** pane and in the **Connections** pane, click the **+ New** button.
2. Enter a unique name for the connection.
3. Make sure **SharePoint Online** is selected in the **Data Source** combo box.
4. Enter the **Tenant URL** for your SharePoint repository and click **OK**.

**Note:**

If you are still logged in when you close Oxygen XML Editor Eclipse plugin, the authentication persists the next time the application is started. If, for some reason, the authentication fails to recover the

access token, an error is displayed in the **Results** pane at the bottom of the application. If this happens, you need to re-authenticate Oxygen XML Editor Eclipse plugin.

SharePoint Connection (Older Version)

To configure a SharePoint connection, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*), go to **Data Sources**. Select **SharePoint Online** in the **Data Sources** pane and in the **Connections** pane, click the **+ New** button.
2. Enter a unique name for the connection.
3. Make sure **SharePoint** is selected in the **Data Source** combo box.
4. Fill-in the connection details:
 - a. Enter the **SharePoint URL** for your SharePoint repository.
 - b. Set the server domain in the **Domain** field. If you are using a SharePoint 365 account, leave this field empty.
 - c. Set the user name to access the SharePoint repository in the **User** field.
 - d. Set the password to access the SharePoint repository in the **Password** field.
5. Click **OK**.

Troubleshooting SharePoint Online Connections

Allowed SharePoint Online Sites

SharePoint Online sites supported by Oxygen XML Editor Eclipse plugin have the following syntax:

- `https://tenant.SharePoint.com`
- `https://tenant.SharePoint.com/sites/siteName`
- `https://tenant.SharePoint.com/sites/siteName/subsiteName1/.../subsiteNameK`
- `https://tenant.SharePoint.com/teams/siteName`
- `https://tenant.SharePoint.com/teams/siteName/subsiteName1/.../subsiteNameK`

Authentication Workflow Problems

Once you configure the [SharePoint Online Connection](#) (*on page 1893*) and use the *Log in with Microsoft account* action, the action will open the default browser for authentication. If this is the first time you access this SharePoint site, you will have to [Grant Permissions to Oxygen XML Editor Eclipse plugin](#) (*on page 1895*).

If the authentication is successful, the browser should display the **Authentication complete** page:

**Attention:**

If you cannot get past the *This page isn't working* response while using *Google Chrome*, try using a different browser.

Once you go back to Oxygen XML Editor Eclipse plugin, in the *SharePoint Browser* you should see your username details and be able to browse the repository.

Grant Permissions to Oxygen XML Editor Eclipse plugin

When you first **Log in** and access your **SharePoint** server, you may need to grant **SharePoint Enterprise Application** permissions for the Oxygen XML Editor Eclipse plugin application to:

- View your basic profile.
- Maintain access to data you have given access to.
- Edit or delete items in all site collections.

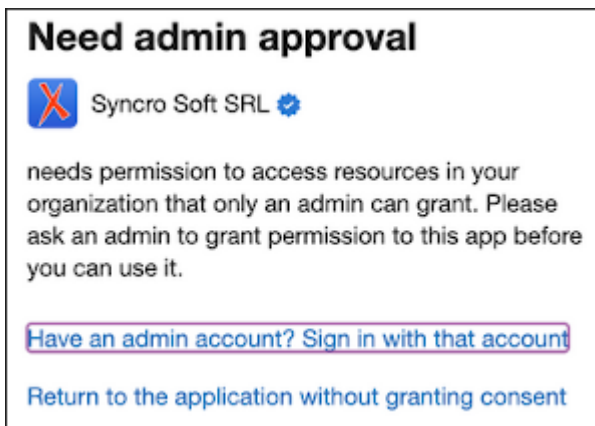

The **Permissions requested** form will appear when you first authenticate to your **SharePoint** server from Oxygen XML Editor Eclipse plugin.

If you have administrative privileges, you are able to grant permissions directly from the form:

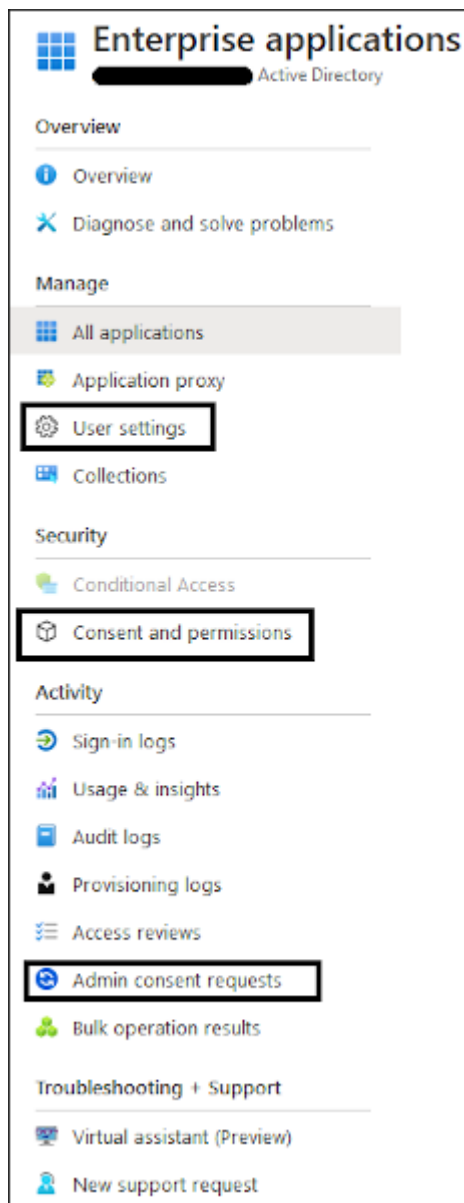

Figure 485. Permissions Requested Form

If you do not have admin rights to give Oxygen XML Editor Eclipse plugin permissions to access the **SharePoint** server, the **Permissions requested** form will suggest that you contact the administrator for your **SharePoint** account so that they can grant the permissions.

The **SharePoint** global administrator should log in to <https://portal.azure.com/>, navigate to **Manage Azure Active Directory > Enterprise applications**, and approve the request under the **Admin consent requests** category.

The administrator can also check the **User settings** category and configure the **Users can request admin consent to apps they are unable to consent to** options and policies.

More consent settings can be configured by the admin under the **User consent settings** category.

SharePoint Contextual Menu Actions

While browsing SharePoint connections in the **Data Source Explorer** view (*on page 1831*), the following contextual menu actions are available, depending on the type of node:

Connection Nodes

Configure Database Sources

Opens the **Data Sources preferences page** (*on page 74*) where you can configure both data sources and connections.

Log in with Microsoft Account (when not connected)

Opens the Microsoft login page in your default browser and authenticates Oxygen XML Editor Eclipse plugin.

Disconnect (when connected)

Stops the connection.

Refresh

Performs a refresh on the selected node.

Site Nodes / **Sub-site Nodes**

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Refresh

Performs a refresh on the selected node.

Folder Level Nodes

New File

Creates a new file on the connection, in the current folder.

New Folder

Creates a new folder on the connection.

Import Folders

Imports folders on the server.

Import Files

Allows you to add a new file on the connection, in the current folder.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Resource Level Nodes

Open

Opens the selected resource in the editor.

Open in System Application

When you use this action, Oxygen XML Editor Eclipse plugin downloads the selected resource to a local temporary folder and opens the selected resource in the system application that is currently set as the default application associated with that type of resource. You can then edit the resource, save it, and when you switch the focus back to the **Data Source Explorer** view, Oxygen XML Editor Eclipse plugin will detect that there was a change and will ask if you want to upload the edited resource to the server.

Copy location

Allows you to copy (to the clipboard) an application-specific URL for the resource that can then be used for various actions, such as opening or transforming the resources.

Check Out

Checks out the selected document on the server.

Check In

Checks in the selected document on the server. This action opens the **Check In** dialog box. For SharePoint Online connections, you only have the option to enter a comment and click the **Check In** button to process it.

For SharePoint (older version), the following options are available:

- **Minor Version** - Increments the minor version of the file on the server.
- **Major Version** - Increments the major version of the file on the server.
- **Overwrite** - Overwrites the latest version of the file on the server.
- **Comment** - Allows you to add a comment for a file that you check in.

Discard Check Out

Discards the previous checkout operation, making the file available to other users.

Important:

Due to some API restrictions, the *Discard Checkout* action may not work when SharePoint Online connections are made directly to a sub-site.

Rename

Renames the current resource

Delete

Deletes the current container.

Refresh

Performs a refresh on the selected node.

Compare

Compares two selected resources.

15.

Importing Data

Computer systems and databases contain data in incompatible formats and exchanging data between these systems can be very time consuming. Converting the data to XML can greatly reduce the complexity and create data that can be read by various types of applications.

Oxygen XML Editor Eclipse plugin offers support for importing text files, MS Excel files, Database Data, and HTML files into XML documents. The XML documents can be further converted into other formats using the [Transform features \(on page 1171\)](#).

Import from Text Files

Oxygen XML Editor Eclipse plugin includes the possibility of importing text files (`txt` or `csv` file extensions) as XML documents.

To import a text file into an XML file, follow these steps:

1. Go to **File > Import/Convert > Oxygen XML Editor Eclipse plugin > Text File to XML** and click **Next**.
A **Select text file** dialog box is displayed.
2. Select the URL of the text file (`txt` or `csv` file extensions).
3. Select the encoding of the text file.
4. Click the **Next** button.

The **Import from text file** dialog box is displayed.

Figure 486. Import from Text File to XML Dialog Box

5. Configure the settings for the conversion.

- a. Select the **Field delimiter** for the import settings. You can choose between the following: Comma, Semicolon, Tab, Space, OR Pipe.
- b. The **Import settings** section presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
- c. **First row contains field names** - If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the

first row is interpreted as containing the field names. The changes are also visible in the preview panel.

- d. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following options in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, OR `SKIPPED`.
 - e.  **Import Settings** - Clicking this button opens the [Import preferences page \(on page 181\)](#) that allows you to configure more import options.
 - f. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
 - g. **Save in file** - If selected, the new XML document is saved in the specified path.
6. Click **Finish** to generate the XML document.

Import from MS Excel Files

Oxygen XML Editor Eclipse plugin provides several methods for importing MS Excel files into an XML file. The first method is to use the Oxygen XML Editor Eclipse plugin [Smart Paste mechanism \(on page 390\)](#) by simply copying data from Excel and pasting it into a document in **Author** mode (note that this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents). You can also copy data from Excel and paste it into inserted cells in **Grid** mode, but this is a more manual process. If you want to import an entire Excel file, Oxygen XML Editor Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method in Author Mode

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the Excel spreadsheet in your office application, copy its content, and simply paste it into your document in **Author** mode.

The Oxygen XML Editor Eclipse plugin [Smart Paste mechanism \(on page 390\)](#) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Grid Mode Method

The **Grid** mode in Oxygen XML Editor Eclipse plugin displays all content in an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. When importing Excel data into **Grid** mode, you first need to insert new cells in the particular nested table and then you can paste data from Excel the same as you would in any table or spreadsheet.

1. Copy the particular cells from your Excel spreadsheet that you want to import into an XML file.
2. Switch to **Grid** mode in Oxygen XML Editor Eclipse plugin.

3. Expand the particular nodes and locate the nested table where you want to insert the copied cells.
4. Right-click a particular row or column where you want to insert the data and select  **Insert row** or  **Insert column**, depending on the structure of the copied cells.
5. Paste the copied cells from the clipboard into the newly inserted cells in **Grid** mode.
6. You may need to make some manual adjustments. For example, if the selection of copied cells contained an empty cell, Oxygen XML Editor Eclipse plugin might ignore that cell.

Import Wizard Method

To use the **Import** wizard to import an Excel file into an XML file, follow these steps:

1. Go to **File > Import/Convert > Oxygen XML Editor Eclipse plugin > MS Excel file to XML**.
2. Select the URL of the Excel file. The sheets of the document you are importing are presented in the **Available Sheets** section of this dialog box.
3. Click the **Next** button to proceed to the next stage of the wizard.

Figure 487. Import Wizard

4. Configure the settings for the conversion. This stage of the wizard offers the following options:

Import settings section

Presents the input data in a tabular form. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.

First row contains field names

If this option is selected, the default column headers are replaced (where such information is available) by the content of the first row. In other words, the first row is interpreted as containing the field names. The changes are also visible in the preview panel.

Customize

This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, or `SKIPPED`.

Import Settings

Clicking this button opens the [Import preferences page \(on page 181\)](#) that allows you to configure more import options.

Import formatted data (as displayed in Excel)

If this option is selected, the imported data retains the Excel data formatting (such as the representation of numeric values or dates). If deselected, the data formatting is not imported.

XML Import Preview panel

Contains an example of what the generated XML document will look like.

Save in file

If selected, the new XML document is saved in the specified path.

5. Click **Finish** to generate the XML document.

Resources

For more information about exchanging data between Oxygen XML Editor Eclipse plugin and spreadsheet applications, watch our video demonstration:

<https://www.youtube.com/embed/8VwsF58zLkU>

Related information

[Exporting XML Content to Excel \(on page 366\)](#)

Import Database Data as an XML Document

To import the data from a relational database table as an XML document, follow these steps:

1. Go to **File > Import/Convert > Oxygen / Database Data to XML** and click **Next** to start the **Import** wizard.

This opens a **Select database table** dialog box that lists all the defined database connections:

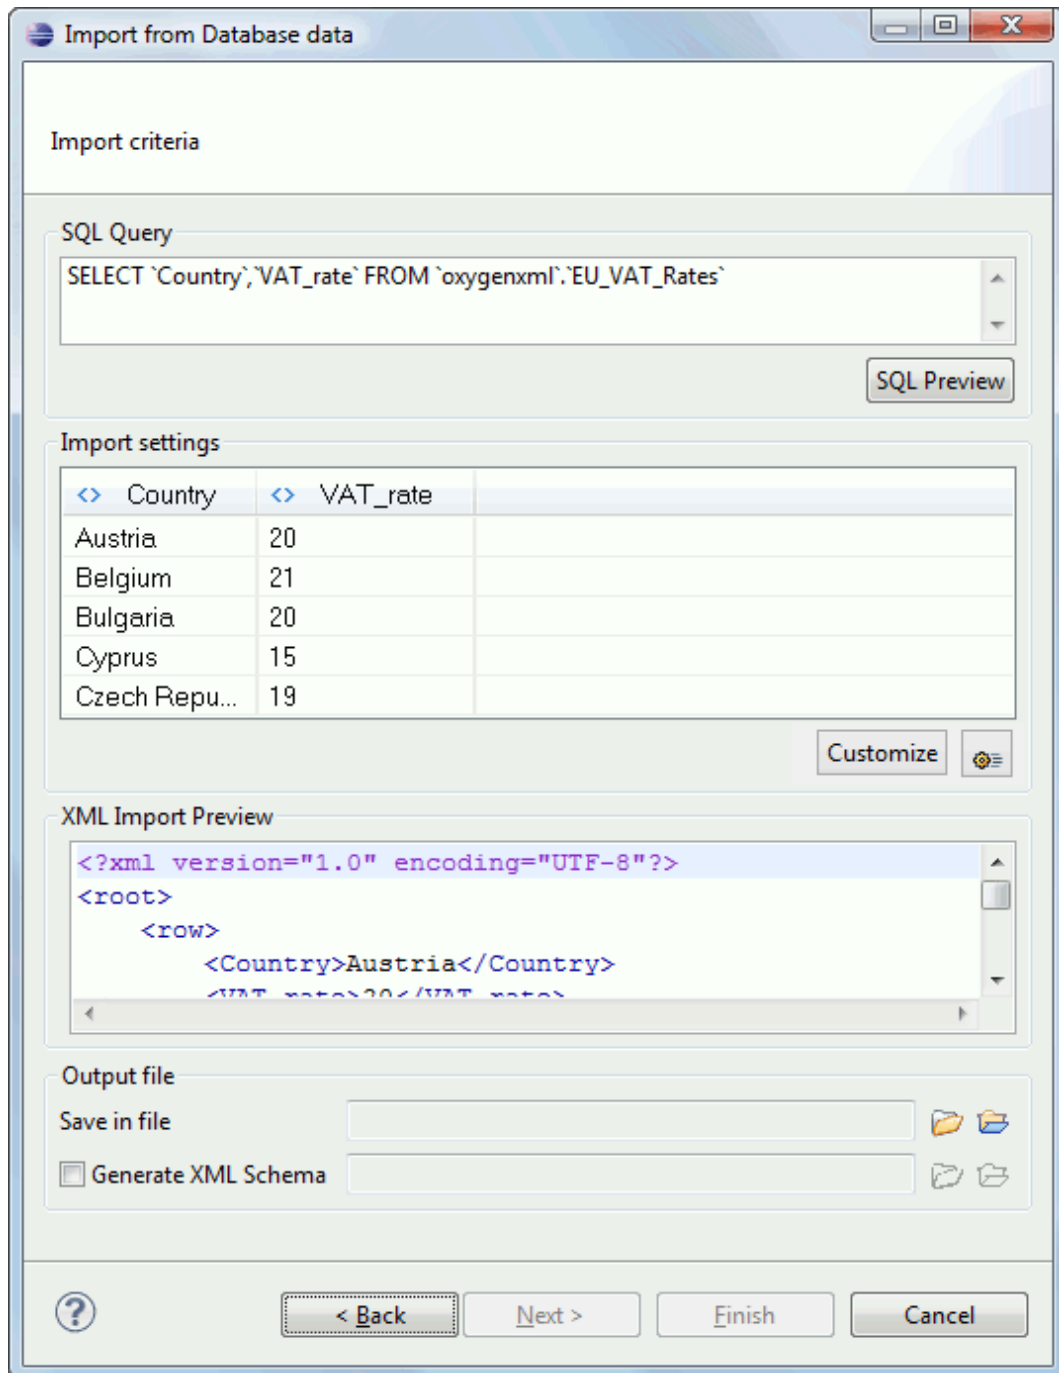

Figure 488. Select Database Table Dialog Box

2. Select the connection to the database that contains the appropriate data.
Only connections configured in relational data sources can be used to import data.
3. If you want to edit, delete, or add a data source or connection, click the **Configure Database Sources** button.
The **Preferences/Data Sources** option page is opened.
4. Click **Connect**.
5. In the list of sources, expand a schema and choose the required table.
6. Click the **Next** button.

The **Import Criteria** dialog box is opened with a default query string in the **SQL Query** pane.

Figure 489. Import from Database Criteria Dialog Box

7. Configure the settings for the conversion.

- a. **SQL Preview** - If this button is pressed, the **Import settings** pane displays the labels that are used in the XML document and the first five lines from the database. By default, all data items are converted to element content (<> symbol), but this can be overridden by clicking the individual column headers. Clicking a column header once causes the data from this column to be converted to attribute values (= symbol). Clicking a second time causes the column data to be ignored (x symbol) when generating the XML file. You can cycle through these three options by continuing to click the column header.
- b. **Customize** - This button opens a **Presentation Names** dialog box that allows you to edit the name, XML name, and conversion criterion for the root and row elements. The XML names can

be edited by double-clicking the desired item and entering the label. The conversion criteria can also be modified by selecting one of the following option in the drop-down menu: `ELEMENT`, `ATTRIBUTE`, `OR SKIPPED`.

- c.  **Import Settings** - Clicking this button opens the **Import preferences page** (*on page 181*) that allows you to configure more import options.
 - d. The **XML Import Preview** panel contains an example of what the generated XML document looks like.
 - e. **Save in file** - If selected, the new XML document is saved in the specified path.
 - f. **Generate XML Schema** - Allows you to specify the path of the generated XML Schema file.
8. Click **Finish** to generate the XML document.

Import from HTML Files

Oxygen XML Editor Eclipse plugin offers two methods for importing HTML files into an XML document. The first method is to simply copy data from an HTML document and paste it into a document in **Author** mode, but this is only supported in DITA, DocBook, TEI, JATS, and XHTML documents. Oxygen XML Editor Eclipse plugin also offers a configurable import wizard that works with any type of XML document.

Smart Paste Method

If you are importing data into DITA, DocBook, TEI, JATS, or XHTML documents, you can open the HTML document in your web browser, copy its content, and paste it into your document in **Author** mode.

The Oxygen XML Editor Eclipse plugin **Smart Paste mechanism** (*on page 390*) will convert the pasted content to the equivalent XML markup and considers various pasting solutions to keep the resulting document valid, while preserving the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs).

Import Wizard Method

To use the **Import** wizard to import from HTML files, follow these steps:

1. Go to **File > Import/Convert > Oxygen XML Editor Eclipse plugin > HTML File to XHTML**. The **Import HTML to XHTML** wizard is displayed.
2. Select a parent folder and file name for the resulting XHTML document.
3. Enter the URL of the HTML document.
4. Select the type of the resulting XHTML document:
 - XHTML5
 - XHTML 1.0 Transitional
 - XHTML 1.0 Strict
5. Click the **Finish** button.

Result: The resulting document is an XHTML file containing a DOCTYPE declaration that references the XHTML DTD definition on the Web. The parsed content of the imported file is transformed to XHTML5, XHTML Transitional, or XHTML Strict depending on the option you chose.

Import Content Dynamically

Along with the built-in support for various useful URL protocols (such as HTTP or FTP), Oxygen XML Editor Eclipse plugin also provides special support for a *convert* protocol that can be used to chain predefined processors to dynamically import content from various sources.

Important:

Starting with version 26, the dynamic conversion protocol is disabled by default. To enable it, you must set the `com.oxygenxml.enable.convert.url.protocol` system property to the value of `true`.

A *dynamic conversion URL* chains various processors that can be applied, in sequence, on a target resource and has the following general syntax:

```
convert:/processor=xslt;ss=urn:processors:excel2d.xsl/processor=excel!/urn:files:my.xls
```

The previous example first applies a processor (`excel`) on a target identified by the identifier (`urn:files:sample.xls`) and converts the Excel™ resource to XML. The second applied processor (`xslt`) applies an XSLT stylesheet identified using the identifier (`urn:processors:excel2d.xsl`) over the resulting content from the first applied processor. These identifiers are all mapped to real resources on disk via an *XML catalog* that is configured in the application, as in the following example:

```
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <rewriteURI uriStartString="urn:files:" rewritePrefix="./resources/" />
  <rewriteURI uriStartString="urn:processors:" rewritePrefix="./processors/" />
</catalog>
```

The target resource part of the conversion URL must always follow the `! /` pattern. It can be any of the following:

- An absolute URL that points to a resource.
- An identifier that will be resolved to an actual resource via the *XML Catalog (on page 2683)* support in the application. In the example above, the `urn:files:sample.xls` target resource is resolved via the *XML catalog*.
- A relative location. This location can only be resolved to an actual resource URL when the application has enough information about the location where the URL is referenced.

For example, for a *DITA map (on page 2678)* with a `<topicref>` such as:

```
<topicref href="convert:/.../processor=excel!/resources/sample.xls" />
```

the `resources/sample.xls` path will be resolved relative to the *DITA map* location.

This type of URL can be opened in the application by using the **Open URL** action from the **File** menu. It can also be referenced from existing XML resources via *xi:include* or as a topic reference from a *DITA map*.

A *GitHub* project that contains various dynamic conversion samples for producing DITA content from various sources (and then publishing it) can be found here: <https://github.com/oxygenxml/dita-glass>.

Conversion Processors

A set of predefined conversion processors is provided in Oxygen XML Editor Eclipse plugin. Each processor has its own parameters that can be set to control the behavior of the conversion process. All parameters that are resolved to resources are passed through the *XML catalog* mapping.

The following predefined conversion processors are included:

- **xslt Processor** - Converts an XML input using the Saxon EE XSLT processor. The `ss` parameter indicates the stylesheet resource to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xslt;ss=urn:processors:convert.xsl;p1=v1!/urn:files:sample.xml
```

- **xquery Processor** - Converts an XML input using the Saxon EE XQuery processor. The `ss` parameter indicates the XQuery script to be loaded. All other specified parameters will be set as parameters to the XSLT transformation.

```
convert:/processor=xquery;ss=urn:processors:convert.xquery;p1=v1!/urn:files:sample.xml
```

- **excel Processor** - Converts an Excel™ input to an XML format that can later be converted by other piped processors. It has a single parameter `sn`, which indicates the name of the sheet that needs to be converted. If this parameter is missing, the XML will contain the combined content of all sheets included in the Excel™ document.

```
convert:/processor=excel;sn=test!/urn:files:sample.xls
```

- **java Processor** - Converts an input to another format by applying a specific Java method. The `jars` parameter is a comma-separated list of *JAR* (on page 2679) libraries, or folders that libraries will be loaded from. The `ccn` parameter is the fully qualified name of the conversion class that will be instantiated. The conversion class needs to have a method with the following signature:

```
public void convert(String systemID, String originalSourceSystemID,
    InputStream is, OutputStream os, LinkedHashMap<String, String> properties)
    throws IOException
```

```
convert:/processor=java;jars=libs;ccn=test.JavaToXML!/
urn:files:java/WSEditorBase.java
```

- **js Processor** - Converts an input to another format by applying a JavaScript method. The `js` parameter indicates the script that will be used. The `fn` parameter is the name of the method that will be called from the script. The method must take a string as an argument and return a string. If any of the parameters are missing, an error is thrown and the conversion stops.

```
convert:/processor=js;js=urn:processors:md.js;fn=convertExternal!/urn:files:sample.md
```

- **json Processor** - Converts a JSON input to XML. It has no parameters.

```
convert:/processor=json!/urn:files:personal.json
```

- **xhtml Processor** - Converts HTML content to well-formed XHTML. It has no parameters.

```
convert:/processor=xhtml!/urn:files:test.html
```

- **wrap Processor** - Wraps content in a tag name making it well-formed XML. The `rn` parameter indicates the name of the root tag to use. By default, it is `wrapper`. The `encoding` parameter specifies the encoding that should be used to read the content. By default, it is `UTF8`. As an example, this processor can be used if you want to process a comma-separated values file with an XSLT stylesheet to produce XML content. The CSV file is first wrapped as well-formed XML, which is then processed with an `xslt` processor.

```
convert:/processor=wrap!/urn:files:test.csv
```

- **cache Processor** - Caches the converted content obtained from the original document to a temporary file. The cache will be used on subsequent uses of the same URL, thus increasing the speed for the application returning the converted content. If the original URL points to the local disk, the cache will be automatically invalidated when the original file content gets modified. Otherwise, if the original URL points to a remote resource, the cache will need to be invalidated by reloading ( **Reload (F5)**) from the toolbar) the URL content that is opened in the editor.

```
convert:/processor=cache/processor=xslt;...!/urn:files:test.csv
```

Reverse Conversion Processors

All processors defined above can also be used for saving content back to the target resource if they are defined in the URL as reverse processors. Reverse processors are evaluated right to left. These reverse processors allow *round-tripping* content to and from the target resource.

As an example, the following URL converts HTML to DITA when the URL is opened using the `h2d.xsl` stylesheet and converts DITA to HTML when the content is saved in the application using the `d2h.xsl` stylesheet.

```
convert:/processor=xslt;ss=h2d.xsl/rprocessor=xslt;ss=d2h.xsl!/urn:files:sample.html
```

Important:

If you are publishing a *DITA map* that has such conversion URL references inside, you need to edit the transformation scenario and set the value of the parameter `fix.external.refs.com.oxygenxml` to **true**. This will instruct Oxygen XML Editor Eclipse plugin to resolve such references during a special pre-processing stage. Depending on the conversion, you may also require additional libraries to be added using the **Libaries** button in the **Advanced** tab of the transformation scenario.

16.

Debugging XSLT Stylesheets and XQuery Documents

Oxygen XML Editor Eclipse plugin includes a powerful debugging interface that helps you to detect and solve problems with XSLT and XQuery transformations.

XSLT Debugger Perspective

The **XSLT Debugger perspective** ([on page 2680](#)) allows you to detect problems in an XSLT transformation by executing the process step by step. To switch the focus to this *perspective*, select **Window > Open Perspective > Other > Oxygen XSLT Debugger**.

XQuery Debugger Perspective

The **XQuery Debugger perspective** ([on page 2680](#)) allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select **Window > Open Perspective > Other > Oxygen XQuery Debugger**.

XSLT/XQuery Debugging Overview

The **XSLT Debugger** and **XQuery Debugger perspectives** ([on page 2680](#)) allows you to test and debug XSLT 1.0 / 2.0 / 3.0 stylesheets and XQuery 1.0 / 3.0 documents including complex XPath 2.0 / 3.0 expressions. The interface presents simultaneous views of the source XML document, the XSLT/XQuery document and the result document. As you go step by step through the XSLT/XQuery document the corresponding output is generated step by step, and the corresponding position in the XML file is highlighted. At the same time, special views provide various types of debugging information and events useful to understand the transformation process.

The following set of features allow you to test and solve XSLT/XQuery problems:

- Support for XSLT 1.0 stylesheets (using Saxon 6.5.5 and Xalan XSLT engines), XSLT 2.0 / 3.0 stylesheets and XPath 2.0 / 3.0 expressions that are included in the stylesheets (using Saxon 12.3 XSLT engine) and XQuery 1.0 / 3.0 (using Saxon 12.3 XQuery engine).
- Stepping capabilities: step in, step over, step out, run, run to cursor, run to end, pause, stop.
- Output to source mapping between every line of output and the instruction element / source context that generated it.
- [Breakpoints](#) ([on page 1934](#)) on both source and XSLT/XQuery documents.
- Call stack on both source and XSLT/XQuery documents.
- Trace history on both source and XSLT/XQuery documents.
- Support for XPath expression evaluation during debugging.
- Step into imported/included stylesheets as well as included source entities.

- Available templates and hits count.
- Variables view.
- Dynamic output generation.

Resources

For even more information, watch our video demonstration:

<https://www.youtube.com/embed/m9d8c4V-LJw>

Debugger Layout

The XML and XSL files are displayed in **Text mode** (*on page 306*). The other modes (**Author mode** (*on page 242*), **Grid mode** (*on page 242*)) are available only in the **Editor perspective** (*on page 234*).

The **XSLT/XQuery Debugger perspective** (*on page 2680*) contains the following components:

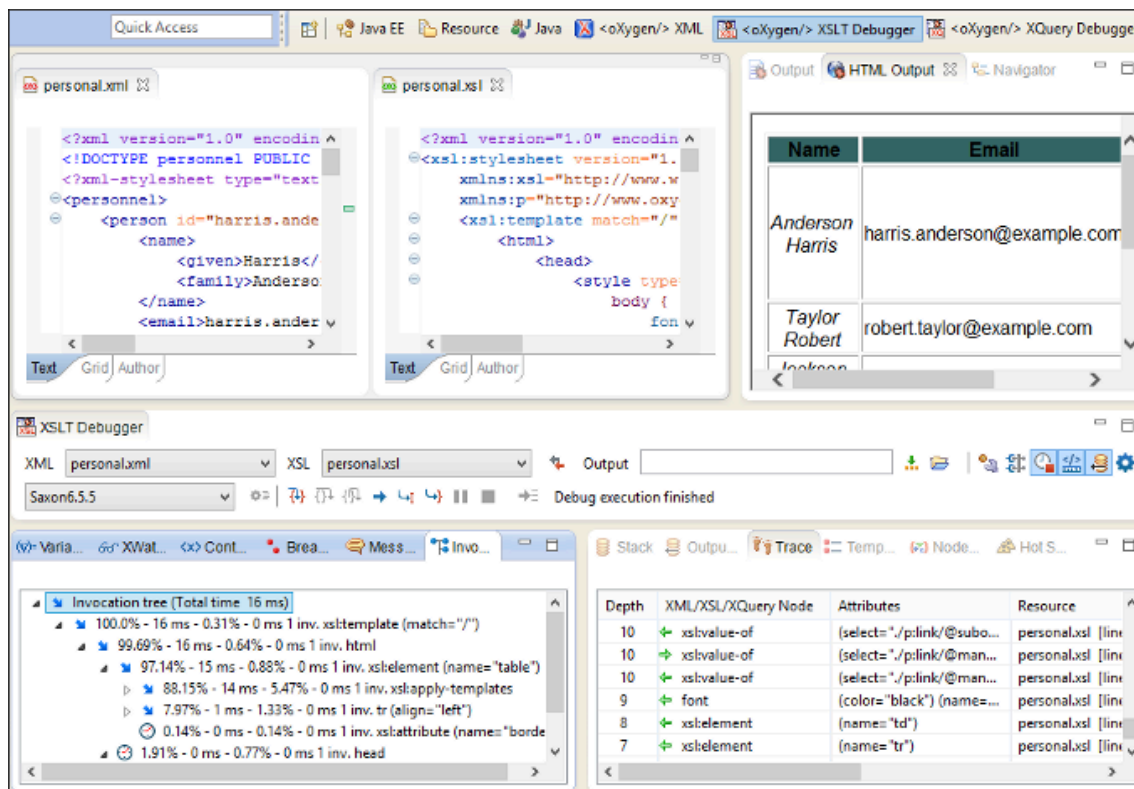

- **Source Document View (XML)** - Displays and allows the editing of XML files (documents).
- **XSLT/XQuery Document View (XSLT/XQuery)** - Displays and allows the editing of XSL files (stylesheets) or XQuery documents.
- **Output View** - Displays the output that results from inputting a document (XML) and a stylesheet (XSL) or XQuery document in the transformer. The transformation result is written dynamically while the transformation is processed (using the [➔ Run button on the Control toolbar](#) (*on page 1917*)). Several actions are available in the contextual menu for this view, including **Find/Replace**,  **Copy**, and  **Format and Indent**. There are two types of output views: a text-based **Output** view (with XML syntax highlights) and **HTML** view.
- **Control Toolbar** (*on page 1915*) - Contains a variety of actions to help you configure and control the debugging process.
- **Information Views** (*on page 1918*) - The information views at the bottom of the editor display various types of information to help you understand the transformation process.

Tip:

The **Output** view and the various other information views are **dockable** (*on page 2677*) so that you can configure the workspace according to your preferences.

Figure 490. Debugger Interface

XML documents and XSL stylesheets or XQuery documents that were opened in the **Editor perspective** (on page 2680) are automatically sorted into the first two panes. When multiple files of each type are opened, the individual documents and stylesheets are separated using the familiar tab management system that you are used to in the **Editor perspective**. Selecting a tab brings the document or stylesheet into focus and enables editing without the need to go back to the **Editor perspective**.

During debugging, the current execution node is highlighted in both document (XML) and XSLT/XQuery views.

Related Information:

- [Steps in a Typical Debugging Process \(on page 1931\)](#)
- [Identify the XSLT / XQuery Expression that Generated Particular Output \(on page 1932\)](#)
- [Supported Processors for XSLT / XQuery Debugging \(on page 1940\)](#)
- [Performance Profiling of XSLT Stylesheets and XQuery Documents \(on page 1935\)](#)

Control Toolbar

The **Control** toolbar contains all the actions that you need to configure and control the debugging process. The following actions are described as they appear in the toolbar from left to right.

Figure 491. Control Toolbar

XML source selector

The current selection represents the source document used as input by the transformation engine. The selection list contains all open files (XML files being emphasized). This option allows you to use other file types also as source documents. In an XQuery debugging session this selection field can be set to the default value `NONE`, because usually XQuery documents do not require an input source.

XSL / XQuery selector

The current selection represents the stylesheet or XQuery document to be used by the transformation engine. The selection list contains all open files (XSLT / XQuery files being emphasized).

Link with editor

When selected, the XML and XSLT/XQuery selectors display the names of the files open in the central editor panels. This button is toggled off by default.

Output selector

The selection represents the output file specified in the associated transformation scenario. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Configure parameters

Opens a dialog box that allows you to configure the XSLT / XQuery parameters to be used by the transformation.

Edit extensions

Allows you to add and remove the Java classes and *JARS* (on page 2679) used as XSLT extensions.

Turn on/off profiling

Enables / Disables current transformation profiling.

Enable XHTML output

Enables the rendering of the output in the **HTML output view** (on page 1914) during the transformation process. For performance issues, disable XHTML output when working with very large files. Note that only XHTML conformant documents can be rendered by this view. To view the output result of other formats, such as HTML, save the **Text output** area to a file and use an external browser for viewing.

When starting a debug session from the **Editor perspective** (on page 2680) by using the **Debug Scenario** action, the state of this toolbar button reflects the state of the **Show as XHTML** output option from the scenario.

Turn on/off output to source mapping

Enables or disables the output to source mapping between every line of output and the instruction element / source context that generated it.

Debugger preferences

Quick link to [Debugger preferences page \(on page 201\)](#).

XSLT / XQuery engine selector

Lists the [processors available for debugging XSLT and XQuery transformations \(on page 1940\)](#).

XSLT / XQuery engine advanced options

If Saxon HE/PE/EE is selected, you can click this button to open the [Advanced Saxon Transformation Options page \(on page 1210\)](#).

Step into F7

Starts the debugging process and runs until the next instruction is encountered.

Step over F8 (Option + F8 on macOS)

Run until the current instruction and its sub-instructions are over. Usually this will advance to the next sibling instruction.

Step out Shift + F7 (Command + F8 on macOS)

Run until the parent of the current instruction is over. Usually this will advance to the next sibling of the parent instruction.

Run Shift + F5

Starts the debugging process. The execution of the process is paused when a [breakpoint \(on page 1919\)](#) is encountered or the transformation ends.

Run to cursor Ctrl + F5

Starts the debugging process and runs until one of the following conditions occur: the line of cursor is reached, a valid [breakpoint \(on page 1934\)](#) is reached or the execution ends.

Run to end Alt + F5

Runs the transformation until the end, without taking into account enabled [breakpoints \(on page 1934\)](#), if any.

Pause Shift + F6

Request to pause the current transformation as soon as possible.

Stop F6

Request to stop the current transformation without completing its execution.

Show current execution nodes

Reveals the current debugger context showing both the current instruction and the current node in the XML source. Possible displayed states:

- Entering (→) or leaving (←) an XML execution node.
- Entering (→) or leaving (←) an XSL execution node.
- Entering (→) or leaving (←) an XPath execution node.

**Note:**

When you set a MarkLogic server as a processor, the **Show current execution nodes** button is named **Refresh current session context from server**. Click this button to refresh the information in all the views.

**Note:**

For some XSLT processors (Saxon-HE/PE/EE), the debugger could be configured to step into the XPath expressions affecting the behavior of the following debugger actions: **Step into**, **Step over** or **Step Out**.

Related Information:

[Advanced Saxon HE/PE/EE XQuery Transformation Options \(on page 1226\)](#)

Debugging Information Views

The information views at the bottom of the editor is comprised of two panes that are used to display various types of information used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This enables the developer to obtain a clear view of the transformation progress. By using the debug controls, developers can easily isolate parts of stylesheet. Therefore, they may be more easily understood and modified.

The information types include the following:

Left side information views

- **Breakpoints** view ([on page 1919](#))
- **XWatch** view ([on page 1921](#))
- **Context** view ([on page 1920](#))
- **Messages** view ([on page 1922](#)) (XSLT only)
- **Variables** view ([on page 1929](#))
- **Invocation Tree** view ([on page 1937](#))

Right side information views

- **Stack** view ([on page 1923](#))
- **Output Mapping Stack** view ([on page 1924](#))
- **Trace** view ([on page 1926](#))

- **Templates** view (on page 1927) (XSLT only)
- **Nodes/Values Set** view (on page 1928)
- **Hotspots** view (on page 1938)

**Tip:**

The information views are **dockable** (on page 2677) so that you can configure the workspace according to your preferences.

Breakpoints View

The **Breakpoints** view lists all *breakpoints* (on page 1934) that are set on open documents. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. *Breakpoints can be inserted* (on page 1934) in the XML source document or the XSLT/XQuery document in debugging sessions.

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

Figure 492. Breakpoints View

Ena...	Resource	Condition
<input checked="" type="checkbox"/>	personal.xml: 11	count(preceding::person)=2
<input checked="" type="checkbox"/>	personal.xml: 9	local-name()='person'
<input checked="" type="checkbox"/>	personal.xml: 8	(No condition)
<input checked="" type="checkbox"/>	personal.xml: 6	(No condition)

The **Breakpoints** view contains the following columns:

- **Enabled** - If selected, the current condition is evaluated and taken into account.
- **Resource** - Resource file and number of the line where the *breakpoint* is set.
- **Condition** - XSLT/XQuery expression to be evaluated during debugging. The expression will be evaluated at every debug step.

Clicking a record highlights the *breakpoint* line in the document.

**Note:**

The *breakpoints* list is not deleted at the end of a transformation (it is preserved between debugging sessions).

The following actions are available in the contextual menu of the table:

Go to

Moves the cursor to the source of the *breakpoint*.

Run to Breakpoint

Runs the debugger up to the point of this particular *breakpoint* and ignores the others (regardless of whether they were previously enabled or disabled).

Enable

Enables the *breakpoint*.

Disable

Disables the *breakpoint*. A disabled *breakpoint* will not be evaluated by the Debugger.

Add

Allows you to add a new *breakpoint* and *breakpoint condition*.

Edit

Allows you to edit an existing *breakpoint*.

Remove

Deletes the selected *breakpoint*.

Enable all

Enables all *breakpoints*.

Disable all

Disables all *breakpoints*.

Remove all

Removes all *breakpoints*.

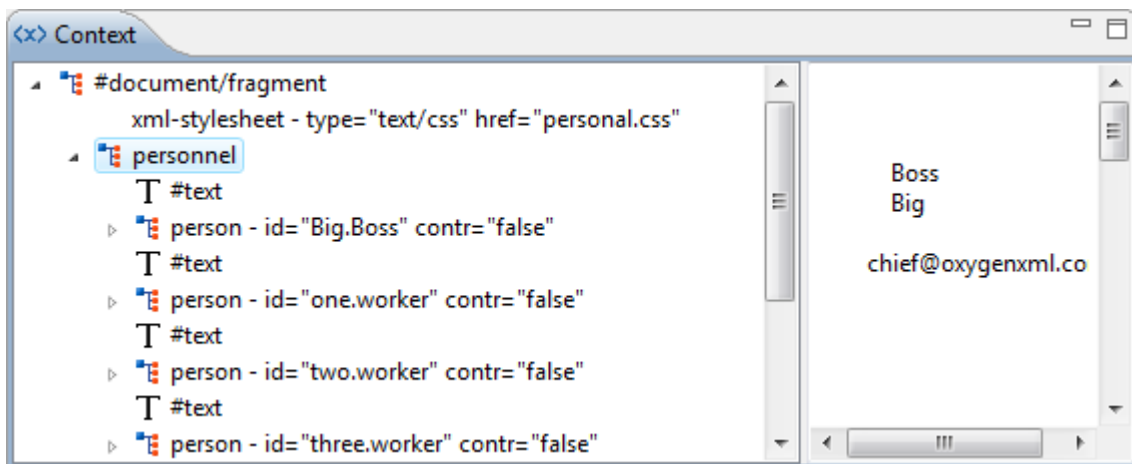

Related Information:

[Using Breakpoints \(on page 1934\)](#)

Context View

The context node is valid only for XSLT debugging sessions and is a source node corresponding to the XSL expression that is evaluated. It is also called the context of execution. The context node implicitly changes as the processor hits various steps (at the point where XPath expressions are evaluated). This node has the same value as evaluating '.' (dot) XPath expression in **XWatch** view (on page 1921). The value of the context node is presented as a tree in the **Context** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 493. Context node view

The context nodes are presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel. The **Context** view also presents the current mode of the XSLT processor if this mode differs from the default one.

XPath Watch (XWatch) View

The **XWatch** view shows XPath expressions evaluated during the debugging process. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Expressions are evaluated dynamically as the processor changes its source context. When you type an XPath expression in the **Expression** column, Oxygen XML Editor Eclipse plugin supports you with syntax highlight and [content completion assistance \(on page 661\)](#).

Figure 494. XPath Watch View

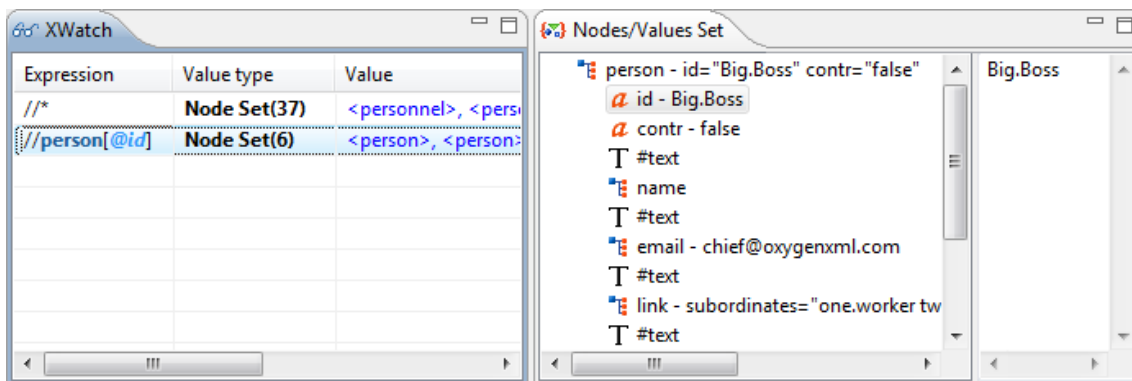

Table 43. XWatch columns

Column	Description
Expression	XPath expression to be evaluated (XPath 1.0 or 2.0 / 3.0 compliant).

Table 43. XWatch columns (continued)

Col- umn	Description
Val- ue	Result of XPath expression evaluation. Value has a type (see the possible values (on page 1929) in the Variables View (on page 1929)) section. For <i>Node Set</i> results, the number of nodes in the set is shown in parenthesis.

Important:

Notes about working with the **XWatch** view:

- Expressions that reference variable names are not evaluated.
- The expression list is not deleted at the end of the transformation (it is preserved between debugging sessions).
- To insert a new expression, click the first empty line of the **Expression** column and start typing.
- To delete an expression, click its **Expression** column and delete its content.
- If the expression result type is a *Node Set*, click it (**Value** column) and its value is displayed in the [Nodes/Values Set view \(on page 1928\)](#).
-

Messages View

Using an `xsl:message` instruction is one way to signal special situations encountered during transformation as well as a raw way of doing the debugging. The **Messages** view is available only for XSLT debugging sessions and shows all `xsl:message` calls executed by the XSLT processor during transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 495. Messages View

Message	Terminate	Resource
Message 1	no	personal.xml [line: 8]
Message 2	no	personal.xml [line: 12]
Message 3	no	personal.xml [line: 29]

Table 44. Messages columns

Column	Description
Mes- sage	Message content.
Termi- nate	Signals whether or not the processor terminates the transformation once it encounters the mes- sage (yes/no respectively).

Table 44. Messages columns (continued)

Column	Description
Re-source	Resource file where <code>xsl:message</code> instruction is defined and the message line number.

The following actions are available in the contextual menu:

Go to

Highlight the XSL fragment that generated the message.

Copy

Copies to clipboard message details (system ID, severity info, description, start location, terminate state).

✖ Clear all

Removes all messages from the view.

**Important:**

- Clicking a record from the table highlights the `xsl:message` declaration line.
- Message table values can be sorted by clicking the corresponding column header. Clicking the column header switches the sorting order between: ascending, descending, no sort.

Stack View

The **Stack** view shows the current execution stack of both source and XSLT/XQuery nodes. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

During the transformation, two stacks are managed. One for source nodes being processed and the other for XSLT/XQuery nodes being processed. Oxygen XML Editor Eclipse plugin shows both node types in one common stack. The source (XML) nodes are preceded by a red color icon while XSLT/XQuery nodes are preceded by a green color icon. The advantage of this approach is that you can always see the source scope on which an XSLT/XQuery instruction is executed (the last red color node on the stack). The stack is oriented upside down.

Figure 496. Stack View

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line containing the XSLT element that is displayed on the selected line from the view.

Table 45. Stack Columns

Column	Description
#	Order number, represents the depth of the node (0 is the stack base).
XML/XSLT/XQuery Node	Node from source or stylesheet document currently being processed. One particular stack node is the document root, noted as #document .
Attributes	Attributes of the node (a list of <i>id="value"</i> pairs).
Resource	Resource file where the node is located.

Important:

Remarks:

- Clicking a record from the stack highlights that node's location inside resource.
- Using Saxon, the stylesheet elements are qualified with XSL proxy, while using Xalan you only see their names. (example: `xsl:template` using Saxon and `template` using Xalan).
- Only the Saxon processor shows element attributes.
- The Xalan processor shows also the built-in rules.

Output Mapping Stack View

The **Output Mapping Stack** view displays [context data \(on page 1932\)](#) and presents the XSLT templates/XQuery elements that generated specific areas of the output. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 497. Output Mapping Stack view

#	XML/XSL/XQuery Node	Attributes	Resource
8	xsl:value-of	(select= "email/text()")	file:/D:/runtime-Eclipse
7	font	(name= "verdana") (size= "3")	file:/D:/runtime-Eclipse
6	xsl:element	(name= "td")	file:/D:/runtime-Eclipse
5	xsl:element	(name= "tr")	file:/D:/runtime-Eclipse
4	xsl:template	(match= "//person")	file:/D:/runtime-Eclipse
3	xsl:apply-templates		file:/D:/runtime-Eclipse
2	xsl:element	(name= "table")	file:/D:/runtime-Eclipse
1	html		file:/D:/runtime-Eclipse
0	xsl:template	(match= "/")	file:/D:/runtime-Eclipse

The **Go to** action of the contextual menu takes you to the line that contains the XSLT element displayed in the **Output Mapping Stack** view.

Table 46. Output Mapping Stack Columns

Column	Description
#	The order number in the stack of XSLT templates/XQuery elements. Number 0 corresponds to the bottom of the stack in the status of the XSLT/XQuery processor. The highest number corresponds to the top of the stack.
XSL/XQuery Node	The name of an XSLT template/XQuery element that participated in the generation of the selected output area.
Attributes	The attributes of the XSLT template/XQuery node.
Resource	The name of the file containing the XSLT template/XQuery element.

**Important:**

Remarks:

- Clicking a record highlights that XSLT template definition/XQuery element inside the resource (XSLT stylesheet file/XQuery file).
- Saxon only shows the applied XSLT templates having at least one hit from the processor. Xalan shows all defined XSLT templates, with or without hits.
- The table can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in XSLT rules.

Related Information:

[Identify the XSLT / XQuery Expression that Generated Particular Output \(on page 1932\)](#)

[Stack View \(on page 1923\)](#)

[Trace View \(on page 1926\)](#)

[Templates View \(on page 1927\)](#)

Trace View

Usually, the XSLT/XQuery processors signal the following events during transformation:

- → - Entering a source (XML) node.
- ← - Leaving a source (XML) node.
- → - Entering an XSLT/XQuery node.
- ← - Leaving an XSLT/XQuery node.

The **Trace** view catches all of these events, so you can see how the process evolved. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The red icon lines denote source nodes while the green icon lines denote XSLT/XQuery nodes. It is possible to save the element trace in a structured XML document (using the **Export to XML** action in the contextual menu). Thus, you have the possibility of comparing the trace results from multiple debug sessions.

Figure 498. Trace History View

Depth	XML/XSL/X...	Attributes	Resource
3	→ xsl:element	(name="tab...	file:/D:/runtime-New_configuration/...
4	→ xsl:messa...		file:/D:/runtime-New_configuration/...
4	← xsl:messa...		file:/D:/runtime-New_configuration/...
4	→ xsl:messa...		file:/D:/runtime-New_configuration/...
4	← xsl:messa...		file:/D:/runtime-New_configuration/...
4	→ xsl:messa...	(terminate=...	file:/D:/runtime-New_configuration/...

The contextual menu contains the following actions:

Go to

Moves the selection in the editor panel to the line containing the XSLT element or XML element that is displayed on the selected line from the view;

Export to XML

Saves the entire trace list in XML format.

Table 47. Trace History Columns

Column	Description
Depth	Shows you how deep the node is nested in the XML or stylesheet structure. The bigger the number, the more nested the node is. A depth 0 node is the document root.
XML/XSLT/XQuery Node	Represents the node from the processed source or stylesheet document. One particular node is the document root, noted as <i>#document</i> . Every node is preceded by an arrow that represents what action was performed on it (entering or leaving the node).
Attributes	Attributes of the node (a list of <i>id="value"</i> pairs).
Resource	Resource file where the node is located.

**Important:**

Remarks:

- Clicking a record highlights that node's location inside the resource.
- Only the Saxon processor shows the element attributes.
- The Xalan processor shows also the built-in rules.

Templates View

The **xsl:template** is the basic element for stylesheets transformation. The **Templates** view is only available during XSLT debugging sessions and shows all *xsl:template* instructions used by the transformation. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Being able to see the number of *hits* for each of the templates allows you to get an idea of the stylesheet coverage by template rules with respect to the input source.

Figure 499. Templates view

Match	Hits	Pr...	M...	N...	Resource
//person	4	N/A	N/A	N/A	file:/D:/runtime-New_configuration
/	1	N/A	N/A	N/A	file:/D:/runtime-New_configuration

The contextual menu contains one action: **Go to**, which moves the selection in the editor panel to the line that contains the XSLT template displayed on the selected line from the view.

Table 48. Templates columns

Col- umn	Description
Match	The <i>match</i> attribute of the <i>xsl:template</i> .
Hits	The number of hits for the <i>xsl:template</i> . Shows how many times the XSLT processor used this particular template.
Priori- ty	The template priority as established by XSLT processor.
Mode	The <i>mode</i> attribute of the <i>xsl:template</i> .
Name	The <i>name</i> attribute of the <i>xsl:template</i> .
Re- source	The resource file where the template is located.

**Important:**

Remarks:

- Clicking a record highlights that template definition inside the resource.
- Saxon only shows the applied templates having at least one hit from the processor. Xalan shows all defined templates, with or without hits.
- Template table values can be sorted by clicking the corresponding column header. When clicking a column header the sorting order switches between: ascending, descending, no sort.
- Xalan shows also the built-in rules.

Nodes/Values Set View

The **Nodes/Values Set** view is always used in relation with the **Variables** view (on page 1929) and **XWatch** view (on page 1921). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. It shows an XSLT node set value in a tree form. This view is updated as a response to the following events:

- You click a variable that has a node set value in the **Variables** (on page 1929) or **XWatch** view (on page 1921).
- You click a tree fragment in the **Variables** (on page 1929) or **XWatch** view (on page 1921).
- You click an XPath expression evaluated to a node set in the **Variables** (on page 1929) or **XWatch** view (on page 1921).

Figure 500. Node Set view

The nodes / values set is presented in a tree-like fashion. Nodes from a defined namespace bound to a prefix are displayed using the qualified name. If the namespace is not bound to a prefix, the namespace URI is presented before the node name. The value of the selected attribute or node is displayed in the right side panel.

**Important:**

Remarks:

- For longer values in the right side panel, the interface displays it with an ellipsis (...) at the end. A more detailed value is available as a tooltip when hovering over it.
- Clicking a record highlights the location of that node in the source or stylesheet view.

Variables View

The **Variables** view displays variables and parameters (local and global), along with their values. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Variables and parameters play an important role during an XSLT/XQuery transformation. Oxygen XML Editor Eclipse plugin uses the following icons to differentiate variables and parameters:

- **V** - Global variable.
- **{V}** - Local variable.
- **P** - Global parameter.
- **{P}** - Local parameter.

The following value types are available:

- **Boolean**
- **String**
- **Date** - XSLT 2.0 / 3.0 only.
- **Number**
- **Set**
- **Object**

- **Fragment** - Tree fragment.
- **Any**
- **Undefined** - The value was not yet set, or it is not accessible.

 **Note:**

When Saxon 6.5 is used, if the value is unavailable, then the following message is displayed in the **Value** field: "The variable value is unavailable".

When Saxon 9 is used:

- If the variable is not used, the **Value** field displays "The variable is declared but never used".
- If the variable value cannot be evaluated, the **Value** field displays "The variable value is unavailable".

- **Document**
- **Element**
- **Attribute**
- **ProcessingInstruction**
- **Comment**
- **Text**
- **Namespace**
- **Evaluating** - Value under evaluation.
- **Not Known** - Unknown types.

Figure 501. Variables View

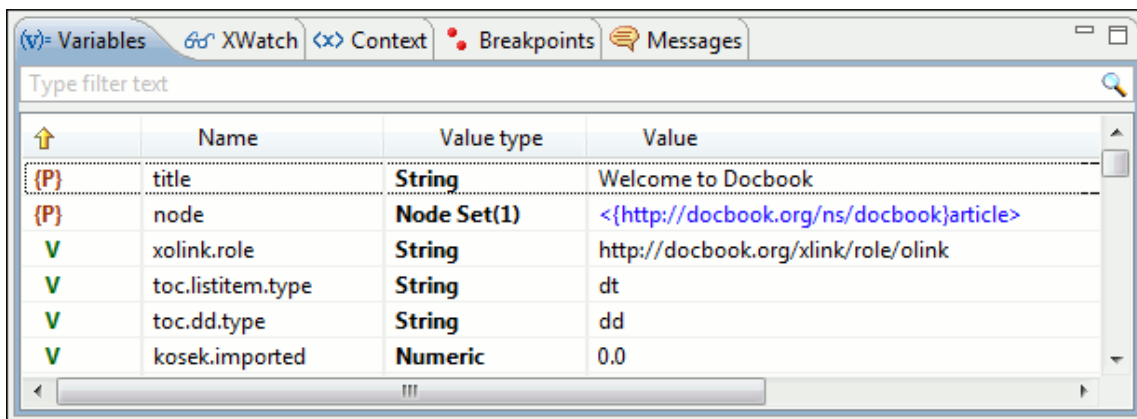

Table 49. Variables Columns

Column	Description
Name	Name of variable / parameter.
Value Type	Type of variable/parameter.

Table 49. Variables Columns (continued)

Column	Description
Value	Current value of variable / parameter.

The value of a variable (the **Value** column) can be copied to the clipboard for pasting it to other editor areas with the **Copy value** action from the contextual menu. This is useful if you have long and complex values that cannot be easily remembered just by looking at them once.

**Important:**

Remarks:

- Local variables and parameters are the first entries presented in the table.
- Clicking a record highlights the variable definition line.
- Variable values could differ depending on the transformation engine used or stylesheet version set.
- If the value of the variable is a node set or a tree fragment, clicking it causes the **Node Set view** (on page 1928) to be shown with the corresponding set of values.
- Variable table values can be sorted by clicking the corresponding column header. Clicking the column header switches between the orders: ascending, descending, no sort.

Multiple Output Documents in XSLT 2.0 and XSLT 3.0

For XSLT 2.0 and XSLT 3.0 stylesheets that store the output in multiple files by using the `xsl:result-document` instruction, the content of the file created in this way is displayed in an output view after the transformation is finished. There is one tab for each `xsl:result-document` instruction in the **Result Documents** view so that the output is not mixed while still being presented in multiple views.

Steps in a Typical Debugging Process

Depending on your situation and needs, the debugging process might be more complex, but the following procedure is an example of a typical debugging process:

1. Open the source XML document and the XSLT/XQuery document.
2. If you are in the **Editor perspective** (on page 2680), switch to the **XSLT Debugger** or **XQuery Debugger perspective** (on page 2680) with one of the following actions:
 - Select **Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger**.
 - Select the  **Debug scenario** action on the toolbar.. This action initializes the Debugger **perspective** (on page 2680) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger **perspective**.

3. Select the source XML document in the [XML source selector of the Control toolbar \(on page 1915\)](#). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
4. Select the XSLT/XQuery document in the [XSL/XQuery selector of the Control toolbar \(on page 1916\)](#).
5. Set XSLT/XQuery parameters using the **Configure parameters** button on the Control toolbar [\(on page 1916\)](#).
6. [Set one or more breakpoints \(on page 1934\)](#).
7. Step through the stylesheet using the [following buttons available on the Control toolbar \(on page 1917\)](#):
 -  **Step into**
 -  **Step over**
 -  **Step out**
 -  **Run**
 -  **Run to cursor**
 -  **Run to end**
 -  **Pause**
 -  **Stop**
8. Examine the data in the information views to find the bug in the transformation process.
For more information about fixing bugs in the transformation, see: [Identify the XSLT / XQuery Expression that Generated Particular Output \(on page 1932\)](#).

Related Information:

[Identify the XSLT / XQuery Expression that Generated Particular Output \(on page 1932\)](#)

Identify the XSLT / XQuery Expression that Generated Particular Output

To quickly spot the XSLT templates or XQuery expressions with problems, it is important to know what XSLT template in the XSLT stylesheet (or XQuery expression in the XQuery document) and what element in the source XML document generated a specified area in the output.

Some of the debugging capabilities (for example, **Step in**) can be used for this purpose. Using **Step in**, you can see how output is generated and link it with the XSLT/XQuery element being executed in the current source context. However, this can become difficult on complex XSLT stylesheets or XQuery documents that generate a large output.

You can click particular text in the **Output** view and the editor will select the XML source context and the XSLT template/XQuery element that generated that text. Also, inspecting the whole stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the specified output area speeds up the debugging process.

This is an example of a typical procedure for identifying an expression that generated particular output:

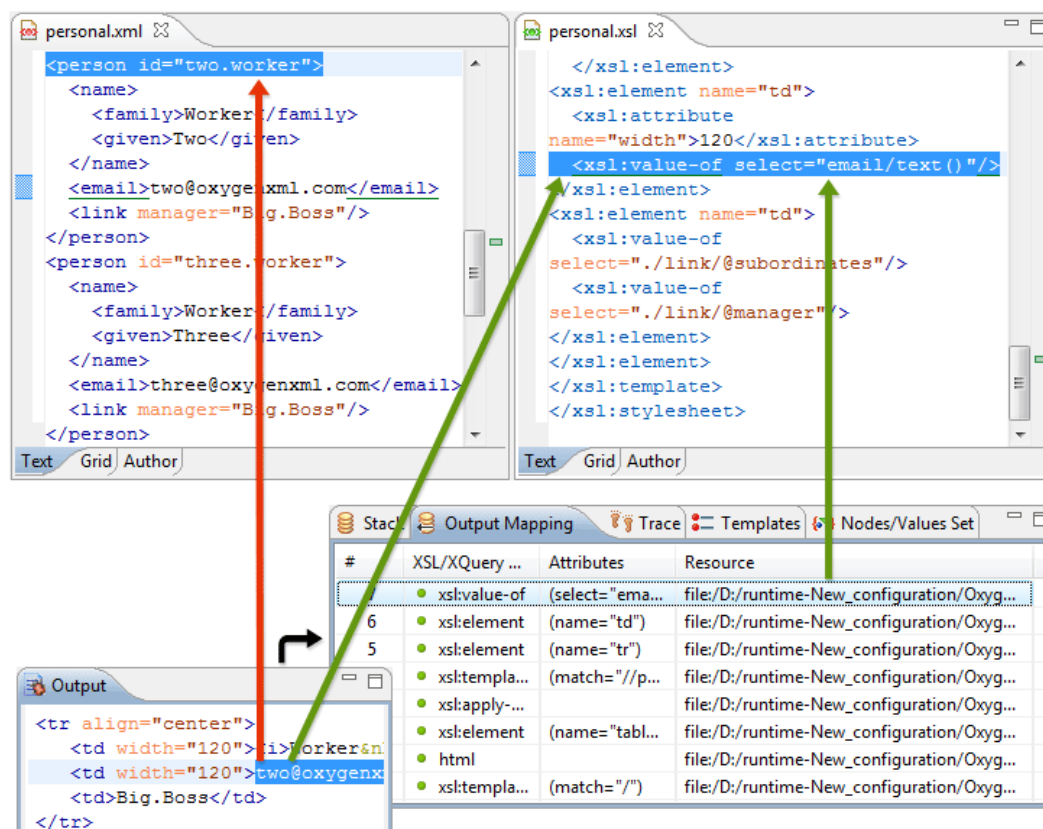

- Switch to the **XSLT Debugger** or **XQuery Debugger perspective** (on page 2680) with one of the following actions:
 - Select **Window > Open Perspective > Other > Oxygen XSLT Debugger/XQuery Debugger**.
 - Select the  **Debug scenario** action on the toolbar.. This action initializes the Debugger perspective (on page 2680) with the parameters of the transformation scenario. Any modification applied to the scenario parameters (the transformer engine, XSLT parameters, transformer extensions, etc.) will be saved back in the scenario when exiting from the Debugger perspective.
- Select the source XML document in the **XML source selector** of the **Control toolbar** (on page 1915). In the case of XQuery debugging, if your XQuery document has no implicit source, set the source selector value to **NONE**.
- Select the XSLT/XQuery document in the **XSL/XQuery selector** of the **Control toolbar** (on page 1916).
- Select the appropriate engine in the **XSLT/XQuery engine selector** of the **Control toolbar** (on page 1917).
- Set XSLT/XQuery parameters using the **Configure parameters** button on the **Control toolbar** (on page 1916).
- Apply the XSLT stylesheet or XQuery transformation using the  **Run to end** button that is available on the **Control toolbar** (on page 1917).
- Inspect the mapping by clicking a section of the output in the **Output** view.

Figure 502. Text Output to Source Mapping

This action will highlight the XSLT / XQuery element and the XML source context. This XSLT template/XQuery element that is highlighted in the XSLT/XQuery editor represents only the top of the stack of XSLT templates/XQuery elements that determined the state of the XSLT/XQuery processor at the moment of generating the clicked output section. In the case of complex transformations, inspecting the whole stack of XSLT templates/XQuery elements speeds up the debugging process. This stack is available in the **Output Mapping Stack view** (on page 1924).

Related Information:

[Output Mapping Stack View](#) (on page 1924)

[Trace View](#) (on page 1926)

[Templates View](#) (on page 1927)

Using Breakpoints

The Oxygen XML Editor Eclipse plugin XSLT/XQuery Debugger allows you to interrupt XSLT/XQuery processing to gather information about variables and processor execution at particular points. To ensure *breakpoints* are persistent between work sessions, they are saved at project level. You can set a maximum of 100 *breakpoints* per project.

Inserting Breakpoints

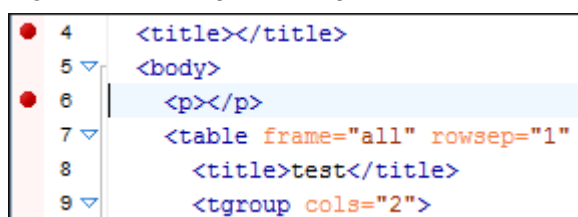

To insert a *breakpoint*, follow these steps:

1. Click the line where you want to insert the *breakpoint* in the XML source document or the XSLT/XQuery document. *Breakpoints* are automatically created on the ending line of a start tag, even if you click a different line.
2. Right-click the vertical stripe on the left side of the editor panel and select **Add breakpoint**.

Result:

Once you insert a *breakpoint*, it is automatically added to the list in the **Breakpoints** view and you can edit its associated *condition*. A *breakpoint* can have an associated break condition that represents an XPath expression evaluated in the current debugger context. For them to be processed, their evaluation result should be a boolean value. A *breakpoint* with an associated condition only stops the execution of the Debugger if the *breakpoint condition* is evaluated as **true**.

Figure 503. Example: Breakpoints

```
4 <title></title>
5 <body>
6 <p></p>
7 <table frame="all" rowsep="1"
8 <title>test</title>
9 <tgroup cols="2">
```

The image shows a code editor with XML content. Line 6, which contains the closing tag for a paragraph (<p></p>), is highlighted in light blue. A red circle icon is positioned to the left of line 6, indicating that a breakpoint has been set at this location. The rest of the XML code is visible, including a table structure starting on line 7.

**Tip:**

You can configure the color and how *breakpoints* are shown from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on macOSX) > Preferences > General > Editors > Text Editors > Annotations**).

Removing Breakpoints

To remove a *breakpoint*, Right-click the *breakpoint* icon (●) in the vertical stripe on the left side of the editor panel and select **Remove breakpoint**.

Related Information:

[Breakpoints View \(on page 1919\)](#)

Performance Profiling of XSLT Stylesheets and XQuery Documents

Whether you are trying to identify a performance issue that is causing your production XSLT/XQuery transformation to not meet customer expectations or you are trying to proactively identify issues prior to deploying your XSLT/XQuery transformation, using the XSLT/XQuery profiler feature is essential to helping you save time and ultimately ensure a better performing, more scalable XSLT/XQuery transformation.

The XSLT/XQuery profiling feature can use any available XSLT/XQuery processor that can be used for debugging and it is available from the debugging *perspective* (on page 2680).

Enabling the Profiler

Enabling and disabling the profiler is controlled by the  **Profiler** button from the debugger **Control toolbar** (on page 1916). The XSLT/XQuery profiler is off by default. This option is not available during a debugger session so you need to set it before starting the transformation. For information about a common debugging procedure, see [Steps in a Typical Debugging Process \(on page 1931\)](#).

Profiling Information Views

Immediately after enabling the profiler, two new information views are added to the current debugger *information views* (on page 1918):

- **Invocation tree view** (on page 1937) on left side
- **Hotspots view** (on page 1938) on right side

Profiling data is available only after the transformation ends successfully.

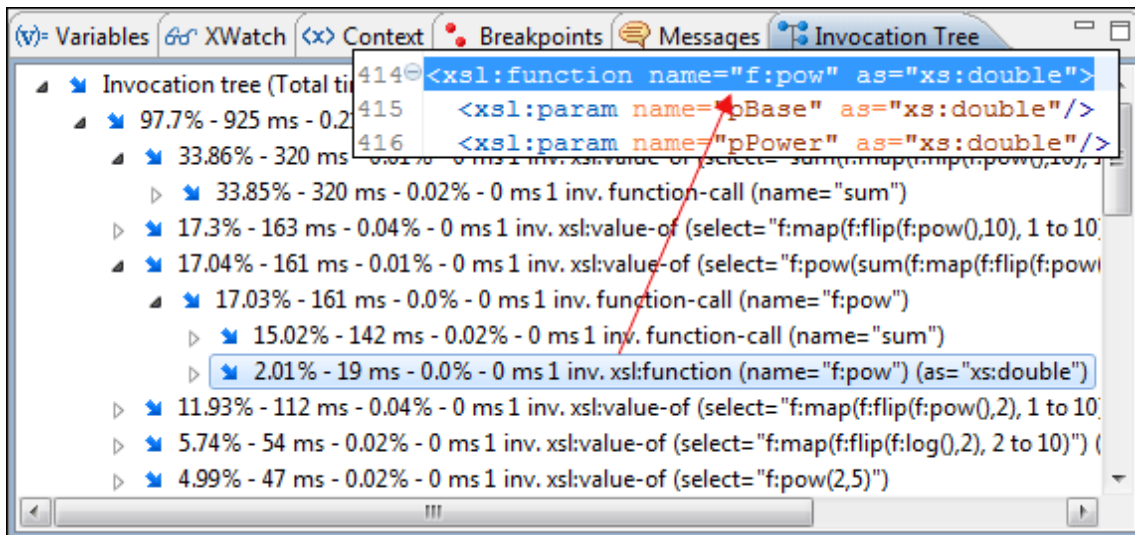

On the left side (**Invocation tree view** (on page 1937)), you can examine how style instructions are processed. This result view is also named call-tree, as it represents the order of style processing. The profiling result shows the duration time for each of the style-instruction including the time needed for its called children.

On the right side (**Hotspots view** [\(on page 1938\)](#)), you can immediately spot the time the processor spent in each instruction. As an instruction usually calls other instructions, the used time of the called instruction is extracted from the duration time of the caller (the hotspot only presents the inherent time of the instruction).

Source Backmapping

In either the **Invocation tree** [\(on page 1937\)](#) or **Hotspots view** [\(on page 1938\)](#), you can use the backmapping feature to find the XSLT stylesheet or XQuery expression definition. Clicking the selected item causes Oxygen XML Editor Eclipse plugin to highlight the XSLT stylesheet or XQuery expression source line where the instruction is defined.

Figure 504. Source Backmapping

Saving and Customizing Profiling Data

The profiling data can be saved (exported) into XML and HTML format. In either the **Invocation tree** [\(on page 1937\)](#) or **Hotspots view** [\(on page 1938\)](#), right-click anywhere in the view and select **Export to XML** or **Export to HTML**. The HTML report can be customized based upon the profiling raw data. When you select **Export to HTML**, Oxygen XML Editor Eclipse plugin will save it as XML and apply an XSLT stylesheet to render the report as HTML. You can customize these stylesheets to suit your needs. By default, they are located in:

`[OXYGEN_INSTALL_DIR]/frameworks/profiler/`.

Other Profiling Notes

- If you want to change the **XSLT/XQuery profiler settings** [\(on page 202\)](#), use the contextual menu and choose the corresponding **View settings** entry.
- Profiling exhaustive transformations may run into an **OutOfMemory** error due to the large amount of information being collected. If this is the case, you can close unused projects when running the profiling or use high values for Java VM options `-Xms` and `-Xmx`. If this does not help you can shorten your source XML file and try again.

Resources

For more information about the XSLT/XQuery Profiler, watch our video demonstration:

<https://www.youtube.com/embed/4ftHschjLqA>

Invocation Tree View

The **Invocation Tree** view shows a top-down call tree that represents how XSLT instructions or XQuery expressions are processed. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 505. Invocation Tree View

The entries in the invocation tree include a few possible icons that indicate the following:

-  - Points to a call whose inherent time is insignificant compared to its total time.
-  - Points to a call whose inherent time is significant compared to its total time (greater than 1/3rd of its total time).

Every entry in the invocation tree includes textual information that depends on the **XSLT/XQuery profiler settings** (on page 202):

- A percentage number of the total time that is calculated with respect to either the root of the tree or the calling instruction.
- A total time measurement in milliseconds or microseconds. This is the total execution time that includes calls into other instructions.
- A percentage number of the inherent time that is calculated with respect to either the root of the tree or the calling instruction.
- An inherent time measurement in milliseconds or microseconds. This is the inherent execution time of the instruction.
- An invocation count that shows how often the instruction has been invoked on this call-path.
- An instruction name that contains also the attributes description.

The **Invocation Tree** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: `[OXYGEN_INSTALL_DIR]/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the [XSLT/XQuery Profiler preferences page \(on page 202\)](#) that allows you to configure various profiling settings.

Hotspots View

The **Hotspots** view displays a list of all instruction calls that lie above the threshold defined in the [XSLT/XQuery profiler settings \(on page 202\)](#). If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 506. Hotspots View

Instruction	Percentage	Time	Calls
85 Hotspots			
xsl:choose	8.38%	151 ms	698
8.38% - 151 ms - 698 inv. let (name="vdiffResult")			
8.38% - 151 ms - 698 inv. let (name="vnewResult")			
8.38% - 151 ms - 698 inv. let (name="vnewElem")			
8.38% - 151 ms - 698 inv. let (name="vnext")			
8.38% - 151 ms - 698 inv. xsl:function (name="vdiff")			
let (name="vdiffResult")			698
xsl:apply-templates (select="\$pFunc") (mode="f:FXSL")			295
function-call (name="int:lnIter")	5.75%	103 ms	632

By opening a hotspot instruction entry, the tree of back-traces leading to that instruction call are calculated and shown.

Every hotspot is described by the values from the following columns:

- **Instruction** - The name of the instruction.
- **Percentage** - The percentage number for this hotspot entry with respect to the total time.
- **Time** - The inherent time in milliseconds or microseconds of how much time has been spent in the hotspot. All calls into this instruction are summed up regardless of the particular call sequence.
- **Calls** - The invocation count of the hotspot entry.

If you click the  handle on the left side of a hotspot, a tree of back-traces will be shown.

Every entry in the backtrace tree has textual information attached to it that depends on the [XSLT/XQuery profiler settings](#) (on page 202):

- A percentage number that is calculated with respect to either the total time or the called instruction.
- A time measured in milliseconds or microseconds of how much time has been contributed to the parent hotspot on this call-path.
- An invocation count that shows how often the hotspot has been invoked on this call-path.

Note:

This is not the number of invocations of this instruction.

- An instruction name that also contains its attributes.

The **Hotspots** view also includes the following contextual menu actions:

Export to HTML

Selecting this option will save the profiling data as XML and then apply an XSLT stylesheet to render the report as HTML. These stylesheets are included in the subfolder: `[OXYGEN_INSTALL_DIR]/frameworks/profiler/`. You can use them to customize your own report based on the profiling raw data.

Export to XML

Use this option to save the profiling data as an XML file in a specified location.

View settings

Opens the [XSLT/XQuery Profiler preferences page](#) (on page 202) that allows you to configure various profiling settings.

Debugging XSLT that Call Java Extensions

It is possible to debug an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the debugging can be done based upon the same scenario.

To debug XSLT with Java extensions, follow this procedure:

1. Create an [XSLT transformation on XML scenario](#) (on page 1258) for your XSLT document (select  **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation on XML**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.
3. Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
4. Use the  **Debug scenario** action on the toolbar and the debugging will be based upon the same transformation scenario you just configured and saved.

**Tip:**

You could achieve this during a [typical debugging process \(on page 1931\)](#) by specifying the Java extensions using the  **Edit extensions** button on the debugger control toolbar [\(on page 1916\)](#).

Related Information:

[Validating XSLT Stylesheets that Call Java Extensions \(on page 656\)](#)

Debugging Java Extensions

The XSLT/XQuery debugger does not step into Java classes that are configured as XSLT/XQuery extensions of the transformation. To step into Java classes, inspect variable values, and set *breakpoints* [\(on page 1934\)](#) in Java methods, you can set up a Java debug configuration in an IDE (such as the Eclipse SDK) as described in the following steps:

1. Create a debug configuration.

- a. Make sure the `[OXYGEN_INSTALL_DIR]/lib/oxygen.jar` file and your Java extension classes are on the Java classpath.

The Java extension classes should be the same classes that were [set as an extension \(on page 1916\)](#) of the XSLT/XQuery transformation in the debugging [perspective \(on page 2680\)](#).

- b. Set the class `ro.sync.exml.Oxygen` as the main Java class of the configuration.

The main Java class `ro.sync.exml.Oxygen` is located in the `oxygen.jar` file.

2. Start the debug configuration.

Now you can set *breakpoints* and inspect Java variables as in any Java debugging process executed in the selected IDE (Eclipse SDK, and so on.).

Supported Processors for XSLT / XQuery Debugging

The following built-in XSLT processors are integrated in the debugger and can be selected in the [Control Toolbar \(on page 1915\)](#):

- **Saxon 12.3 HE (Home Edition)** - a limited version of the Saxon 9 processor, capable of running XSLT 1.0, XSLT 2.0 / 3.0 basic and XQuery 1.0 transformations, available in both the XSLT debugger and the XQuery one,
- **Saxon 12.3 PE (Professional Edition)** - capable of running XSLT 1.0 transformations, XSLT 2.0 basic ones and XQuery 1.0 ones, available in both the XSLT debugger and the XQuery one,
- **Saxon 12.3 EE (Enterprise Edition)** - a schema-aware processor, capable of running XSLT 1.0 transformations, XSLT 2.0 / 3.0 basic ones, XSLT 2.0 / 3.0 schema-aware ones and XQuery 1.0 / 3.0 ones, available in both the XSLT debugger and the XQuery debugger,
- **Saxon 6.5.5** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger,
- **Xalan 2.7.2 (Deprecated)** - capable of running only XSLT 1.0 transformations, available only in the XSLT debugger.

17.

Framework and Author Mode Customization

This section contains information and tutorials about customizing the authoring experience through custom frameworks and customizing the **Author** editing mode through CSS styling or API extensions.

Creating and Configuring Custom Frameworks

Oxygen XML Editor Eclipse plugin includes built-in, configured *frameworks* (on page 2679) for DocBook, DITA, TEI, XHTML, and JATS, but you can also create your own customization to handle other types of documents. A common use-case is wanting to customize the interface to accommodate the needs of your authoring team.

Fully configuring a *framework* usually involves customizing CSS stylesheets, XML schemas, GUI components (menu actions, toolbars, inline components, content completion proposals, and more), configuring other more general settings, then bundling the framework to share with your team. The CSS and GUI components are used to customize the interface, while other general settings can be configured to accommodate custom document templates, XML catalogs, transformation scenarios, and more.

Advanced users who are familiar with API development can also create *custom Author mode operations* (on page 1988) for a particular framework.

This section includes information about numerous possibilities for creating and customizing a *framework*, and how to share your customization with others.

Tip:

A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: <https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip>. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Creating a Framework through the Configuration Dialog

The easiest way to create a custom *framework* (on page 2679) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it. You can then easily *share the custom framework* (on page 2099) with your team.

To create a custom *framework* by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
`custom_frameworks/dita-extension`.
2. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association > Locations** ([on page 90](#)). Add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list and click **OK** or **Apply** to save your changes.
3. Go to the **Document Type Association** preferences page ([on page 88](#)) and select an existing *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.

Step Result: This opens the **Document Type Configuration** dialog box ([on page 90](#)) where you can define the set of rules and settings for your custom framework.

4. Give the extension an appropriate name, select **External** for the **Storage** option, click the browsing button () to specify the location of the custom directory you created in step 1.
5. Continue to configure the extension using the tabs on the bottom half of the dialog box. For details about each of those tabs, see the child topics in the **Document Type Configuration dialog box** ([on page 90](#)) section. For even more information about customizing the extended framework, see the various topics and tutorials in the [Creating and Configuring Custom Frameworks](#) ([on page 1941](#)) section. Make sure that you save any resources you reference in your framework configuration (CSS files, new document templates, schemas used for validation, catalogs, etc.) in your custom framework directory you created in step 1.
6. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

Results: You now have a fully functional *framework* that can be [shared with others](#) ([on page 2099](#)).

[Sharing a Framework](#) ([on page 2099](#))

[Webinar: Creating Frameworks Using an Extension Script](#)

Creating a Framework Using an Extension Script

A custom *framework* ([on page 2679](#)) (document type) can be created using a special XML descriptor file, either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it. You can then easily [share the custom framework](#) ([on page 2099](#)) with your team.

The easiest way to create such a descriptor is to use the **New document wizard** ([on page 246](#)) and choose the **Extend Framework Script** or **Create Framework Script** template.

Tip:

To see a visual, detailed look at how to create frameworks with an extension script, watch our webinar: [Creating Frameworks Using an Extension Script](#) (some samples are also available on that events page).

Creating a Custom Framework Starting from an Existing Framework

To create a custom *framework* by extending an existing one, follow these steps:

1. In a location where you have full write access, create a folder structure similar to this:
`custom_frameworks/dita-extension`.
2. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association > Locations** ([on page 90](#)). Add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list and click **OK** or **Apply** to save your changes and close the dialog box.
3. Click the  **New** button on the toolbar and select the **Extend Framework Script** template. Save it inside the previously configured framework path (e.g. `custom_frameworks/dita-extension`).
4. Set the `@base` attribute on the script element to the value of the name of the extended framework (e.g. **DITA**).

Note:

Removing the `@base` attribute will create a framework from scratch.

5. Edit the script as described in [Framework Extension Script File \(on page 1944\)](#).

To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to **Options > Preferences > Document Type Association** and inspect the resulting framework structure.

Note:

If you want to use the framework in an older Oxygen XML Editor Eclipse plugin version that does not have support for these scripts, you can compile the script to obtain the `*.framework` file by using the **Compile Framework Extension script** action from the contextual menu or by running the `scripts/compileFrameworkScript.bat` external tool.

Creating a Custom Framework Without a Base Framework

To create a custom *framework* without starting from an existing one, follow these steps

1. In a location where you have full write access, create a folder structure similar to this:
`custom_frameworks/dita-extension`.
2. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association > Locations** ([on page 90](#)). Add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list and click **OK** or **Apply** to save your changes and close the dialog box.
3. Click  **New** button on the toolbar and select the **Create Framework Script** template. Save it inside the previously configured framework path, `custom_frameworks/dita-extension`.
4. Edit the script as described in [Framework Extension Script File \(on page 1944\)](#).

To test your customization, open a document that matches the newly created framework and inspect how your settings apply or go to **Options > Preferences > Document Type Association** and inspect the newly generated framework structure.

Note:

If you want to use the framework in an older Oxygen XML Editor Eclipse plugin version that does not have support for these scripts, you can compile the script to obtain the `*.framework` file by using the **Compile Framework Extension script** action from the contextual menu or by running the `scripts/compileFrameworkScript.bat` external tool.

Related information

[Sharing a Framework \(on page 2099\)](#)

[Webinar: Creating Frameworks Using an Extension Script](#)

Framework Extension Script File

The framework extension file is used to describe a new framework configuration. Optionally, you can extend an existing built-in framework configuration (such as DITA or DocBook) and then make additions and changes to it.

The easiest way to create such a file is to use the [New document wizard \(on page 246\)](#) and choose the **Extend Framework Script** or **Create Framework Script** template.

The following examples assume that the newly created framework extends a built-in one.

Basic Information

Once you have created a new script file, you need to:

- Specify the name of the framework using the `<name>` element. Optionally, you can also add a description using the `<description>` element.
- If you want to extend an existing framework (such as DITA or DocBook), specify the name of the extended framework using the `@base` attribute on the `<script>` element.
- The `<priority>` element might be needed to instruct Oxygen XML Editor Eclipse plugin to use this new framework instead of the one being extended or another framework that matches the same document.

Example: Extending the Built-in DITA Framework

```
<script xmlns="http://www.oxygenxml.com/ns/framework/extend"
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.oxygenxml.com/ns/framework/extend
  http://www.oxygenxml.com/ns/framework/extend/frameworkExtensionScript.xsd"
  base="DITA">
  <name>My custom DITA framework</name>
  <description>A custom framework based on the built-in DITA framework</description>
```

```
<priority>High</priority>
</script>
```

Changing the Association Rules

Oxygen XML Editor Eclipse plugin identifies the type of a document when the document matches at least one of the *association rules*.

Example: Instructing the Built-in Associations to Inherit None to Add Your Own

```
<associationRules inherit="none">
  <addRule rootElementLocalName="concept" />
  <addRule fileName="test.xml" />
</associationRules>
```

Setting the Initial Editing Mode

You can set the default editing mode that is loaded when a document is opened for the first time. For example, if the files are usually edited in the **Author** mode, you can set it as the initial page. For more details on the possible values, see [Document Type Configuration Dialog Box - Initial Edit Mode \(on page 91\)](#).

Example: Setting the Initial Editing Mode to Author

```
<initialPage>Author</initialPage>
```

Changing the Classpath

The **Classpath** tab displays a list of folders and *JAR (on page 2679)* libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and *framework (on page 2679)* translation files. Oxygen XML Editor Eclipse plugin loads the resources looking in the folders in the order they appear in the list.

Example: Customizing and Extending the Classpath Inherited From the Base Framework

```
<classpath inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework
  because Oxygen loads the resources looking in the folders in the order they
  appear in the list.
  -->
  <addEntry path="{framework}/resources_2x" position="before"/>

  <removeEntry path="{baseFramework}/refactoring"/>
</classpath>
```

Notice:

Relative paths in the framework extension file are automatically resolved to the location of the script file.

**Note:**

When removing entries with framework editor variables, take into consideration how they were added in the base framework.

- An entry present in the base framework with the path `${framework}/file` can be removed using an identical path or by using the `${baseFramework}` variable: `${baseFramework}/file`.
- An entry present in the base framework with the path `${frameworkDir}/file` can be removed using an identical path or by using the `${baseFrameworkDir}` variable: `${baseFrameworkDir}/file`.

Sharing a Plugin Class Loader

If your *framework* uses the same JAVA extensions/classes as a *plugin* (on page 2681), it is recommended that they share the same classloader. This way, the common classes are loaded by only one *Class Loader* and they will both use the same static objects and have the ability to cast objects between one another.

```
<classpath parentClassLoaderID="com.oxygenxml.git.plugin" />
```

Setting a Default Schema

You can specify a default schema for Oxygen XML Editor Eclipse plugin to use if an XML document does not contain a schema declaration and no default validation scenario is associated with it.

Example: Setting a Default XML Schema Relative to the Script Location

```
<defaultSchema schemaType="xmlschema" href="xsd/my-schema.xsd" />
```

Changing XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an internet connection may not be available, an *XML Catalog* (on page 2683) may be used to map the web location to a local file system entry.

Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework

```
<xmlCatalogs inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework
  because Oxygen loads the resources looking in the folders in the order they
  appear in the list.
  -->
  <addEntry path="${framework}/catalog.xml" position="before" />

  <removeEntry path="${baseFramework}/oldCatalog.xml" />
</xmlCatalogs>
```

**Notice:**

Relative paths in the framework extension file are automatically resolved to the location of the script file.

Changing the Document Templates

You can create your own custom document templates or remove templates inherited from the base framework.

Example: Customizing and Extending the XML Catalogs Inherited From the Base Framework

```
<documentTemplates inherit="all">
  <!-- Contribute this resource before the ones inherited from the base framework
  to make them appear first in the list.
  -->
  <addEntry path="{framework}/newTemplates" position="before" />

  <removeEntry path="{baseFramework}/oldTemplates" />
</documentTemplates>
```

**Notice:**

Relative paths in the framework extension file are automatically resolved to the location of the script file.

Adding New Transformation Scenarios and Removing Existing Ones

You can create new transformation scenarios and export them in one of the following locations:

- The Transformation Scenarios View (*on page 1306*).
- The Configure Transformation Scenario(s) Dialog Box (*on page 1300*).
- The Transformation Tab (*on page 115*).

Example: Importing New Transformation Scenarios

The `@href` attribute from the `<addScenarios>` element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The `framework` editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```
<transformationScenarios>
  <addScenarios href="scenarioExport.scenarios" />
  <removeScenario name="DITA HTML5" />
  <defaultScenarios>
    <name>DITA</name>
```

```

<name>XML</name>

</defaultScenarios>

</transformationScenarios>

```

Adding New Validation Scenarios and Removing Existing Ones

You can create new validation scenarios and export them in one of the following locations:

- The [Configure Validation Scenario Dialog Box](#) (*on page 558*).
- The [Validation Tab](#) (*on page 116*).

Example: Importing New Validation Scenarios

The `@href` attribute from the `<addScenarios>` element is used to point to the location of the scenarios export file. Relative paths are resolved relative to the script's location. The `${framework}` editor variable also resolves to the script's location. You can also remove any scenario inherited from the base framework or set the default scenario (the one used when another specific scenario is not specified).

```

<validationScenarios>
  <addScenarios href="validationScenarioExport.scenarios"/>
  <removeScenario name="DITA"/>
  <defaultScenarios>
    <name>DITA Validation</name>
    <name>XML Validation</name>
  </defaultScenarios>
</validationScenarios>

```

Customizing the Author Mode Through New CSS Files

The **Author** mode layout is driven by CSS rules. To customize it, you need to create new CSS files and add them in the new framework.

Example: Using Larger Fonts in Titles

```

<author>
  <css>
    <removeCss path="${framework}/base.css"/>
    <!--
      Adding CSS after the ones in the base gives the opportunity to
      override rules from previous CSSs.
    -->
    <addCss path="${framework}/titles.css" position="after"/>
  </css>
</author>

```

The `${framework}/titles.css` file contains a rule like this:

```
*[class~='topic/title'] {
    font-size:larger;
}
```

Example: Creating an Alternate CSS That Activates When the User Selects it in the Styles Menu

```
<author>
    <css>
        <addCss path="{framework}/pink.css" title="Pink titles" alternate="true"/>
    </css>
</author>
```

The `{framework}/pink.css` file contains a rule like this:

```
*[class~='topic/title'] {
    color:#FF1493;
}
```

Control How CSS Styles are Handled in the Author mode

The **Author** mode layout is driven by CSS rules. You can configure how CSS styles are handled in the framework by using the following attributes in the script file:

selectMultipleAlternateCSS

If set to *true*, any number of alternate CSS files can be activated and they will be applied like layers. If set to *false*, the alternate styles are treated like a main CSS style and only one can be selected at a time.

Example: Using the selectMultipleAlternateCSS Attribute in the Script

```
<css selectMultipleAlternateCSS="true"/>
```

mergeDocumentCSS

Controls how CSS files are handled if there are CSS styles specified in the document. If set to *true*, they will be merged with the CSS files from the framework. If set to *false*, they will be ignored.

Example: Using the mergeDocumentCSS Attribute in the Script

```
<css mergeDocument="true"/>
```

Example: Changing the styling in the author mode

We add a new CSS located in the new framework directory and we remove a CSS contributed by the base framework.

```
<author>
    <css>
```

```

<addCss path="css/style.css" />

<removeCss path="{baseFramework}/resources/css/base.css" />

</css>

</author>

```

**Notice:**

Relative paths in the framework extension file are automatically resolved to the location of the script file.

Defining Author Actions for the New Framework

Create [external author actions \(on page 1958\)](#), save them in a [specific subdirectory of your particular framework directory \(on page 1961\)](#), and they will be loaded automatically.

Removing Author Actions from the Base Framework

Suppose that the base framework configuration defines some [author actions \(on page 1958\)](#) that are added in the [main menu \(on page 107\)](#), [contextual menu \(on page 107\)](#), [toolbar \(on page 109\)](#), or [content completion window \(on page 110\)](#). If you do not want to inherit one of these actions in the new framework and you also want to remove it from all the GUI elements, you can use the `<removeAction>` element:

```

<author>

  <authorActions>

    <removeAction id="action.to.remove" />

  </authorActions>

</author>

```

**Note:**

If the new framework has an [external author action \(on page 1958\)](#) with the same ID as one of the actions specified in a `<removeAction>` element, the action will not be removed from the GUI elements (menus, toolbars, content completion window).

Replacing Author Actions from the Base Framework

Suppose that the base framework configuration defines some [author actions \(on page 1958\)](#) that are added in the [main menu \(on page 107\)](#), [contextual menu \(on page 107\)](#), [toolbar \(on page 109\)](#), or [content completion window \(on page 110\)](#). If you want to keep one of these actions in all the GUI elements, but to perform differently in the new framework, just create an [external author action \(on page 1958\)](#) with the same ID as the action to replace and save it in the [specific subdirectory within your new framework directory \(on page 1961\)](#).

Author Toolbar Configuration

The **Author** mode-specific toolbars for the new framework can be customized by:

- Adding or removing actions from toolbars.
- Changing toolbar groups by adding or removing actions.
- Creating new toolbars and action groups.

Example: Customizing the Toolbar

```

<author>

  <toolbars>
    <toolbar>

      <!-- Remove an action inherited from the base framework. -->
      <removeAction id="bold"/>

      <!-- Insert an action into an existing group -->
      <group name="{i18n(link)}">
        <addAction id="insert.note"/>
      </group>

      <!-- Add actions, separators and new groups-->
      <separator/>
      <addAction id="insert.note"/>

      <group name="New group">
        <addAction id="insert.note"/>
        <addAction id="insert.table"/>
      </group>
    </toolbar>
  </toolbars>
</author>

```

Note:

If you create a toolbar or group configuration and a toolbar/group with the same name already exists in the base framework, you will change the one inherited instead of creating a new one. You can inspect the names of the existing toolbars/groups inherited from the base framework in the [Toolbar Subtab \(on page 109\)](#).

Example: Creating a New Toolbar

A new toolbar is created if the `@name` attribute does not match a toolbar inherited from the base.

```

<author>

  <toolbars>
    <toolbar name="Extra Toolbar">

      <!-- Add actions, separators and new groups-->

```

```

<separator/>

<addAction id="insert.note"/>

<group name="New group">
  <addAction id="insert.note"/>
  <addAction id="insert.table"/>
</group>
</toolbar>
</toolbars>
</author>

```

Example: Adding an Action in the Toolbar at a Specific Location

You can insert items (actions or groups) relative to other items already present in the toolbar because they were inherited from the base framework configuration. The `@anchor` attribute specifies either the ID of an action or the name of a group already present in the toolbar and the `@position` attribute specifies whether the new item should be added before or after it.

Note:

If the `@anchor` attribute is missing, the entries will be added either first or last, according to `@position` value.

```

<toolbar>
  <addAction id="insert.note" anchor="bold" position="before"/>

  <group name="Table menu" anchor="${i18n(link)}" position="after">
    <addAction id="insert.table"/>
  </group>
</toolbar>

```

Author Menu and Contextual Menu Configuration

The **Author** mode-specific menus for the new framework can be customized by:

- Adding or removing actions and submenus.
- Changing existing submenus by adding or removing actions.

Example: Customizing the Contextual Menu

```

<contextualMenu>
  <!-- Add new actions and submenu -->
  <separator/>
  <addAction id="insert.table"/>
  <submenu name="Other actions">
    <addAction id="insert.note"/>

```

```

</submenu>

<!-- Contribute to an existing submenu -->
<submenu name="{i18n(section)}">
  <addAction id="paragraph"/>
</submenu>

<!-- Remove a submenu inherited from the base framework. -->
<removeSubmenu name="{i18n(link)}"/>
</contextualMenu>

```

**Note:**

The framework main menu is configured similarly, inside a `<menu>` container.

**Tip:**

You can inspect the names of the submenus inherited from the base framework in the [Contextual Menu Subtab \(on page 107\)](#) and [Menu Subtab \(on page 107\)](#).

Example: Adding an Action in the Contextual Menu at a Specific Location

You can insert new actions and submenus relative to other actions and submenus already present in the menu because they were inherited from the base framework configuration. The `@anchor` attribute specifies the ID of an **Author** mode action or a name of a submenu already present in the menu and the `@position` attribute specifies whether the new action should be added before or after it.

**Note:**

If the `@anchor` attribute is missing, the entries will be added either first or last, according to `@position` value.

```

<contextualMenu>
  <addAction id="insert.note" anchor="edit.image.map" position="before"/>

  <submenu name="Table menu" anchor="{i18n(insert)}" position="after">
    <addAction id="insert.table"/>
  </submenu>
</contextualMenu>

```

Configuring the Content Completion in Author Mode

You can replace content completion entries obtained from the associated schema with **Author** mode actions [\(on page 1958\)](#).

In the `<authorActions>` container, you can specify the **Author** mode actions to be contributed. Optionally, you can mark them as a replacement for an existing schema proposal with the `@replacedElement` attribute.

The `<schemaProposals>` element allows you to remove proposals detected from the associated schema through the `<removeProposal>` element. If some proposals were removed in the base framework configuration and you want them re-added, you can do so through the `<addProposal>` element.

Example: Customizing the Content Completion Assistant

```
<contentCompletion>
  <authorActions>
    <addAction id="insert.note" replacedElement="note" inCCWindow="true"/>
  </authorActions>

  <schemaProposals>
    <removeProposal renderName="table"/>

    <!-- The base framework removed the "list" element proposal. We want it back... -->
    <addProposal renderName="list"/>
  </schemaProposals>
</contentCompletion>
```

Using Framework Extension Points

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type. Libraries that contain the implementations must be present in the **classpath of your framework** (*on page 1945*). The Javadoc available at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/> contains details about how each API implementation functions.

Example: Setting a Custom Extensions Bundle

```
<extensionPoints>
  <extension
    name="extensionsBundleClassName"
    value="ro.sync.ecss.extensions.dita.map.DITAMapExtensionsBundle"/>
</extensionPoints>
```

Reusing Parts of the Script Using XInclude

Elements in the script can be specified in dedicated files that can then be referenced using XInclude in the script.

Example: Using XInclude to Reference Elements in the Script

```
<script xmlns="http://www.oxygenxml.com/ns/framework/extend">
  <name>New framework</name>
```

```
<xi:include href="classpath.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</script>
```

Where the referenced `classpath.xml` has this content:

```
<classpath xmlns="http://www.oxygenxml.com/ns/framework/extend">
  <addEntry path="test.jar"/>
</classpath>
```

Notice:

Relative paths in the framework extension file are automatically resolved to the location of the script file.

Customizing the Author Mode Editing Experience for a Framework

You can customize the editing experience in **Author** mode for you and any other user who shares the same framework. This includes the ability to configure actions, menus, toolbars, icons, structure insertion shortcuts, and content completion proposals specifically for a particular *framework* (on page 2679) (document type). Advanced users who are familiar with API development can also create *custom Author mode operations* (on page 1988) for a particular framework.

Configuring and Managing Multiple CSS Styles for a Framework

Oxygen XML Editor Eclipse plugin provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style* (on page 2680) and multiple *alternate CSS styles* (on page 2676). This makes it easy to change the look of the document as it appears in **Author** mode.

An example of a common use case is when content authors want to use custom styling within a document. You can select a *main* CSS stylesheet that styles the whole document and then apply *alternate* styles, as layers, to specific parts of the document.

Note:

When altering a CSS file configured as a stylesheet for the current document framework, you can quickly check its effects in the **Author** mode by using the  **Reload** document action that is available on the toolbar.

Managing the CSS Styles

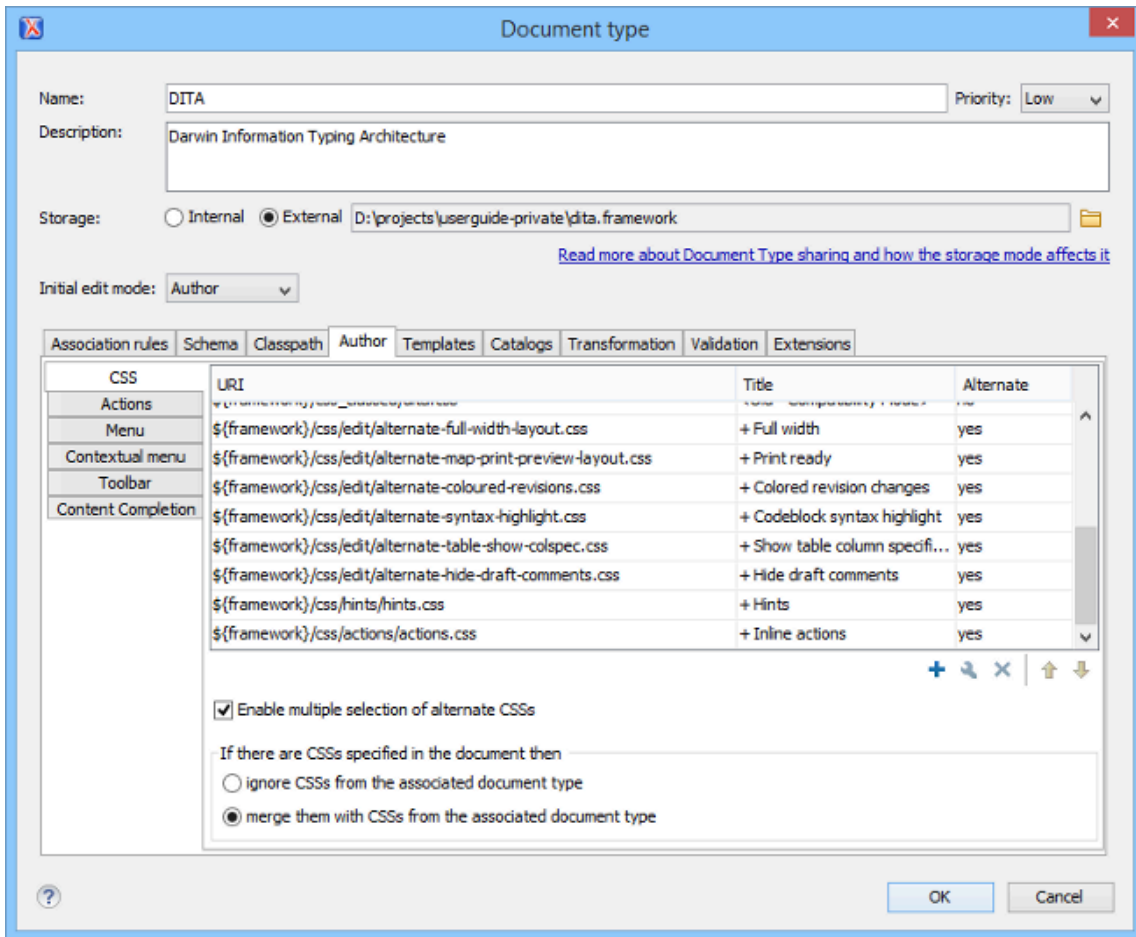

The *main* (on page 2680) and *alternate* (on page 2676) styles that are listed in the **Styles** drop-down menu can be controlled in the **Document Type** configuration dialog box (on page 90). To access it, follow these steps:

1. Open the **Preferences** dialog box (on page 70) .
2. Go to **Document Type Association**.
3. Select the appropriate document type and click the **Edit** button.

! **Important:**
 If you do not have access rights to the folder where the *framework* (on page 2679) files are stored, you can either elevate read/write permissions on that *framework* folder or you can extend the *framework* and customize the CSS stylesheets in the extension. If you want to share the customized extension with the rest of your team, see [Sharing the Extended Framework](#) (on page 2099).

The CSS styles (CSS files) associated with the particular document type are listed in the **CSS** subtab (on page 96) of the **Author** tab.

Figure 507. Main and Alternate CSS Styles in the Document Type Configuration Dialog Box

You can **+** Add, **E**dit, or **X** Delete styles from this dialog box to manage the *main* (on page 2680) and *alternate* (on page 2676) styles associated to the particular document type. You can also change the order of the styles by using the **U** Move Up and **D** Move Down buttons. This also changes the order that they appear in the **Styles** drop-down menu. The *alternate* styles are combined with the *main* CSS sequentially, in the order that they appear in this list. Therefore, if the same style rules are included in multiple CSS files, the *alternate* style that is listed last in this list takes precedence, since it is the last one to be combined (applied as a layer).

The **URI** column shows the path of each CSS file. The names listed in the **Styles** drop-down menu match the values in the **Title** column. The value in the **Alternate** column determines whether it is a *main* or *alternate* CSS.

If the value is *no*, it is a *main* CSS. If the value is *yes*, it is an *alternate* CSS and the style can be combined with a *main* CSS or other *alternate* styles when using the **Styles** drop-down menu.

Note:

To group alternate styles into categories (submenus), use a vertical bar character (|) in the **Title** column. You can use multiple vertical bars for multiple submenus. The text before each vertical bar will be rendered as the name of a submenu entry in the **Styles** drop-down menu, while the text after the final vertical bar is rendered as the name of the style inside the submenu.

Example: Suppose that you want to add two alternate stylesheets in separate submenus, with the *Title* column set to **My Styles|User Assistance|Hints** and **My Styles|User Actions|Inline Actions**, respectively.

URI	Title	Alternate
\${framework}/css/hints/hints.css	My Styles User Assistance Hints	yes
\${framework}/css/actions/actions.css	My Styles User Actions Inline actions	yes

Oxygen XML Editor Eclipse plugin will add a **My Styles** submenu with two submenus (**User Assistance** that contains the **Hints** style, and **User Actions** that contains the **Inline Actions** style) in the **Styles** drop-down menu.

The **Enable multiple selection of alternate CSSs** checkbox ([on page 96](#)) at the bottom of the pane must be selected for the *alternate CSS styles* ([on page 2676](#)) to be combined. They are applied like layers and you can activate any number of them. If this option is not selected, the *alternate* styles are treated like *main CSS styles* ([on page 2680](#)) and you can only select one at a time. By default, this option is selected. There are also a few options that allow you to specify how to handle the CSS if there are CSS styles specified in the document. You can choose to *ignore* or *merge* them.

The following rules apply for merging CSS styles:

- CSS files with the same title will be merged.
- CSS files without a title will contribute to all others.
- They are merged sequentially, in the order that they appear in the list.

[CSS Subtab](#) ([on page 96](#))

[Adding an extra CSS to customize the DITA visual editor](#)

Creating and Customizing Author Mode Actions for a Framework

There are several possibilities for creating new **Author** mode actions:

- You can create new actions for a framework or edit existing ones using the **Actions** subtab of the **Document Type** configuration dialog box (on page 90). In this case, the actions are stored internally in the `*.framework` file.
- You can export existing actions from the **Document Type** configuration dialog box (on page 90) into individual XML files or use a built-in template to create a new XML file that defines a single action. In this case, the actions are stored externally as separate XML files. The benefits of using this approach are explained in the [Creating or Editing Actions Using an Individual XML File for Each Action \(on page 1958\)](#) section below.

Creating or Editing Actions Using the Document Type Configuration Dialog Box

To add or configure **Author** mode actions for a *framework* (on page 2679) (document type) using the **Document Type** configuration dialog box (on page 90), follow this procedure:

1. Open the **Preferences** dialog box (on page 70), go to **Document Types Association**, and select the *framework*.
2. Select your framework and click the **Edit** button (or you can use the **Duplicate** or **Extend** button to create an extension of the framework (on page 1941)).
3. In the resulting **Document Type** configuration dialog box (on page 90), go to the **Author** tab, then the **Actions** subtab.
4. To create a new action, click the **+ New** button. To edit an existing action, select the action and click the  **Edit** button.

Step Result: In either case, this opens the **Action** configuration dialog box (on page 98) where you can configure numerous aspects of the action.

5. Once you are finished, click **OK** several times to exit the configuration dialog box.

Result: Your changes are stored in the `*.framework` file for your particular framework.

Creating or Editing Actions Using an Individual XML File for Each Action

It is possible to work with **Author** mode actions outside the **Document Type** configuration dialog box (on page 90) and store them externally from the `*.framework` file. You can either export existing actions or use a template to create a new action from scratch. The benefits of using this approach are:

- You can share, copy, or reuse each individual action across multiple projects or frameworks.
- It is easier to develop and test action configurations. After configuring the XML file that defines an action, you can test its functionality by opening a document from your particular framework and invoking the action to see if it works as expected. If you did not get the desired result, you can simply repeat the process until you are happy with the result without having to navigate through the framework configuration dialog box.

Exporting Actions

To export existing **Author** mode actions into individual XML files, follow this procedure:

1. Open the **Preferences** dialog box (*on page 70*), go to **Document Types Association**, and select the *framework*.
2. Select your framework and click the **Edit** button (or you can use the **Duplicate** or **Extend** button to *create an extension of the framework (on page 1941)*).
3. In the resulting **Document Type** configuration dialog box (*on page 90*), go to the **Author** tab, then the **Actions** subtab.
4. **[Important]** Make sure the **Storage** option (*on page 91*) in the top part of the dialog box is set to **External** and the external location must be a subdirectory of your current framework directory (see the *Notes About the Storage Path* section (*on page 1961*)).
5. Select the action (or multiple actions) you want to export, right-click, and use the  **Export** action (this action is also located at the bottom of the table of actions).

Step Result: If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have **_externalAuthorActions** at the end of the folder name) inside your current framework directory.

6. **[Important]** Click **OK** several times to confirm your changes and exit the **Preferences** dialog box. The files will not be created until you exit this dialog box.

Step Result: Each exported action is extracted from the framework configuration file and exported as an individual XML file.

7. To configure and test a particular action, you can open its corresponding XML file in Oxygen XML Editor Eclipse plugin, make changes, save the file, then open a document from your framework, test the action and repeat until you get the desired result.

Note:

You can add or edit the action files outside of Oxygen XML Editor Eclipse plugin, but you will need to restart the application each time to reload the changes.

Creating New Actions

To create a new **Author** mode action outside the framework configuration dialog box, follow these steps:

1. Open the **New from templates** wizard (*on page 253*), search for a template called **Author Action**, and choose a storage path and file name. Remember that ultimately, it must be saved in a subdirectory of your particular framework directory (see the *Notes About the Storage Path* section (*on page 1961*)). Complete the creation process.

Step Result: The resulting XML file contains some hints and it is an example of an action configuration that will insert a new paragraph.

2. Configure the action as needed and save your changes.

Note:

You can use XInclude to reuse different fragments (such as XPath expressions or configured operations between actions).

Example: Reusing and XPath Expression

```
<a:operations>
  <a:operation id="InsertFragmentOperation">
    <a:xpathCondition>
      <xi:include href="expression.txt"
        xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
    </a:xpathCondition>
    <a:arguments>
      <a:argument name="insertLocation">
        <xi:include href="expression.txt"
          xmlns:xi="http://www.w3.org/2001/XInclude" parse="text"/>
      </a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```

Where the content of the `expression.txt` file is `self::para`.

Example: Reusing an Entire Operation

```
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <xi:include href="operation.xml"
    xpointer="element(/1/1)" xmlns:xi="http://www.w3.org/2001/XInclude" />
</a:operations>
```

Where the content of `operation.xml` is:

```
<a:operations xmlns:a="http://www.oxygenxml.com/ns/author/external-action">
  <a:operation id="ToggleSurroundWithElementOperation">
    <a:xpathCondition>ancestor-or-self::p</a:xpathCondition>
    <a:arguments>
      <a:argument name="element"><i/></a:argument>
    </a:arguments>
  </a:operation>
</a:operations>
```

Step Result: At this point, the action has been created but it needs to be added to the UI (in a toolbar or menu).

3. Add the new action to a UI component. For example, to add it in a toolbar, open the **Document Type configuration dialog box** ([on page 90](#)), go to the **Author** tab, then the **Toolbar** subtab ([on page 109](#)), and add the action.
4. To test the action, you can open a document from your framework and test the action. If you don't get the desired result, open the action file, make changes, then test them again. Repeat until you get the desired result.

Note:

You can add or edit the action files outside of Oxygen XML Editor Eclipse plugin, but you will need to restart the application each time to reload the changes.

Notes About the Storage Path

As mentioned above, it is imperative that the action configuration files be stored in a specific subdirectory of your particular framework directory.

There are two possible naming conventions for this subdirectory:

- **{framework_directory}/externalAuthorActions** - If there are multiple framework subdirectories inside {framework_directory}, using this path structure will make the actions available to all of them.
- **{framework_directory}/{framework_file_name}_externalAuthorActions** - Using this path structure will make the actions only available in the framework stored inside the {framework_file_name}.framework file.

Note:

When [exporting actions from the UI](#) ([on page 1959](#)), this is the directory structure that is used.

Action Configuration Tips

- If an action is configured to insert a fragment that contains entities, you need to wrap it in `CDATA` markup.
- For a list of default operation, see [Built-in Author Mode Operations](#) ([on page 1962](#)).

Resources

For more information about customizing **Author** mode actions, see the following resources:

- Webinar: [Improving the Authoring Experience Through Custom Actions](#).
- Webinar: [Working with DITA in Oxygen - Customizing the Editing Experience](#).

[Framework Configuration Dialog Box: Actions Subtab \(on page 97\)](#)

Built-in Author Mode Operations

This topic lists the default operations for the **Author** mode.

ChangeAttributeOperation

This operation allows you to add/modify/remove an attribute. You can use this operation in your own custom **Author** mode action to modify the value for a certain attribute on a specific XML element. The arguments of the operation are:

name

The attribute local name.

namespace

The attribute namespace.

elementLocation

The XPath location that identifies the element.

value

The new value for the attribute. If empty or null the attribute will be removed.

editAttribute

If an in-place editor exists for this attribute, it will automatically activate the in-place editor and start editing.

removeIfEmpty

The possible values are `true` and `false`. True means that the attribute should be removed if an empty value is provided. The default behavior is to remove it.

ChangeAttributesOperation

This operation allows you to add/modify/remove multiple attributes. You can use this operation in your own custom **Author** mode action to modify the value for one or more attributes for one or more XML elements. The arguments of the operation are:

elementLocations

The XPath location that identifies the elements whose attributes will be affected. If not defined, the element at the cursor location will be used.

attributeNames

The names of the attributes to add, modify, or remove, separated by the new-line character (`\n`). The values can be local names or Clark notations.

values

The new attributes values, each on a new line, separated by the new-line character (`\n`). An empty value will remove the attribute if `removeIfEmpty` is set to `true`.

removeIfEmpty

The possible values are `true` (default) and `false`. **True** means that the attribute will be removed if an empty value is provided.

ChangePseudoClassesOperation

Operation that sets a list of pseudo-class values to nodes identified by an XPath expression. It can also remove a list of values from nodes identified by an XPath expression. The operation accepts the following parameters:

setLocations

An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes set. If it is not defined, then the element at the cursor position will be used.

setPseudoClassNames

A space-separated list of pseudo-class names that will be set on the matched nodes.

removeLocations

An XPath expression indicating a list of nodes that will have the specified list of pseudo-classes removed. If it is not defined, then the element at the cursor position will be used.

removePseudoClassNames

A space-separated list of pseudo-class names that will be removed from the matched nodes.

includeAllNodes

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

DeleteElementOperation

Deletes the node indicated by the `elementLocation` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

DeleteElementsOperation

Deletes the nodes indicated by the `elementLocations` parameter XPath expression. If missing, the operation will delete the node at the cursor location.

ExecuteCommandLineOperation

This operation allows you to start a process executing a given command line. It has the following arguments:

name

The name of the operation (or name of the console panel that corresponds to the process run by an action built over this operation).

workingDirectory

The path to the directory where the command line is executed. The default value is `"."` (current directory).

cmdLine

The command line to be executed (accepts [editor variables \(on page 1979\)](#)).

showConsole

If set to `true`, the console panel will be displayed in Oxygen XML Editor Eclipse plugin. The default value is `false`.

wait

If set to `true`, the command line will wait for the operation to finish. The default value is `false`.

ExecuteCustomizableTransformationScenarioOperation

Allows you to run a publishing transformation scenario configured at framework level with a specified set of parameters.

Notice:

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

scenarioName

The name of the transformation scenario to execute.

scenarioParameters

Provided parameters for the transformation scenario. The parameters are inserted as `name=value` pairs separated by line breaks. The set parameters are taken into account for **XSLT**, **DITA**, **Chemistry**, and **ANT** transformation scenario types.

markInProgressXPathLocation

XPath expression that identifies the element(s) on which a specific `-oxy-transformation-in-progress` pseudo class is set before transformation is started. The pseudo class is reset when the transformation ends or is cancelled. If this XPath expression is not defined, the current node is used.

markOthersInProgressXPathLocation

XPath expression that identifies other elements on which a specific `-oxy-transformation-in-progress-others` pseudo class is set before the transformation is started. The pseudo class is reset when the transformation ends.

ExecuteMultipleActionsOperation

This operation allows the execution of a sequence of actions, defined as a list of action IDs. The actions must be defined by the corresponding *framework*, or one of the common actions for all *frameworks* supplied by Oxygen XML Editor Eclipse plugin.

actionIDs

The action IDs list that will be executed in sequence, the list must be a string sequence containing the IDs separated by commas or new lines.

ExecuteMultipleWebappCompatibleActionsOperation

An implementation of an operation that runs a sequence of Oxygen XML Web Author-compatible actions, defined as a list of IDs.

ExecuteTransformationScenariosOperation

This operation allows running one or more transformation scenarios defined in the current *document type association* ([on page 2678](#)), in the project options, or in the global options. A use case would be to add a toolbar button that triggers publishing to various output formats. The argument of the operation is:

scenarioNames

The list of scenario names that will be executed, separated by new lines.

ExecuteValidationScenariosOperation

This operation allows running one or more validation scenarios defined in the current *document type association* ([on page 2678](#)), in the project options, or in the global options. The single argument for the operation is:

scenarioNames

The list of scenario names that will be executed, separated by new lines.

InsertEquationOperation

Inserts a fragment containing a MathML equation at the cursor offset. The argument of this operation is:

fragment

The XML fragment containing the MathML content that should be inserted.

InsertFragmentOperation

Inserts an XML fragment at the current cursor position. The selection, if there is one, remains unchanged. The fragment will be inserted in the current context of the cursor position meaning that if the current XML document uses some namespace declarations then the inserted fragment must use the same declarations. The namespace declarations of the inserted fragment will be adapted to the existing namespace declarations of the XML document. For more details about its list of parameters, see [Arguments of InsertFragmentOperation \(on page 1985\)](#).

InsertOrReplaceFragmentOperation

Similar to [InsertFragmentOperation \(on page 1966\)](#), except it removes the selected content before inserting the fragment. Also, the `insertPosition` parameter has another possible value: **Replace**. If this value is used, the operation deletes the node selected by the XPath expression denoted by the `insertLocation` parameter. For more details about its list of parameters, see [Arguments of InsertFragmentOperation \(on page 1985\)](#).

InsertOrReplaceTextOperation

Inserts a text at current position removing the selected content, if any. The argument of this operation is:

text

The text section to insert.

InsertXIncludeOperation

Insert an `xInclude` element at the cursor offset. Opens a dialog box that allows you to browse and select content to be included in your document and automatically generates the corresponding XInclude instruction.

JSOperation

Allows you to call the Java API from custom JavaScript content. For some sample **JSOperation** implementations, see <https://github.com/oxygenxml/javascript-sample-operations>.

Notice:

For the Oxygen XML Web Author, this operation cannot be invoked using the JavaScript API. However, it can be used when configuring an Action for Author mode using the [Document Type Configuration dialog box \(on page 101\)](#).

This operation accepts the following parameter:

script

The JavaScript content to execute. It must have a function called `doOperation()`, which can use the predefined `authorAccess` variable. The `authorAccess` variable has access to the entire `ro.sync.ecss.extensions.api.AuthorAccess` Java API.

The following example is a script that retrieves the current value of the **type** attribute on the current element, allows the end-user to edit its new value and sets the new value in the document:

```
function doOperation(){
    //The current node is either entirely selected...
    currentNode = authorAccess.getEditorAccess().getFullySelectedNode();
    if(currentNode == null){
        //or the cursor is placed in it
        caretOffset = authorAccess.getEditorAccess().getCaretOffset();
        currentNode = authorAccess.getDocumentController().getNodeAtOffset
            (caretOffset);
    }
    //Get current value of the @type attribute
    currentTypeValue = "";
    currentTypeValueAttr = currentNode.getAttribute("type");
    if(currentTypeValueAttr != null){
        currentTypeValue = currentTypeValueAttr.getValue();
    }
    //Ask user for new value for attribute.
    newTypeValue = javax.swing.JOptionPane.showInputDialog
        ("Input @type value", currentTypeValue);
    if(newTypeValue != null){
        //Create and set the new attribute value for the @type attribute.
        attrValue = new Packages.ro.sync.ecss.extensions.api.node.AttrValue
            (newTypeValue);
        authorAccess.getDocumentController().setAttribute
            ("type", attrValue, currentNode);
    }
}
```

Tip:

You can call functions defined inside a script called `commons.js` from your custom script content so that you can use that external script file as a library of functions. Note that this `commons.js` file must be placed in the root of the `framework` directory (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/commons.js`) because that is the only location where Oxygen XML Editor Eclipse plugin will look for it.

MoveCaretOperation

Flexible operation for moving the cursor within a document and it is also capable of performing a selection. The operation accepts the following arguments:

xpathLocation

An XPath expression that identifies the node relative to where the cursor will be moved. If the expression identifies more than one node, only the first one will be taken into account.

position

The position relative to the node obtained from the XPath expression where the cursor will be moved. When also choosing to perform a selection, you can use the following possible values:

- **Before** - Places the cursor at the beginning of the selection.
- **Inside, at the beginning** - Places the cursor at the beginning of the selection.
- **After** - Places the cursor at the end of the selection.
- **Inside, at the end** - Places the cursor at the end of the selection.

selection

Specifies if the operation should select the element obtained from the XPath expression, its content, or nothing at all. The possible values of the argument are: `None`, `Element`, and `Content`.

MoveElementOperation

Flexible operation for moving an XML element to another location from the same document. XPath expressions are used to identify the source element and the target location. The operation takes the following parameters:

sourceLocation

XPath expression that identifies the content to be moved.

deleteLocation

XPath expression that identifies the node to be removed. This parameter is optional. If missing, the **sourceLocation** parameter will also identify the node to be deleted.

surroundFragment

A string representation of an XML fragment. The moved node will be wrapped in this string before moving it in the destination.

targetLocation

XPath expression that identifies the location where the node must be moved to.

insertPosition

Argument that indicates the insert position.

moveOnlySourceContentNodes

When set to `true`, only the content of the source element is moved.

processTrackedChangesForXPathLocations

When nodes are located via an XPath expression and the nodes are deleted with [Change Tracking \(on page 2683\)](#) enabled, they are considered as being present by default (thus, the *change tracking* is ignored). If you set this argument to `true` and *change tracking* is enabled,

deleted nodes will be ignored when the XPath locations are computed (thus, the *change tracking* is NOT ignored).

alwaysPreserveTrackedChangesInMovedContent

When set to `true`, tracked changes are included when a copied fragment is inserted in a document, regardless of the current state of the **Track Changes** feature.

OpenInSystemAppOperation

Opens a resource in the system application that is associated with the resource in the operating system. The arguments of this operation are:

resourcePath

An XPath expression that, when executed, returns the path of the resource to be opened. [Editor variables \(on page 218\)](#) are expanded in the value of this parameter, before the expression is executed.

isUnparsedEntity

Possible values are `true` or `false`. If the value is `true`, the value of the **resourcePath** argument is treated as the name of an unparsed entity.

ReloadContentOperation

Reloads the content of the editor by re-reading the information from the URL used to open it. It accepts the following argument:

markAsNotModified

The possible values are `true` and `false`. After reloading the editor, the content may appear as modified and in some cases where the content is already present on the file server, you would not want the user to save it again. You can set this flag to `true` to prevent the editor from showing the content as modified.

RemovePseudoClassOperation

An operation that removes a pseudo-class from an element. Accepts the following parameters:

name

Name of the pseudo-class to be removed.

includeAllNodes

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

elementLocation

The XPath location that identifies the element. If it is not defined, then the element at the cursor position is used. It can also identify multiple elements, in which case the pseudo class will be removed from all of them.

Example:

Suppose that there is a pseudo-class called `myClass` on the element `paragraph` and there are CSS styles matching the pseudo-class.

```
paragraph:myClass{
  font-size:2em;
  color:red;
}
paragraph{
  color:blue;
}
```

In the previous example, by removing the pseudo-class, the layout of the `paragraph` is rebuilt by matching the other rules (in this case, the foreground color of the `paragraph` element will become blue).

RenameElementOperation

This operation allows you to rename all occurrences of the elements identified by an XPath expression. The operation requires two parameters:

elementName

The new element name.

elementLocation

The XPath expression that identifies the element occurrences to be renamed. If this parameter is missing, the operation renames the element at current cursor position.

ReplaceElementContentOperation

An operation that replaces the content of the element at the cursor location (or fully selected element). The operation accepts the following parameters:

fragment

Specifies the fragment that will be inserted as the element content.

elementLocation

An XPath expression that identifies the element. If it is not defined, then the element at the cursor position is used.

SetPseudoClassOperation

An operation that sets a pseudo-class to an element. The operation accepts the following parameters:

elementLocation

An XPath expression that identifies the element that will have the pseudo-class set. If it is not defined, then the element at the cursor position is used.

name

The pseudo-class local name.

includeAllNodes

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

ShowElementDocumentationOperation

Opens the associated specification HTML page for the current element. The operation accepts as parameter a URL pattern that points to the HTML page containing the documentation.

StopCurrentTransformationScenarioOperation

Allows you to stop the transformation scenario that is currently running.

Notice:

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

SurroundWithFragmentOperation

Surrounds the selected content with a text fragment. Since the fragment can have multiple nodes, the surrounded content will be always placed in the first leaf element. If there is no selection, the operation will simply insert the fragment at the cursor position. For more details about the list of parameters go to: [Arguments of SurroundWithFragmentOperation \(on page 1987\)](#).

SurroundWithTextOperation

This operation has two arguments (two text values) that will be inserted before and after the selected content. If there is no selected content, the two sections will be inserted at the cursor position. The arguments of the operation are:

header

The text that is placed before the selection.

footer

The text that is placed after the selection.

TogglePseudoClassOperation

An implementation of an operation to toggle on/off the pseudo-class of an element. Accepts the following parameters:

name

Name of the pseudo-class to be toggled on/off.

includeAllNodes

The possible values are `yes` and `no`. If set to `yes`, comments, CDATA, and text nodes are included when evaluating XPath expressions. If set to `no`, they are ignored.

elementLocation

The XPath location that identifies one or more elements that will have the pseudo class toggled. If it is not defined, then the element at the cursor position is used.

Example:

```
paragraph:myClass{
  color:red;
}
paragraph{
  color:blue;
}
```

By default, the paragraph content is rendered in blue. Suppose that you have a `TogglePseudoClassOperation` configured for the `myClass` pseudo-class. Invoking it the first time will set the `myClass` pseudo-class and the paragraph will be rendered in red. Invoking the operation again, will remove the pseudo-class and the visible result will be a blue rendered `paragraph` element.

ToggleSurroundWithElementOperation

This operation allows wrapping and unwrapping content in a specific wrapper element that can have certain attributes specified on it. It is useful to implement toggle actions such as highlighting text as bold, italic, or underline. The operation supports processing multiple selection intervals, such as multiple cells within a table column selection. The arguments of the operation are:

element

The element to wrap or unwrap content.

schemaAware

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try

to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

ToggleCommentOperation

This operation allows for commenting or un-commenting the selected content. It does not have any arguments. If the selection is text, the operation wraps the selection in a comment. If the selection is a comment, the operation removes the comment.

UnwrapTagsOperation

This operation allows removing the element tags either from the current element or for an element identified with an XPath location. The argument of the operation is:

unwrapElementLocation

An XPath expression that identifies the element to unwrap. If it is not defined, the element at the cursor position is unwrapped.

XQueryUpdateOperation

Allows you to execute an XQuery Update script directly over content in **Author** mode.

Notice:

This operation is not applicable to the Oxygen XML Author Component or the Oxygen XML Web Author.

It supports the following arguments:

script

The XQuery Update script to be executed. The value can either be an XQuery script or a URL that points to the XQuery Update script. You can use the `#{framework}` (on page 225) or `#{frameworkDir}` (on page 225) editor variables to refer the scripts from the *framework* directory.

The script will be executed in the context of the node at the cursor position. If the script declares the following variable, it will also receive the selected nodes (assuming that entire nodes are selected):

```
declare variable $oxyxq:selection external;
```

In the [example below \(on page 1974\)](#), you can see how this argument is used.

externalParams

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the **externalParams** to

```
param1=value1,param2=value2.
```

expandXincludeReferences

Makes all *Xinclude* elements transparent to the XQuery transformer. When the *Xinclude* references are transparent, the **XQueryUpdateOperation** can use the referenced elements for further processing in the current document, but it cannot change their values in the original document. The default value is `false`, which means the *Xinclude* elements are not transparent.

An example of an *XQuery Update Script* that converts paragraphs to list items:

```
declare namespace oxyxq = "http://www.oxygenxml.com/ns/xqu";

(: This variable will be linked to the selected nodes assuming that there are
actually fully selected nodes. For example this selection will return null:
<p>{SEL_START}text{SEL_END} in para</p>
but this will give two "p" elements:
{SEL_END}<p>text</p><p>text2</p>{SEL_END}

If a multiple selection exists it will also be processed and forwarded.
Again, only fully selected nodes will be passed.
:)

declare variable $oxyxq:selection external;

(: We will process either the selection or the context node :)
let $toProcess := if (empty($oxyxq:selection)) then
  (.)
else
  ($oxyxq:selection)

return if (not(empty($toProcess))) then
  (
    (: Create the list :)
    let $ul :=
      <ul>
        {
          for $sel in $toProcess
          return
            <li>{$sel}</li>
        }
      </ul>
```

```

return
    (
        (: Delete the processed nodes :)
        for $sel in $stoProcess
        return
            delete node $sel,
        (: Inserts the constructed list :)
        insert node $sul
            before $stoProcess[1]
    )
)
else
    (

```

XSLTOperation and XQueryOperation

Applies an XSLT or XQuery script on a source element and then replaces or inserts the result in a specified target element.

Notice:

For Oxygen XML Web Author, these operations cannot be invoked using the [JavaScript API](#).

These operations accept the following parameters:

sourceLocation

An XPath expression indicating the element that the script will be applied on. If it is not defined, then the element at the cursor position will be used.

There may be situations where you want to look at an ancestor of the current element and make decisions in the script based on that. To do this, you can set the **sourceLocation** to point to an ancestor node then use the `oxy:current-element()` function to access the current element, as in the following example:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0"
  xpath-default-namespace="http://docbook.org/ns/docbook"
  xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
  exclude-result-prefixes="oxy">
  <xsl:template match="/">
    <xsl:apply-templates select="oxy:current-element()" />
  </xsl:template>

  <xsl:template match="para">
    <!-- And the context is again inside the current element,
    but we can use information from the entire XML -->

```

```

<xsl:variable
  name="keyImage" select="//imagedata[@fileref='images/lake.jpeg']
  /ancestor::inlinemediaobject/@xml:id/string()" />
<xref linkend="{ $keyImage }" role="key_include"
  xmlns="http://docbook.org/ns/docbook" />
</xsl:template>
</xsl:stylesheet>

```

targetLocation

An XPath expression indicating the insert location for the result of the transformation. If it is not defined then the insert location will be at the cursor location.

script

The script content (XSLT or XQuery). The base system ID for this will be the *framework* file, so any include/import reference will be resolved relative to the *.framework* file that contains this action definition.

For example, for the following script, the imported *xslt_operation.xsl* needs to be located in the current *framework* directory.

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  version="1.0">
  <xsl:import href="xslt_operation.xsl" />
</xsl:stylesheet>

```

You can also use a path for an included or imported reference. When using a path, the following apply:

- A relative path is resolved to the *framework* directory.
- The *framework* editor variable (on page 225) can also be used to reference resources from the *framework* directory.
- The path is passed through the catalog mappings. It helps to use an absolute URL (for instance, <http://www.oxygenxml.com/fr/testy.xsl>) and map it in the *catalog.xml* file from the *framework* directory to a resource from the *framework*.

action

The insert action relative to the node determined by the target XPath expression. It can be: Replace, At cursor position, Before, After, Inside as first child or Inside as last child.

caretPosition

The position of the cursor after the action is executed. It can be: `Preserve`, `Before`, `Start`, `First editable position`, `End`, or `After`. If this parameter is not set, you can still indicate the position of the cursor by using the *framework* editor variable (on page 223) in the inserted content.

expandEditorVariables

Parameter controlling the expansion of [editor variables \(on page 218\)](#) returned by the script processing. Expansion is enabled by default.

suspendTrackChanges

It has 2 possible values (`true` and `false`). The default value is `false`. When set to `true`, the [Track Changes \(on page 2683\)](#) feature is deactivated. When using this argument, after the action is finished, the state of the *Track Changes* feature is restored to its initial value.

externalParams

A string that can assign multiple key-value pairs separated by a comma or a new line character.

For example, if an XQuery script declares two external parameters like this:

```
declare variable $param1 external;
declare variable $param2 external;
```

You can pass custom values for each parameter by setting the **externalParams** to

```
param1=value1,param2=value2.
```

escapeEntityRefs

Escapes entity references in processed content to plain text and unescapes them back in the returned content.

XSLTOperation Example: Sort a list with respect to the language declared on the root element:

Suppose you want an action that will sort a list with respect to the language declared on the root element and you have an XML file like this:

```
<article xml:lang="en">
  <ul>
    <li>B</li>
    <li>C</li>
    <li>A</li>
  </ul>
</article>
```

The **XSLTOperation** needs to be configured as follows:

- **sourceLocation** is set to `/*` so that the script has access to the root element and its children.
- **targetLocation** is left untouched (assuming that the action is active only when the cursor is inside the list).

The XSLT script would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:oxy="http://www.oxygenxml.com/ns/author/xpath-extension-functions"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs oxy" version="2.0">
```

```

<xsl:template match="/">
  <!--
    sourceLocation parameter was set to /* to have a larger context.
    We can pinpoint the element that contained the caret
    using the oxy:current-element() function.
  -->
  <xsl:apply-templates select="oxy:current-element()" />
</xsl:template>

<xsl:template match="ul">

  <!-- Because the sourceLocation parameter was set to /* we now have access to
    the root element and its attributes. -->
  <xsl:variable name="lang" select="*/@xml:lang"/>
  <xsl:variable name="collationURI">
    <xsl:value-of select="concat('http://www.w3.org/2013/collation/UCA?lang=', $lang)"/>
  </xsl:variable>

  <xsl:copy>
    <xsl:copy-of select="@*" />

    <!-- Copy the list items, but sorted. -->
    <xsl:apply-templates select="li">
      <xsl:sort collation="{ $collationURI }" select="text()" />
    </xsl:apply-templates>
  </xsl:copy>
</xsl:template>

<!-- This copy template will handle the contents of the list items. -->
<xsl:template match="@* | node()">
  <xsl:copy>
    <xsl:apply-templates select="@* | node()" />
  </xsl:copy>
</xsl:template>
</xsl:stylesheet>

```

Using Entities and Xincludes with the XSLTOperation

- **Entities** are treated as plain text and not expanded.
- **Xincludes** are resolved in the result, and you can alter the XML obtained afterward using the XSLT/XQuery script of the operation, but you cannot alter the included document itself.

Editor Variables in Author Mode Operations

Author mode operations can include parameters that contain the following *editor variables* (on page 218):

- **`\${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

Note:

The **`\${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **`\${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

Note:

The **`\${caret}** editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use **AuthorDocumentFilter** and inside the **insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)** method, use the **AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)** API on the given fragment.

- **`\${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **`\${ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the *ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value')* editor variable.

You can set the following parameters:

- **'message'** - The displayed message. Note the quotes that enclose the message.
- **'default-value'** - Optional parameter. Provides a default value.
- **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **`\${answer(@id)}** editor variable.
- **type** - Optional parameter (defaults to **generic**), with one of the following values:

Note:

The title of the dialog box will be determined by the type of parameter and as follows:

- For *url* and *relative_url* parameters, the title will be the name of the parameter and the value of the *'message'*.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

**Notice:**

Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
${ask( 'Provide a date', generic, '${date(yyyy-MM-dd'T'HH:MM)}' ) }
```

Parameter**generic** (default)

Format: `${ask('message', generic, 'default')}`

Description: The input is considered to be generic text that requires no special handling.

Example:

- `${ask('Hello world!')}` - The dialog box has a *Hello world!* message displayed.
- `${ask('Hello world!', generic, 'Hello again!')}` - The dialog box has a *Hello world!* message displayed and the value displayed in the input box is *Hello again!*.

url

Format: `${ask('message', url, 'default_value')}`

Description: Input is considered a URL. Oxygen XML Editor Eclipse plugin checks that the provided URL is valid.

Example:

- `${ask('Input URL', url)}` - The displayed dialog box has the name *Input URL*. The expected input type is URL.
- `${ask('Input URL', url, 'http://www.example.com')}` - The displayed dialog box has the name *Input URL*. The expected input type is URL. The input field displays the default value *http://www.example.com*.

relative_url

Format: `${ask('message', relative_url, 'default')}`

Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Editor Eclipse plugin tries to make the URL relative to that of the document you are editing.

**Note:**

If the `$ask` editor variable is expanded in content that is not yet saved (such as an *untitled* file, whose path cannot be determined), then Oxygen XML Editor Eclipse plugin will transform it into an absolute URL.

Parameter	
	<p>Example:</p> <p><code>ask('File location', relative_url, 'C:/example.txt')</code> - The dialog box has the name <i>'File location'</i>. The URL inserted in the input box is made relative to the currently edited document location.</p>
password	<p>Format: <code>ask('message', password, 'default')</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>ask('Input password', password)</code> - The displayed dialog box has the name <i>'Input password'</i> and the input is hidden with bullet symbols. ▪ <code>ask('Input password', password, 'abcd')</code> - The displayed dialog box has the name <i>'Input password'</i> and the input hidden with bullet symbols. The input field already contains the default abcd value.
combobox	<p>Format: <code>ask('message', combobox, ('real_value1':'rendered_value1';...; 'real_valueN':'rendered_valueN'), 'default')</code></p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p> <div data-bbox="560 1227 1437 1402" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>xpath_eval()</code>.</p> </div> <div data-bbox="560 1435 1437 1610" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>ask('Operating System', combobox, ('win':'Microsoft Windows'; 'macos':'macOS'; 'lnx':'Linux/UNIX'), 'macos')</code> - The dialog box has the name <i>'Operating System'</i>. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection.

Parameter	
	<div data-bbox="639 226 1437 577" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: In this example, the default value is indicated by the <code>osx</code> key. However, the same result could be obtained if the default value is indicated by <code>macOS</code>, as in the following example: <code>\${ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macOS')}</code> </div> <ul style="list-style-type: none"> ▪ <code>\${ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android')}</code> ▪ <code>\${ask('Mobile OS', combobox, (\$xpath_eval(for \$pair in ([['ios', 'iOS'], ['and', 'Android']] return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>
<p>editable_combobox</p>	<p>Format: <code>\${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <code>rendered_value</code> values. Choosing such a value will return its associated real value (<code>real_value</code>) or the value inserted when you edit a list entry.</p> <div data-bbox="560 1144 1437 1323" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: The list of <code>'real_value':'rendered_value'</code> pairs can be computed using <code>\$xpath_eval()</code>. </div> <div data-bbox="560 1346 1437 1525" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: The <code>'default'</code> parameter specifies the default-selected value and can match either a key or a value. </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name <code>'Operating System'</code>. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ <code>\${ask('Operating System', editable_combobox, (\$xpath_eval(for \$pair in ([['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']] return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>

Parameter	
radio	<p>Format: <code>\${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a <i>rendered_value</i> and will return an associated <i>real_value</i>.</p> <div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The list of <i>real_value</i>:'<i>rendered_value</i>' pairs can be computed using <code>\${xpath_eval()}</code>.</p> </div> <div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The <i>default</i> parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code>- The dialog box has the name <i>Operating System</i>. The radio button group allows you to choose between the three operating systems. <div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: In this example, <code>macOS</code> is the default-selected value and if selected, it would return <code>macos</code> for the output.</p> </div> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', radio, (\${xpath_eval(for \$pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return "" \$pair?1 "":" \$pair?2 "":""})), 'ios')}</code>

- **`\${timeStamp}** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **`\${uid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java `UUID` class.
- **`\${id}** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **`\${cfn}** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **`\${cfne}** - Current file name with extension. The current file is the one currently open and selected.
- **`\${cf}** - Current file as file path, that is the absolute file path of the currently edited document.

- **`\${cfd}`** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **`\${frameworksDir}`** - The path (as file path) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main `frameworks` folder defined in the **Document Type Association > Locations** preferences page.
- **`\${pd}`** - The file path to the folder that contains the current project file (`.xpr`).
- **`\${oxygenInstallDir}`** - Oxygen XML Editor Eclipse plugin installation folder as file path.
- **`\${homeDir}`** - The path (as file path) of the user home folder.
- **`\${pn}`** - Current project name.
- **`\${env(VAR_NAME)}`** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **`\${system(var.name)}`** editor variable.
- **`\${system(var.name)}`** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **`\${env(VAR_NAME)}`** editor variable instead.
- **`\${date(pattern)}`** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`.

**Note:**

This editor variable supports both the **xs:date** and **xs:datetime** parameters. For details about **xs:date**, go to: <http://www.w3.org/TR/xmlschema-2/#date>. For details about **xs:datetime**, go to: <http://www.w3.org/TR/xmlschema-2/#dateTime>.

How to Find More Information About the Arguments of an Operation

If you need to find more information about the arguments of an operation, there are several places where this information is available:

- In the [API documentation](#) for the particular operation.
- By invoking the `getArguments()` method on the operation.
- In the source code of the operation.
- In Oxygen XML Editor Eclipse plugin:
 1. Go to **Options > Preferences > Document Type Association**, select a document type and click the **New, Edit, Duplicate, or Extend** button (*on page 88*).
 2. Go to the **Author** tab and then the **Actions** subtab. At the bottom of this subtab, click **+ New** to open the **Action dialog box** (*on page 98*).
 3. Locate the **Operation** field and click the **Choose** button on the right side. This will open a dialog box that displays the default operations.
 4. Double-click the operation (or select it and click **OK**).

The arguments for the operation will now be displayed in the **Action dialog box** (*on page 98*).

Arguments of InsertFragmentOperation

fragment

This argument has a textual value. This value is parsed by Oxygen XML Editor Eclipse plugin as it was already in the document at the cursor position. You can use entity references declared in the document and it is namespace aware. The fragment may have multiple roots.

You can even use namespace prefixes that are not declared in the inserted fragment, if they are declared in the document where the insertion is done. For the sake of clarity, you should always prefix and declare namespaces in the inserted fragment!

If the fragment contains namespace declarations that are identical to those found in the document, the namespace declaration attributes will be removed from elements contained by the inserted fragment.

There are two possible scenarios:

- **Prefixes that are not bound explicitly**

For instance, the fragment:

```
<x:item id="dty2"/>
&ent;
<x:item id="dty3"/>
```

Can be correctly inserted in the document: (| marks the insertion point):

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [
  <!ENTITY ent "entity">
]>

<x:root xmlns:x="nsp">
  |
</x:root>
```

Result:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE x:root [
  <!ENTITY ent "entity">
]>

<x:root xmlns:x="nsp">
  <x:item id="dty2"/>
  &ent;
  <x:item id="dty3"/>
</x:root>
```

- **Default namespaces**

If there is a default namespace declared in the document and the *document fragment (on page 2677)* does not declare a namespace, the elements from the fragment are considered to be in **no namespace**.

For instance, the fragment:

```
<item id="dty2" />
<item id="dty3" />
```

Inserted in the document:

```
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
|
</root>
```

Gives the result document:

```
<?xml version="1.0" encoding="UTF-8"?>
<root xmlns="nsp">
  <item xmlns="" id="dty2" />
  <item xmlns="" id="dty3" />
</root>
```

insertLocation

An XPath expression that is relative to the current node. It selects the reference node for the fragment insertion. When missing, the fragment will be inserted at the cursor position.

insertPosition

Specifies where the insertion is made relative to the reference node selected by the *insertLocation*. It can be one of the following constants:

- **Inside as first child** (default value) - The fragment is inserted as first child of the reference node.
- **Inside as last child** - The fragment is inserted as the last child of the reference node.
- **After** - The fragment is inserted after the reference node.
- **Before** - The fragment is inserted before the reference node.

goToNextEditablePosition

After inserting the fragment, the first editable position is detected and the cursor is placed at that location. It handles any in-place editors used to edit attributes. It will be ignored if the fragment specifies a cursor position using the **caret** editor variable (on page 223). The possible values of this action are **true** and **false**.

schemaAware

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

insertEvenIfInvalid

The possible values of this argument are **true** and **false**. If **true**, the content that would make the document invalid is accepted. If **false** and the insertion is not valid, the operation will not be executed and an error message will be displayed.

Arguments of SurroundWithFragmentOperation

fragment

The XML fragment that will surround the selection. For example, consider the fragment:

```
<F>
  <A></A>
  <B>
    <C></C>
  </B>
</F>
```

and the document:

```
<doc>
  <X></X>
  <Y></Y>
  <Z></Z>
</doc>
```

Considering the selected content to be surrounded is the sequence of elements `x` and `y`, then the result is:

```
<doc>
  <F>
    <A>
      <X></X>
      <Y></Y>
    </A>
    <B>
      <C></C>
    </B>
  </F>
```

```
<Z></Z>
<doc>
```

Since the element `A` was the first leaf in the fragment, it received the selected content. The fragment was then inserted in the place of the selection.

Note:

If the first leaf is not the desired location for the surrounded fragment, you can use `ro.sync.ecss.extensions.commons.operations.InsertOrReplaceFragmentOperation` and set the following arguments:

fragment

The XML fragment that will surround the selection. Use the `${selection}` editor variable in the location you want to place the surrounded fragment.

schemaAware

Set it to *false* to avoid moving the fragment if it is not valid at the given location.

schemaAware

This argument applies only on the surround with element operation and controls whether or not the insertion is valid, based upon the schema. If the insertion is not valid, then wrapping action will be broken up into smaller intervals until the wrapping action is valid. For example, if you try to wrap a *paragraph* element with a *bold* element, it would not be valid, so the operation will wrap the text inside the paragraph instead, since it would be valid at that position.

Note:

If a selection exists, the surround with fragment operation is not schema aware.

Adding a Custom Operation to an Existing Framework

This task explains how to add a custom **Author** mode operation to an existing *framework* (on page 2679) (document type).

1. Set up a sample project.
2. A variety of classes implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface. Depending on your use-case, modify one of these classes.
3. Pack the operation class inside a Java *JAR* library.
4. Copy the *JAR* library to your framework directory (for example, `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]`).
5. Open the **Preferences** dialog box (on page 70), go to **Document Type Association**, and edit the document type (you need write access to the `[OXYGEN_INSTALL_DIR]`) to open the **Document Type** configuration dialog box (on page 90).

- a. In the **Classpath** tab, add a reference to your JAR library (for example, `${framework}/customAction.jar`).
 - b. Go to the **Author** tab, then go to the **Actions** subtab.
 - c. Click the **+ New** button and use the **Action dialog box** (on page 98) to create a new action that uses your custom operation.
 - d. Mount the action to the toolbars or menus. You can also define a shortcut key.
6. Share the modifications (on page 2099) with your colleagues. The files that should be shared are your `customAction.jar` library and the `.framework` configuration file from the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.

Related Information:

[AuthorOperation API](#)

Example: Configuring the Insert Section Action for a Framework

This topic describes the procedure for defining the **Insert Section** action for a custom *framework* (on page 2679). It is assumed that the icon files, `§` (`Section16.gif`) for the menu item and `§` (`Section20.gif`) for the toolbar, are already available. Although you could use the same icon size for both the menu and toolbar, usually the icons from the toolbars are larger than the ones found in the menus. These files should be placed in your custom *framework* directory (`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

Figure 508. Action Dialog Box

The screenshot shows the 'Action' dialog box with the following fields and values:

- ID: `bold`
- Name: `${18n(bold)}`
- Description: `${18n(bold_description)}`
- Menu access key: `B`
- Large icon (24x24): `/images/Bold24.png` (with a 'B' preview button)
- Small icon (16x16): `/images/Bold16.png` (with a 'B' preview button)
- Shortcut key: `M1+B` (with a 'Clear' button)
- Enable platform-independent shortcut keys (with an info icon)

The 'Operations' section contains:

- Operations list: `1`
- Activation XPath: (empty field)
- Operation: `ro.sync.ecss.extensions.common.Operation` (with a 'Choose' button)
- Arguments table:

Name	Description	Type	Value
element	The element to surround with.	Fragment	
schemaAware	This argument applies only on the sun	ConstantList	true

At the bottom, there is an 'Operation priority' section with 'Increase' and 'Decrease' buttons, and a checkbox for 'Evaluate activation XPath expressions even in read-only contexts'. The 'OK' and 'Cancel' buttons are at the bottom right.

1. Set the **ID** field to **insert_section**. This is a unique action identifier.
2. Set the **Name** field to **Insert Section**. This will be the action's name, displayed as a tooltip when the action is placed in the toolbar, or as the menu item name.
3. Set the **Menu access key** to **i**. On Windows, the menu items can be accessed using **Alt+letter** keys combination, when the menu is visible. The *letter* is visually represented by underlining the first letter from the menu item name having the same value.
4. Add a **Description**.
5. Set the **Large icon (20x20)** field to `${framework}/Section20.gif`. A good practice is to store the image files inside the *framework* directory and use *editor variable (on page 218)* `${framework}` to make the image relative to the *framework* location.

If the images are bundled in a *JAR (on page 2679)* archive together with some Java operations implementation, for instance, it might be convenient for you to reference the images not by the file name, but by their relative path location in the class-path.

If the image file `Section20.gif` is located in the **images** directory inside the *JAR* archive, you can reference it by using `/images/Section20.gif`. The *JAR* file must be added into the **Classpath** list.

6. Set the **Small icon (16x16)** field to `${framework}/Section16.gif`.
7. Click the text field next to **Shortcut key** and set it to **Ctrl+Shift+S (Meta+Shift+S on macOS)**. This will be the key combination to trigger the action using the keyboard only.
The shortcut is enabled only by [adding the action to the main menu of Author mode \(on page 1992\)](#), which contains all the actions that the author will have in a menu for the current document type.
8. At this time the action has no functionality added to it. Next you must define how this action operates. An action can have multiple operation modes. The first action mode enabled by the evaluation of its associated XPath expression will be executed when the action is triggered by the user. The XPath expression needs to be version 2.0 and its scope must be only element and attribute nodes of the edited document. Otherwise, the expression will not return a match and will not trigger the action. If the expression is left empty, the action will be enabled anywhere in the scope of the root element. For this example, suppose you want the action to add a section only if the current element is either a `<book>`, `<article>`, or another `<section>`.

- a. Set the XPath expression field to:

```
local-name()='section' or local-name()='book' or
local-name()='article'
```

- b. Set the **invoke operation** field to *InsertFragmentOperation* built-in operation, designed to insert an XML fragment at the cursor position. This belongs to a set of built-in operations, a complete list of which can be found in the [Author Default Operations \(on page 1962\)](#) section. This set can be expanded with your own Java operation implementations.
- c. Configure the arguments section as follows:

```
<section xmlns=
"http://www.oxygenxml.com/sample/documentation">
```

```
<title/>
</section>
```

`insertLocation` - leave it empty. This means the location will be at the cursor position.

`insertPosition` - select **"Inside"**.

Example: Configuring the Insert Table Action for a Framework

This topic describes the procedure for defining the **Insert Table** action for a custom *framework* (on page 2679). Suppose that you want to create an action that inserts a table with three rows and three columns into a document and the first row is the table header. As with the [insert section action](#) (on page 1989), you will use the `InsertFragmentOperation` built-in operation.

Place the icon files for the menu item, and for the toolbar, in your custom *framework* directory (`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

1. Set **ID** field to `insert_table`.
2. Set **Name** field to **Insert table**.
3. Set **Menu access key** field to **t**.
4. Set **Description** field to **Adds a table element**.
5. Set **Toolbar icon** to `${framework} / toolbarIcon.png`.
6. Set **Menu icon** to `${framework} / menuIcon.png`.
7. Set **Shortcut key** to **Ctrl + Shift + T (Command + Shift + T on macOS)**.
8. Set up the action's functionality:
 - a. Set **XPath expression** field to `true()`.
`true()` is equivalent with leaving this field empty.
 - b. Set **Invoke operation** to use **InsertFragmentOperation** built-in operation that inserts an XML fragment to the cursor position.
 - c. Configure operation's arguments as follows:

fragment - set it to:

```
<table xmlns=
"http://www.oxygenxml.com/sample/documentation">
  <header><td/><td/><td/></header>
  <tr><td/><td/><td/></tr>
  <tr><td/><td/><td/></tr>
</table>
```

`insertLocation` - to add tables at the end of the section use the following code:

```
ancestor::section/*[last()]
```

`insertPosition` - Select **After**.

Using Retina/HiDPI Icons for the Actions from a Framework

Higher resolution icons can also be included in customized *frameworks* (on page 2679) for rendering them in a Retina or HiDPI display. The icons can be referenced directly from the **Document Type Configuration** dialog box (on page 90) (from the **Action** dialog box (on page 98)) or from an API (`ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer` (on page 2080)).

As with any image, the higher resolution icons are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, icons with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myIcon@2x.png`).

Developers should not specify the path of the alternate icons (`@2x` or `@3x`) in the **Action** dialog box (on page 98) or the `XMLNodeRendererCustomizer` API (on page 2080). When using a Retina or HiDPI display, Oxygen XML Editor Eclipse plugin automatically searches the folder of the *normal* icon for a corresponding image file with a Retina scaling factor in the name. If the higher resolution icon file does not exist, the *normal* icon is scaled and used instead.

Related Information:

[Retina/HiDPI Images in Author Mode \(on page 495\)](#)

Customizing the Menu for a Framework

Defined actions can be grouped into customized menus in the Oxygen XML Editor Eclipse plugin menu bar.

1. Open the **Document Type** configuration dialog box (on page 90), select your custom *framework* (on page 2679), and go to the **Author** tab.
2. Go to the **Menu** subtab. In the left side you have the list of actions and some special entries:
 - **Submenu** - Creates a submenu. You can nest an unlimited number of menus.
 - **Separator** - Creates a separator into a menu. This way you can logically separate the menu entries.
3. The right side of the panel displays the current actions for that menu tree. To change its name, click this label to select it, then click the  **Edit** button.
4. Select the **Submenu** label in the left panel section and the appropriate label in the right panel section, then click the  **Add as child** button. Change the submenu name to **Table**, using the  **Edit** button.
5. Select the **Insert section** action in the left panel section and the **Table** label in the right panel section, then click the  **Add as sibling** button.
6. Now select the **Insert table** action in the left panel section and the **Table** in the right panel section. Click the  **Add as child** button.

Figure 509. Configuring the Menu

When opening a test document for a custom *framework* in **Author** mode, the menu you created is displayed in between the **Tools** and the **Document** menus. The upper part of the menu contains generic **Author** mode actions (common to all document types) and the two actions created previously (with **Insert table** under the **Table** submenu).

Figure 510. Author Mode Menu

Customizing the Contextual Menu for a Framework

The contextual menu is displayed when you right-click in the **Author** editing area. You can only configure the bottom part of the menu, since the top part is reserved for a list of generic actions (such as Copy, Paste, Undo, etc.)

1. Open the **Document Type** configuration dialog box ([on page 90](#)) for the particular *framework* ([on page 2679](#)) and go to the **Author** tab. Next, go to the **Contextual Menu** subtab.
2. Follow the same steps as explained in the [Configuring the Main Menu \(on page 1992\)](#), except changing the menu name because the contextual menu does not have a name.

Note:

You can choose to reuse a submenu that contains general authoring actions. In this case, all actions (both general and *framework*-specific ones) are grouped together under the same submenu.

Figure 511. Configuring the Contextual Menu

To test it, open the test file, and open the contextual menu. In the lower part there is shown the **Table** submenu and the **Insert section** action.

Customizing the Content Completion Assistant for Author Mode Only

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- *Content Completion Assistant (on page 2677)* window
- **Elements** view (on page 410)
- **Insert Element** menus (from the **Outline** view (on page 326) or breadcrumb (on page 378) contextual menus)

You can use the content completion customization support in a custom *framework (on page 2679)* by following this procedure:

1. Open the **Document type** configuration dialog box (on page 90) for your custom *framework* and select the **Author** tab. Next, go to the **Content Completion** tab (on page 110).

Figure 512. Customize Content Completion

The top side of the **Content Completion** section contains the list with all the actions defined within the custom *framework* and the list of actions that you decided to include in the *Content Completion Assistant* list of proposals. The bottom side contains the list with all the items that you decided to remove from the *Content Completion Assistant* list of proposals.

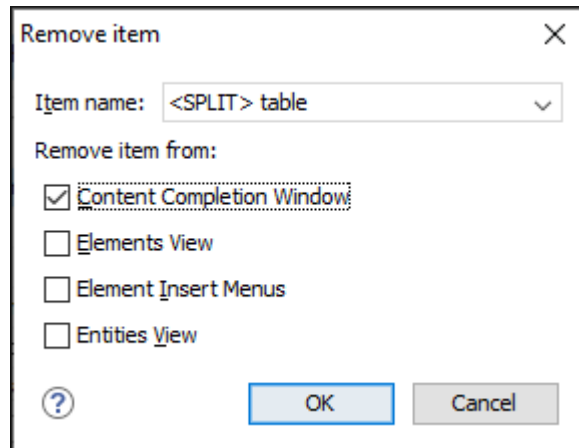

- If you want to add a custom action to the list of current **Content Completion** proposals, select the action item from the **Available actions** list and click the  **Add as child** or  **Add as sibling** button to include it in the **Current actions** list. A **Content Completion Item** dialog box appears, giving you the possibility to select where to provide the selected action.

Figure 513. Content Completion Item Dialog Box

- If you want to exclude a certain item from the **Content Completion** proposals, you can use the  **Add** button from the **Filter - Remove content completion items** list. The **Remove item** dialog box is

displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

Figure 514. Remove Item Dialog Box

Note:

In the **Item name** drop-down menu, **<SPLIT>** refers to the action of splitting the element and creating a new one, while **<ENTER>** refers to the action of inserting a new line.

Related Information:

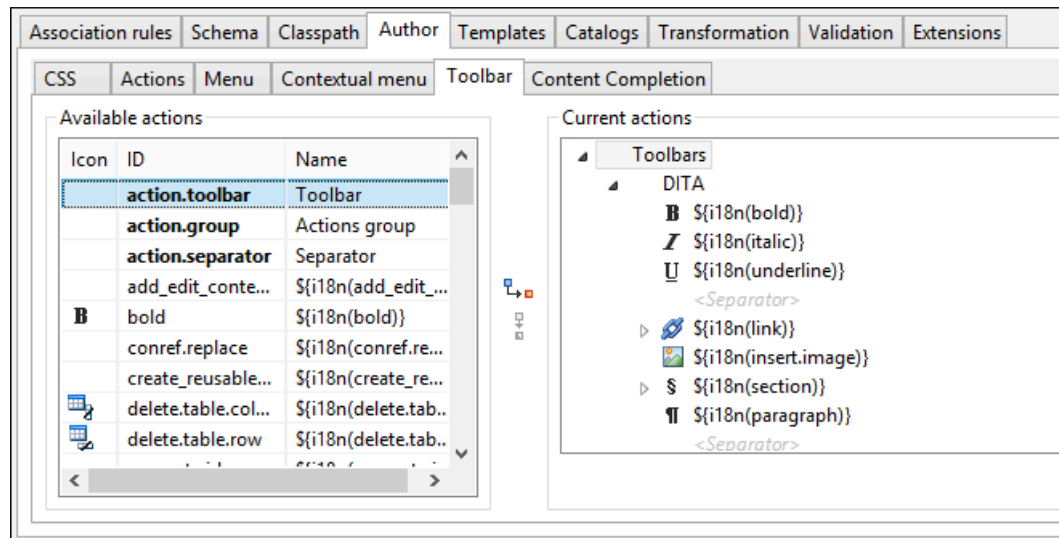

[Customizing the Content Completion Assistant Using a Configuration File \(on page 2002\)](#)

Customizing the Toolbars for a Framework

This procedure describes how to add defined actions to a toolbar for a custom *framework* (on page 2679).

You can also create additional custom toolbars with existing or custom actions.

1. Open the **Document Type** configuration dialog box (on page 90) for your custom *framework* and select the **Author** tab.
2. Go to the **Toolbar** subtab.

Figure 515. Configuring the Toolbar

The panel is divided in two sections. The left side contains a list of actions, while the right side contains an action tree, displaying the list of actions added in the toolbar. The special entry called *Separator* allows you to visually separate the actions in the toolbar.

- To add an action, select it in the left panel and select the particular toolbar label where you want it added in the right panel section, then click the  **Add as child** or  **Add as sibling** button.

Result: When opening a document for the particular *framework* in **Author** mode, the toolbar with the new buttons will be displayed in the toolbar area.

**Tip:**

If you have many custom toolbar actions, or want to group actions according to their category, add more toolbars with custom names and split the actions to better suit your purpose. If your toolbar is not displayed when switching to the **Author** mode, right-click the main toolbar, select **Configure Toolbars**, and make sure the appropriate toolbar (such as the **Author Custom Actions** toolbar) is selected.

**Note:**

A maximum of 16 toolbars can be added. If you add more, all extra toolbars will be automatically converted to sub-toolbars for the last added toolbar.

Customizing Text-to-Markup Shortcut Patterns

Some built-in frameworks include a configuration file that defines shortcut patterns that can be used in **Author** mode to automatically insert a certain XML structure. More specifically, the XML structure (fragment) automatically replaces a specific prefix pattern. For example, if you are editing a DITA document using the built-in DITA framework, entering a hyphen (-) followed by a space at the beginning of a paragraph would

automatically replace them with an unordered list element (``) with a child list item element (``). This is made possible by the *AutoCorrect* mechanism in Oxygen XML Editor Eclipse plugin.

It is possible to customize the particular configuration file (`structureAutocorrect.xml`) to define your own markup insertion shortcut patterns by following these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab (on page 95) add a link to that `resources` folder (if it does not already exist).
3. Create a new `structureAutocorrect.xml` file or edit an existing one (this file already exists in the `resources` folder of particular document types and you can use an existing file as a starting point for your customization).
4. Make the appropriate changes to your `structureAutocorrect.xml` file. The file should look like this:

```
<structure-autocorrect>
  <!-- Unordered lists -->
  <prefix-replacement prefix="-">
    <ul><li/></ul>
  </prefix-replacement>
  <!-- Ordered lists -->
  <prefix-replacement prefix="1.">
    <ol><li/></ol>
  </prefix-replacement>
  <!-- Code block -->
  <prefix-replacement prefix="```">
    <codeblock/>
  </prefix-replacement>
</structure-autocorrect>
```

Using this example, when a user enters one of the defined prefixes at the start of an element that allows the corresponding fragment, Oxygen XML Editor Eclipse plugin will automatically replace the prefix with its corresponding fragment. For example, entering a hyphen (-) at the beginning of a paragraph followed by a space would automatically replace them with an unordered list element (``) with a child list item element (``). Any subsequently added content would be placed inside the first node/element that does not have a child node/element (in this example, the cursor would be placed in the first `` element).

5. Save the file in the `resources` folder for the particular document type, using the fixed name: `structureAutocorrect.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/structureAutocorrect.xml`).

- Restart the application and open a document for your particular framework to test your customization.

**Note:**

Once the file is created, changes that you make to it are processed by Oxygen XML Editor Eclipse plugin when you press the  **Reload** toolbar button.

Customizing Smart Paste Support

The *Smart Paste* feature (on page 390) preserves certain style and structure information when copying content from some of the most common applications and pasting into *frameworks (document types)* that support *Smart Paste* (on page 391) in Oxygen XML Editor Eclipse plugin. For other document types, the default behavior of the paste operation is to keep only the text content without the styling.

The style of the pasted content can be customized by editing an XSLT stylesheet for a particular document type (*framework (on page 2679)*). The XSLT stylesheet must accept an XHTML flavor of the copied content as input, and transform it to the equivalent XML markup that is appropriate for the target document type of the paste operation.

How to Customize the Smart Paste Mapping

To customize the mapping between the markup of the copied content and the markup of the pasted content for a particular document type, follow these steps:

1. Make sure the particular *framework* contains a folder named `resources` in the following path structure:

```
/frameworks/[Document Type]/resources
```

2. Create an XSLT file named `xhtml2content.xsl` and save it in the `resources` folder for the particular *framework*.

For example: `/frameworks/[Document Type]/resources/xhtml2content.xsl`

3. Add your customized styling in the XSLT file. A list of supported parameters can be found in the [Supported Parameters for the Custom Smart Paste XSLT \(on page 2000\)](#) section below.

**Tip:**

The built-in DITA framework includes an `xhtml2ditaDriver.xsl` file (in `[OXYGEN_INSTALL_DIR]/frameworks/dita/resources`) that imports various other stylesheets that apply cleanup and handle the conversion from the pasted HTML content to DITA. If you are using a custom extension of the DITA framework, you can copy the entire

contents of the built-in `dita/resources` folder and customize the stylesheets according to your needs.

4. You can test modifications done in the stylesheet by pasting content without having to restart Oxygen XML Editor Eclipse plugin.

Result: When you paste content from external applications (such as a web browser or and Office document) to a document that is open in **Author** mode, and that matches the particular *framework*, the styling from the `xhtml2content.xsl` stylesheet will be applied on the clipboard contents.

Customized Smart Paste Stylesheet Sample:

```
<xsl:stylesheet version="1.0"
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xhtml="http://www.w3.org/1999/xhtml"
  xmlns="urn:hl7-org:v3"
  exclude-result-prefixes="xsl xhtml">

  <xsl:output method="xml" indent="no" omit-xml-declaration="yes"/>

  <xsl:template match="xhtml:b | xhtml:strong">
    <content styleCode="bold" >
      <xsl:apply-templates select="@* | node()"/>
    </content>
  </xsl:template>

  <xsl:template match="*">
    <xsl:apply-templates select="@* | node()"/>
  </xsl:template>

  <xsl:template match="@* | node()">
    <xsl:copy>
      <xsl:apply-templates select="@* | node()"/>
    </xsl:copy>
  </xsl:template>

</xsl:stylesheet>
```

Supported Parameters for the Custom Smart Paste XSLT

The following parameters can be used in your XSLT stylesheet for customizing the *Smart Paste* mechanism:

inTableContext

The custom XSLT stylesheet receives this parameter with a value of **true** if the end-user is pasting content inside a table.

folderOfPasteTargetXml

A URL pointing to the folder where the currently edited XML document is located. This is used to save images relative to the current XML document.

context.path.names

A sequence of element names showing the current context in the XML document where the paste occurred.

context.path.uris

A sequence of namespaces, one for each context path name.

context.path.separator

The separator between the path names. Its value can be used to split the context path names to a sequence.

By default, there is an extra check in place to ensure that the applied XSLT does not remove the original text from the pasted content. If there is a file called `externalPasteOptions.xml` in the `resources` folder, you can use it to specify the default behavior for checking if the XSLT stylesheet loses content during conversion:

```
<!-- Options that control external paste
(automatic conversions when pasting HTML and URL flavors from the clipboard). -->
<pasteOptions>
  <!-- True to check if the entire sequence of words which get pasted are
converted to the target vocabulary. If the check fails, the content
will be inserted as a simple sequence of words without any formatting. -->
  <checkEntireContentIsFullyPreserved>true</checkEntireContentIsFullyPreserved>
</pasteOptions>
```

Customize the Content Completion Assistant

Oxygen XML Editor Eclipse plugin gathers information from the associated schemas (DTDs, XML Schema, RelaxNG) to determine the proposals that appear in the *Content Completion Assistant (on page 2677)*.

Oxygen XML Editor Eclipse plugin also includes support that allows you to customize the *Content Completion Assistant* to suit your specific needs.

There are two ways to customize the *Content Completion Assistant* in Oxygen XML Editor Eclipse plugin:

- You can add, modify, or remove actions that are proposed for each particular document type (*framework (on page 2679)*) by using the **Content Completion** subtab in the **Document Type Association** configuration dialog box (*on page 110*). To access this subtab, open the **Preferences** dialog box (*on page 70*), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (*on page 88*), click on the **Author** tab, and then the **Content Completion** subtab.

**Note:**

This works only for Author visual mode.

- You can use a `cc_config.xml` configuration file that is specific to each document type (*framework*) to configure the values that are proposed in certain contexts, to customize the attributes or elements that are proposed, or to customize how certain aspects of the proposals are rendered in the interface. The rest of the topics in this section explain how you can use this configuration file to customize the content completion.

Resources

To see more ideas for various advanced customization possibilities (including how to insert or reject proposals for the content completion assistant), watch our Webinar: [Working with DITA in Oxygen - Customizing the Editing Experience](#).

[Customizing the Content Completion Assistant for Author Mode Only \(on page 1994\)](#)

Configuring the Proposals for Elements and Attributes

There are many cases where elements have a relaxed content model and can accept a large number of child elements. For example, the DITA list item element (``) accepts more than 60 child elements. Oxygen XML Editor Eclipse plugin includes support to allow the content architect to put some constraints on the possible elements or attributes, or to impose some best practices in the way content is edited.

For an example of a specific use-case, suppose that you want to restrict DITA list item elements (``) to only accept paragraph elements (`<p>`). In this case, the [Content Completion Assistant \(on page 2677\)](#) should not offer any element other than a paragraph (`<p>`) when a list item (``) is inserted into a document. It would also be helpful if the required child element (`<p>`) was automatically inserted whenever a list item (``) is inserted.

One method of changing the content model is to alter the element definition in the associated schema (XML Schema, DTD, RelaxNG), but this may be complicated in some cases. Fortunately, Oxygen XML Editor Eclipse plugin offers a simple, alternative method of using a configuration file to customize the content completion proposals for each element.

Setting up the Content Completion Configuration File

To customize the configuration file for the [Content Completion Assistant \(on page 2677\)](#), follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab ([on page 95](#)) add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
 - a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor Eclipse plugin (**File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration**). The document template includes details about how each element and attribute is used in the configuration file.
 - b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.

- c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it (e.g. create a `resources` folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the `cc_config.xml` file in your extension (e.g. `resources`) is listed in the **Classpath** tab (on page 95) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it `cc_config_ext.xml` and all the rules inside it are merged with the base `cc_config.xml` file. The merging is done by taking all the rules specified in the `cc_config_ext.xml` file into consideration after processing the set of rules from the base `cc_config.xml` file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the *Content Completion Assistant* you should see your customizations.

**Tip:**

In some cases, you can simply use the  **Refresh (F5)** action to test your customizations, without having to restart the application.

**Attention:**

In the **Classpath** tab (on page 95), if you have references to multiple `resources` folders, each with its own `cc_config.xml` file, the first reference listed in the **Classpath** tab takes precedence and the multiple configuration files are not combined.

Configuring Elements or Attributes that are Proposed for Each Element

For the purposes of customizing the elements or attributes that are proposed for each individual element, the configuration file (`cc_config.xml`) uses `<elementProposals>` elements. This element allows you to customize or filter the child elements and attributes for an element.

**Warning:**

Note that you can only choose elements or attributes that are already allowed by the schema in a particular context. For example, you cannot specify an element that is not allowed by the schema as a child of a particular node.

Elements:

To control the **elements** that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

- **path** - A path within the document that matches the element that will have its content completion proposals changed. For example, "title" matches all the <title> elements in the document, while "chapter/title" matches only the <title> elements that are direct children of the <chapter> element. You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use AND/OR boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- *element[@attr]*- Matches all instances of the specified element that include the specified attribute.
- *element[not(@attr)]*- Matches all instances of the specified element that do not include the specified attribute.
- *element[@attr = "value"]*- Matches all instances of the specified element that include the specified attribute with the given value.
- *element[@attr != "value"]*- Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- *elementName*
- *//elementName*
- */elementName1/elementName2/elementName3*
- *//xs:localName*
- *//xs:documentation[@lang="en"]*

Note:

Using a namespace prefix requires that you declare it on the <elementProposals> element or on an ancestor element. For example:

```
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
  path="db5:listitem" insertElements="db5:para" />
```

Other Important Notes:

- If the @path attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use *possibleElements* (on page 2006) or *rejectElements* (on page 2007) to specify or restrict particular elements for a framework (on page 2679).

For example, suppose that in your DITA documents, you want to restrict your users from using `<image>` and `<fig>` elements because you do not want images to be included in your output. The configuration file should look like this:

```
<elementProposals rejectElements="image fig" />
```

Since the `@path` attribute is missing, the specified element will be filtered out from the proposals for the entire *framework*.

- If the particular document type has name namespaces, the `@path` should contain the qualified name. For example, in TEI documents, if you want to set a list of possible attributes for the `` element, you need to use a qualified name like this (notice the declaration of the namespace prefix `"t"` and its usage):

```
<config xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.oxygenxml.com/ns/ccfilter/config
  http://www.oxygenxml.com/ns/ccfilter/config/ccConfigSchemaFilter.xsd"
  xmlns="http://www.oxygenxml.com/ns/ccfilter/config"
  xmlns:t="http://www.tei-c.org/ns/1.0">

  <elementProposals path="t:span" possibleAttributes="type" />
```

- **insertElements** - A space-separated sequence of child element names. Each time the element specified in the `@path` attribute is inserted into the document, these child elements will also be inserted in the order that they are listed. For example, `insertElements="b i"` will insert exactly one `` element, followed by an `<i>` element. An empty value (`" "`) means that no child elements should be inserted.

**Note:**

If this attribute is missing, the default required child elements will be inserted, as specified in the associated schema for the document.

- **possibleElements** - A space-separated list of element names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute. For example, `"b i codeph ph"` means that the *Content Completion Assistant* will contain these four elements when invoked on the element specified in the `@path` attribute. The following other possible values are also supported:
 - **NONE** - There will be no proposals in the content completion list.
 - **ALL** - All the possible elements specified in the associated schema will be presented in the content completion list. This is also the default behavior if this attribute is missing.
 - **INSERTED** - The proposals will be the same list of elements that are defined in the `@insertElements` attribute.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```
<elementProposals possibleElements="b i codeph ph" />
```

- **rejectElements** - A space-separated list of element names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the *Content Completion Assistant* will include the entries that are defined in the associated schema, minus the elements specified in this attribute.

Note:

This setting makes the application behave as if the rejected elements were not allowed by the schema in that location. Most of the toolbar actions take the schema into account when inserting content. If the inserted content is not allowed by the schema in that particular location, the application tries to find another location within close proximity where the content is allowed.

For example, suppose you reject the insertions of images in paragraphs. If a user has the cursor inside a paragraph and uses the toolbar action that inserts an image, the image will be inserted after the current paragraph rather than at the current location.

If you want to avoid having users insert an element directly from the content completion mechanism and want them to use a toolbar action instead, it is better to use the [Document Type Configuration \(on page 110\)](#) dialog box to remove the element.

When using this attribute to specify multiple elements, only use one entry with the element names separated by a space:

```
<elementProposals rejectElements="image fig imagemap foreign" />
```

- **contentType** - Forces an element to have an imposed content type. The possible values are:

`elementOnly`, `mixed`, or `empty`.

```
<elementProposals path="section" insertElements="title p" contentType="elementOnly" />
```

- **merge** - By default, if there are multiple element proposal rules that match the current element context, then only the rule that has the most specific path is used. By setting the `@merge` attribute to `true` on the proposal rules that might match the same element context, all the rules will be applied. Example:

```
<elementProposals
  path="/*[not(@xml:lang='ja')]/*"
  rejectElements="japaneseTag"
  merge="true" />
```

```
<elementProposals
  path="/*[@xml:lang!='he']/*"
  rejectElements="hebrewTag"
```

```
merge="true"
/>
```

Attributes:

To control the **attributes** that are proposed for an element, you can use the following attributes for the `<elementProposals>` element:

- **path** - A path within the document that matches the element that will have its attribute proposals changed. For example, `"title"` matches all the `<title>` elements in the document, while `"chapter/title"` matches only the `<title>` elements that are direct children of the `<chapter>` element. You can use simplified forms of XPath in this attribute. For examples of such forms of XPath expressions, see the [note in XML Preferences \(on page 168\)](#).

Note:

If this attribute is missing, the customization will apply to the proposals for all elements. You can intentionally omit this attribute and use [possibleAttributes \(on page 2008\)](#) or [rejectAttributes \(on page 2009\)](#) to specify or restrict attributes for an entire *framework*.

For example, suppose that you only want to allow a limited set of attributes in a customized *framework*. The configuration file should look like this:

```
<elementProposals possibleAttributes="
    id domains href scope format type conref
    props keyref class"/>
```

Since the `@path` attribute is missing, this applies to the entire *framework* and only the specified attributes will be proposed.

- **insertAttributes** - A space-separated sequence of attribute names that will be inserted along with the element.

```
<elementProposals path="ol/li" insertAttributes="product platform"/>
```

- **insertAttribute** - This is similar to the preceding attribute, but this one also allows you to specify a value for the attribute that will be inserted. This attribute should be used like this:

```
<elementProposals path="ol/li">
  <insertAttribute name="platform" value="test"/>
</elementProposals>
```

- **possibleAttributes** - A space-separated list of attribute names that will be shown in the content completion list when invoked inside an element that is specified in the `@path` attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```
<elementProposals possibleAttributes="scope format type"/>
```

- **rejectAttributes** - A space-separated list of attribute names that will be filtered out from the list of proposals that are presented in the content completion list. Each time the element specified in the `@path` attribute is inserted into the document, the list of proposals in the *Content Completion Assistant* will include the entries that are defined in the associated schema, minus the attributes specified in this attribute.

When using this attribute to specify multiple attributes, only use one entry with the attribute names separated by a space:

```
<elementProposals rejectAttributes="importance platform product"/>
```

Other Important Notes About the Configuration File

Important:

- By default, the element names that do not have a namespace prefix are considered from *no-namespace*. Consider declaring the namespace mapping on the root of the configuration file and prefixing the element names from the `@elementPath` and `@model` attributes.
- This configuration file only affects the content completion assistance. It has no effect on validation or operations invoked from other areas in the interface (such as the toolbar or menus).
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the  **Reload (F5)** action to test your customizations.
- When an XML element from the document is matched against a list of configured `elementProposals`, the first one in sequence takes precedence. Therefore, make sure you place the more specific `elementProposals` (those with a longer path) first in your configuration file.
- Simple wildcard patterns can be used in the following attributes: `@possibleElements`, `@rejectElements`, `@possibleAttributes`, and `@rejectAttributes`. For example, `code*`, `*block`, `con*ref`, `_*`.
- Editor variables (*on page 218*) can be used in the `@value` attribute of the `<insertAttribute>` element. For example:

```
<elementProposals path="prolog/critdates/created">
  <insertAttribute name="date" value="\${date(yyyy-MM-dd)}"/>
</elementProposals>
```

- Only simple recursion cases are detected and avoided by the editor, and logged to the console. Therefore, if complex `elementProposals` patterns are defined, you should avoid *infinite recursions*.

Examples: Configuring the Element Proposals

• Example 1: Automatically Insert Elements

Suppose that you want to automatically insert a paragraph element (`<p>`) whenever a DITA ordered list item element (`<ol/li>`) is inserted, and also to not allow any other element besides a paragraph inside the ordered list items.

To achieve this, the configuration file should include the following:

```
<elementProposals path="ol/li" insertElements="p"
    possibleElements="__INSERTED_" />
```

Tip:

This particular example modifies an action that inserts a list in a DITA document. There are several ways to invoke this action in the interface. For example, there is a toolbar button and an action in the **DITA** menu that inserts a list. However, since the configuration file only affects the *Content Completion Assistant*, this modification will have no effect on the behavior of the toolbar or menu action. Those actions would need to be configured separately if you want the result to be the same as the content completion proposal. For more information, see [Customizing the Author Mode Editing Experience for a Framework \(on page 1955\)](#).

• Example 2: Insert Complex Element Structure

For a more complex example, suppose that you want to insert a complex structure whenever a DITA `<prolog>` element is inserted.

For instance, if you want to insert the following structure inside `<prolog>` elements:

```
<prolog>
  <author></author>
  <metadata>
    <keywords>
      <keyword></keyword>
      <keyword></keyword>
    </keywords>
  </metadata>
</prolog>
```

the configuration file should include the following:

```
<elementProposals path="prolog" insertElements="author metadata" />
<elementProposals path="prolog/metadata" insertElements="keywords" />
<elementProposals path="prolog/metadata/keywords"
    insertElements="keyword, keyword" />
```

• Example 3: Limit Possible Elements

Suppose that you also want to limit the proposals for the `<keywords>` element to only allow the user to insert `<audience>` or `<keyword>` elements. The configuration file should include the following:

```
<elementProposals path="prolog/metadata" insertElements="keywords"
    possibleElements="audience keywords" />
```

Suppose that you want to simply restrict your users from inserting `<image>` elements inside DITA list item elements (``), but still propose all the other elements that are defined in the associated schema. The configuration file should look like this:

```
<elementProposals path="li" rejectElements="image" />
```

Examples: Configuring the Attributes Proposals

• Example 1: Automatically Insert Attributes

Suppose that you want to insert an `@id` attribute (with an empty value) whenever a DITA list item element (``) is inserted. The configuration file should include the following:

```
<elementProposals path="li" insertAttributes="id" />
```

• Example 2: Limit Possible Attributes

Suppose that you also want to limit the number of choices for attributes that are presented to the user whenever a DITA list item element (``) is inserted. The configuration file should look like this:

```
<elementProposals path="li" insertAttributes="id"
    possibleAttributes="id product platform audience" />
```

Suppose that you want to simply restrict your users from inserting `@conref` attributes inside DITA topics (`<topic>` element), but still propose all the other attributes that are defined in the associated schema.

The configuration file should look like this:

```
<elementProposals path="topic" rejectAttributes="conref" />
```

[Configuring the Proposals for Attribute and Element Values \(on page 2011\)](#)

[Customizing the Rendering of Elements \(on page 2018\)](#)

Configuring the Proposals for Attribute and Element Values

Oxygen XML Editor Eclipse plugin includes support for configuring the proposed values that appear in the *Content Completion Assistant* (on page 2677). To do so, a configuration file is used, along with the associated schema, to add or replace possible values for attributes or elements that are proposed in the *Content Completion Assistant*.

For an example of a specific use-case, suppose that you want the *Content Completion Assistant* to propose several possible values for the language code when you use an `@xml:lang` attribute.

Setting up the Content Completion Configuration File

To customize the configuration file for the *Content Completion Assistant* (on page 2677), follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab (on page 95) add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
 - a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor Eclipse plugin (**File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration**). The document template includes details about how each element and attribute is used in the configuration file.
 - b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
 - c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it (e.g. create a `resources` folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the `cc_config.xml` file in your extension (e.g. `resources`) is listed in the **Classpath** tab (on page 95) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it `cc_config_ext.xml` and all the rules inside it are merged with the base `cc_config.xml` file. The merging is done by taking all the rules specified in the `cc_config_ext.xml` file into consideration after processing the set of rules from the base `cc_config.xml` file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the *Content Completion Assistant* you should see your customizations.

**Tip:**

In some cases, you can simply use the  **Refresh (F5)** action to test your customizations, without having to restart the application.

**Attention:**

In the **Classpath** tab (on page 95), if you have references to multiple `resources` folders, each with its own `cc_config.xml` file, the first reference listed in the **Classpath** tab takes precedence and the multiple configuration files are not combined.

Configuring Proposed Values

For the purposes of adding or replacing the values that are proposed, the configuration file (`cc_config.xml`) includes a series of `valueProposals` instructions that will match an element or attribute name and has the following attributes:

- **path** - A path within the document that matches the element or attribute that will have its content completion proposals changed. For example:
 - `path="title"` matches all the `<title>` elements in the document.
 - `path="chapter/title"` matches only the `<title>` elements that are direct children of the `<chapter>` element.
 - `path="@xml:lang"` matches all the `@xml:lang` attributes in the document.
 - `path="title/@xml:lang"` matches only the `@xml:lang` attributes that appear on `<title>` elements.

You can use simplified forms of XPath in this attribute.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use *AND/OR* boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- `element[@attr]`- Matches all instances of the specified element that include the specified attribute.
- `element[not(@attr)]`- Matches all instances of the specified element that do not include the specified attribute.
- `element[@attr = "value"]`- Matches all instances of the specified element that include the specified attribute with the given value.
- `element[@attr != "value"]`- Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following are examples of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- *elementName*
- *//elementName*
- */elementName1/elementName2/elementName3*
- *//xs:localName*
- *//xs:documentation[@lang="en"]*

Note:

Using a namespace prefix requires that you declare it on the `<elementProposals>` element or on an ancestor element. For example:

```
<elementProposals xmlns:db5="http://docbook.org/ns/docbook"
  path="db5:listitem" insertElements="db5:para" />
```

- **editable** - Specifies the editable state of the attribute values, as reflected in the **Attributes view** (on page 405) and the **In-place Attributes Editor** (on page 407). The possible values for the `@editable` attribute are:
 - **true** - The attribute values can be edited by choosing from a combo box or manually providing a value.
 - **false** - The attribute values cannot be edited.
 - **onlyAllowedItems** - The attribute values can be edited, but only by choosing from a list of proposed values, in a non-editable combo box.

The new value proposals are specified in the `<valueProposals>` element through:

- One or more `<item>` elements, which are grouped inside an `<items>` element.

Tip:

The `<item>` element can have a `@listValue` attribute, which can be set to **true** if you want those items to be part of a list attribute value (such as `attr="item1 item2"`).

- An `<xslt>` element that references an XSLT script that gets executed and must return an `<items>` element.

The behavior of the `<items>` or `<xslt>` elements are specified with the help of the `@action` attribute, which can have any of the following values:

- **append** - Adds new values to appear in the proposals list (default value).
- **addIfEmpty** - Adds new values to the proposals list only if no other values are contributed by the schema.
- **replace** - Replaces the values contributed by the schema with new values to appear in the proposals list.

The values in the configuration file can be specified either directly or by calling an external XSLT file that will extract data from an external source. An `<xslt>` element must be used in this situation.

Note:

`valueProposals` offers more flexibility compared to the old `match` element that was marked as deprecated.

```
<match elementName="lg" elementNS="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</match>
```

Other Important Notes About the Configuration File

Important:

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should [Refresh the source document \(on page 526\)](#).

Example: Specifying Values Directly

If you want to specify the values directly, the configuration file should look like this:

```
<!-- Replaces the values for an element with the local name "lg",
      from the given namespace -->
<valueProposals path="x:lg" xmlns:x="http://www.oxygenxml.com/ns/samples">
  <items action="replace">
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</valueProposals>

<!-- Adds two values for an attribute "type", from no namespace -->
<valueProposals path="@type" editable="onlyAllowedItems">
  <items>
    <item value="stanza"/>
    <item value="refrain"/>
  </items>
</valueProposals>
```

Example: Using Attribute Conditions

The possible values of an attribute depend on the value of another attribute from the same element:

```
<valueProposals path="property[@name='color']">
  <items>
    <item value="red"/>
    <item value="blue"/>
  </items>
</valueProposals>

<valueProposals path="property[@name='shape']">
  <items>
    <item value="rectangle"/>
    <item value="square"/>
  </items>
</valueProposals>
```

Example: Calling an External XSLT Script

If you want to collect values from an external XSLT script, the configuration file should include something like this:

```
<xslt href="../../../xsl/get_values_from_db.xsl" useCache="false" action="replace"/>
```

In this example, the `get_values_from_db.xsl` is executed to extract values from a database.

Tip:

You can use `xsl:message` as a debugging mechanism. These messages are presented in the results area at the bottom of the application whenever the *Content Completion Assistant* is invoked.

Note:

A comprehensive XSLT sample is included in the **Content Completion Configuration** document template (in the **Framework Templates > Oxygen Extensions** section of the [New from templates wizard](#) (on page 253)).

Note:

If `@useCache` is set to `false`, then the XSLT will be invoked any time the proposals are needed. If `@useCache` is set to `true`, then the XSLT is executed once and the obtained proposals are kept in a cache and returned every time the proposals are requested again. You can use the **Validate** action to drop the cached values and recompute them.

Configuring Proposed Values in the Context Where the Content Completion was Invoked

Web Author Customization Note:

This particular scenario is not supported for an Oxygen XML Web Author customization.

A more complex scenario is if you want to choose the possible values to propose, depending on the context of the element where the content completion was invoked.

Suppose that you want to propose certain possible values for one property (for example, *color*) and other values for another property (for example, *shape*). If the property represents a color, then the values should represent applicable colors, while if the property represents a shape, then the values should represent applicable shapes. See the following code snippets:

Your main document:

```
<sampleArticle>
  <!-- The possible values for @value should be "red" and "blue" -->
  <property name="color" value="" />
  <!-- The possible values for @value should be "square" and "rectangle" -->
  <property name="shape" value="" />
</sampleArticle>
```

The content completion configuration file:

```
<config xmlns="http://www.oxygenxml.com/ns/ccfilter/config">
  <valueProposals path="property/@value">
    <xslt href="get_values.xsl" useCache="false" action="replace" />
  </valueProposals>
</config>
```

The stylesheet that defines the possible values based on the context of the property on which the content completion was invoked:

```
<xsl:stylesheet
  xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  version="3.0">

  <xsl:param name="documentSystemID" as="xs:string"></xsl:param>
  <xsl:param name="contextElementXPathExpression" as="xs:string"></xsl:param>

  <xsl:template name="start">
    <xsl:apply-templates select="doc($documentSystemID)" />
  </xsl:template>
```

```

<xsl:template match="/">
  <xsl:variable name="propertyElement" as="element()">
    <xsl:evaluate xpath="$contextElementXPathExpression" context-item="./*" />
  </xsl:variable>

  <items>
    <xsl:if test="$propertyElement/@name = 'color'">
      <item value='red' />
      <item value='blue' />
    </xsl:if>
    <xsl:if test="$propertyElement/@name = 'shape'">
      <item value='rectangle' />
      <item value='square' />
    </xsl:if>
  </items>
</xsl:template>
</xsl:stylesheet>

```

The `contextElementXPathExpression` parameter will be bound to an XPath expression that identifies the element in the context where the content completion was invoked.

Related information

[Configuring the Proposals for Elements and Attributes \(on page 2003\)](#)

[Customizing the Rendering of Elements \(on page 2018\)](#)

Customizing the Rendering of Elements

In addition to the support for configuring the proposals that appear in the *Content Completion Assistant (on page 2677)*, Oxygen XML Editor Eclipse plugin also includes support for customizing how the elements are rendered. You can do this by using the *XMLNodeRendererCustomizer API extension (on page 2080)*, but you can also use the same configuration file that is used to configure the content completion proposals.

For an example of a specific use-case, suppose that in DITA you want the names of paragraph elements (`<p>`) to be rendered as **"Paragraph"** instead of **"p"** in the various components in **Author** mode (such as in the **Outline view (on page 326)**, **Elements view (on page 410)**, **Attributes view (on page 405)**, and the breadcrumb navigation bar). To achieve this, you can use the `<elementRenderings>` element in the configuration file.

Setting up the Content Completion Configuration File

To customize the configuration file for the *Content Completion Assistant (on page 2677)*, follow these steps:

1. Create a new `resources` folder (if it does not already exist) in the `frameworks` directory for the particular document type (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources`).
2. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association**. Select the particular document type, click the **Edit** button, and in the **Classpath** tab (on page 95) add a link to that `resources` folder (if it does not already exist).
3. Create a new configuration file or edit an existing one.
 - a. To easily create a new configuration file, you can use the *Content Completion Configuration* document template that is included in Oxygen XML Editor Eclipse plugin (**File > New > New from Templates > Framework templates > Oxygen Extensions > Content Completion Configuration**). The document template includes details about how each element and attribute is used in the configuration file.
 - b. If a configuration file (`cc_config.xml`) already exists for the particular document type (in the `resources` folder), you can modify this existing file.
 - c. If you extend a framework, you need to copy the content of the `cc_config.xml` file from the base framework and modify it (e.g. create a `resources` folder in your framework extension folder and place the file there). You also need to make sure that the folder that contains the `cc_config.xml` file in your extension (e.g. `resources`) is listed in the **Classpath** tab (on page 95) before the one from the base framework.

If you only want to make small changes or add extra rules in your custom content completion configuration file, you need to name it `cc_config_ext.xml` and all the rules inside it are merged with the base `cc_config.xml` file. The merging is done by taking all the rules specified in the `cc_config_ext.xml` file into consideration after processing the set of rules from the base `cc_config.xml` file.

4. Make the appropriate changes to your custom configuration file.
5. Save the file in the `resources` folder for the particular document type, using the fixed name: `cc_config.xml` (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/resources/cc_config.xml`).
6. Restart the application and open an XML document. In the *Content Completion Assistant* you should see your customizations.

**Tip:**

In some cases, you can simply use the  **Refresh (F5)** action to test your customizations, without having to restart the application.

**Attention:**

In the **Classpath** tab (on page 95), if you have references to multiple `resources` folders, each with its own `cc_config.xml` file, the first reference listed in the **Classpath** tab takes precedence and the multiple configuration files are not combined.

Changing the Rendering of Elements (Their Names, Annotations, and Icons)

For the purposes of customizing how the content completion elements are rendered, you can use the `<render>` element inside a `<elementRenderings>` element to specify how element names, their annotations, and their icons are rendered.

The `<elementRenderings>` element supports the `@platform` attribute, which can have one of the following values:

webapp

The element renderings are only applied to Oxygen XML Web Author.

standalone

The element renderings are only applied to standalone distributions of **Oxygen**.

eclipse

The element renderings are only applied to Eclipse plugin distributions of **Oxygen**.

Note:

If the `@platform` attribute is missing, the element renderings are applied to all types of distributions.

You can use the following attributes for the `<render>` element:

element

Identifies the element to be customized, in the form of a qualified name. If it does not have a prefix, it is considered to be from *noNamespace*.

as

Provides the name (label) that will be displayed for the element in various components in **Author** mode (the *Content Completion Assistant*, the breadcrumb navigation bar, the **Full Tags** display mode (on page 372), and the **Outline** (on page 326), **Elements** (on page 410), and **Attributes** (on page 405) views). This attribute is optional. If it is missing, the name of the element is used.

If you want to translate this label into another language, use the `#{i18n(key_name)}` editor variable (on page 225). The following code snippet shows how the DITA paragraph elements (`<p>`) can be translated:

```
<elementRenderings>
  <render element="p" as="#{i18n(cc_p)}"/>
</elementRenderings>
```

Note:

The `cc_p` id is a key that identifies the translations available for the paragraph element.

iconPath

Optional attribute that specifies the icon for the element. This is shown in the *Content Completion Assistant* and the **Outline view** (on page 326) in **Author** mode. If it is a relative path, the full path of the icon image file will be computed starting from the directory of the configuration file (for example, a value of `"myImg.png"` will cause Oxygen XML Editor Eclipse plugin to load `"frameworks/$ {framework}/resources/myImg.png"`). If you want to access a built-in resource, the value can begin with a forward slash `"/"`, and the image file will be searched for in the Oxygen XML Editor Eclipse plugin classpath resources (for example, `"/images/OrderedList16.png"` will load an icon from the built-in Oxygen XML Editor Eclipse plugin JAR file resources).

xml:lang (Deprecated)

It is recommended to use the `{i18n(key_name)}` editor variable (on page 225) instead. Optional attribute that could be used to render the same element differently, depending on the language. If there are multiple `<render>` elements for the same `@element` attribute (element name) and the `@xml:lang` attribute is missing on one of them, that one will be considered the default fallback value to be used if none of the others match the language specified in the interface.

Note:

The default entry should be listed first, since the application tries to match them in sequence and the last match found is the one that is used.

For example, suppose that you want the name of DITA paragraph elements (`<p>`) to be rendered as "Paragraphe" if the language is French, "Absatz" if the language is German, and "Paragraph" if the language is English (or any other language). Your configuration file should look something like this:

```
<elementRenderings>
  <render element="p" as="Paragraph" />
  <render element="p" as="Paragraphe" xml:lang="fr" />
  <render element="p" as="Absatz" xml:lang="de" />
</elementRenderings>
```

You can also use the configuration file to customize the annotations for elements. For this purpose, the `<render>` element also accepts the following element to change the tooltip annotations for an element (in both **Author** mode and **Text** mode):

annotation

This element can be used within the `<render>` element to customize the tooltip annotations that are displayed for the element in various components in **Author** mode (such as tooltips shown in the *Content Completion Assistant* documentation window, the breadcrumb navigation bar, the **Full Tags** display mode (on page 372), and the **Outline** (on page 326), **Elements** (on page 410), **Attributes** (on page 405) views), as well as the tooltips that are displayed when you hover over

elements in **Text** mode. You can use HTML content to style the annotations (see the [example below](#) (on page 2023)).

**Note:**

If this element is missing, the [styling for the annotations for that element is collected from the associated schema](#) (on page 397).

**Tip:**

The annotations can also be translated in the configuration file. For example:

```
<elementRenderings>
  <render element="p" as="\${i18n(cc_p)}">
    <annotation>\${i18n(cc_p)}</annotation>
  </render>
</elementRenderings>
```

Other Important Notes About the Configuration File for Rendering Elements

**Important:**

- This configuration file only affects the content completion assistance, not validation.
- To test the effects of your changes, you should restart the application, although in some cases, you can simply use the  **Reload (F5)** action to test your customizations.
- If the *framework* (on page 2679) has an associated *style guide*, then the annotations defined in the configuration file will take precedence over those defined in the *style guide*. To check to see if your *framework* uses a *style guide*, look for the following folder: `\${oxygenInstallDir}frameworks/\${framework}/styleguide/`. If that folder exists, it is recommended that you make your annotation changes directly in the *style guide*, rather than in the configuration file.
- If an *XMLNodeRendererCustomizer* API extension (on page 2080) has been implemented for the *framework* and a configuration file is also used, the rendering customization for an element will be the result of merging the two. For example, if the *XMLNodeRendererCustomizer* implementation customizes the element name, while the configuration file specifies an icon for the element, the properties of both customizations will be rendered. However, if both implementations define the same property (for example, both specify the rendering of an element name), the customizations defined in the configuration file take precedence.
- The rendering customizations defined in the configuration file also apply to aspects of the Oxygen XML Web Author interface.

Example: Changing the Rendering of an Element

Suppose that you want to render the name of the DITA `<title>` element to begin with a capital letter, use a custom icon for it, and provide specific documentation for that element in the various components in **Author** mode. The configuration file should look like this:

```
<elementRenderings>
  <render element="title"   as="Title"   iconPath="cimg/AcceptAll16.png">
    <annotation>
      <html xmlns="http://www.w3.org/1999/xhtml">
        <head>
          <title>Documentation for the Title Element</title>
        </head>
        <body>
          <p>A <i>heading</i> or <b>label</b> for the main parts of a topic</p>
        </body>
      </html>
    </annotation>
  </render>
</elementRenderings>
```

[Configuring the Proposals for Elements and Attributes \(on page 2003\)](#)

[Customizing XML Node Rendering \(on page 2080\)](#)

[Schema Annotations in Author Mode \(on page 397\)](#)

[Customizing Annotations in the Content Completion Assistant \(on page 2023\)](#)

Customizing Annotations in the Content Completion Assistant

Oxygen XML Editor Eclipse plugin gathers documentation from the associated schemas (DTD, XML Schema, RelaxNG) and presents it for each element or attribute. For example, if you open the *Content Completion Assistant (on page 2677)* for a recognized XML vocabulary, documentation is displayed for each element provided by the associated schema. Similar information is displayed when you hover over tag names presented in the **Elements view (on page 410)**. If you hover over attributes in the **Attributes view (on page 405)** you also see information about each attribute, gathered from the same schema.

If you have a *framework configuration (on page 90)* set up for your XML vocabulary, there is a special XML configuration file that can be added to provide additional documentation information or links to additional information for certain elements and attributes.

To provide this additional information in the *Content Completion Assistant*, follow these steps:

1. Create a new folder in the configuration directory for the document type.

Example: `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`

2. Use the **New** document wizard to create a file using the **Content Completion Styleguide** document template (in the **Framework Templates > Oxygen Extensions** section).

3. Save the file in the folder created in step 1, using the fixed name:

`contentCompletionElementsMap.xml`.

4. Open the **Preferences** dialog box (*on page 70*), go to **Document Type Association**, and edit the document type configuration for your XML vocabulary. Now you need to indicate where Oxygen XML Editor Eclipse plugin will locate your mapping file by doing one of the following:

- In the **Classpath** tab add a link to the newly created folder.
- In the **Catalogs** tab **add a new catalog file** (*on page 594*). The selected file needs to contain the following:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE catalog PUBLIC "-//OASIS//DTD XML Catalogs V1.1//EN"
    "http://www.oasis-open.org/committees/entity/release/1.1/catalog.dtd">
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
    <uri name="http://www.oxygenxml.com/{processed_dt_name}/styleguide/
contentCompletionElementsMap.xml" uri="contentCompletionElementsMap.xml" />
</catalog>
```

where `{processed_dt_name}` is the name of the document type in lower case and with spaces replaced by underscores.

Note:

If Oxygen XML Editor Eclipse plugin finds a mapping file in both locations, the one in the **Catalogs** tab takes precedence.

5. Make the appropriate changes to your custom mapping file.

Example: You can look at how the DITA mapping file is configured: `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide/contentCompletionElementsMap.xml`

The associated XML Schema contains additional details about how each element and attribute is used in the mapping file.

6. Re-open the application and open an XML document.

In the *Content Completion Assistant* (*on page 2677*), you should see the additional annotations for each element.

Translating Annotations

Annotations in the Content Completion Assistant can be displayed in various languages. Based on the language set for the interface, Oxygen XML Editor Eclipse plugin looks for several filename formats to determine the information to load for the content completion annotations. These files that begin with the name `contentCompletionElementsMap`, are located in the `styleguide` folder for each built-in framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/styleguide`).

For example, for English, the files are loaded in the following order (from specific to more general):

- `contentCompletionElementsMap_en_US.xml` or `contentCompletionElementMap_en_UK.xml`, and so on
- `contentCompletionElementsMap_en.xml`
- `contentCompletionElementsMap.xml`

If you want the annotations to be displayed in another language, you need to create similar files for the particular language. For example, to show annotations in German, create a file with one of the following names (and store it in the `styleguide` folder for your framework):

- `contentCompletionElementsMap_de_DE.xml`
- `contentCompletionElementsMap_de.xml`

Related Information:

[Customizing the Rendering of Elements \(on page 2018\)](#)

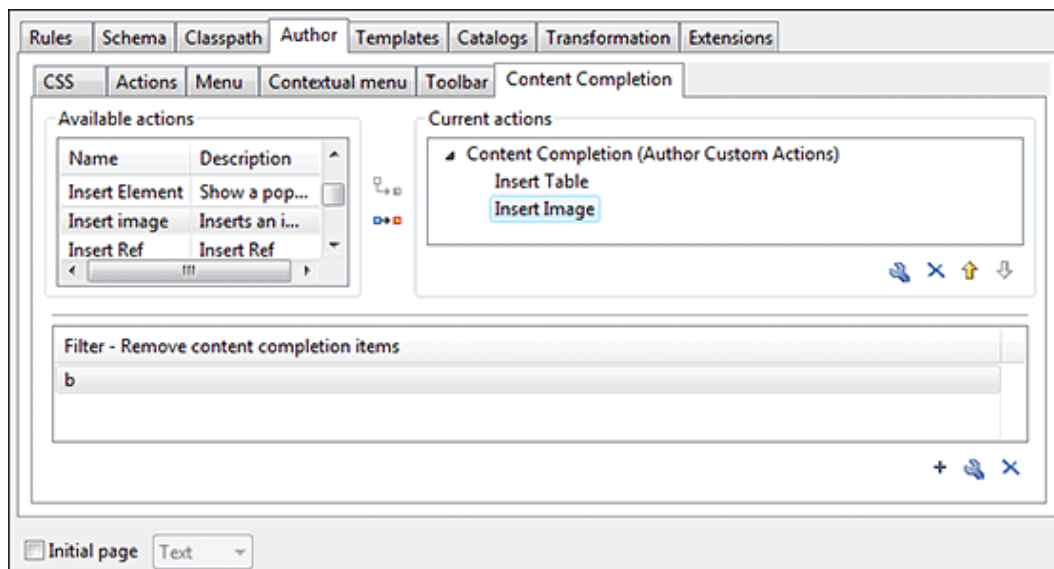

Customizing the Content Completion Assistant for Author Mode Only

You can customize the content of the following **Author** controls, adding items (which, when invoked, perform custom actions) or filtering the default contributed ones:

- *Content Completion Assistant* (on page 2677) window
- **Elements** view (on page 410)
- **Insert Element** menus (from the **Outline** view (on page 326) or breadcrumb (on page 378) contextual menus)

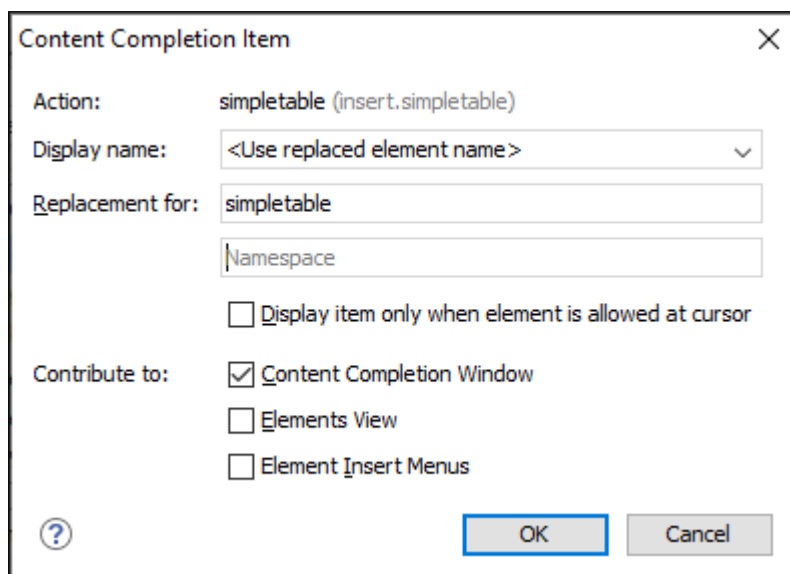

You can use the content completion customization support in a custom *framework* (on page 2679) by following this procedure:

1. Open the **Document type** configuration dialog box (on page 90) for your custom *framework* and select the **Author** tab. Next, go to the **Content Completion** tab (on page 110).

Figure 516. Customize Content Completion

The top side of the **Content Completion** section contains the list with all the actions defined within the custom *framework* and the list of actions that you decided to include in the *Content Completion Assistant* list of proposals. The bottom side contains the list with all the items that you decided to remove from the *Content Completion Assistant* list of proposals.

- If you want to add a custom action to the list of current **Content Completion** proposals, select the action item from the **Available actions** list and click the **Add as child** or **Add as sibling** button to include it in the **Current actions** list. A **Content Completion Item** dialog box appears, giving you the possibility to select where to provide the selected action.

Figure 517. Content Completion Item Dialog Box

- If you want to exclude a certain item from the **Content Completion** proposals, you can use the **Add** button from the **Filter - Remove content completion items** list. The **Remove item** dialog box is

displayed, allowing you to input the item name and to choose the controls that filter it. The **Item name** combo box accepts wildcards.

Figure 518. Remove Item Dialog Box

Note:

In the **Item name** drop-down menu, **<SPLIT>** refers to the action of splitting the element and creating a new one, while **<ENTER>** refers to the action of inserting a new line.

Related Information:

[Customizing the Content Completion Assistant Using a Configuration File \(on page 2002\)](#)

Configuring Transformation Scenarios for a Framework

When distributing a *framework* (on page 2679) to users, it is a good idea to have the transformation scenarios already configured. This helps the content authors publish their work in various formats. By being contained in the *framework* configuration, the scenarios can be distributed along with the actions, menus, toolbars, and catalogs.

To create a transformation scenario for your *framework*, follow these steps:

1. Create an `xsl` folder inside your custom *framework* directory (`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).

The folder structure for the documentation *framework* should be:

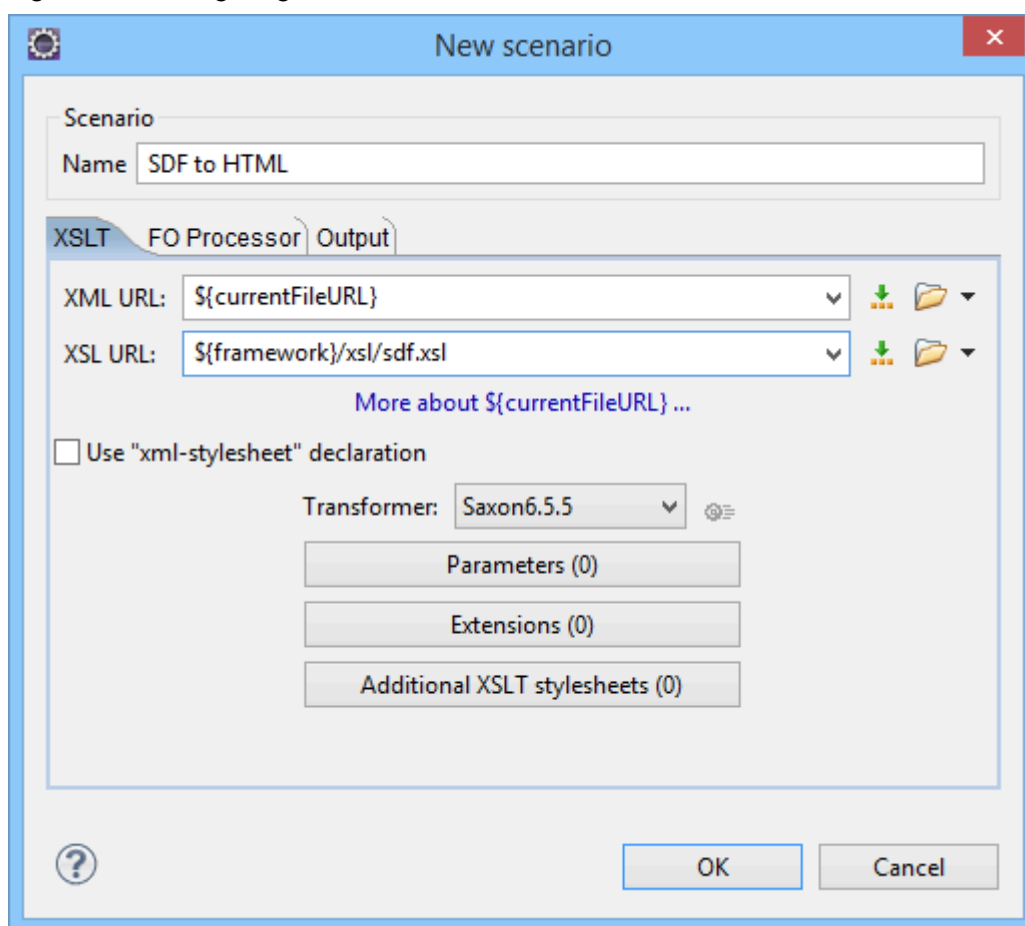

```
oxygen
  frameworks
    [CUSTOM_FRAMEWORK_DIR]
      schema
      css
      templates
      xsl
```

2. Create an `xsl` file and save it in the `xsl` folder. To help you get started, you can use the sample `sdf.xsl` file found in the [sample framework customization package](#).
3. Open the **Preferences** dialog box (*on page 70*) and go to **Document Type Associations**. Select the particular *framework*, click the **Edit** button to open **Document Type Configuration** dialog box (*on page 90*), and choose the **Transformation** tab. Click the **+ New** button and choose the appropriate type of transformation (for example, **XML transformation with XSLT**).

In the **New scenario** dialog box, fill in the following fields:

- Fill in the **Name** field with the name of your transformation scenario.
- Set the **XSL URL** field to path of your custom stylesheet (for example, `${framework}/xsl/mycustom.xsl`).

Figure 519. Configuring a New XSLT Transformation Scenario

4. Change to the **Output** tab. Configure the fields as follows:
 - Set the **Save as** field to `${cfd}/${cfn}.html`. This means the transformation output file will have the name of the XML file and the `html` extension and will be stored in the same folder.
 - Select the **Open in Browser/System Application** option.

**Note:**

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- Select the **Saved file** option.

5. Click the **OK** button to save the new scenario.

Now the scenario is listed in the **Transformation** tab:

Figure 520. Transformation Tab

To test the transformation scenario that you just created, you can use the sample `sdf.xml` file found in the [sample framework customization package](#). Click the **Apply Transformation Scenario(s)** button to display the **Transform with** dialog box. The scenario list contains the scenario you defined earlier. Select the *SDF to HTML* scenario that you just defined and click the **Apply associated** button. The HTML file is saved in the same folder as the XML file and displayed in the browser.

Configuring Validation Scenarios for a Framework

You can distribute a *framework* ([on page 2679](#)) with a series of already configured validation scenarios. Also, this provides enhanced validation support that allows you to use multiple grammars to check the document. For example, you can use Schematron rules to impose guidelines that are otherwise impossible to enforce using conventional validation.

**Note:**

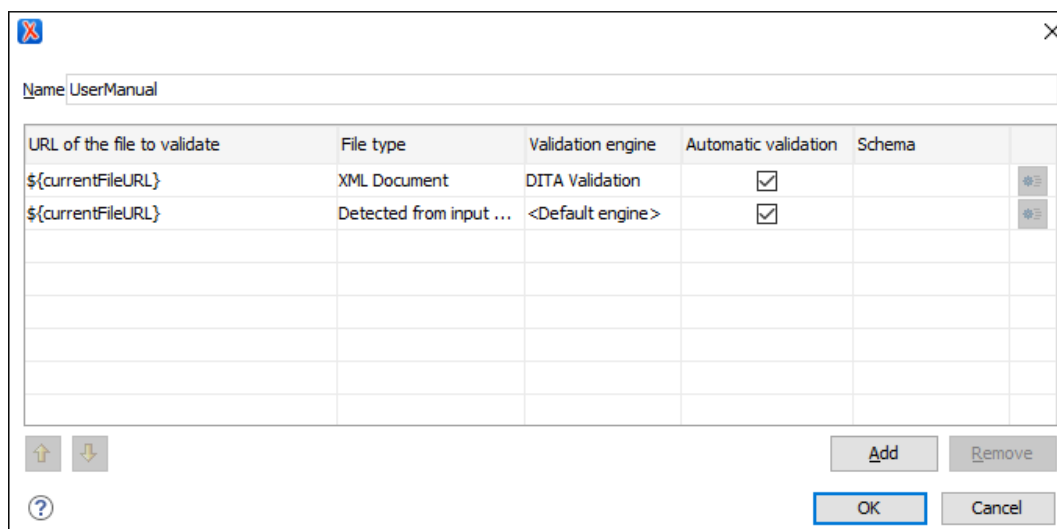

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 597\)](#).

To associate a validation scenario with a specific *framework*, follow these steps:

1. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association**.
2. Select the document type and click the **Edit** button to open the **Document Type Configuration** dialog box (on page 90), then choose the **Validation** tab. This tab displays a list of document types. To set one or more of the validation scenarios listed in this tab to be used as the default validation scenario (when another one is not specified in the validation process) for a specific document type, check the **Default** box for that specific document type.
3. To edit an existing scenario, select the scenario and click the  **Edit** button. To add a new scenario, click the  **New** button.

In either case, a scenario configuration dialog box is displayed. It lists all the validation units for the scenario.

Figure 521. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an [editor variable \(on page 218\)](#) or a [custom editor variable \(on page 227\)](#).

Figure 522. Insert an Editor Variable

<code>\${start-dir}</code>	- Start directory of custom validator
<code>\${standard-params}</code>	- List of standard parameters
<code>\${cfn}</code>	- The current file name without extension
<code>\${currentFileURL}</code>	- The path of the currently edited file (URL)
<code>\${cfdu}</code>	- The path of current file directory (URL)
<code>\${frameworks}</code>	- Oxygen frameworks directory (URL)
<code>\${pdu}</code>	- Project directory (URL)
<code>\${oxygenHome}</code>	- Oxygen installation directory (URL)
<code>\${home}</code>	- The path to user home directory (URL)
<code>\${pn}</code>	- Project name
<code>\${env(VAR_NAME)}</code>	- Value of environment variable VAR_NAME
<code>\${system(var.name)}</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page \(on page 206\)](#), [XQuery preferences page \(on page 203\)](#), [XML Schema preferences page \(on page 195\)](#)).
- **DITA Validation engine** - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**, but for a local file rather than an entire *DITA map* (on page 2678)).
- **DITA Map Validation and Completeness Check engine** - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).
- **DITA-OT Project Validation and Completeness Check engine** - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).
- **Table Layout Validation engine** - Looks for table layout problems (for more information, see the [Report table layout problems option \(on page 2387\)](#)).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the [automatic validation feature \(on page 547\)](#). If the **Automatic validation** feature is disabled

in the [Document Checking preferences page \(on page 133\)](#), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

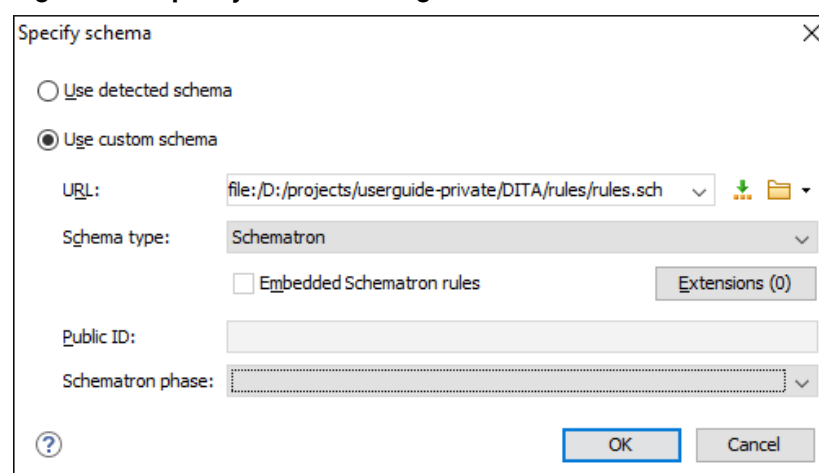

⚙️ Settings

Depending on the selected validation engine, clicking the ⚙️ **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

◦ **Specify Schema Dialog Box**

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 523. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document \(on page 585\)](#).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the 📄 **Insert Editor Variables** (on page 218) button, or the browsing actions in the 📁 **Browse** drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs (on page 2679)* to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

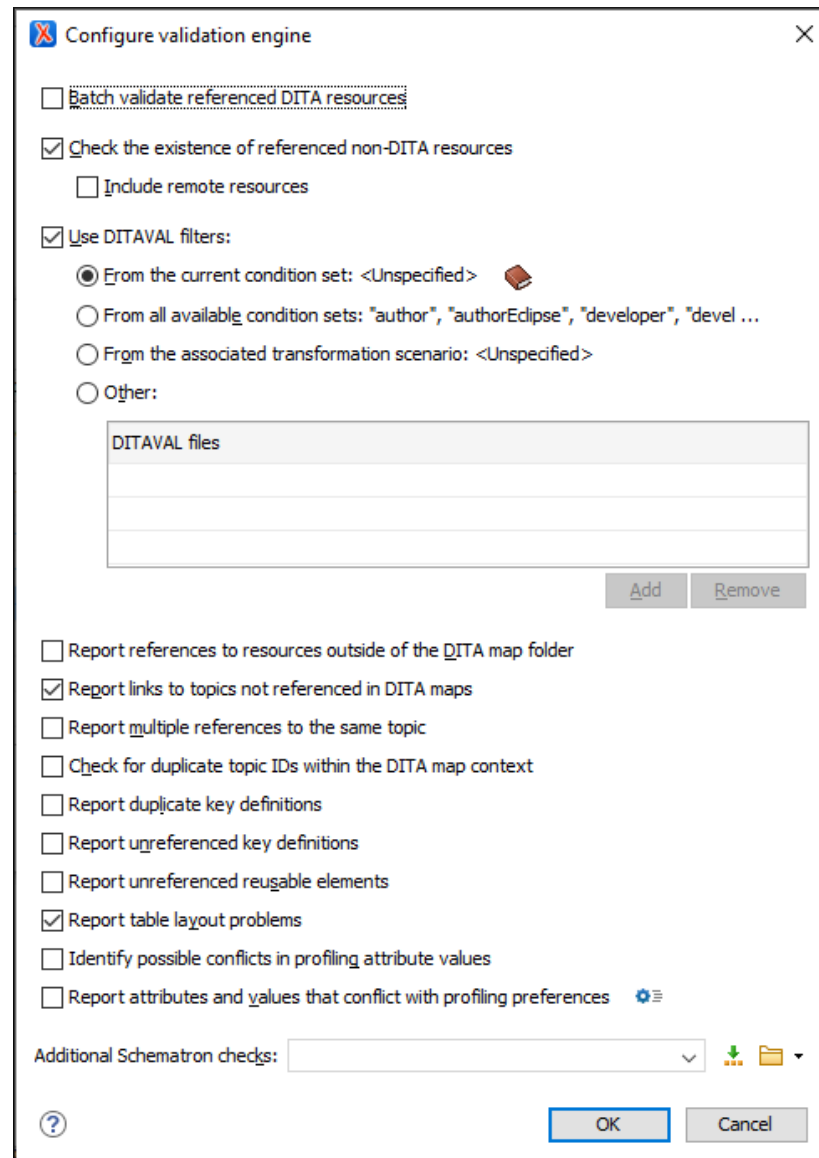

◦ **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).

Note:

The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 524. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated [validation scenario \(on page 557\)](#).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager view** (on page 2337). Clicking the  **Details** icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* (on page 2682) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes *key scopes (on page 2503)* into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2" />
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2" />
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 2503)* on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITaval filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page \(on page 145\)](#) (you can click the  **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.

**Advanced Tip:**

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLExtensionFunctionUtil](#).

↑ Move Up

Moves the selected validation unit up one spot in the list.

↓ Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

- Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
- Click **Ok**.
The newly created validation scenario is now included in the list of scenarios in the **Validation tab** ([on page 116](#)). You can use the **Default** checkbox to specify that the new scenario be used as the default validation scenario when another specific scenario is not specified in the validation process.

Customizing New Document Templates for a Framework

You can create your own custom document templates and attach them to a custom [framework](#) ([on page 2679](#)). You can then [share the custom framework](#) ([on page 2099](#)) so that all users will have access to the templates in the **New from templates wizard** ([on page 253](#)).

To create your own custom document template and have it appear in the new document wizard, follow these steps:

- Create a new file and customize it to become a starting point for creating new files of this type.

**Tip:**

You can use [editor variables](#) ([on page 218](#)) in the template file content and they will be expanded when the files are opened. Also, see [Customizing Document Templates](#) ([on page 255](#)) for other template customization tips (for example, you could [add placeholders or hints](#) ([on page 258](#)) to assist authors).

2. Save the new template in a directory (for example, called `templates`) within your custom framework directory.

Attention:

The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as **My Custom Template1**). You can also configure the displayed name in a properties file by following the procedure found in the [Configure the Displayed Names for Document Templates \(on page 257\)](#) section.

3. Open the **Document Type** configuration dialog box ([on page 90](#)) for that specific framework, go to the **Templates** tab ([on page 113](#)), and click the **+** button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). Binding to an absolute file (e. g.: `C:\some_dir\templates`) makes the association difficult to share between users.
4. Click **OK** for all of the dialog boxes to save your changes.
5. To test the template, open the new document wizard ( **New** toolbar button or **File > New > New from Templates**) and you should see your custom template in the folder for your custom *framework* (in the **Framework templates** section).

Related information

[Customizing Document Templates \(on page 255\)](#)

Configuring XML Catalogs

For cases where you need to reference the location of a schema file from a remote web location and an Internet connection may not be available, an *XML Catalog* ([on page 2683](#)) may be used to map the web location to a local file system entry. The following procedure presents an example of using an *XML catalog* in a custom *framework* ([on page 2679](#)) by modifying an XML Schema file.

1. Create a catalog file that will help the parser locate the schema for validating the XML document. The file must map the location of the schema to a local version of the schema.

Example:

Create a new XML file called `catalog.xml` and save it in your custom *framework* directory (`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`). The content of the file should look like this:

```
<?xml version="1.0"?>
<catalog xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
      uri="schema/abs.xsd" />
  <uri name="http://www.oxygenxml.com/SDF/abs.xsd"
```

```
uri="schema/abs.xsd" />
</catalog>
```

2. Add catalog files to your custom *framework* using the **Catalogs** tab (on page 114) from the **Document Type** configuration dialog box (on page 90).

To test the catalog settings, restart Oxygen XML Editor Eclipse plugin and try to validate a new sample document for your custom *framework*. There should be no errors.

Example:

The schema that validates the document refers the other file `abs.xsd` through an **import** element:

```
<xs:import namespace=
"http://www.oxygenxml.com/sample/documentation/abstracts"
schemaLocation="http://www.oxygenxml.com/SDF/abs.xsd" />
```

The `@schemaLocation` attribute references the `abs.xsd` file:

```
xmlns:schemaLocation="http://www.oxygenxml.com/sample/documentation/abstracts"
http://www.oxygenxml.com/SDF/abs.xsd" />
```

The catalog mapping is:

```
http://www.oxygenxml.com/SDF/abs.xsd -> schema/abs.xsd
```

This means that all the references to `http://www.oxygenxml.com/SDF/abs.xsd` must be resolved to the `abs.xsd` file located in the `schema` directory (note that the `schema` directory needs to be in the same folder as the *XML Catalog*). The URI element is used by URI resolvers (for example, to resolve a URI reference used in an XSLT stylesheet).

Localizing Frameworks

Oxygen XML Editor Eclipse plugin supports *framework* (on page 2679) localization (translating *framework* actions, buttons, and menu entries to various languages). This lets you develop and distribute a *framework* to users that speak other languages without changing the distributed *framework*.

To localize the content of a *framework*, follow this procedure:

1. Create a `translation.xml` file that contains all the translation (key, value) mappings. The `translation.xml` has the following format:

```
<translation>
  <languageList>
    <language description="English" lang="en_US" />
    <language description="German" lang="de_DE" />
    <language description="French" lang="fr_FR" />
  </languageList>
  <key value="list">
```

```

<comment>List menu item name.</comment>

<val lang="en_US">List</val>

<val lang="de_DE">Liste</val>

<val lang="fr_FR">Liste</val>

</key>

.....

</translation>

```

Oxygen XML Editor Eclipse plugin matches the GUI language with the language set in the `translation.xml` file. If this language is not found, the first available language declared in the `<language list>` tag for the corresponding *framework* is used.

- The `translation.xml` file must be stored in a directory named `i18n` located in the framework folder. You also need to add a reference to the `i18n` directory in the **Classpath** list corresponding to the edited document type (on page 95).

<code>\${framework}/i18n/</code>	<code>file:/D:/Programs/oxygen/frameworks/TRANSLATIONS/i18n/</code>
----------------------------------	---------------------------------------------------------------------

Note:

If you are working with an extension of a framework, you have to add the reference to your directory after (below) the reference to the `i18n` directory for the base directory:

<code>\${baseFramework}/i18n/</code>	<code>file:/D:/Programs/oxygen/frameworks/dita/i18n/</code>
<code>\${framework}/i18n/</code>	<code>file:/D:/Programs/oxygen/frameworks/TRANSLATIONS/i18n/</code>

- After you create this file, you can use the keys defined in it to customize the name and description of the following:
 - Actions
 - Menu entries
 - Contextual menus
 - Toolbars
 - Static CSS content

For example, if you want to localize the bold action, open the **Preferences** dialog box (on page 70) and go to **Document Type Association**. Use the **New** or **Edit** button to open the **Document type** configuration dialog box (on page 90), go to **Author > Actions**, and rename the bold action to `${i18n(translation_key)}`. Actions with a name format other than `${i18n(translation_key)}` are not localized. *Translation_key* corresponds to the key from the `translation.xml` file.

- Next, open the `translation.xml` file and edit the translation entry if it exists or create one if it does not exist. This is an example of an entry in the `translation.xml` file:

```

<key value="translation_key">
  <comment>Bold action name.</comment>

```

```

<val lang="en_US">Bold</val>
<val lang="de_DE">Bold</val>
<val lang="fr_FR">Bold</val>

</key>

```

To use a description from the `translation.xml` file in the Java code used by your custom *framework*, use the new `ro.sync.ecss.extensions.api.AuthorAccess.getAuthorResourceBundle()` API method to request the associated value for a certain key. This allows all the dialog boxes that you present from your custom operations to have labels translated in multiple languages.

You can also reference a key directly in the CSS content:

```

title:before{
    content:"${i18n(title.key)} : ";
}

```

Tip:

You can enter any language you want in the `<language list>` tag and any number of keys.

DocBook Example:

The `translation.xml` file for the DocBook *framework* is located here: `[OXYGEN_INSTALL_DIR]/frameworks/docbook/i18n/translation.xml`. In the **Classpath** list corresponding to the DocBook document type, the following entry was added:

```

${framework}/i18n/.

```

To see how the DocBook actions are defined to use these keys for their name and description, [open the Preferences dialog box \(on page 70\)](#) and go to **Document Type Association > Author > Actions**. If you look in the Java class `ro.sync.ecss.extensions.docbook.table.SADocbookTableCustomizerDialog` available in the `oxygen-sample-framework` module of the [Oxygen SDK Maven archetype](#), you can see how the new `ro.sync.ecss.extensions.api.AuthorResourceBundle` API is used to retrieve localized descriptions for various keys.

Framework Java Extensibility Guide

You can add *extensions (on page 2681)* to your custom *framework (on page 2679)* (document type) by using the **Extensions** tab from the **Document Type** configuration dialog box [\(on page 90\)](#).

If you want to customize the Eclipse plugin, you can look at the [Eclipse IDE Integration Sample Project](#) to see how an Eclipse plugin can interact with the **Oxygen** APIs.

Configuring an Extensions Bundle

All *extensions (on page 2681)* that are provided by Oxygen XML Editor Eclipse plugin are included in a single bundle.

**Note:**

The individual extensions can still be set (open the **Preferences** dialog box (on page 70), go to **Document Type Association**, double-click a document type, and go to the extension tab), and if present, they take precedence over the single provider. However, this practice is discouraged and the single provider should be used instead.

The extensions bundle is represented by the `ro.sync.ecss.extensions.api.ExtensionsBundle` class. The provided implementation of the `ExtensionsBundle` is instantiated when the *Document Type Association* (on page 2678) rules defined for the custom *framework* (on page 2679) matches a document opened in the editor. Therefore, references to objects that need to be persistent throughout the application running session must not be kept in the bundle because the next detection event can result in creating another `ExtensionsBundle` instance.

To configure an extensions bundle, follow this procedure:

1. Create a new Java project in your IDE. Create a `lib` folder in the Java project folder and copy in it the `oxygen.jar` file from the `[OXYGEN_INSTALL_DIR]/lib` folder.
2. Create the class (for example, `simple.documentation.framework.SDFExtensionsBundle`) to extend the abstract class `ro.sync.ecss.extensions.api.ExtensionsBundle`.

For example:

```
public class SDFExtensionsBundle extends ExtensionsBundle {
```

3. A `Document Type ID` and a short description should be defined by implementing the `getDocumentTypeID` and `getDescription` methods. The `Document Type ID` is used to uniquely identify the current *framework*. Such an ID must be provided especially if options related to the *framework* need to be persistently stored and retrieved between sessions.

For example:

```
public String getDocumentTypeID() {
    return "Simple.Document.Framework.document.type";
}

public String getDescription() {
    return "A custom extensions bundle used for the Simple Document" +
        "Framework document type";
}
```

4. **[Optional]** To be notified about the activation of the custom *Author Extension* in relation with an open document, `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` should be implemented. The **activation** and **deactivation** events received by this listener should be used to perform custom initializations and to register or remove listeners such as `ro.sync.ecss.extensions.api.AuthorListener`, `ro.sync.ecss.extensions.api.AuthorMouseListener`, or `ro.sync.ecss.extensions.api.AuthorCaretListener`. The custom *Author Extension* state listener should be provided by implementing the `createAuthorExtensionStateListener` method.

For example:

```
public AuthorExtensionStateListener createAuthorExtensionStateListener() {
    return new SDFAuthorExtensionStateListener();
}
```

The `AuthorExtensionStateListener` is instantiated and notified about the activation of the *framework* when the rules of the *Document Type Association* match a document opened in the **Author** editing mode. The listener is notified about the deactivation when another *framework* is activated for the same document, the user switches to another mode or the editor is closed. A complete description and implementation of `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` can be found in [Implementing an Author Extension State Listener \(on page 2056\)](#).

If [Schema-Aware mode \(on page 154\)](#) is active in Oxygen XML Editor Eclipse plugin, all actions that can generate invalid content will be redirected toward the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandler`. The handler can resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing `ro.sync.ecss.extensions.api.InvalidEditException`. The actions that are forwarded to this handler include typing, delete, or paste.

For more details about this handler, see [Handling Schema-Aware Editing Events \(on page 2094\)](#).

5. **[Optional]** You can customize the content completion proposals by creating a schema manager filter extension. The interface that declares the methods used for content completion proposals filtering is `ro.sync.contentcompletion.xml.SchemaManagerFilter`. The filter can be applied on elements, attributes, or on their values. The `createSchemaManagerFilter` method is responsible for creating the content completion filter. A new `SchemaManagerFilter` will be created each time a document matches the rules defined by the *Document Type Association* that contains the filter declaration.

For example:

```
public SchemaManagerFilter createSchemaManagerFilter() {
    return new SDFSchemaManagerFilter();
}
```

A detailed presentation of the schema manager filter can be found in the [Configuring a Content Completion Handler \(on page 2049\)](#) section.

6. **[Optional]** The **Author** mode supports link-based navigation between documents and document sections. Therefore, if the document contains elements defined as links to other elements (for example, links based on the `@id` attributes), the extension should provide the means to find the referenced content. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface should be returned by the `createElementLocatorProvider` method. Each time an element pointed by a link needs to be located, the method is invoked.

For example:

```
public ElementLocatorProvider createElementLocatorProvider() {
    return new DefaultElementLocatorProvider();
}
```

For more information on how to implement an element locator provider, see the [Configuring a Link Target Element Finder \(on page 2074\)](#) section.

7. **[Optional]** The drag and drop functionality can be extended by implementing the [ro.sync.xml.editor.xmleditor.pageauthor.AuthorDnDListener](#) interface. Relevant methods from the listener are invoked when the mouse is dragged, moved over, or exits the **Author** editing mode, when the drop action changes, and when the drop occurs. Each method receives the `DropTargetEvent` containing information about the drag and drop operation. The drag and drop extensions are available in **Author** mode for both Oxygen XML Editor Eclipse plugin Eclipse plugin and standalone application. The **Text** mode corresponding listener is available only for Oxygen XML Editor Eclipse plugin Eclipse plugin. The methods corresponding to each implementation are: *createAuthorAWTDndListener*, *createTextSWTDndListener*, and *createAuthorSWTDndListener*.

```
public AuthorDndListener createAuthorAWTDndListener() {
    return new SDFAuthorDndListener();
}
```

For more details about the **Author** mode drag and drop listeners, see the [Configuring a custom Drag and Drop Listener \(on page 2052\)](#) section.

8. **[Optional]** Another extension that can be included in the bundle is the reference resolver. For example, the references represented by the **ref** element and the attribute indicating the referenced resource is **location**. To be able to obtain the content of the referenced resources you will have to implement a Java extension class that implements [ro.sync.ecss.extensions.api.AuthorReferenceResolver](#). The method responsible for creating the custom references resolver is *createAuthorReferenceResolver*. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated references resolver object is kept and used until another extensions bundle corresponding to another document type is activated as result of the detection process.

For example:

```
public AuthorReferenceResolver createAuthorReferenceResolver() {
    return new ReferencesResolver();
}
```

A more detailed description of the references resolver can be found in the [Configuring a References Resolver \(on page 2052\)](#) section.

9. **[Optional]** To be able to dynamically customize the default CSS styles for a certain [ro.sync.ecss.extensions.api.node.AuthorNode](#), an implementation of [ro.sync.ecss.extensions.api.StylesFilter](#) can be provided. The extensions bundle method responsible

for creating the `StylesFilter` is `createAuthorStylesFilter`. The method is called each time a document opened in an **Author** editing mode matches the *Document Type Association* where the extensions bundle is defined. The instantiated filter object is kept and used until another extensions bundle corresponding to another document type is activated as a result of the detection process.

For example:

```
public StylesFilter createAuthorStylesFilter() {
    return new SDFStylesFilter();
}
```

See the [Configuring CSS Styles Filter \(on page 2073\)](#) section for more details about the styles filter extension.

10. **[Optional]** To edit data in custom tabular format, implementations of the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` and the `ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider` interfaces should be provided.

The two methods from the `ExtensionsBundle` specifying these two extension points are `createAuthorTableCellSpanProvider` and `createAuthorTableColumnWidthProvider`.

For example:

```
public AuthorTableCellSpanProvider createAuthorTableCellSpanProvider() {
    return new TableCellSpanProvider();
}

public AuthorTableColumnWidthProvider
createAuthorTableColumnWidthProvider() {
    return new TableColumnWidthProvider();
}
```

The two table information providers are not reused for different tables. The methods are called for each table in the document so new instances should be provided every time. Read more about the cell span and column width information providers in [Configuring a Table Cell Span Provider \(on page 2065\)](#) and [Configuring a Table Column Width Provider \(on page 2060\)](#) sections.

If the functionality related to one of the previous extension points does not need to be modified, then the developed `ro.sync.ecss.extensions.api.ExtensionsBundle` should not override the corresponding method and leave the default base implementation to return **null**.

11. **[Optional]** An XML vocabulary can contain links to various areas of a document. If the document contains elements defined as links, you can choose to present a more relevant text description for each link. To do this, an implementation of the `ro.sync.ecss.extensions.api.link.LinkTextResolver` interface should be returned by the `createLinkTextResolver` method. This implementation is used each time the `oxy_link-text()` function (on page 2175) is encountered in the CSS styles associated with an element.

For example:

```
public LinkTextResolver createLinkTextResolver() {
    return new DitaLinkTextResolver();
}
```

Oxygen XML Editor Eclipse plugin offers built-in implementations for DITA and DocBook: [ro.sync.ecss.extensions.dita.link.DitaLinkTextResolver](#) and [ro.sync.ecss.extensions.docbook.link.DocbookLinkTextResolver](#) respectively.

12. Pack the compiled class into a *JAR* (on page 2679) file.
13. Copy the *JAR* file into your custom *framework* directory (for example, [frameworks/sdf](#)).
14. Add the *JAR* file to the class path. To do this, [open the Preferences dialog box](#) (on page 70), go to **Document Type Association**, select the document type (for example, *SDF*), click the **Edit** button, select the **Classpath** tab, and click the **+ Add** button. In the displayed dialog box, enter the location of the *JAR* file relative to the Oxygen XML Editor Eclipse plugin [frameworks](#) folder.
15. Register the Java class by going to the **Extensions** tab. Click the **Choose** button and select the name of the class (for example, *SDFExtensionsBundle*).

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

[Sample DITA \(framework\) extension that sets a custom ExtensionsBundle implementation for customizing links](#)

Adding a Custom Image Decorator for Author Mode

The *AuthorImageDecorator* extension point allows you to add a custom decorator over images in **Author** mode. For example, you could use it to add a message over an image informing the user that they can double-click the image to edit it.

How to Implement an *AuthorImageDecorator*

To implement your own *AuthorImageDecorator*, follow this procedure:

1. Implement the [ro.sync.ecss.extensions.api.AuthorImageDecorator](#) interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:

- a. If you have [configured an extensions bundle \(on page 2042\)](#), you can return the *AuthorImageDecorator* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorImageDecorator()* method.
- b. Specify the *AuthorImageDecorator* in the **Author image decorator** individual extension in the **Extensions** tab [\(on page 117\)](#) of the **Document Type** configuration dialog box [\(on page 90\)](#) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple message over an image that informs the user that they can double-click the image to edit it:

```
/**
 * Custom Author image decorator for drawing string over images.
 */
public class CustomAuthorImageDecorator extends AuthorImageDecorator {

    /**
     * @see ro.sync.ecss.extensions.api.AuthorImageDecorator#paint
     (ro.sync.exml.view.graphics.Graphics, int, int, int, int,
     ro.sync.exml.view.graphics.Rectangle,
     ro.sync.ecss.extensions.api.node.AuthorNode,
     ro.sync.ecss.extensions.api.AuthorAccess, boolean)
     */
    @Override
    public void paint(Graphics g, int x, int y, int imageWidth, int imageHeight,
        Rectangle originalSize, AuthorNode element,
        AuthorAccess authorAccess, boolean wasAnnotated) {
        if ("image".equals(commonsOperationsUtil.getLocalName(element.getName()))) {
            g.drawString(
                "[Double-click to edit image]",
                // Draw near the top-left corner
                x + 15,
                y + 15);
        }
    }
}
```

Example result: In the top-left corner of the image, the following message will be displayed: `[Double-click to edit image]`.

Adding Custom Persistent Highlights

The *Author API* includes a class that allows you to create or remove custom persistent highlights, set new properties for the highlights, and customize their appearance. An example of a possible use case would be

if you want to implement your own way of editing review comments. The custom persistent highlights get serialized in the XML document as processing instructions, with the following format:

```
<?oxy_custom_start prop1="val1"...?> xml content <?oxy_custom_end?>
```

This functionality is available through the *AuthorPersistentHighlighter* class that is accessible through the *AuthorEditorAccess#getPersistentHighlighter()* method.

For more information, see the JavaDoc details for this class at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/highlights/AuthorPersistentHighlighter.html>.

Configuring the Automatic ID Generation and Unique Attributes Recognizer

The *ro.sync.ecss.extensions.api.UniqueAttributesRecognizer* interface can be implemented if you want to provide for your *framework* (on page 2679) the following features:

- **Automatic ID generation** - You can automatically generate unique IDs for newly inserted elements. Implementations are already available for the DITA and DocBook *frameworks* (on page 2679). The following methods can be implemented to accomplish this: *assignUniqueIDs(int startOffset, int endOffset), isAutoIDGenerationActive()*
- **Avoiding copying unique attributes when "Split" is called inside an element** - You can split the current *block element* (on page 2676) by pressing the "Enter" key and then choosing "Split". This is a very useful way to create new paragraphs, for example. All attributes are by default copied on the new element but if those attributes are IDs you sometimes want to avoid creating validation errors in the editor. Implementing the following method, you can decide whether or not an attribute should be copied during the split: *boolean copyAttributeOnSplit(String attrQName, AuthorElement element)*

Tip:

The *ro.sync.ecss.extensions.commons.id.DefaultUniqueAttributesRecognizer* class is an implementation of the interface that can be extended by your customization to provide easy assignation of IDs in your *framework* (on page 2679). You can also check out the DITA and DocBook implementations of *ro.sync.ecss.extensions.api.UniqueAttributesRecognizer* to see how they were implemented and connected to the extensions bundle.

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the **Oxygen SDK**, available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Configuring Content Completion Proposals

You can filter or contribute to proposals offered for content completion by implementing the *ro.sync.contentcompletion.xml.SchemaManagerFilter* interface.

```

import java.util.List;

import ro.sync.contentcompletion.xml.CIAttribute;
import ro.sync.contentcompletion.xml.CIElement;
import ro.sync.contentcompletion.xml.CIValue;
import ro.sync.contentcompletion.xml.Context;
import ro.sync.contentcompletion.xml.SchemaManagerFilter;
import ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatElementsCanGoHereContext;
import ro.sync.contentcompletion.xml.WhatPossibleValuesHasAttributeContext;

public class SDFSchemaManagerFilter implements SchemaManagerFilter {

```

You can implement the various callbacks of the interface either by returning the default values given by Oxygen XML Editor Eclipse plugin or by contributing to the list of proposals. The filter can be applied on elements, attributes or on their values. Attributes filtering can be implemented using the *filterAttributes* method and changing the default content completion list of *ro.sync.contentcompletion.xml.CIAttribute* for the element provided by the current *ro.sync.contentcompletion.xml.WhatAttributesCanGoHereContext* context. For example, the `SDFSchemaManagerFilter` checks if the element from the current context is the `table` element and adds the `frame` attribute to the `table` list of attributes.

```

/**
 * Filter attributes of the "table" element.
 */
public List<CIAttribute> filterAttributes(List<CIAttribute> attributes,
    WhatAttributesCanGoHereContext context) {
    // If the element from the current context is the 'table' element add the
    // attribute named 'frame' to the list of default content completion proposals
    if (context != null) {
        ContextElement contextElement = context.getParentElement();
        if ("table".equals(contextElement.getQName())) {
            CIAttribute frameAttribute = new CIAttribute();
            frameAttribute.setName("frame");
            frameAttribute.setRequired(false);
            frameAttribute.setFixed(false);
            frameAttribute.setDefaultValue("void");
            if (attributes == null) {
                attributes = new ArrayList<CIAttribute>();
            }
            attributes.add(frameAttribute);
        }
    }
}

```

```

return attributes;
}

```

The elements that can be inserted in a specific context can be filtered using the `filterElements` method. The `SDFSchemaManagerFilter` uses this method to replace the `td` child element with the `th` element when `header` is the current context element.

```

public List<CIElement> filterElements(List<CIElement> elements,
    WhatElementsCanGoHereContext context) {
    // If the element from the current context is the 'header' element remove the
    // 'td' element from the list of content completion proposals and add the
    // 'th' element.
    if (context != null) {
        Stack<ContextElement> elementStack = context.getElementStack();
        if (elementStack != null) {
            ContextElement contextElement = context.getElementStack().peek();
            if ("header".equals(contextElement.getQName())) {
                if (elements != null) {
                    for (Iterator<CIElement> iterator =
elements.iterator(); iterator.hasNext();) {
                        CIElement element = iterator.next();
                        // Remove the 'td' element
                        if ("td".equals(element.getQName())) {
                            elements.remove(element);
                            break;
                        }
                    }
                } else {
                    elements = new ArrayList<CIElement>();
                }
                // Insert the 'th' element in the list of content completion proposals
                CIElement thElement = new SDFElement();
                thElement.setName("th");
                elements.add(thElement);
            }
        }
    } else {
        // If the given context is null then the given list of content completion
        // elements contains global elements.
    }
    return elements;
}

```

The elements or attributes values can be filtered using the *filterElementValues* or *filterAttributeValues* methods.

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Configuring a Custom Drag and Drop Listener

Sometimes it is useful to perform various operations when certain objects are dropped from outside sources in the editing area. You can choose from three interfaces to implement depending on whether you are using the Eclipse plugin or the standalone version of the application, or if you want to add the handler for the **Text** or **Author** modes.

Interfaces for the Drag and Drop Listener

ro.sync.exml.editor.xmleditor.pageauthor.AuthorDnDListener

Receives callbacks from the standalone application for Drag And Drop in **Author** mode.

com.oxygenxml.editor.editors.author.AuthorDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in **Author** mode.

com.oxygenxml.editor.editors.TextDnDListener

Receives callbacks from the Eclipse plugin for Drag And Drop in **Text** mode.

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

To configure how dropped URLs or XHTML fragments are handled in documents, see [Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode \(on page 2096\)](#).

Related Information:

[Customizing Smart Paste Support \(on page 1999\)](#)

Configuring a Reference Resolver

This information is helpful if you need to provide a handler for resolving references and obtain the content they reference. For example, suppose the element that has references is **ref** and the attribute indicating the referenced resource is **location**. You need to implement a Java extension class for obtaining the referenced resources.

1. Create the class `simple.documentation.framework.ReferencesResolver`. This class must implement the `ro.sync.ecss.extensions.api.AuthorReferenceResolver` interface.

```
import ro.sync.ecss.extensions.api.AuthorReferenceResolver;

import ro.sync.ecss.extensions.api.AuthorAccess;

import ro.sync.ecss.extensions.api.node.AttrValue;

import ro.sync.ecss.extensions.api.node.AuthorElement;

import ro.sync.ecss.extensions.api.node.AuthorNode;

public class ReferencesResolver

    implements AuthorReferenceResolver {
```

2. The `hasReferences` method verifies if the handler considers the node to have references. It takes `AuthorNode` as an argument that represents the node that will be verified. The method will return `true` if the node is considered to have references. In the following example, to be a reference, the node must be an element with the name `ref` and it must have an attribute named `location`.

```
public boolean hasReferences(AuthorNode node) {

    boolean hasReferences = false;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {

        AuthorElement element = (AuthorElement) node;

        if ("ref".equals(element.getLocalName())) {

            AttrValue attrValue = element.getAttribute("location");

            hasReferences = attrValue != null;

        }

    }

    return hasReferences;

}
```

3. The method `getDisplayname` returns the display name of the node that contains the expanded referenced content. It takes `AuthorNode` as an argument that represents the node that needs the display name. The referenced content engine will ask this `AuthorReferenceResolver` implementation for the display name for each node that is considered a reference. In the following example, the display name is the value of the `location` attribute from the `ref` element.

```
public String getDisplayName(AuthorNode node) {

    String displayName = "ref-fragment";

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {

        AuthorElement element = (AuthorElement) node;

        if ("ref".equals(element.getLocalName())) {

            AttrValue attrValue = element.getAttribute("location");

            if (attrValue != null) {

                displayName = attrValue.getValue();

            }

        }

    }

}
```

```

return displayName;
}

```

4. The method *resolveReference* resolves the reference of the node and returns a *SAXSource* with the parser and its input source. It takes *AuthorNode* as an argument that represents the node that needs the reference resolved, the `systemID` of the node, the *AuthorAccess* with access methods to the **Author** mode data model and a *SAX EntityResolver* that resolves resources that are already opened in another editor or resolve resources through the *XML Catalog (on page 2683)*. In the implementation, you need to resolve the reference relative to the `systemID`, and create a parser and an input source over the resolved reference.

```

public SAXSource resolveReference(
    AuthorNode node,
    String systemID,
    AuthorAccess authorAccess,
    EntityResolver entityResolver) {
    SAXSource saxSource = null;

    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();

                try {
                    URL absoluteUrl = new URL(new URL(systemID),
                        authorAccess.getUtilAccess().correctURL(attrStringVal));

                    InputSource inputSource = entityResolver.resolveEntity(null,
                        absoluteUrl.toString());
                    if(inputSource == null) {
                        inputSource = new InputSource(absoluteUrl.toString());
                    }

                    XMLReader xmlReader = authorAccess.newNonValidatingXMLReader();
                    xmlReader.setEntityResolver(entityResolver);

                    saxSource = new SAXSource(xmlReader, inputSource);
                } catch (MalformedURLException e) {
                    logger.error(e, e);
                } catch (SAXException e) {
                    logger.error(e, e);
                } catch (IOException e) {
                    logger.error(e, e);
                }
            }
        }
    }
}

```

```

    }
  }
}
}

return saxSource;
}

```

5. The method `getReferenceUniqueID` should return a unique identifier for the node reference. The unique identifier is used to avoid resolving the references recursively. The method takes `AuthorNode` as an argument that represents the node with the reference. In the following example, the unique identifier is the value of the `location` attribute from the `ref` element.

```

public String getReferenceUniqueID(AuthorNode node) {
    String id = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                id = attrValue.getValue();
            }
        }
    }
    return id;
}

```

6. The method `getReferenceSystemID` should return the `systemID` of the referenced content. It takes `AuthorNode` as an argument that represents the node with the reference and the `AuthorAccess` with access methods to the **Author** mode data model. For example, the value of the `location` attribute is used from the `ref` element and resolved relatively to the XML base URL of the node.

```

public String getReferenceSystemID(AuthorNode node,
                                   AuthorAccess authorAccess) {
    String systemID = null;
    if (node.getType() == AuthorNode.NODE_TYPE_ELEMENT) {
        AuthorElement element = (AuthorElement) node;
        if ("ref".equals(element.getLocalName())) {
            AttrValue attrValue = element.getAttribute("location");
            if (attrValue != null) {
                String attrStringVal = attrValue.getValue();
                try {
                    URL absoluteUrl = new URL(node.getXMLBaseURL(),
                                             authorAccess.getUtilAccess().correctURL(attrStringVal));
                    systemID = absoluteUrl.toString();
                }
            }
        }
    }
}

```

```

    } catch (MalformedURLException e) {
        logger.error(e, e);
    }
}
}
}
return systemID;
}

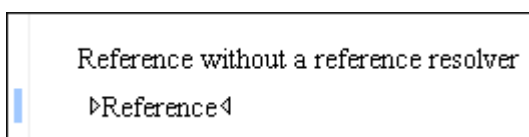

```

In the listing below, the XML document contains the **ref** element:

```
<ref location="referenced.xml">Reference</ref>
```

When no reference resolver is specified, the reference has the following layout:

Figure 525. Reference with no specified reference resolver

When the above implementation is configured, the reference has the expected layout:

Figure 526. Reference with reference resolver

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Configuring a State Listener for Author Mode

The `ro.sync.ecss.extensions.api.AuthorExtensionStateListener` implementation is notified when the **Author** mode extension (where the listener is defined) is activated or deactivated in the document type detection process.

```

import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorExtensionStateListener;

public class SDFAuthorExtensionStateListener implements
    AuthorExtensionStateListener {

```

```

private AuthorListener sdfAuthorDocumentListener;

private AuthorMouseListener sdfMouseListener;

private AuthorCaretListener sdfCaretListener;

private OptionListener sdfOptionListener;

```

When the association rules of the *framework (on page 2679)* (document type) configuration match that of a document open in the **Author** editing mode, the *activation* event received by this listener should be used to perform custom initializations and to register listeners such as *ro.sync.ecss.extensions.api.AuthorListener*, *ro.sync.ecss.extensions.api.AuthorMouseListener*, or *ro.sync.ecss.extensions.api.AuthorCaretListener*.

```

public void activated(AuthorAccess authorAccess) {

    // Get the value of the option.
    String option = authorAccess.getOptionsStorage().getOption(
        "sdf.custom.option.key", "");

    // Use the option for some initializations...

    // Add an OptionListener.
    authorAccess.getOptionsStorage().addOptionListener(sdfOptionListener);

    // Add author DocumentListeners.
    sdfAuthorDocumentListener = new SDFAuthorListener();
    authorAccess.getDocumentController().addAuthorListener(
        sdfAuthorDocumentListener);

    // Add MouseListener.
    sdfMouseListener = new SDFAuthorMouseListener();
    authorAccess.getEditorAccess().addAuthorMouseListener(sdfMouseListener);

    // Add CaretListener.
    sdfCaretListener = new SDFAuthorCaretListener();
    authorAccess.getEditorAccess().addAuthorCaretListener(sdfCaretListener);

    // Other custom initializations...

}

```

The `authorAccess` parameter received by the *activated* method can be used to gain access to specific **Author** mode actions and informations related to components such as the editor, document, workspace, tables, or the *change tracking* manager.

If options specific to the custom developed *Author Extension* need to be stored or retrieved, a reference to the *ro.sync.ecss.extensions.api.OptionsStorage* can be obtained by calling the *getOptionsStorage* method from the **authorAccess**. The same object can be used to register *ro.sync.ecss.extensions.api.OptionListener*

listeners. An option listener is registered in relation with an option **key** and will be notified about the value changes of that option.

An *AuthorListener* can be used if events related to the **Author** mode document modifications are of interest. The listener can be added to the [ro.sync.ecss.extensions.api.AuthorDocumentController](#). A reference to the document controller is returned by the *getDocumentController* method from the **authorAccess**. The document controller can also be used to perform operations involving document modifications.

To provide access to the **Author** mode component-related functionality and information, the **authorAccess** has a reference to the [ro.sync.ecss.extensions.api.access.AuthorEditorAccess](#) that can be obtained when calling the *getEditorAccess* method. At this level, *AuthorMouseListener* and *AuthorCaretListener* can be added to provide notification of mouse and cursor events that occur in the **Author** editor mode.

The *deactivation* event is received when another *framework* is activated for the same document, the user switches to another editor mode or the editor is closed. The *deactivate* method is typically used to unregister the listeners previously added on the *activate* method and to perform other actions. For example, options related to the deactivated *Author Extension* can be saved at this point.

```
public void deactivated(AuthorAccess authorAccess) {
    // Store the option.
    authorAccess.getOptionsStorage().setOption(
        "sdf.custom.option.key", optionValue);

    // Remove the OptionListener.
    authorAccess.getOptionsStorage().removeOptionListener(sdfOptionListener);

    // Remove DocumentListeners.
    authorAccess.getDocumentController().removeAuthorListener(
        sdfAuthorDocumentListener);

    // Remove MouseListener.
    authorAccess.getEditorAccess().removeAuthorMouseListener(sdfMouseListener);

    // Remove CaretListener.
    authorAccess.getEditorAccess().removeAuthorCaretListener(sdfCaretListener);

    // Other actions...
}
```

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Configuring Tables

There are standard CSS properties used to indicate what elements are tables, table rows and table cells. What CSS is missing is the possibility to indicate the cell spanning, row separators or the column widths. Oxygen XML Editor Eclipse plugin offers support for adding extensions to solve these problems.

The table in this example is a simple one. The header must be formatted in a different way than the ordinary rows, so it will have a background color.

```
table{
    display:table;
    border:1px solid navy;
    margin:1em;
    max-width:1000px;
    min-width:150px;
}

table[width]{
    width:attr(width, length);
}

tr, header{
    display:table-row;
}

header{
    background-color: silver;
    color:inherit
}

td{
    display:table-cell;
    border:1px solid navy;
    padding:1em;
}
```

Suppose that in the schema, the `<td>` tag has the attributes `@row_span` and `@column_span` that are not automatically recognized by Oxygen XML Editor Eclipse plugin, a Java extension will be implemented that will provide information about the cell spanning. See the section [Configuring a Table Cell Span Provider \(on page 2065\)](#).

Suppose the column widths are specified by the `@width` attribute of the `<customcol>` elements that are not automatically recognized by Oxygen XML Editor Eclipse plugin. It is necessary to implement a Java extension

that will provide information about the column widths. For more information, see [Configuring a Table Column Width Provider \(on page 2060\)](#).

The table from the example does not make use of the attributes `@colsep` and `@rowsep` (which are automatically recognized) but if you want the rows to be separated by horizontal lines, it is necessary to implement a Java extension that will provide information about the row and column separators. For more information, see [Configuring a Table Cell Row and Column Separator Provider \(on page 2069\)](#).

Configuring a Table Column Width Provider

In a custom *framework (on page 2679)*, the `<table>` element as well as the table columns can have specified widths. For these widths to be considered by **Author** mode, you need to provide the means for determining them. As explained in [Configuring Tables \(on page 2059\)](#), if you use the table element attribute **width** Oxygen XML Editor Eclipse plugin can determine the table width automatically. In this example the table has `<col>` elements with `@width` attributes that are not recognized by default. You will need to implement a Java extension class to determine the column widths.

1. Create the class *simple.documentation.framework.TableColumnWidthProvider*. This class must implement the *ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider* interface.

```
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperationException;
import ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider;
import ro.sync.ecss.extensions.api.WidthRepresentation;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableColumnWidthProvider
    implements AuthorTableColumnWidthProvider {
```

2. Method *init* is taking as argument an *ro.sync.ecss.extensions.api.node.AuthorElement* that represents the XML `<table>` element. In our case the column widths are specified in `<col>` elements from the `<table>` element. In such cases you must collect the span information by analyzing the `<table>` element.

```
public void init(AuthorElement tableElement) {
    this.tableElement = tableElement;
    AuthorElement[] colChildren = tableElement.getElementsByLocalName("customcol");
    if (colChildren != null && colChildren.length > 0) {
        for (int i = 0; i < colChildren.length; i++) {
            AuthorElement colChild = colChildren[i];
            if (i == 0) {
                colsStartOffset = colChild.getStartOffset();
            }
            if (i == colChildren.length - 1) {
                colsEndOffset = colChild.getEndOffset();
            }
        }
        // Determine the 'width' for this col.
    }
}
```

```

AttrValue colWidthAttribute = colChild.getAttribute("width");
String colWidth = null;
if (colWidthAttribute != null) {
    colWidth = colWidthAttribute.getValue();
    // Add WidthRepresentation objects for the columns this 'customcol'
    // specification spans over.
    colWidthSpecs.add(new WidthRepresentation(colWidth, true));
}
}
}
}
}

```

3. The method *isTableAcceptingWidth* should check if the table cells are a `<td>` element.

```

public boolean isTableAcceptingWidth(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}

```

4. The method *isTableAndColumnsResizable* should check if the table cells are a `<td>` element. This method determines if the table and its columns can be resized by dragging the edge of a column.

```

public boolean isTableAndColumnsResizable(String tableCellsTagName) {
    return "td".equals(tableCellsTagName);
}

```

5. Methods *getTableWidth* and *getCellWidth* are used to determine the table and column width. The table layout engine will ask this [ro.sync.ecss.extensions.api.AuthorTableColumnWidthProvider](#) implementation what is the table width for each table element and the cell width for each cell element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of the **width** attribute. The methods must return `null` for the tables / cells that do not have a specified width.

```

public WidthRepresentation getTableWidth(String tableCellsTagName) {
    WidthRepresentation toReturn = null;
    if (tableElement != null && "td".equals(tableCellsTagName)) {
        AttrValue widthAttr = tableElement.getAttribute("width");
        if (widthAttr != null) {
            String width = widthAttr.getValue();
            if (width != null) {
                toReturn = new WidthRepresentation(width, true);
            }
        }
    }
    return toReturn;
}

```

```

public List<WidthRepresentation>
getCellWidth(AuthorElement cellElement, int colNumberStart,
    int colSpan) {
    List<WidthRepresentation> toReturn = null;
    int size = colWidthSpecs.size();
    if (size >= colNumberStart && size >= colNumberStart + colSpan) {
        toReturn = new ArrayList<WidthRepresentation>(colSpan);
        for (int i = colNumberStart; i < colNumberStart + colSpan; i++) {
            // Add the column widths
            toReturn.add(colWidthSpecs.get(i));
        }
    }
    return toReturn;
}

```

6. Methods *commitTableWidthModification* and *commitColumnWidthModifications* are used to commit changes made to the width of the table or its columns when using the mouse drag gestures.

```

public void commitTableWidthModification
(AuthorDocumentController authorDocumentController,
    int newTableWidth, String tableCellsTagName) throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (newTableWidth > 0) {
            if (tableElement != null) {
                String newWidth = String.valueOf(newTableWidth);
                authorDocumentController.setAttribute("width", new AttrValue(newWidth),
                    tableElement);
            } else {
                throw new AuthorOperationException("Cannot find the table element.");
            }
        }
    }
}

```

```

public void commitColumnWidthModifications
(AuthorDocumentController authorDocumentController,
    WidthRepresentation[] colWidths, String tableCellsTagName)
throws AuthorOperationException {
    if ("td".equals(tableCellsTagName)) {
        if (colWidths != null && tableElement != null) {
            if (colsStartOffset >= 0 && colsEndOffset >= 0
&& colsStartOffset < colsEndOffset) {
                authorDocumentController.delete(colsStartOffset, colsEndOffset);
            }
        }
    }
}

```

```

String xmlFragment = createXMLFragment(colWidths);
int offset = -1;
AuthorElement[] header = tableElement.getElementsByLocalName("header");
if (header != null && header.length > 0) {
    // Insert the cols elements before the 'header' element
    offset = header[0].getStartOffset();
}
if (offset == -1) {
    throw new AuthorOperationException(
        "No valid offset to insert column width");
}
authorDocumentController.insertXMLFragment(xmlFragment, offset);
}
}
}

private String createXMLFragment(WidthRepresentation[] widthRepresentations) {
    StringBuffer fragment = new StringBuffer();
    String ns = tableElement.getNamespace();
    for (int i = 0; i < widthRepresentations.length; i++) {
        WidthRepresentation width = widthRepresentations[i];
        fragment.append("<customcol");
        String strRepresentation = width.getWidthRepresentation();
        if (strRepresentation != null) {
            fragment.append(" width=\"" + width.getWidthRepresentation() + "\"");
        }
        if (ns != null && ns.length() > 0) {
            fragment.append(" xmlns=\"" + ns + "\"");
        }
        fragment.append(">");
    }
    return fragment.toString();
}
}

```

7. The following three methods are used to determine what type of column width specifications the table column width provider support. In our case all types of specifications are allowed:

```

public boolean isAcceptingFixedColumnWidths(String tableCellsTagName) {
    return true;
}

public boolean isAcceptingPercentageColumnWidths(String tableCellsTagName) {
    return true;
}
}

```

```
public boolean isAcceptingProportionalColumnWidths(String tableCellsTagName) {
    return true;
}
```

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

In the listing below, the XML document contains the table element:

```
<table width="300">
  <customcol width="50.0px" />
  <customcol width="1*" />
  <customcol width="2*" />
  <customcol width="20%" />
  <header>
    <td>C1</td>
    <td>C2</td>
    <td>C3</td>
    <td>C4</td>
  </header>
  <tr>
    <td cs=1, rs=1</td>
    <td cs=1, rs=1</td>
    <td row_span="2">cs=1, rs=2</td>
    <td row_span="3">cs=1, rs=3</td>
  </tr>
  <tr>
    <td cs=1, rs=1</td>
    <td cs=1, rs=1</td>
  </tr>
  <tr>
    <td column_span="3">cs=3, rs=1</td>
  </tr>
</table>
```

When no table column width provider is specified, the table has the following layout:

Figure 527. Table layout when no column width provider is specified

C1	C2	C3	C4
cs=1, rs=1	cs=1, rs=1	cs=1, rs=2	cs=1, rs=3
cs=1, rs=1	cs=1, rs=1		
cs=3, rs=1			

When the above implementation is configured, the table has the correct layout:

Figure 528. Columns with custom widths

C1	C2	C3	C4
cs=1, rs=1	cs=1, rs=1	cs=1, rs=2	cs=1, rs=3
cs=1, rs=1	cs=1, rs=1		
cs=3, rs=1			

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Configuring a Table Cell Span Provider

In a custom *framework* (on page 2679), the `<table>` element can have cells that span over multiple columns and rows. As explained in [Configuring Tables](#) (on page 2059), you need to indicate Oxygen XML Editor Eclipse plugin a method to determine the cell spanning. If you use the `@rowspan` and `@colspan` attributes, Oxygen XML Editor Eclipse plugin can determine the cell spanning automatically. In the following example, the `<td>` element uses the `@row_span` and `@column_span` attributes that are not recognized by default. You will need to implement a Java extension class for defining the cell spanning.

1. Create the class `simple.documentation.framework.TableCellSpanProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider` interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSpanProvider;
import ro.sync.ecss.extensions.api.node.AttrValue;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSpanProvider
    implements AuthorTableCellSpanProvider {
```

2. The `init` method takes `ro.sync.ecss.extensions.api.node.AuthorElement` that represents the XML `<table>` element as its argument. In this example, the cell span is specified for each of the cells so you leave this method empty. However, there are cases (such as the CALS table model) when the cell spanning is specified in the `<table>` element. In such cases, you must collect the span information by analyzing the `<table>` element.

```
public void init(AuthorElement table) {
}
```

3. The `getColSpan` method is taking as argument the table cell. The table layout engine will ask this `AuthorTableSpanSupport` implementation what is the column span and the row span for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The implementation is simple and just parses the value of `column_span` attribute. The method must return `null` for all the cells that do not change the span specification.

```
public Integer getColSpan(AuthorElement cell) {
    Integer colSpan = null;

    AttrValue attrValue = cell.getAttribute("column_span");
    if(attrValue != null) {
        // The attribute was found.
        String cs = attrValue.getValue();
        if(cs != null) {
            try {
                colSpan = new Integer(cs);
            } catch (NumberFormatException ex) {
                // The attribute value was not a number.
            }
        }
    }
    return colSpan;
}
```

4. The row span is determined in a similar manner:

```
public Integer getRowSpan(AuthorElement cell) {
    Integer rowSpan = null;
```

```

AttrValue attrValue = cell.getAttribute("row_span");
if(attrValue != null) {
    // The attribute was found.
    String rs = attrValue.getValue();
    if(rs != null) {
        try {
            rowspan = new Integer(rs);
        } catch (NumberFormatException ex) {
            // The attribute value was not a number.
        }
    }
}
return rowspan;
}

```

5. The method *hasColumnSpecifications* always returns `true` considering column specifications always available.

```

public boolean hasColumnSpecifications(AuthorElement tableElement) {
    return true;
}

```

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

6. In the listing below, the XML document contains the table element:

```

<table>
  <header>
    <td>C1</td>
    <td>C2</td>
    <td>C3</td>
    <td>C4</td>
  </header>
  <tr>
    <td>cs=1, rs=1</td>
    <td column_span="2" row_span="2">cs=2, rs=2</td>
    <td row_span="3">cs=1, rs=3</td>
  </tr>
  <tr>
    <td>cs=1, rs=1</td>

```

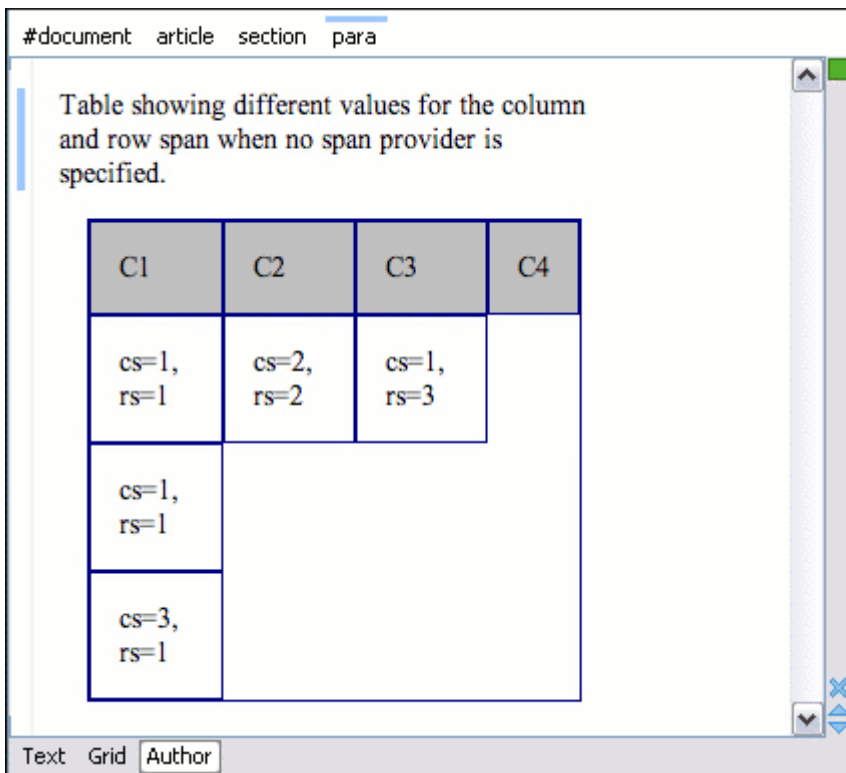

```

</tr>
<tr>
  <td column_span="3">cs=3, rs=1</td>
</tr>
</table>

```

When no table cell span provider is specified, the table has the following layout:

Figure 529. Table layout when no cell span provider is specified

When the above implementation is configured, the table has the correct layout:

Figure 530. Cells spanning multiple rows and columns.

The screenshot shows the Oxygen XML Editor interface with a table displayed in the Author mode. The table has four columns labeled C1, C2, C3, and C4. The cells contain the following content:

C1	C2	C3	C4
cs=1, rs=1	cs=2, rs=2	cs=1, rs=3	cs=1, rs=3
cs=1, rs=1			
cs=3, rs=1			

The editor's status bar at the bottom shows 'Text Grid Author' and a toolbar with navigation icons.

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Configuring a Table Cell Row and Column Separator Provider

In a custom *framework* (on page 2679), the `<table>` element has separators between rows. As explained in [Configuring Tables](#) (on page 2059), you need to indicate a method to determine the way rows and columns are separated. If you use the `@rowsep` and `@colsep` cell element attributes, or your table is conforming to the CALS table model, Oxygen XML Editor Eclipse plugin can determine the cell separators. Even if there are no attributes that define the separators, you can still force a separator between rows by implementing a Java extension.

1. Create the class `simple.documentation.framework.TableCellSepProvider`. This class must implement the `ro.sync.ecss.extensions.api.AuthorTableCellSepProvider` interface.

```
import ro.sync.ecss.extensions.api.AuthorTableCellSepProvider;
import ro.sync.ecss.extensions.api.node.AuthorElement;

public class TableCellSepProvider implements AuthorTableCellSepProvider{
```

2. The `init` method takes the `ro.sync.ecss.extensions.api.node.AuthorElement` interface that represents the XML `<table>` element as its argument. If the separator information is implicit, it does not depend on the current table, so you leave this method empty. However, there are cases (such as the CALS table

model) when the cell separators are specified in the `<table>` element. In such cases, you should initialize your provider based on the given argument.

```
public void init(AuthorElement table) {
}
```

- The `getColSep` method takes the table cell as its argument. The table layout engine will ask this `AuthorTableCellSepProvider` implementation if there is a column separator for each XML element from the table that was marked as cell in the CSS using the property `display:table-cell`. The following example returns **false**, meaning there will not be column separators.

```
/**
 * @return false - No column separator at the right of the cell.
 */
@Override
public boolean getColSep(AuthorElement cellElement, int columnIndex) {
    return false;
}
```

- The row separators are determined in a similar manner. This time the example returns **true**, forcing a separator between the rows.

```
/**
 * @return true - A row separator below each cell.
 */
@Override
public boolean getRowSep(AuthorElement cellElement, int columnIndex) {
    return true;
}
```

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

- In the example below, the XML document contains the table element:

```
<table>
  <header>
    <td>H1</td>
    <td>H2</td>
    <td>H3</td>
    <td>H4</td>
  </header>
  <tr>
    <td>C11</td>
```

```

<td>C12</td>
<td>C13</td>
<td>C14</td>
</tr>
<tr>
<td>C21</td>
<td>C22</td>
<td>C23</td>
<td>C24</td>
</tr>
<tr>
<td>C31</td>
<td>C32</td>
<td>C33</td>
<td>C34</td>
</tr>
</table>

```

When the borders for the `<td>` element are removed from the CSS, the row separators become visible:

Figure 531. Row separators provided by the Java implementation.

H1	H2	H3	H4
C11	C12	C13	C14
C21	C22	C23	C24
C31	C32	C33	C34

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Customizing Attribute Value Editors

The *CustomAttributeValueEditor* extension point allows you customize the attribute value editing mechanisms in Oxygen XML Editor Eclipse plugin. It changes the **Browse** button found in the attribute editors to an **Edit** button. When a user clicks that **Edit** button, your custom attribute value editor will be presented.

The  **Edit** button can be accessed in the following attribute editors:

- The **Attributes** view in **Author** mode (*on page 405*) (when the  **Expand** button is used to reveal an expanded panel).
- The **Attributes** view in **Text** mode (*on page 329*) (when the  **Expand** button is used to reveal an expanded panel).
- The **In-place Attributes Editor** (*on page 407*) when invoked in **Author** mode.
- The **In-place Attributes Editor** invoked in the **Outline** view (*on page 326*).

How to Implement a *CustomAttributeValueEditor*

To implement your own *CustomAttributeValueEditor*, follow this procedure:

1. Extend the *ro.sync.ecss.extensions.api.CustomAttributeValueEditor* abstract class.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
 - a. If you have *configured an extensions bundle (on page 2042)*, you can return the *CustomAttributeValueEditor* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.createCustomAttributeValueEditor()* method.
 - b. Specify the *CustomAttributeValueEditor* in the **Author custom attribute value editor** individual extension in the **Extensions** tab (*on page 117*) of the **Document Type** configuration dialog box (*on page 90*) for your particular document type.

Example

The following example creates a very simple custom attribute value editor:

```
/**
 * A custom attribute value editor.
 */
public class MyCustomAttributeValueEditor extends CustomAttributeValueEditor {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "My custom attribute value editor";
    }

    /**
     * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#getAttributeValue
     *      (ro.sync.ecss.extensions.api.EditedAttribute, java.lang.Object)
     */
}
```

```

@Override
public String getAttributeValue(EditedAttribute attribute, Object parentComponent)
    throws CancelledByUserException {
    // Show an input dialog for collecting the new value
    return JOptionPane.showInputDialog
        ("Set a new value for " + attribute.getAttributeQName() + ":");
}

/**
 * @see ro.sync.ecss.extensions.api.CustomAttributeValueEditor#shouldHandleAttribute
 *      (ro.sync.ecss.extensions.api.EditedAttribute)
 */
@Override
public boolean shouldHandleAttribute(EditedAttribute attribute) {
    // Handle all attributes
    return true;
}
}

```

Example result: If a user were to click the  **Edit** button in any of the attribute editors, the following dialog box would be displayed that allows the user to insert a value for the particular attribute:

Customizing the CSS Styles Filter

You can modify the CSS styles for each `ro.sync.ecss.extensions.api.node.AuthorNode` rendered in the **Author** mode using an implementation of `ro.sync.ecss.extensions.api.StylesFilter`. You can implement the various callbacks of the interface either by returning the default value given by Oxygen XML Editor Eclipse plugin or by contributing to the value. The received styles `ro.sync.ecss.css.Styles` can be processed and values can be overwritten with your own. For example, you can override the `KEY_BACKGROUND_COLOR` style to return your own implementation of `ro.sync.exml.view.graphics.Color` or override the `KEY_FONT` style to return your own implementation of `ro.sync.exml.view.graphics.Font`.

For instance, in this simple document example, the filter can change the value of the `KEY_FONT` property for the `<table>` element:

```

package simple.documentation.framework;

```

```

import ro.sync.ecss.css.Styles;
import ro.sync.ecss.extensions.api.StylesFilter;
import ro.sync.ecss.extensions.api.node.AuthorNode;
import ro.sync.exml.view.graphics.Font;

public class SDFStylesFilter implements StylesFilter {

    public Styles filter(Styles styles, AuthorNode authorNode) {
        if (AuthorNode.NODE_TYPE_ELEMENT == authorNode.getType()
            && "table".equals(authorNode.getName())) {
            styles.setProperty(Styles.KEY_FONT, new Font(null, Font.BOLD, 12));
        }
        return styles;
    }
}

```

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Customizing Elements that Wrap Profiled Content

For each *framework* (on page 2679) (document type), you can configure the phrase-type elements that wrap the profiled content by setting a custom `ro.sync.ecss.extensions.api.ProfilingConditionalTextProvider`. This configuration is set by default for DITA and DocBook *frameworks*.

Customizing the Link Target Reference Finder

The link target reference finder represents the support for finding references from links that indicate specific elements inside an XML document. This support will only be available if a schema is associated with the document type.

If you do not define a custom link target reference finder, the `DefaultElementLocatorProvider` implementation (on page 2075) will be used by default. The interface that should be implemented for a custom link target reference finder is `ro.sync.ecss.extensions.api.link.ElementLocatorProvider`. As an alternative, the `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider` implementation can also be extended.

The used `ElementLocatorProvider` will be queried for an `ElementLocator` when a link location must be determined (when a link is clicked). Then, to find the corresponding (linked) element, the obtained `ElementLocator` will be queried for each element from the document.

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Creating a Custom Link Target Reference Finder

If you need to create a custom link target reference finder you can do so by creating the class that will implement the `ro.sync.ecss.extensions.api.link.ElementLocatorProvider` interface. As an alternative, your class could extend `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`, the default implementation.

**Note:**

The complete source code of the `ro.sync.ecss.extensions.commons.DefaultElementLocatorProvider`, `ro.sync.ecss.extensions.commons.IDElementLocator` or `ro.sync.ecss.extensions.commons.XPointerElementLocator` can be found in the **oxygen-sample-framework** project.

Default Link Target Reference Finder

The *DefaultElementLocatorProvider* implementation is used by default to find link target references. It offers support for the most common types of links:

- [Links based on ID attribute values \(on page 2076\)](#).
- [XPointer element\(\) scheme \(on page 2077\)](#).

The method *getElementLocator* determines what *ElementLocator* should be used. In the default implementation, it checks if the link is an XPointer element() scheme. Otherwise, it assumes it is an ID. A non-null *IDTypeVerifier* will always be provided if a schema is associated with the document type.

The `link` string argument is the [anchor \(on page 2676\)](#) part of the of the URL that is composed from the value of the link property specified for the link element in the CSS.

```
public ElementLocator getElementLocator(IDTypeVerifier idVerifier,
    String link) {
    ElementLocator elementLocator = null;
    try {
        if(link.startsWith("element(")){
            // xpointer element() scheme
            elementLocator = new XPointerElementLocator(idVerifier, link);
        } else {
            // Locate link element by ID
            elementLocator = new IDElementLocator(idVerifier, link);
        }
    }
}
```

```

} catch (ElementLocatorException e) {
    logger.warn("Exception when create element locator for link: "
        + link + ". Cause: " + e, e);
}
return elementLocator;
}

```

ID Element Locator

The *IDElementLocator* is an implementation of the abstract class [ro.sync.ecss.extensions.api.link.ElementLocator](#) for links that use an **ID**.

The constructor only assigns field values and the method *endElement* is empty for this implementation.

The method *startElement* checks each of the element's attribute values and when one matches the link, it considers the element found if one of the following conditions is satisfied:

- The qualified name of the attribute is `xml:id`.
- The attribute type is ID.

The attribute type is checked with the help of the method *IDTypeVerifier.hasIDType*.

```

public boolean startElement(String uri, String localName,
    String name, Attr[] atts) {
    boolean elementFound = false;
    for (int i = 0; i < atts.length; i++) {
        if (link.equals(atts[i].getValue())) {
            if ("xml:id".equals(atts[i].getQName())) {
                // xml:id attribute
                elementFound = true;
            } else {
                // check if attribute has ID type
                String attrLocalName =
                    ExtensionUtil.getLocalName(atts[i].getQName());
                String attrUri = atts[i].getNamespace();
                if (idVerifier.hasIDType(localName, uri, attrLocalName, attrUri)) {
                    elementFound = true;
                }
            }
        }
    }
}

return elementFound;
}

```

XPointer Element Locator

XPointerElementLocator is an implementation of the abstract class [ro.sync.ecss.extensions.api.link.ElementLocator](#) for links that have one of the following XPointer element() scheme patterns:

element (elementID)

Locate the element with the specified ID.

element (/1/2/3)

A child sequence appearing alone identifies an element by means of stepwise navigation, which is directed by a sequence of integers separated by slashes (/). Each integer n locates the nth child element of the previously located element.

element (elementID/3/4)

A child sequence appearing after a *NCName* identifies an element by means of stepwise navigation, starting from the element located by the given name.

The constructor separates the ID/integers, which are delimited by slashes(/) into a sequence of identifiers (an XPointer path). It will also check that the link has one of the supported patterns of the XPointer element() scheme.

```
public XPointerElementLocator(IDTypeVerifier idVerifier, String link)
    throws ElementLocatorException {
    super(link);
    this.idVerifier = idVerifier;

    link = link.substring("element(".length(), link.length() - 1);

    StringTokenizer stringTokenizer = new StringTokenizer(link, "/", false);
    xpointerPath = new String[stringTokenizer.countTokens()];
    int i = 0;
    while (stringTokenizer.hasMoreTokens()) {
        xpointerPath[i] = stringTokenizer.nextToken();
        boolean invalidFormat = false;

        // Empty xpointer component is not supported
        if(xpointerPath[i].length() == 0){
            invalidFormat = true;
        }

        if(i > 0){
            try {
                Integer.parseInt(xpointerPath[i]);
            }
        }
    }
}
```

```

    } catch (NumberFormatException e) {
        invalidFormat = true;
    }
}

if(invalidFormat){
    throw new ElementLocatorException(
        "Only the element() scheme is supported when locating XPointer links."
        + "Supported formats: element(elementID), element(/1/2/3),
        element(elemID/2/3/4).");
}
i++;
}

if(Character.isDigit(xpointerPath[0].charAt(0))){
    // This is the case when xpointer have the following pattern /1/5/7
    xpointerPathDepth = xpointerPath.length;
} else {
    // This is the case when xpointer starts with an element ID
    xpointerPathDepth = -1;
    startWithElementID = true;
}
}
}

```

The method *startElement* will be invoked at the beginning of every element in the XML document (even when the element is empty). The arguments it takes are

uri

The namespace URI, or the empty string if the element has no namespace URI or if namespace processing is disabled.

localName

Local name of the element.

qName

Qualified name of the element.

atts

Attributes attached to the element. If there are no attributes, this argument will be empty.

The method returns `true` if the processed element is found to be the one indicated by the link.

The *XPointerElementLocator* implementation of the *startElement* will update the depth of the current element and keep the index of the element in its parent. If the `xpointerPath` starts with an element ID then the current

element ID is verified to match the specified ID. If this is the case the depth of the XPointer is updated taking into account the depth of the current element.

If the XPointer path depth is the same as the current element depth then the kept indices of the current element path are compared to the indices in the XPointer path. If all of them match then the element has been found.

```

public boolean startElement(String uri, String localName,
    String name, Attr[] atts) {
    boolean linkLocated = false;
    // Increase current element document depth
    startElementDepth++;

    if (endElementDepth != startElementDepth) {
        // The current element is the first child of the parent
        currentElementIndexStack.push(new Integer(1));
    } else {
        // Another element in the parent element
        currentElementIndexStack.push(new Integer(lastIndexInParent + 1));
    }

    if (startWithElementID) {
        // This the case when xpointer path starts with an element ID.
        String xpointerElement = xpointerPath[0];
        for (int i = 0; i < atts.length; i++) {
            if(xpointerElement.equals(atts[i].getValue())){
                if(idVerifier.hasIDType(
                    localName, uri, atts[i].getQName(), atts[i].getNamespace())){
                    xpointerPathDepth = startElementDepth + xpointerPath.length - 1;
                    break;
                }
            }
        }
    }

    if (xpointerPathDepth == startElementDepth){
        // check if xpointer path matches with the current element path
        linkLocated = true;
        try {
            int xpointerIdx = xpointerPath.length - 1;
            int stackIdx = currentElementIndexStack.size() - 1;
            int stopIdx = startWithElementID ? 1 : 0;
            while (xpointerIdx >= stopIdx && stackIdx >= 0) {

```

```

    int xpointerIndex = Integer.parseInt(xpointerPath[xpointerIdx]);
    int currentElementIndex =
        ((Integer)currentElementIndexStack.get(stackIdx)).intValue();
    if(xpointerIndex != currentElementIndex) {
        linkLocated = false;
        break;
    }

    xpointerIdx--;
    stackIdx--;
}

} catch (NumberFormatException e) {
    logger.warn(e,e);
}
}
return linkLocated;
}

```

The method *endElement* will be invoked at the end of every element in the XML document (even when the element is empty).

The *XPointerElementLocator* implementation of the *endElement* updates the depth of the current element path and the index of the element in its parent.

```

public void endElement(String uri, String localName, String name) {
    endElementDepth = startElementDepth;
    startElementDepth --;
    lastIndexInParent = ((Integer)currentElementIndexStack.pop()).intValue();
}

```

Customizing XML Node Rendering

You can use this API extension to customize the way an XML node is rendered in the **Outline view** ([on page 326](#)) in **Author** mode, **breadcrumb navigation bar** ([on page 378](#)) in **Author** mode, **Outline view** ([on page 326](#)) in **Text** mode, **Content Completion Assistant** ([on page 2677](#)) window, or **DITA Maps Manager** view ([on page 2337](#)).

Note:

Oxygen XML Editor Eclipse plugin uses *XMLNodeRendererCustomizer* implementations for the following [frameworks](#) ([on page 2679](#)): DITA, DITA Map, DocBook 4, DocBook 5, TEI, XHTML, XSLT, and XML Schema.

There are two methods to provide an implementation of *ro.sync.exml.workspace.api.node.customizer.XMLNodeRendererCustomizer*.

- As a part of a bundle, returning it from the *createXMLNodeCustomizer()* method of the *ExtensionsBundle* associated with your document type in the **Document type** configuration dialog box (on page 90) (**Extensions bundle** field in the **Extensions** tab).
- As an individual extension, associated with your document type in the **Document type** configuration dialog box (on page 90) (**XML node renderer customizer** field in the **Individual extensions** section of the **Extensions** tab).

Support for Retina/HiDPI Displays

To support Retina or HiDPI displays, the icons provided by the *XMLNodeRendererCustomizer* should be backed up by a copy of larger size using the proper [Retina/HiDPI naming convention](#) (on page 496).

For example, for the `<title>` element, if the *XMLNodeRendererCustomizer* returns the path `${framework}/images/myImg.png`, then to support Retina images with a scaling factor of 2, an extra file (`myImg@2x.png`) should be added to the same images directory (`${framework}/images/myImg@2x.png`). If the higher resolution icon (the `@2x` file) does not exist, the *normal* icon is scaled and used instead.

For more information about using Retina/HiDPI images, refer to the [Using Retina/HiDPI Images in Author Mode](#) (on page 495) section.

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Related Information:

[Customizing the Rendering of Elements](#) (on page 2018)

[Using Retina/HiDPI Icons for the Actions from a Framework](#) (on page 1992)

Customizing Author Operations

Oxygen XML Editor Eclipse plugin **Author** mode has a built-in set of operations covering the insertion of text and XML fragments (see the [Author Default Operations](#) (on page 1962)) and the execution of XPath expressions on the current document edited in **Author** mode. However, there are situations where you need to extend this set. The following examples are just a few of the possible situations:

- You need to enter an element whose attributes will be edited by the user through a graphical user interface.
- The user must send selected element content (or the whole document) to a+ server for some kind of processing.

- Content authors need to extract pieces of information from a server and insert it directly into the edited XML document.
- You need to apply an XPath expression on the current document and process the nodes of the resulting node set.

To extend the Oxygen XML Editor Eclipse plugin **Author** mode functionality through Java, you will need the **Oxygen SDK** available [on the Oxygen XML Editor Eclipse plugin website](#). It includes the source code of the **Author** mode operations in the built-in document types and the full documentation (in Javadoc format) of the public API available for **Author** mode custom actions.

The subsequent Java examples make use of AWT classes. If you are developing extensions for the Oxygen XML Editor Eclipse plugin XML Editor plugin for Eclipse, you will have to use their SWT counterparts.

**Attention:**

Make sure the Java classes of your custom **Author** mode operations are compiled with the same Java version used by Oxygen XML Editor Eclipse plugin. Otherwise, the classes may not be loaded by the Java virtual machine. For example, if you run a version of Oxygen XML Editor Eclipse plugin with a Java 11 virtual machine but the Java classes of your custom **Author** mode operations are compiled with a Java 12 or later virtual machine, then the custom operations cannot be loaded and used by the Java 11 virtual machine.

**Important:**

From a legal standpoint, you can freely develop and share extensions using the **Oxygen SDK** ONLY if you have a legal, active license to use Oxygen XML Editor Eclipse plugin and ONLY if such extensions are used from inside Oxygen XML Editor Eclipse plugin. To use such extensions outside of Oxygen XML Editor Eclipse plugin (for example, a 3rd-party application that has Oxygen XML Editor Eclipse plugin built in to it), an additional license must be purchased to use the SDK according the **Oxygen XML SDK Licensing Policy** .

Related Information:

<https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/ro/sync/ecss/extensions/api/AuthorOperation.html>

Example 1 - Simple Use of a Dialog Box from an Author Mode Operation

In this example, functionality is added for inserting images in a custom *framework* (on page 2679). The images are represented by the `<image>` element. The location of the image file is represented by the value of the `@href` attribute. In the Java implementation, a dialog box will be displayed with a text field where the user can enter a full URL or browse for a local file.

1. Set up a sample project following [this set of instructions](#). The *framework* project is **oxygen-sample-framework**.
2. Modify the *simple.documentation.framework.InsertImageOperation* class that implements the *ro.sync.ecss.extensions.api.AuthorOperation* interface. This interface defines three methods: *doOperation*, *getArguments* and *getDescription*

A short description of these methods follows:

- The *doOperation* method is invoked when the action is performed either by pressing the toolbar button, by selecting the menu item or by pressing the shortcut key. The arguments taken by this method can be one of the following combinations:
 - An object of type *ro.sync.ecss.extensions.api.AuthorAccess* and a map.
 - Argument names and values.
- The *getArguments* method is used by Oxygen XML Editor Eclipse plugin when the action is configured. It returns the list of arguments (name and type) that are accepted by the operation.
- The *getDescription* method is used by Oxygen XML Editor Eclipse plugin when the operation is configured. It returns a description of the operation.

Example:

Here is the implementation of these three methods:

```
/**
 * Performs the operation.
 */
public void doOperation(
    AuthorAccess authorAccess,
    ArgumentsMap arguments)
    throws IllegalArgumentException,
        AuthorOperationException {

    JFrame oxygenFrame = (JFrame) authorAccess.getWorkspaceAccess().getParentFrame();
    ;

    String href = displayURLDialog(oxygenFrame);
    if (href.length() != 0) {
        // Creates the image XML fragment.
        String imageFragment =
            "<image xmlns='http://www.oxygenxml.com/sample/documentation' href='"
            + href + "'/>";

        // Inserts this fragment at the cursor position.
        int caretPosition = authorAccess.getEditorAccess().getCaretOffset();
        authorAccess.getDocumentController().insertXMLFragment
            (imageFragment, caretPosition);
    }
}
```

```

}

/**
 * Has no arguments.
 *
 * @return null.
 */
public ArgumentDescriptor[] getArguments() {
    return null;
}

/**
 * @return A description of the operation.
 */
public String getDescription() {
    return "Inserts an image element. Asks the user for a URL reference.";
}
}

```

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

**Important:**

Make sure you always specify the namespace of the inserted fragments.

```

<image xmlns='http://www.oxygenxml.com/sample/documentation'
href='path/to/image.png' />

```

3. Package the compiled class into a *JAR* ([on page 2679](#)) file. An example of an Ant script that packages the `classes` folder content into a *JAR* archive named `sdf.jar` is listed below:

```

<?xml version="1.0" encoding="UTF-8"?>
<project name="project" default="dist">
  <target name="dist">
    <jar destfile="sdf.jar" basedir="classes">
      <fileset dir="classes">
        <include name="**/*" />
      </fileset>
    </jar>
  </target>
</project>

```

4. Copy the `sdf.jar` file into your custom *framework* directory
(`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
5. Add the `sdf.jar` to the class path. To do this, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, select **SDF**, and click the **Edit** button.
6. Select the **Classpath** tab in the lower part of the **Document Type** configuration dialog box (on page 90) and click the **+ Add** button. In the displayed dialog box, enter the location of the *JAR* file, relative to the Oxygen XML Editor Eclipse plugin `frameworks` folder.
7. Next, create the action that will use the defined operation. Go to the **Actions** subtab. Copy the icon files for the menu item and for the toolbar in your custom *framework* directory
(`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
8. Define the action's properties:
 - Set **ID** to `insert_image`.
 - Set **Name** to `Insert image`.
 - Set **Menu access key** to letter `i`.
 - Set **Toolbar action** to `${framework}/toolbarImage.png`.
 - Set **Menu icon** to `${framework}/menuImage.png`.
 - Set **Shortcut key** to `Ctrl (Meta on macOS)+Shift+i`.
9. Next, set up the operation. You want to add images only if the current element is a `<section>`, `<book>` or `<article>`.
 - Set the value of **XPath expression** to

```
local-name()='section' or local-name()='book'
or local-name()='article'
```
 - Set the **Invoke operation** field to `simple.documentation.framework.InsertImageOperation`.

Figure 532. Selecting the Operation

10. Add the action to the toolbar, using the **Toolbar** panel.

To test the action, open or create an XML file and place the cursor at a valid location. Then click the button associated with the action from the toolbar. In the dialog box, select an image URL and click **OK**. The image is inserted into the document.

Example 2 - Operations with Arguments - Report from Database Operation

In this example, an operation is created that connects to a relational database and executes an SQL statement. The result should be inserted in the edited XML document as a table. To make the operation fully configurable, it will have arguments for the *database connection string*, the *user name*, the *password* and the *SQL expression*.

1. Set up a sample project following [this set of instructions](#). The *framework* project is **oxygen-sample-framework**.
2. Create the class `simple.documentation.framework.QueryDatabaseOperation`. This class must implement the `ro.sync.ecss.extensions.api.AuthorOperation` interface.

```

import ro.sync.ecss.extensions.api.ArgumentDescriptor;
import ro.sync.ecss.extensions.api.ArgumentsMap;
import ro.sync.ecss.extensions.api.AuthorAccess;
import ro.sync.ecss.extensions.api.AuthorOperation;
import ro.sync.ecss.extensions.api.AuthorOperationException;

public class QueryDatabaseOperation implements AuthorOperation{

```

3. Now define the operation's arguments. For each of them, you will use a `String` constant representing the argument name:

```

private static final String ARG_JDBC_DRIVER = "jdbc_driver";
private static final String ARG_USER = "user";
private static final String ARG_PASSWORD = "password";
private static final String ARG_SQL = "sql";
private static final String ARG_CONNECTION = "connection";

```

4. You must describe the argument name and type. To do this, implement the `getArguments` method that will return an array of argument descriptors:

```

public ArgumentDescriptor[] getArguments() {
    ArgumentDescriptor args[] = new ArgumentDescriptor[] {
        new ArgumentDescriptor(
            ARG_JDBC_DRIVER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the Java class that is the JDBC driver."),
        new ArgumentDescriptor(
            ARG_CONNECTION,
            ArgumentDescriptor.TYPE_STRING,
            "The database URL connection string."),
        new ArgumentDescriptor(
            ARG_USER,
            ArgumentDescriptor.TYPE_STRING,
            "The name of the database user."),
        new ArgumentDescriptor(
            ARG_PASSWORD,
            ArgumentDescriptor.TYPE_STRING,
            "The database password."),
        new ArgumentDescriptor(
            ARG_SQL,
            ArgumentDescriptor.TYPE_STRING,
            "The SQL statement to be executed.")
    };
}

```

```

return args;
}

```

These names, types and descriptions will be listed in the **Arguments** table when the operation is configured.

- When the operation is invoked, the implementation of the `doOperation` method extracts the arguments, forwards them to the method that connects to the database and generates the XML fragment. The XML fragment is then inserted at the cursor position.

```

public void doOperation(AuthorAccess authorAccess, ArgumentsMap map)
    throws IllegalArgumentException, AuthorOperationException {

    // Collects the arguments.
    String jdbcDriver = (String)map.getArgumentValue(ARG_JDBC_DRIVER);
    String connection = (String)map.getArgumentValue(ARG_CONNECTION);
    String user = (String)map.getArgumentValue(ARG_USER);
    String password = (String)map.getArgumentValue(ARG_PASSWORD);
    String sql = (String)map.getArgumentValue(ARG_SQL);

    int caretPosition = authorAccess.getCaretOffset();
    try {
        authorAccess.getDocumentController().insertXMLFragment(
            getFragment(jdbcDriver, connection, user, password, sql), caretPosition);
    } catch (SQLException e) {
        throw new AuthorOperationException(
            "The operation failed due to the following database error: "
            + e.getMessage(), e);
    } catch (ClassNotFoundException e) {
        throw new AuthorOperationException(
            "The JDBC database driver was not found. Tried to load ' "
            + jdbcDriver + "'", e);
    }
}

```

- The `getFragment` method loads the JDBC driver, connects to the database and extracts the data. The result is a `<table>` element from the `http://www.oxygenxml.com/sample/documentation` namespace. The `<header>` element contains the names of the SQL columns. All the text from the XML fragment is escaped. This means that the '`<`' and '`&`' characters are replaced with the '`<`' and '`&`' character entities to ensure that the fragment is well-formed.

```

private String getFragment(String jdbcDriver, String connectionURL, String user,
    String password, String sql) throws SQLException, ClassNotFoundException {

    Properties pr = new Properties();

```

```

pr.put("characterEncoding", "UTF8");
pr.put("useUnicode", "TRUE");
pr.put("user", user);
pr.put("password", password);

// Loads the database driver.
Class.forName(jdbcDriver);
// Opens the connection
Connection connection = DriverManager.getConnection(connectionURL, pr);
java.sql.Statement statement = connection.createStatement();
ResultSet resultSet = statement.executeQuery(sql);

StringBuffer fragmentBuffer = new StringBuffer();
fragmentBuffer.append(
    "<table xmlns=" +
    "'http://www.oxygenxml.com/sample/documentation'>");

//
// Creates the table header.
//
fragmentBuffer.append("<header>");
ResultSetMetaData metaData = resultSet.getMetaData();
int columnCount = metaData.getColumnCount();
for (int i = 1; i <= columnCount; i++) {
    fragmentBuffer.append("<td>");
    fragmentBuffer.append(xmlEscape(metaData.getColumnName(i)));
    fragmentBuffer.append("</td>");
}
fragmentBuffer.append("</header>");

//
// Creates the table content.
//
while (resultSet.next()) {
    fragmentBuffer.append("<tr>");
    for (int i = 1; i <= columnCount; i++) {
        fragmentBuffer.append("<td>");
        fragmentBuffer.append(xmlEscape(resultSet.getObject(i)));
        fragmentBuffer.append("</td>");
    }
    fragmentBuffer.append("</tr>");
}

```

```

fragmentBuffer.append("</table>");

// Cleanup
resultSet.close();
statement.close();
connection.close();

return fragmentBuffer.toString();
}

```

**Note:**

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

7. Package the compiled class into a *JAR* (on page 2679) file.
8. Copy the *JAR* file and the JDBC driver files into your custom *framework* directory (`[OXYGEN_INSTALL_DIR]\frameworks\[CUSTOM_FRAMEWORK_DIR]`).
9. Add the *JARS* to the class path. To do this, open the **Document Type Association** preferences page (on page 88), select **SDF** and click the **Edit** button. Select the **Classpath** tab in the lower part of the **Document Type** configuration dialog box (on page 90) and click the **+ Add** button. In the displayed dialog box, enter the location of the *JAR* file, relative to the Oxygen XML Editor Eclipse plugin `frameworks` folder.
10. Go to the **Actions** subtab. The action properties are:
 - Set **ID** to `clients_report`.
 - Set **Name** to **Clients Report**.
 - Set **Menu access key** to letter `r`.
 - Set **Description** to **Connects to the database and collects the list of clients**.
 - Set **Toolbar icon** to `framework/TableDB20.png` (the `TableDB20.png` icon is stored in the `frameworks/sdf` folder).
 - Leave empty the **Menu icon**.
 - Set **shortcut key** to **Ctrl + Shift + C (Command + Shift + C on macOS)**.
11. The action will work only if the current element is a **section**. Set up the operation as follows:
 - Set **XPath expression** to:

```
local-name()='section'
```

- Use the Java operation defined earlier to set the **Invoke operation** field. Click the **Choose** button, then select `simple.documentation.framework.QueryDatabaseOperation`. Once selected, the list of arguments is displayed. In the figure below the first argument, `jdbc_driver`, represents the class name of the MySQL JDBC driver. The connection string has the URL syntax: `jdbc://<database_host>:<database_port>/<database_name>`.

The SQL expression used in the example follows, but it can be any valid SELECT expression that can be applied to the database:

```
SELECT userID, email FROM users
```

12. Add the action to the toolbar, using the **Toolbar** panel.

Figure 533. Java Operation Arguments Setup

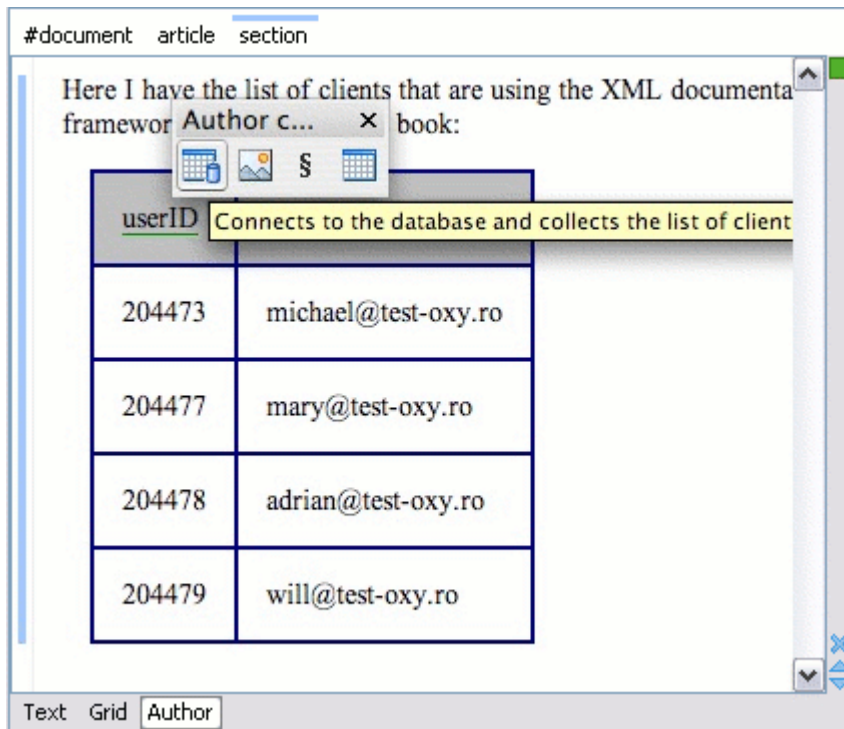

To test the action, open or create an XML file and place the cursor at a valid location. Then click the  **Create Report** button from the toolbar. You can see below the toolbar with the action button and sample table inserted by the **Clients Report** action.

Figure 534. Table Content Extracted from the Database

Handling Author Mode Action Events

The *AuthorActionEventHandler* extension point allows you to handle certain **Author** mode actions in a special way. For example, a specific use-case would be if you want to insert new lines when you press **Enter** instead of it opening the *Content Completion Assistant* (on page 2677).

How to Implement an *AuthorActionEventHandler*

To implement your own *AuthorActionEventHandler*, follow this procedure:

1. Implement the *ro.sync.ecss.extensions.api.AuthorActionEventHandler* interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
 - a. If you have configured an extensions bundle (on page 2042), you can return the *AuthorActionEventHandler* implementation using the *ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorActionEventHandler()* method.
 - b. Specify the *AuthorActionEventHandler* in the **Author action event handler** individual extension in the **Extensions** tab (on page 117) of the **Document Type** configuration dialog box (on page 90) for your particular document type.

Example

The following example illustrates the use-case mentioned in the introduction, that is an implementation for inserting a new line when the user presses **Enter** in **Author** mode. It uses the *canHandleEvent* method to make sure the insertion will be performed in an element that will preserve the `new-line` character. Then the *handleEvent* method inserts the new line at the current cursor position.

```

public class CustomAuthorActionEventHandler implements AuthorActionEventHandler
{
    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#canHandleEvent
     (AuthorAccess, AuthorActionEventType)
     */
    @Override
    public boolean canHandleEvent(AuthorAccess authorAccess,
AuthorActionEventType type) {
        boolean canHandle = false;

        if (type == AuthorActionEventType.ENTER) {
            AuthorDocumentController documentController =
authorAccess.getDocumentController();
            int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
            try {
                AuthorNode nodeAtOffset = documentController.getNodeAtOffset(caretOffset);
                if (nodeAtOffset instanceof AuthorElement) {
                    AuthorElement elementAtOffset = (AuthorElement) nodeAtOffset;
                    AttrValue xmlSpace = elementAtOffset.getAttribute("xml:space");
                    if (xmlSpace != null && xmlSpace.getValue().equals("preserve")) {
                        canHandle = true;
                    }
                }
            } catch (BadLocationException ex) {
                if (logger.isDebugEnabled()) {
                    logger.error(ex.getMessage(), ex);
                }
            }
        }

        return canHandle;
    }

    /**
     * @see ro.sync.ecss.extensions.api.AuthorActionEventHandler#handleEvent
     (ro.sync.ecss.extensions.api.AuthorAccess,
ro.sync.ecss.extensions.api.AuthorActionEventHandler.AuthorActionEventType)
     */
    @Override
    public boolean handleEvent(AuthorAccess authorAccess,

```

```

AuthorActionEventType eventType) {
    int caretOffset = authorAccess.getEditorAccess().getCaretOffset();
    // Insert a new line
    authorAccess.getDocumentController().insertText(caretOffset, "\n");
    return true;
}

/**
 * @see ro.sync.ecss.extensions.api.Extension#getDescription()
 */
@Override
public String getDescription() {
    return "Insert a new line";
}
}

```

Handling Schema-Aware Editing Events

The *AuthorSchemaAwareEditingHandlerAdapter* extension point allows you to handle certain **Author** mode actions in various ways. For example, implementing the `AuthorSchemaAwareEditingHandlerAdapter` makes it possible to handle events such as typing, the keyboard delete event at a given offset (using Delete or Backspace keys), delete element tags, delete selection, join elements, or paste fragment. It also makes it possible to improve solutions that are proposed by the paste mechanism in Oxygen XML Editor Eclipse plugin when pasting content (through the use of [some specific methods \(on page 2095\)](#)).

How to Implement an *AuthorSchemaAwareEditingHandlerAdapter*

For this handler to be called, the **Schema-Aware Editing** option ([on page 154](#)) must be set to **On** or **Custom** in the **Schema-Aware** preferences page ([on page 154](#)). The handler can either resolve a specific case, let the default implementation take place, or reject the edit entirely by throwing an `InvalidEditException`.

To implement your own *AuthorSchemaAwareEditingHandlerAdapter*, follow this procedure:

1. Implement the `ro.sync.ecss.extensions.api.AuthorSchemaAwareEditingHandlerAdapter` extension.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, [configure an extensions bundle \(on page 2042\)](#) and return the *AuthorSchemaAwareEditingHandlerAdapter* implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.getAuthorSchemaAwareEditingHandlerAdapter()` method.

Example

Typing events can be handled using the *handleTyping* method. For example, the `AuthorSchemaAwareEditingHandler` checks if the schema is not a learned one, was loaded successfully, and if

the **Smart paste and drag and drop** option (*on page 155*) is selected. If these conditions are met, the event will be handled.

```
public class AuthorSchemaAwareEditingHandlerAdapter
    extends AuthorSchemaAwareEditingHandler {

/**
 * @see AuthorSchemaAwareEditingHandler#handleTyping
 * (int, char, ro.sync.ecss.extensions.api.AuthorAccess)
 */
public boolean handleTyping(int offset, char ch, AuthorAccess authorAccess)
throws InvalidEditException {
    boolean handleTyping = false;
    AuthorSchemaManager authorSchemaManager =
authorAccess.getDocumentController().getAuthorSchemaManager();
    if (!authorSchemaManager.isLearnSchema() &&
        !authorSchemaManager.hasLoadingErrors() &&
        authorSchemaManager.getAuthorSchemaAwareOptions().isEnabledSmartTyping()) {
        try {
            AuthorDocumentFragment characterFragment =
authorAccess.getDocumentController().createNewDocumentTextFragment
(String.valueOf(ch));
            handleTyping = handleInsertionEvent
(offset, new AuthorDocumentFragment[] {characterFragment}, authorAccess);
        } catch (AuthorOperationException e) {
            throw new InvalidEditException
(e.getMessage(), "Invalid typing event: " + e.getMessage(), e, false);
        }
    }
    return handleTyping;
}
}
```

Note:

The complete source code for *framework* customization examples can be found in the **oxygen-sample-framework** module of the [Oxygen SDK](#), available as a Maven archetype [on the Oxygen XML Editor Eclipse plugin website](#).

Methods for Improving the Paste Mechanism

getAncestorDetectionOptions

When pasting content in **Author** mode, if the result causes the document to become invalid, Oxygen XML Editor Eclipse plugin will propose solutions to make it valid. As a possible solution, Oxygen XML Editor Eclipse plugin might surround the pasted content in a sequence of ancestor

elements. This [getAncestorDetectionOptions](#) method allows you to choose which parent elements might be a possible solution.

canBeReplaced

Allows you to improve solutions that might be proposed by the paste mechanism when pasting content in Oxygen XML Editor Eclipse plugin. For example, when pasting an element inside an empty element with the same name, this [canBeReplaced](#) method allows Oxygen XML Editor Eclipse plugin to replace the empty node rather than pasting it after or before the empty node. The callback could also reject this behavior if, for instance, the replacement node contains attributes.

Related Information:

[AuthorDocumentFragment Class](#)

Handling When URLs or XHTML Fragments are Dropped or Pasted in Author Mode

The [AuthorExternalObjectInsertionHandler](#) extension can be used to configure how URLs or XHTML fragments from external applications are handled when they are dropped or pasted in **Author** mode.

How to Implement an AuthorExternalObjectInsertionHandler

To implement your own *AuthorExternalObjectInsertionHandler*, follow this procedure:

1. Implement the [ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler](#) interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:
 - a. If your framework is an extension of DITA, DocBook, TEI, or XHTML, you can specify the *AuthorExternalObjectInsertionHandler* in the **Author extern object Insertion handler** individual extension in the **Extensions** tab ([on page 117](#)) of the **Document Type** configuration dialog box ([on page 90](#)) for your particular document type.
 - b. Otherwise, you can [configure an extensions bundle](#) ([on page 2042](#)), then return the *AuthorExternalObjectInsertionHandler* implementation using the [ro.sync.ecss.extensions.api.ExtensionsBundle.createAuthorExternalObjectInsertionHandler\(\)](#) method.
3. You can use a stylesheet to convert the pasted XHTML to your own XML vocabulary by overwriting the following method:

```
ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler.getImporterStylesheetFileName(AuthorAccess)
```

and return the file name of the stylesheet that will be applied. The path to the importer stylesheet must also be added in the **Classpath** tab ([on page 95](#)) in the **Document Type** configuration dialog box ([on page 90](#)) for your particular document type.

Example

The following example illustrates an implementation for the DITA framework:

```
/**
 * @see ro.sync.ecss.extensions.api.ExtensionsBundle#
createExternalObjectInsertionHandler()
 */
@Override
public AuthorExternalObjectInsertionHandler createExternalObjectInsertionHandler() {
    return new DITAExternalObjectInsertionHandler();
}
```

```
/**
 * @see ro.sync.ecss.extensions.api.AuthorExternalObjectInsertionHandler#
getImporterStylesheetFileName(ro.sync.ecss.extensions.api.AuthorAccess)
 */
@Override
protected String getImporterStylesheetFileName(AuthorAccess authorAccess) {
    return "xhtml2ditaDriver.xsl";
}
```

Tip:

For XHTML fragments, there is another method that you could use to configure how they are handled when they are pasted in **Author** mode. For more information, see [Customizing Smart Paste Support \(on page 1999\)](#).

Presenting an Edit Properties Dialog Box for Actions in Author Mode

The *EditPropertiesHandler* extension point allows you to present a specialized dialog box when the action of double-clicking an element tag is intercepted in **Author** mode. For example, you could use it to present a dialog box that allows the user to editing the properties of an image.

How to Implement an *EditPropertiesHandler*

To implement your own *EditPropertiesHandler*, follow this procedure:

1. Implement the [ro.sync.ecss.extensions.api.EditPropertiesHandler](#) interface.
2. To instruct Oxygen XML Editor Eclipse plugin to use this newly created implementation, use either of the following methods:

- a. If you have [configured an extensions bundle \(on page 2042\)](#), you can return the `EditPropertiesHandler` implementation using the `ro.sync.ecss.extensions.api.ExtensionsBundle.createEditPropertiesHandler()` method.
- b. Specify the `EditPropertiesHandler` in the **Author edit properties handler** individual extension in the **Extensions** tab [\(on page 117\)](#) of the **Document Type** configuration dialog box [\(on page 90\)](#) for your particular document type.

Example

The following example illustrates an implementation for presenting a simple properties editing dialog box when a user double-clicks an `<image>` tag in **Author** mode (with tags displayed from the  **Tags display mode** drop-down menu):

```
public class CustomEditPropertiesHandler implements EditPropertiesHandler {

    /**
     * @see ro.sync.ecss.extensions.api.Extension#getDescription()
     */
    @Override
    public String getDescription() {
        return "Sample implementation that handles properties for a table element.";
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#canEditProperties
     (ro.sync.ecss.extensions.api.node.AuthorNode)
     */
    @Override
    public boolean canEditProperties(AuthorNode authorNode) {
        // If this node is an image element we can edit its properties.
        return "image".equals(authorNode.getDisplayName());
    }

    /**
     * @see ro.sync.ecss.extensions.api.EditPropertiesHandler#editProperties
     (ro.sync.ecss.extensions.api.node.AuthorNode,
     ro.sync.ecss.extensions.api.AuthorAccess)
     */
    @Override
    public void editProperties(AuthorNode authorNode, AuthorAccess authorAccess) {
        // If we receive this call then it surely an image.
        AuthorElement imageElement = (AuthorElement) authorNode;
        String currentValue = "";
        AttrValue altValue = imageElement.getAttribute("alt");
    }
}
```

```

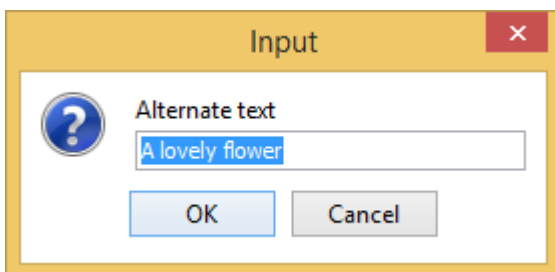

if (altValue != null) {
    currentValue = altValue.getValue();
}

String newValue = JOptionPane.showInputDialog(
    (Component) authorAccess.getWorkspaceAccess().getParentFrame(),
    "Alternate text",
    currentValue);

if (newValue != null) {
    authorAccess.getDocumentController().setAttribute
("alt", new AttrValue(newValue), imageElement);
}
}
}
}

```

Example result: If a user were to double-click an `<image>` tag icon () in **Author** mode, the following dialog box would be displayed that allows the user to edit the *alternate text* property for the image:

Sharing a Framework

You can create a custom *framework* by extending a built-in document type (*on page 1941*) (such as DITA or DocBook) using the **Document Type Association** preferences page (*on page 88*), make modifications to it, and then share the extension with your team.

Sharing the Extended Framework

There are several ways that you can share the *extended custom framework* (*on page 1941*) with others:

- Distribute the extended *framework* along with a project by following these steps:
 1. In a location where you have full write access, create a folder for your project.
 2. Go to the **Project Explorer** view (*on page 269*) and create a project. Save it in the folder you created in step 1.
 3. Create a custom framework by extending an existing one (*on page 1941*), if you have not already done so, and copy the custom framework directory to the folder you created in step 1. Make sure your custom framework directory includes any resources that are referenced in your framework (CSS files, new document templates, schemas used for validation, catalogs, etc.).
 4. Go to **Options > Preferences > Document Type Association > Locations** (*on page 90*).

5. In the **Additional frameworks directories** list, add an entry using the **`${pd}`** editor variable (on page 226) like this: `${pd}/custom_frameworks`.
6. You can then share the new project directory with other users. For example, you can commit it to your version control system and have them update their working copy. When they open the customized project file in their **Project Explorer view** (on page 269), the new *framework* becomes available in the list of document types.
 - Distribute the directory of the *extended framework* (on page 1941) to the other members of your team. They will simply copy that directory to their `/frameworks` directory. The new *framework* will be available in their list of document types when Oxygen XML Editor Eclipse plugin starts.

To test the extended *framework*, the other members of your team can check the list of document types in the **Document Type Association preferences page** (on page 88) to see if the *framework* is present and if it appears before the built-in *frameworks* (meaning that it has higher priority).

Basic Framework Customization Tutorial

This section contains topics meant to provide a general tutorial for customizing a *framework* (on page 2679). It includes information about creating a basic document type association, some basic customizations, testing the configuration, packaging and deploying the custom framework, and more.

Tip:

A sample framework customization package is available that you can dabble with and use to help you get started. It can be downloaded from: <https://www.oxygenxml.com/maven/com/oxygenxml/samples/oxygen-sample-framework/24.0.0.0/oxygen-sample-framework-24.0.0.0-package.zip>. The package includes a sample CSS file, XSL file, schema files, document templates, an XML catalog file, custom icons, and other resources.

Framework Customization Overview

The most important elements of a document type customization are represented by an XML Schema to define the XML structure, the CSS to render the information and the XML instance template that links the first two together.

XML Grammar

To provide as-you-type validation and to compute valid insertion proposals, Oxygen XML Editor Eclipse plugin needs an XML grammar (XML Schema, DTD, or Relax NG) associated to the XML. The grammar specifies how the internal structure of the XML is defined. For information about associating a schema and how Oxygen XML Editor Eclipse plugin detects the schema, see [Associating a Schema to XML Documents](#) (on page 584).

Consider a use-case where several users are testing a system and must send report results to a content management system. The customization should provide a visual editor for this type of document. The following XML Schema, `test_report.xsd` defines a report with results of a testing session. The report

consists of a title, few lines describing the test suite that was run, and a list of test results (each with a name and a boolean value indicating if the test passed or failed).

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="report">
    <xs:complexType>
      <xs:sequence>
        <xs:element ref="title"/>
        <xs:element ref="description"/>
        <xs:element ref="results"/>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="title" type="xs:string"/>
  <xs:element name="description">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="line">
          <xs:complexType mixed="true">
            <xs:sequence minOccurs="0"
              maxOccurs="unbounded">
              <xs:element name="important"
                type="xs:string"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>
  <xs:element name="results">
    <xs:complexType>
      <xs:sequence maxOccurs="unbounded">
        <xs:element name="entry">
          <xs:complexType>
            <xs:sequence>
              <xs:element name="test_name"
                type="xs:string"/>
              <xs:element name="passed"
                type="xs:boolean"/>
            </xs:sequence>
          </xs:complexType>
        </xs:element>
      </xs:sequence>
    </xs:complexType>
  </xs:element>

```

```

        </xs:complexType>
    </xs:element>
</xs:sequence>
</xs:complexType>
</xs:element>
</xs:schema>

```

CSS Stylesheet

A set of rules must be defined for describing how the XML document is to be rendered in **Author** mode. This is done using Cascading Style Sheets (CSS). CSS is a language used to describe how an HTML or XML document should be formatted by a browser. CSS is widely used in the majority of websites.

The elements from an XML document are displayed in the layout as a series of boxes. Some of the boxes contain text and may flow one after the other, from left to right. These are called inline boxes. There are also other types of boxes that flow one below the other (such as paragraphs). These are called block boxes.

For example, consider the way a traditional text editor arranges the text. A paragraph is a block, because it contains a vertical list of lines. The lines are also blocks. However, blocks that contain inline boxes arrange its children in a horizontal flow. That is why the paragraph lines are also blocks, while the traditional "bold" and "italic" sections are represented as inline boxes.

The CSS allows us to specify that some elements are displayed as tables. In CSS, a table is a complex structure and consists of rows and cells. The `table` element must have children that have a *table-row* style. Similarly, the `row` elements must contain elements with a *table-cell* style.

To make it easy to understand, the following section describes how each element from a schema is formatted using a CSS file. Note that this is just one of infinite possibilities for formatting the content.

report

The root of a report document. It should be rendered as a box that contains all other elements. To achieve this, the display type is set to **block**. Additionally, some margins are set for it. The CSS rule that matches this element is:

```

report{
    display:block;
    margin:1em;
}

```

title

The title of the report. Usually titles have a large font. The **block** display is used so that the subsequent elements will be placed below it, and its font is changed to double the size of the normal text.

```

title {
    display:block;
}

```

```
font-size: 2em;
}
```

description

Contains several lines of text describing the report. The lines of text are displayed one below the other, so the description has the **block** display. Also, the background color is changed to make it stand out.

```
description {
  display: block;
  background-color: #EEEEFF;
  color: black;
}
```

line

A line of text in the description. A specific aspect is not defined and it just indicates that the display should be **block** style.

```
line {
  display: block;
}
```

important

Defines important text from the description. Since it can be mixed with text, its display property must be set to **inline**. Also, the text is emphasized with **bold** to make it easier to spot.

```
important {
  display: inline;
  font-weight: bold;
}
```

results

Displays the list of *test_names* and the results for each one. To make it easier to read, it is displayed as a **table**, with a green border and margins.

```
results{
  display: table;
  margin: 2em;
  border: 1px solid green;
}
```

entry

The results are displayed as a table so the entry is a row in the table. Thus, the display is **table-row**.

```
entry {
    display:table-row;
}
```

test_name, passed

The name of the individual test, and its result. They are cells in the results table with the display set to **table-cell**. Padding and a border are added to emphasize the table grid.

```
test_name, passed{
    display:table-cell;
    border:1px solid green;
    padding:20px;
}

passed{
    font-weight:bold;
}
```

The full content of the CSS file `test_report.css` is:

```
report {
    display:block;
    margin:1em;
}

description {
    display:block;
    background-color:#EEEEFF;
    color:black;
}

line {
    display:block;
}

important {
    display:inline;
    font-weight:bold;
}

title {
    display:block;
```

```

    font-size: 2em;
}

results{
    display: table;
    margin: 2em;
    border: 1px solid green;
}

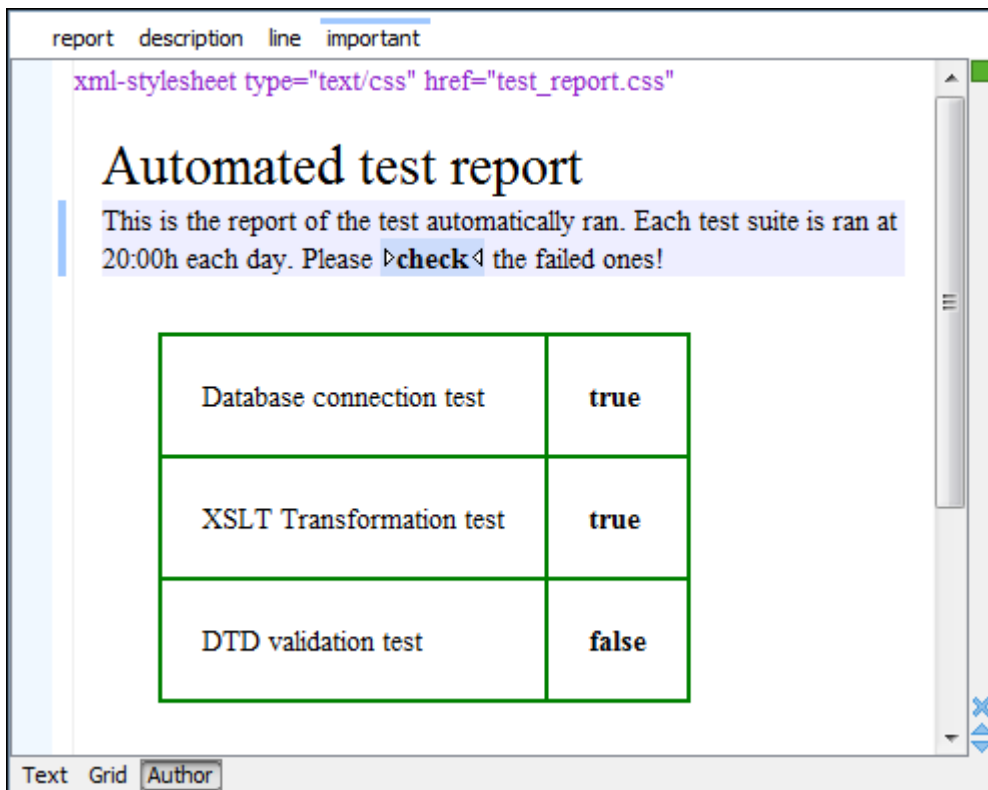

entry {
    display: table-row;
}

test_name, passed{
    display: table-cell;
    border: 1px solid green;
    padding: 20px;
}

passed{
    font-weight: bold;
}

```

Figure 535. Report Rendered in Author Mode

**Note:**

You can edit attributes in-place in the **Author** mode using [form-based controls \(on page 386\)](#).

XML Instance Template

Based on the XML Schema and CSS file Oxygen XML Editor Eclipse plugin can help the content author in loading, editing, and validating the test reports. An XML document template must be created as a kind of skeleton that the users can use as a starting point for creating new test reports. The template must be generic enough and reference the XML Schema file and the CSS stylesheet.

This is an example:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css" href="test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="test_report.xsd">
  <title>Automated test report</title>
  <description>
    <line>This is the report of the test automatically ran.
      Each test suite is ran at 20:00h each day.
      Please <important>check</important> the failed ones!</line>
  </description>
  <results>
    <entry>
      <test_name>Database connection test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>XSLT Transformation test</test_name>
      <passed>true</passed>
    </entry>
    <entry>
      <test_name>DTD validation test</test_name>
      <passed>>false</passed>
    </entry>
  </results>
</report>
```

The processing instruction `xml-stylesheet` associates the CSS stylesheet to the XML file. The `href` pseudo attribute contains the URI reference to the stylesheet file. In the example, the CSS is in the same directory as the XML file.

The next step is to place the XSD file and the CSS file on a web server and modify the template to use the HTTP URLs, like this:

```

<?xml version="1.0" encoding="UTF-8"?>
<?xml-stylesheet type="text/css"
    href="http://www.mysite.com/reports/test_report.css"?>
<report xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
    xsi:noNamespaceSchemaLocation=
    "http://www.mysite.com/reports/test_report.xsd">
    <title>Test report title</title>
    <description>
    .....

```

If you want to share the files with other team members, you could create an archive containing the *test_report.xml*, *test_report.css*, and *test_report.xsd* and send it to the other users.

Creating and Configuring a Custom Framework

This basic tutorial is meant to provide an example of creating and configuring a custom document type (*framework (on page 2679)*). This basic tutorial offers examples for creating a custom schema, adjusting the authoring experience through custom CSS styling, and creating a custom action.

Step 1: Organize Framework Files

First, create a new folder for your customized *framework (on page 2679)*. This folder will be used to store all files related to the documentation *framework*. The folder structure will look something like this:

```

oxygen
  frameworks
    sdf
    schema
    css

```

The *frameworks* directory is the container where all the Oxygen XML Editor Eclipse plugin *framework* customizations are located. Each subdirectory contains files related to a specific type of XML documents (schemas, catalogs, stylesheets, CSS stylesheets, etc.) Distributing a *framework* means delivering a *framework* directory.

It is assumed that you have the right to create files and folders inside the Oxygen XML Editor Eclipse plugin installation directory. If you do not have this right, you will have to install another copy of the program in a folder you have access to, the home directory for instance, or your desktop.

To test your *framework* distribution, copy it in the *frameworks* directory of the newly installed application and start Oxygen XML Editor Eclipse plugin by running the provided start-up script files.

You should copy the created schema files *abs.xsd* and *sdf.xsd*, *sdf.xsd* being the main schema, to the *schema* directory and the CSS file *sdf.css* to the *css* directory.

Step 2: Extend an Existing Framework

The easiest way to create a custom *framework* (on page 2679) (document type) is by extending an existing built-in framework, such as DITA or DocBook, and then making modifications to it.

1. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association > Locations** (on page 90). Add the path to your custom framework directory in the **Additional frameworks directories** list and click **OK** or **Apply** to save your changes.
2. Go to the **Document Type Association preferences page** (on page 88) and select an existing *framework* configuration (for example, **DocBook**) and use the **Extend** button to create an extension for it.

Step Result: This opens the **Document Type Configuration dialog box** (on page 90) where you can define the set of rules and settings for your custom framework.

3. Give the extension an appropriate name, select **External** for the **Storage** option, click the browsing button (📁) to specify the location of your custom framework directory.
4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.

Results: You now have a fully functional *framework* that you can continue to customize.

Step 3: Create a Custom XML Schema

To illustrate an example of creating an XML Schema for a custom DocBook *framework* (on page 2679), suppose the documents are either *articles* or *books*, and composed of *sections*. The *sections* may contain `<title>`, `<para>`, `<figure>`, `<table>`, and other `<section>` elements. To complete the picture, each section includes a `<def>` element from another namespace.

The first schema file:

```
<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace="http://www.oxygenxml.com/sample/documentation"
  xmlns:doc="http://www.oxygenxml.com/sample/documentation"
  xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts"
  elementFormDefault="qualified">

  <xs:import namespace=
    "http://www.oxygenxml.com/sample/documentation/abstracts"
    schemaLocation=
    "abs.xsd" />
```

The namespace of the documents will be `http://www.oxygenxml.com/sample/documentation`. The namespace of the `<def>` element is `http://www.oxygenxml.com/sample/documentation/abstracts`.

Next, the structure of the sections is defined. They all start with a `<title>`, then have the optional `<def>` element then either a sequence of other sections, or a mixture of paragraphs, images, and tables.

```
<xs:element name="book" type="doc:sectionType" />
<xs:element name="article" type="doc:sectionType" />
<xs:element name="section" type="doc:sectionType" />

<xs:complexType name="sectionType">
  <xs:sequence>
    <xs:element name="title" type="xs:string" />
    <xs:element ref="abs:def" minOccurs="0" />
    <xs:choice>
      <xs:sequence>
        <xs:element ref="doc:section" maxOccurs="unbounded" />
      </xs:sequence>
      <xs:choice maxOccurs="unbounded">
        <xs:element ref="doc:para" />
        <xs:element ref="doc:image" />
        <xs:element ref="doc:table" />
      </xs:choice>
    </xs:choice>
  </xs:sequence>
</xs:complexType>
```

The paragraph contains text and other custom styling markup, such as bold (``) and italic (`<i>`) elements.

```
<xs:element name="para" type="doc:paragraphType" />

<xs:complexType name="paragraphType" mixed="true">
  <xs:choice minOccurs="0" maxOccurs="unbounded">
    <xs:element name="emphasis" />
    <xs:element name="i" />
  </xs:choice>
</xs:complexType>
```

The `<image>` element has an attribute with a reference to the file containing image data.

```
<xs:element name="image">
  <xs:complexType>
    <xs:attribute name="href" type="xs:anyURI" use="required" />
  </xs:complexType>
</xs:element>
```

The `<table>` element contains a header row and then a sequence of rows (`<tr>` elements) each of them containing the cells. Each cell has the same content as the paragraphs.

```

<xs:element name="table">
  <xs:complexType>
    <xs:sequence>
      <xs:element name="header">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" maxOccurs="unbounded"
              type="doc:paragraphType" />
          </xs:sequence>
        </xs:complexType>
      </xs:element>
      <xs:element name="tr" maxOccurs="unbounded">
        <xs:complexType>
          <xs:sequence>
            <xs:element name="td" type="doc:tdType"
              maxOccurs="unbounded" />
          </xs:sequence>
        </xs:complexType>
      </xs:element>
    </xs:sequence>
  </xs:complexType>
</xs:element>

<xs:complexType name="tdType">
  <xs:complexContent>
    <xs:extension base="doc:paragraphType">
      <xs:attribute name="row_span" type="xs:integer" />
      <xs:attribute name="column_span" type="xs:integer" />
    </xs:extension>
  </xs:complexContent>
</xs:complexType>

```

The `<def>` element is defined as a text only element in the imported schema `abs.xsd`:

```

<?xml version="1.0" encoding="UTF-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema"
  targetNamespace=
    "http://www.oxygenxml.com/sample/documentation/abstracts">
  <xs:element name="def" type="xs:string" />
</xs:schema>

```

Now the XML data structure will be styled.

Step 4: Associate the Schema to the Framework

In the bottom section of the **Document Type** configuration dialog box (*on page 90*), there are a series of tabs. The **Schema** tab refers to the schema that is used for validation of the documents that match the defined association rules.

Important:

If the document references a schema directly (for example, using a `DOCTYPE` declaration, `xsi:schemaLocation` attribute, or a Relax NG `xml-model` processing instruction), the schema defined in this **Schema** tab is not used for validation or content completion.

Schema Type

Select from the combo box the value **XML Schema**.

Schema URI

Enter the value of the schema location (for example, `${framework}/schema/sdf.xsd`). Use the **`\${framework}** editor variable (*on page 225*) in the schema URI path instead of a full path to be valid for multiple Oxygen XML Editor Eclipse plugin installations.

Important:

The **`\${framework}** variable is expanded at the time of validation into the absolute location of the directory containing the *framework* (*on page 2679*).

Step 5: Create a Custom CSS

If you read the [Framework Customization Overview](#) (*on page 2100*) then you already have some basic knowledge about creating simple styles. The example document contains elements from various namespaces, so you need to use CSS Level 3 extensions (supported by the **Author** mode layout engine) to associate specific properties with that element.

Defining the General Layout

Now the basic layout of the rendered documents is created.

Elements that are stacked one on top of the other are: `book`, `article`, `section`, `title`, `figure`, `table`, `image`.

These elements are marked as having `block` style for display. Elements that are placed one after the other in a flowing sequence are: `b`, `i`. These will have `inline` display.

```
/* Vertical flow */
book,
section,
para,
title,
image,
```

```
ref {
    display:block;
}

/* Horizontal flow */
b,i {
    display:inline;
}
```

**Important:**

Having `block` display children in an `inline` display parent results in Oxygen XML Editor Eclipse plugin changing the style of the parent to `block` display.

Styling an Element

The title of any section must be bold and smaller than the title of the parent section. To create this effect, a sequence of CSS rules must be created. The `*` operator matches any element, it can be used to match titles having progressive depths in the document.

```
title{
    font-size: 2.4em;
    font-weight:bold;
}
* * title{
    font-size: 2.0em;
}
* * * title{
    font-size: 1.6em;
}
* * * * title{
    font-size: 1.2em;
}
```

It is useful to have before the title a constant text, indicating that it refers to a section. This text can include also the current section number. The `:before` and `:after` pseudo-elements will be used, plus the CSS counters.

First declare a counter named `sect` for each `book` or `article`. The counter is set to zero at the beginning of each such element:

```
book,
article{
    counter-reset:sect;
}
```

The `sect` counter is incremented with each `section`, that is a direct child of a `book` or an `article` element.

```
book > section,
article > section{
    counter-increment:sect;
}
```

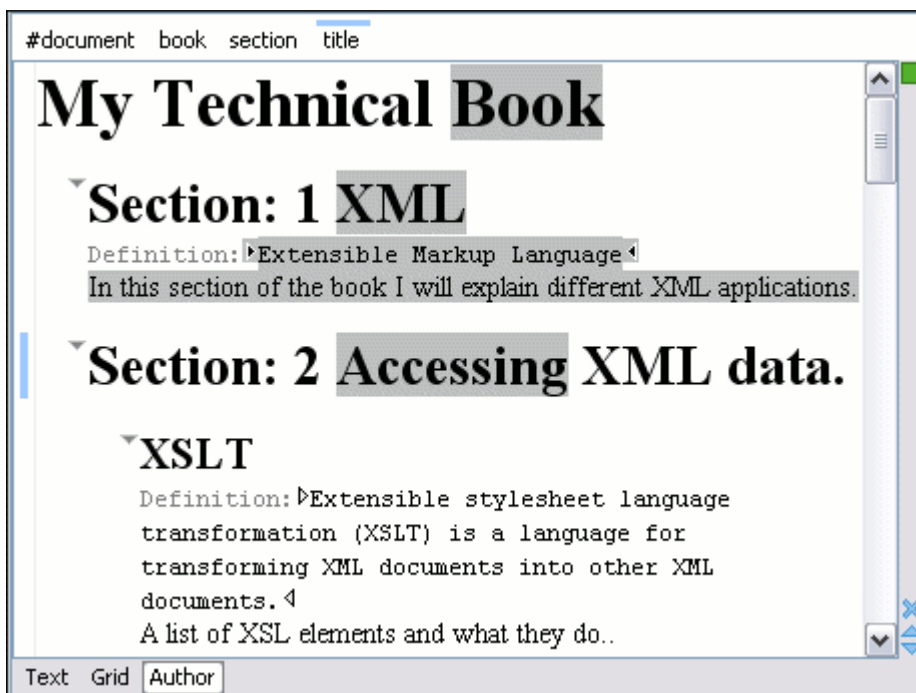

The "static" text that will prefix the section title is composed of the constant "Section ", followed by the decimal value of the `sect` counter and a dot.

```
book > section > title:before,
article > section > title:before{
    content: "Section " counter(sect) ". ";
}
```

To make the documents easy to read, you add a margin to the sections. In this way the higher nesting level, the larger the left side indent. The margin is expressed relatively to the parent bounds:

```
section{
    margin-left:1em;
    margin-top:1em;
}
```

Figure 536. A sample of nested sections and their titles.

In the above screenshot you can see a sample XML document rendered by the CSS stylesheet. The selection "avoids" the text that is generated by the CSS "content" property. This happens because the CSS generated text is not present in the XML document and is just a visual aid.

Styling Inline Elements

The "bold" style is obtained by using the `font-weight` CSS property with the value `bold`, while the "italic" style is specified by the `font-style` property:

```
b {
    font-weight:bold;
}

i {
    font-style:italic;
}
```

Styling Images

The CSS 2.1 does not specify how an element can be rendered as an image. To overpass this limitation, Oxygen XML Editor Eclipse plugin supports a CSS Level 3 extension allowing to load image data from a URL. The URL of the image must be specified by one of the element attributes and it is resolved through the catalogs specified in Oxygen XML Editor Eclipse plugin.

```
image{
    display:block;
    content: attr(href, url);
    margin-left:2em;
}
```

The `image` element has the required `@href` attribute of type `xs:anyURI`. The `@href` attribute contains an image location so the rendered content is obtained by using the function:

```
attr(href, url)
```

The first argument is the name of the attribute pointing to the image file. The second argument of the `attr` function specifies the type of the content. If the type has the `url` value, then Oxygen XML Editor Eclipse plugin identifies the content as being an image. If the type is missing, then the content will be the text representing the attribute value.

Oxygen XML Editor Eclipse plugin handles both absolute and relative specified URLs. If the image has an *absolute* URL location (for example: "http://www.oasis-open.org/images/standards/oasis_standard.jpg") then it is loaded directly from this location. If the image URL is *relative* specified to the XML document (for example: "images/my_screenshot.jpg") then the location is obtained by adding this value to the location of the edited XML document.

An image can also be referenced by the name of a DTD entity that specifies the location of the image file. For example, if the document declares an entity **graphic** that points to a JPEG image file:

```
<!ENTITY graphic SYSTEM "depo/keyboard_shortcut.jpg" NDATA JPEG>
```

and the image is referenced in the XML document by specifying the name of the entity as the value of an attribute:

```
<mediaobject>
  <imageobject>
    <imagedata entityref="graphic" scale="50"/>
  </imageobject>
</mediaobject>
```

The CSS should use the functions `url`, `attr` and `unparsed-entity-uri` for displaying the image in the **Author** mode:

```
imagedata[entityref]{
  content: url(unparsed-entity-uri(attr(entityref)));
}
```

To take into account the value of the `@width` attribute of the `imagedata` and use it for resizing the image, the CSS can define the following rule:

```
imagedata[width]{
  width:attr(width, length);
}
```

Figure 537. Samples of images in Author

Step 6: Associate the Custom CSS to the Framework

Once you have customized your framework through CSS styling rules, you then need to [associate the custom CSS file \(on page 96\)](#).

Step 7: Testing the Framework Customization

To test the new *framework* (on page 2679) customization, create an XML instance that conforms with the association rules that you specified in your *framework* customization. You will not specify an XML Schema location directly in the document, using an `xsi:schemaLocation` attribute. Instead, Oxygen XML Editor Eclipse plugin will detect its associated document type and use the specified schema.

```
<book xmlns="http://www.oxygenxml.com/sample/documentation"
      xmlns:abs="http://www.oxygenxml.com/sample/documentation/abstracts">

  <title>My Technical Book</title>

  <section>

    <title>XML</title>

    <abs:def>Extensible Markup Language</abs:def>

    <para>In this section of the book I will
      explain different XML applications.</para>

  </section>

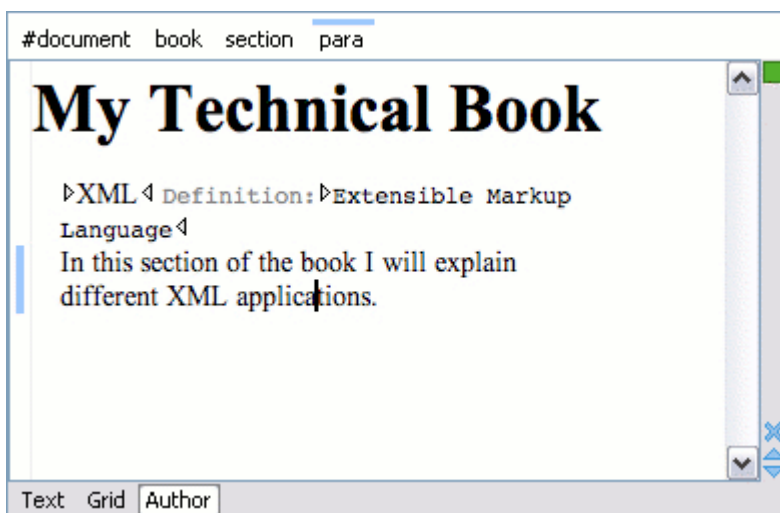

</book>
```

When trying to validate the document there should be no errors. Now modify the `title` to `title2`. Validate again. This time there should be an error.

```
Invalid content was found starting with element
'title2'. One of '{"http://www.oxygenxml.com/sample/documentation":title}'
is expected.
```

Undo the tag name change, go to **Author** mode, and Oxygen XML Editor Eclipse plugin should load the CSS from the *document type association* (on page 2678) and create a layout similar to this:

Figure 538. Example: Testing a Framework Customization

CSS Support in Author Mode

The visual **Author** editing mode can be customized by creating CSS files to define styles for the XML elements and other components. The **Author** editing mode supports most CSS 2.1 selectors, numerous CSS 2.1 properties, and some CSS 3 selectors. Also, Oxygen XML Editor Eclipse plugin has added some custom functions and properties that extend the W3C CSS specification and are useful for a wide range of use-cases for developers who [customize **Author** mode through custom *frameworks* \(on page 1941\)](#).

Resources

To see a visual demonstration of various advanced customization possibilities (including ideas for tailoring the editing experience using CSS), watch our Webinar: [Working with DITA in Oxygen - Customizing the Editing Experience](#).

Associating a CSS with an XML Document

Associating a Stylesheet with an XML Document

The rendering of an XML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium. Some CSS 3 features, such as namespaces and custom extensions, of the CSS specification are also supported.

There are several methods for associating a stylesheet (CSS) with an XML document:

- Insert the `xml-stylesheet` processing instruction with the `@type` attribute at the beginning of the XML document. The easiest way to do this is by using the  **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **XML** menu.

CSS example:

```
<?xml-stylesheet type="text/css" href="test.css"?>
```

- Add a new CSS file to a [framework \(on page 2679\)](#) (document type). To do so, [open the Preferences dialog box \(on page 70\)](#) and go to **Document Type Association**. Edit the appropriate *framework*, open the **Author** tab, then the **CSS** subtab. Click the **+ New** button to add a new CSS file.

Note:

The built-in *frameworks* are read-only, so you need to [Extend \(on page 89\)](#) or [Duplicate \(on page 89\)](#) them to configure them as custom *frameworks*.

If a document has no CSS association or the referenced stylesheet files cannot be loaded, a default one is used. A warning message is also displayed at the beginning of the document, presenting the reason why the CSS cannot be loaded.

Figure 539. Document with no CSS association default rendering

For information about associating a CSS to a *framework* (document type), see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Handling CSS Imports

When a CSS document contains imports to other CSS documents, the references are also passed through the [XML Catalog \(on page 2683\)](#) URI mappings to determine an indirect CSS referenced location.

Example: CSS Import

For example, if you can have a CSS import, such as:

```
@import "http://host/path/to/location/custom.css";
```

and then add your own [XML Catalog \(on page 2683\)](#) file that maps the location to a custom CSS in the [XML Catalog preferences page \(on page 189\)](#):

```
<uri name="http://host/path/to/location/custom.css"
      uri="path/to/custom.css" />
```

Adding a Custom Default CSS for Every XML Document

To add a custom CSS that is applied to every XML document, add a mapping in your [XML Catalog \(on page 2683\)](#) file that looks like this:

```
<uri name="http://www.oxygenxml.com/extensions/author/css/userCustom.css"
      uri="path/to/custom.css" />
```

This extra mapped CSS location will be parsed every time the application processes the CSS stylesheets used to render the opened XML document in the visual **Author** editing mode. This allows your custom CSS to be used without the need to modify all other CSS stylesheets contributed in the document type configuration.

Editor Variables in CSS Imports

You can use various [editor variables \(on page 218\)](#) in CSS imports. When editing an XML document with an associated CSS in **Author** mode, the editor variables will be expanded and resolved.

Example: Editor Variable in a CSS Import

For example, the following editor variable:

```
@import "${framework(DITA)}/custom.css";
```

is resolved in the DITA *framework* ([on page 2679](#)) folder where the `custom.css` is placed. In the [Document Type Association preferences page \(on page 88\)](#), you can see a list of document type. The name for your particular document type needs to be passed as a parameter to the `framework()` function.

Note:

If you use editor variables like `${cfdu}` (Current File Directory URL), it will be expanded to the URL of the current CSS document that contains the imports rather than the XML document that references the CSS.

Displaying Processing Instructions from Other XML Editors

By default, some external processing instructions are hidden (for example, certain processing instructions used to store metadata in other XML editors). If you want them to be displayed (for example, to edit them), they must be [associated with the current document using a CSS \(on page 2117\)](#) like this:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
oxy|processing-instruction[Pub],
oxy|processing-instruction[PubTbl],
oxy|processing-instruction[xm-replace_text],
oxy|processing-instruction[xm-deletion_mark],
oxy|processing-instruction[xm-insertion_mark_start],
oxy|processing-instruction[xm-insertion_mark_end]
{
  display:block !important;
}
```

Specifying Media Types in the CSS

The CSS stylesheets can specify how a document is presented on different types of media (on the screen, paper, etc.) You can specify that some of the selectors from your CSS should be taken into account only in the

Oxygen XML Editor Eclipse plugin **Author** mode and ignored in other media types. This can be accomplished by using the `oxygen` media type.

Example: `oxygen` Media Type

```
b{
  font-weight:bold;
  display:inline;
}

@media oxygen{
  b{
    text-decoration:underline;
  }
}
```

This example results in the text being bold if the document is opened in a web browser that does not recognize `@media oxygen`, while the text is bold and underlined when opened in Oxygen XML Editor Eclipse plugin **Author** mode.

You can also use the `oxygen` media type to specify CSS selectors to be applied in certain operating systems or platforms by using the `os` and `platform` properties. For example, you can specify one set of style rules for displaying Oxygen XML Editor Eclipse plugin in Windows, and another set of style rules for macOS. The supported properties are as follows:

- **os** - The possible values are: `win`, `linux`, or `mac`.
- **platform** - The possible values are: `standalone`, `eclipse`, or `webapp`.

Example: `os` and `platform` Properties

```
@media oxygen AND (os:"win") AND (platform:"standalone") {
  p{
    content:"PPP";
  }
}
```

Related information

[@media Rule \(on page 2121\)](#)

CSS At-Rules

Oxygen XML Editor Eclipse plugin supports some of the standard at-rules specified by CSS Level 2.1 and 3. The `@media` rule also include support for some style rules that are specific to Oxygen XML Editor Eclipse plugin.

@font-face At-Rule

Oxygen XML Editor Eclipse plugin allows you to use custom fonts in the **Author** mode by specifying them in the CSS using the `@font-face` media type. Only the `src` and `font-family` CSS properties can be used for this media type.

Example: @font-face Rule

```
@font-face{
    font-family:"Baroque Script";
    /*The location of the loaded TTF font must be relative to the CSS*/
    src:url("BaroqueScript.ttf");
}
```

The specified `font-family` must match the name of the font declared in the `.ttf` file.

@media Rule

The `@media` rule allows you to set different style rules for multiple types of media in the same stylesheet. For example, you can set the font size to be different on the screen than on paper. Oxygen XML Editor Eclipse plugin supports several media types, allowing you to set the style rules for presenting a document on various media (on screen, paper, etc.)

Supported Media Types

- **screen** - The styles marked with this media type are used only for rendering a document on screen.
- **print** - The styles marked with this media type are used only for printing a document.
- **all** - The styles marked with this media type are used for rendering a document in all supported types of media.
- **oxygen** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin **Author** mode. For more information, see [Specifying Media Types in the CSS \(on page 2119\)](#).
- **oxygen-dark-theme** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin **Author** mode when a dark theme is used (for example, *Graphite*).
- **oxygen-high-contrast-black** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin **Author** mode on a Windows High Contrast Theme with a black background.
- **oxygen-high-contrast-white** - The styles marked with this media type are used only for rendering a document in the Oxygen XML Editor Eclipse plugin **Author** mode on a Windows High Contrast Theme with a white background.

Example: @media Rule

```
@media oxygen{
    b{
        text-decoration:underline;
    }
}
```

```

}
}
@media oxygen-high-contrast-white{
  b{
    font-weight:bold;
  }
}

```

Supported Properties

Oxygen XML Editor Eclipse plugin also supports a few properties to set specific style rules that depend upon the size of the visible area in **Author** mode. These supported properties are as follows:

- **min-width** - The styles selected in this property are applied if the visible area in **Author** mode is equal to or greater than the specified value.
- **max-width** - The styles selected in this property are applied if the visible area in **Author** mode is less than or equal to the specified value.

Example: *min-width* and *max-width* Properties

```

@media (min-width:500px){
  p{
    content:'XXX';
  }
}
@media (max-width:700px){
  p:after{
    content:'yyy';
  }
}

```

Related information

[Specifying Media Types in the CSS \(on page 2119\)](#)

Standard W3C CSS Supported Features

Oxygen XML Editor Eclipse plugin supports most of the CSS Level 3 selectors and most of the CSS Level 2.1 properties

Supported CSS Selectors

Tip:

CSS rules that match attributes are always more specific than element selectors. For more information, see <https://drafts.csswg.org/selectors-3/#specificity>.

The following table lists the CSS selectors that are supported in Oxygen XML Editor Eclipse plugin:

Expression	Name	CSS Level	Description / Example
*	Universal selector	CSS Level 2	Matches any element
E	Type selector	CSS Level 2	Matches any E element (i. e. an element with the local name E)
E F	Descendant selector	CSS Level 2	Matches any F element that is a descendant of an E element.
E > F	Child selectors	CSS Level 2	Matches any F element that is a child of an element E.
E:lang(c)	Language pseudo-class	CSS Level 2	Matches element of type E if it is in (human) language c (the document language specifies how language is determined).
E + F	Adjacent selector	CSS Level 2	Matches any F element immediately preceded by a sibling element E.
E ~ F	General sibling selector	CSS Level 3	Matches any F element preceded by a sibling element E.
E[foo]	Attribute selector	CSS Level 2	Matches any E element with the "foo" attribute set (whatever the value).
E[foo="warning"]	Attribute selector with value	CSS Level 2	Matches any E element whose "foo" attribute value is exactly equal to "warning".
E[foo~="warning"]	Attribute selector containing value	CSS Level 2	Matches any E element whose "foo" attribute value is a list of space-separated values, one of which is exactly equal to "warning".
E[lang = "en"]	Attribute selector containing hyphen separated values	CSS Level 2	Matches any E element whose "lang" attribute has a hyphen-separated list of values beginning (from the left) with "en".
E:before and E:after	Pseudo-elements	CSS Level 2	The ':before' and ':after' pseudo-elements can be used to insert generated content before or after an element's content.

Expression	Name	CSS Level	Description / Example
<code>E:first-child</code>	The first-child pseudo-class	CSS Level 2	Matches element <code>E</code> when <code>E</code> is the first child of its parent.
<code>E:not(s)</code>	Negation pseudo-class	CSS Level 2	An <code>E</code> element that does not match simple selector <code>s</code> .
<code>E:has</code>	Relational pseudo-class	CSS Level 4	<p>The <code>:has()</code> relational pseudo-class is a functional pseudo-class that takes a relative selector as an argument.</p> <p>For more information, see :has Relational Pseudo-Class (on page 2129).</p>
<code>E:hover</code>	The hover pseudo-class	CSS Level 2	The <code>:hover</code> pseudo-class applies while the user designates an element with a pointing device, but does not necessarily activate it. When moving the pointing device over an element, all the parent elements up to the root are taken into account.
<code>E:focus</code>	The focus pseudo-class	CSS Level 2	The <code>:focus</code> pseudo-class applies while an element has the focus (accepts keyboard input).
<code>E:focus-within</code>	The generalized input focus pseudo-class	CSS Level 4	The <code>:focus-within</code> pseudo-class applies to elements that will have the <code>:focus</code> pseudo-class applied. Additionally, the ancestors of an element that matches <code>:focus-within</code> also match.
<code>E::marker</code>	The marker pseudo-class	CSS Level 4	The <code>::marker</code> pseudo-element represents the automatically generated marker box of a list item.
<code>E#myid</code>	The ID selector	CSS Level 2	Matches any <code>E</code> element with ID equal to "myid".

Expression	Name	CSS Level	Description / Example
			 Important: Limitation: In Oxygen XML Editor Eclipse plugin the match is performed only taking into account the attributes with the exact name: "id".
<code>E[att^="val"]</code>	Substring matching attribute selector	CSS Level 3	An E element whose <code>att</code> attribute value begins exactly with the string <code>val</code> .
<code>E[att\$="val"]</code>	Substring matching attribute selector	CSS Level 3	An E element whose <code>att</code> attribute value ends exactly with the string <code>val</code> .
<code>E[att*="val"]</code>	Substring matching attribute selector	CSS Level 3	An E element whose <code>att</code> attribute value contains the substring <code>val</code> .
<code>E:root</code>	Root pseudo-class	CSS Level 3	Matches the root element of the document. In HTML, the root element is always the HTML element.
<code>E:empty</code>	Empty pseudo-class	CSS Level 3	An E element that has no text or child elements.
<code>E:nth-child(n)</code>	The nth-child pseudo-class	CSS Level 3	An E element, the nth child of its parent.
<code>E:nth-last-child(n)</code>	The nth-last-child pseudo-class	CSS Level 3	An E element, the nth child of its parent, counting from the last one.
<code>E:nth-of-type(n)</code>	The nth-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type.
<code>E:nth-last-of-type(n)</code>	The nth-last-of-type pseudo-class	CSS Level 3	An E element, the nth sibling of its type, counting from the last one.
<code>E:last-child</code>	The last-child pseudo-class	CSS Level 3	An E element, last child of its parent.
<code>E:first-of-type</code>	The first-of-type pseudo-class	CSS Level 3	An E element, first sibling of its type.
<code>E:last-of-type</code>	The last-of-type pseudo-class	CSS Level 3	An E element, last sibling of its type.

Expression	Name	CSS Level	Description / Example
<code>E:only-child</code>	The only-child pseudo-class	CSS Level 3	An E element, only child of its parent.
<code>E:only-of-type</code>	The only-of-type pseudo-class	CSS Level 3	An E element, only sibling of its type.
<code>ns E</code>	Element namespace selector	CSS Level 3	An element that has the local name E and the namespace given by the prefix ns. The namespace prefix can be bound to a URI by the at-rule: <div style="background-color: #f0f0f0; padding: 5px; margin: 5px 0;"> <pre>@namespace ns "http://some_namespace_uri";</pre> </div> See Namespace Selector (on page 2126) .
<code>E!>F</code>	The subject selector	CSS Level 4 (experimental)	An element that has the local name E and has a child F. See Subject Selector (on page 2127) .

Namespace Selector

In the CSS 2.1 standard, the element selectors ignore the namespaces of the elements they are matching. Only the local name of the elements are considered in the selector matching process.

Oxygen XML Editor Eclipse plugin uses a different approach that is similar to the CSS Level 3 specification. If the element name from the CSS selector is not preceded by a namespace prefix it is considered to match an element with the same local name as the selector value and ANY namespace. Otherwise, the element must match both the local name and the namespace.

In CSS up to version 2.1, the name tokens from selectors match all elements from ANY namespace that have the same local name. Example:

```
<x:b xmlns:x="ns_x" />
<y:b xmlns:y="ns_y" />
```

Are both matched by the rule:

```
b {font-weight:bold}
```

Starting with CSS Level 3, you can create selectors that are namespace aware.

Example: Defining prefixed and default namespaces

Given the namespace declarations:

```
@namespace sync "http://sync.example.org";
@namespace "http://example.com/foo";
```

Then:

sync|A

Represents the name A in the `http://sync.example.org` namespace.

***|B**

Represents the name B in ANY namespace, including NO NAMESPACE.

C

Represents the name C in ANY namespace, including NO NAMESPACE.

Example: Defining prefixed namespaces combined with pseudo-elements

To match the `<def>` element its namespace declares, bind it to the `abs` prefix and then write a CSS rule:

```
@namespace abs "http://www.oxygenxml.com/sample/documentation/abstracts";
```

Then:

abs|def

Represents the name "def" in the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

abs|def:before

Represents the `:before` pseudo-element of the "def" element from the `http://www.oxygenxml.com/sample/documentation/abstracts` namespace.

Subject Selector

Oxygen XML Editor Eclipse plugin supports the subject selector described in CSS Level 4 (currently a working draft at W3C <http://www.w3.org/TR/selectors4/>). This selector matches a structure of the document, but unlike a compound selector, the styling properties are applied to the subject element (the one marked with "!") instead of the last element from the path.

The subject of the selector can be explicitly identified by appending an exclamation mark (!) to one of the compound selectors in a selector. Although the element structure that the selector represents is the same with or without the exclamation mark, indicating the subject in this way can change which compound selector represents the subject in that structure.

Example:

```
table! > caption {
  border: 1px solid red;
}
```

A border will be drawn to the table elements that contain a caption, as direct child.

This is different from:

```
table > caption {
  border: 1px solid red;
}
```

This draws a border around the caption.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

Descendant Selectors Limitation

Important:

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```

and:

```
a:has(b>c)
```

Related information

[:has Relational Pseudo-Class \(on page 2129\)](#)

:has Relational Pseudo-Class

Oxygen XML Editor Eclipse plugin supports the CSS Level 4 subject selector (currently a working draft at W3C <http://www.w3.org/TR/selectors4/>), as described in [Subject Selector \(on page 2127\)](#). Oxygen XML Editor Eclipse plugin also supports the `:has` relational pseudo-class that has similar functionality and it can match an element by taking its child elements into account. For more information, see <https://drafts.csswg.org/selectors-4/#relational>.

You can create conditions that take into account the structure of the matching element.

Example: *has* Pseudo Class

```
table:has( tbody > thead){
  border: 1px solid red;
}
```

This example will result in a border being drawn for the table elements that contain at least a `<thead>` element in the `<tbody>` element.

Taking Processing Instructions into Account in CSS Subject Selectors

You can test for the existence of specific processing instructions (PI) in the child hierarchy of a subject selector.

For example:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

chapter! > oxy|processing-instruction[important][level="high"]{
  color:red;
}
```

This would change the color of a DocBook chapter to red if it contains the `important` processing instruction:

```
<chapter>
  <title>A title</title>
  <?important level='high'?>
</chapter>
```

Descendant Selectors Limitation

Important:

The current implementation has a known limitation. The general descendant selectors are taken into account as direct child selectors. For example, the following two CSS selectors are considered equivalent:

```
a:has(b c)
```

and:

```
a:has(b>c)
```

Supported CSS Properties

Oxygen XML Editor Eclipse plugin validates all CSS 2.1 properties, but does not render *aural* and *paged* categories properties in **Author** mode, as well as some of the values of the *visual* category that are listed below under the **Ignored Values** column. For the Oxygen XML Editor Eclipse plugin-specific (extension) CSS properties, see [CSS Extensions \(on page 2143\)](#).

Name	Rendered Values	Ignored Values
background	background-color background-image background-position background-repeat inherit initial unset

word-spacing	NONE	
z-index	NONE	

<length> - Refers to distance measurements and is expressed in units such as `mm`, `cm`, `in`, `em`, `rem`, `ex`, `pc`, `pt`, `px`.

For more information, see [the W3 CSS Level 3 length type specifications](#).

Related Information:

[CSS Extensions \(on page 2143\)](#)

Transparent Colors

CSS3 supports RGBA colors. The RGBA declaration allows you to set opacity (via the Alpha channel) as part of the color value. A value of `0` corresponds to a completely transparent color, while a value of `1` corresponds to a completely opaque color. To specify a value, you can use either a *real* number between `0` and `1`, or a percent.

Example: RGBA Color

```
personnel:before {
    display:block;
    padding: 1em;
    font-size: 1.8em;
    content: "Employees";
    font-weight: bold;
    color:#EEEEEE;
    background-color: rgba(50, 50, 50, 0.6);
}
```

attr() Function: Properties Values Collected from the Edited Document

In CSS Level 2.1 you may collect attribute values and use them as content *only* for the pseudo-elements. For instance, the `:before` pseudo-element can be used to insert some content before an element. This is valid in CSS 2.1:

```
title:before{
    content: "[Audience Level: " attr(audience) " ]";
}
```

If the `<title>` element from the XML document is:

```
<title audience="Expert">Changing the Timing Belt</title>
```

Then the title will be displayed as:

```
[Audience Level: Expert] Changing the Timing Belt
```

In Oxygen XML Editor Eclipse plugin, the use of `attr()` function is available not only for the `content` property, but also for any other property. This is similar to the CSS Level 3 working draft: <http://www.w3.org/TR/2006/WD-css3-values-20060919/#functional>. The arguments of the function are:

```
attr ( attribute_name , attribute_type , default_value )
```

attribute_name

The attribute name. This argument is required.

attribute_type

The attribute type. This argument is optional. If it is missing, argument's type is considered `string`. This argument indicates what is the meaning of the attribute value and helps to perform conversions of this value. Oxygen XML Editor Eclipse plugin accepts one of the following types:

color

The value represents a color. The attribute may specify a color in various formats. Oxygen XML Editor Eclipse plugin supports colors specified either by name (`red`, `blue`, `green`, etc.) or as an RGB hexadecimal value `#FFFFFF`.

url

The value is a URL pointing to a media object. Oxygen XML Editor Eclipse plugin supports only images. The attribute value can be a complete URL, or a relative one to the XML document. Note that this URL is also resolved through the catalog resolver.

integer

The value must be interpreted as an integer.

number

The value must be interpreted as a float number.

length

The value must be interpreted as an integer.

percentage

The value must be interpreted relative to another value (length, size) expressed in percents.

em

The value must be interpreted as a size. 1 em is equal to the *font-size* of the relevant font.

ex

The value must be interpreted as a size. 1 ex is equal to the *height* of the **x** character of the relevant font.

px

The value must be interpreted as a size expressed in pixels relative to the viewing device.

mm

The value must be interpreted as a size expressed in millimeters.

cm

The value must be interpreted as a size expressed in centimeters.

in

The value must be interpreted as a size expressed in inches. 1 inch is equal to 2.54 centimeters.

pt

The value must be interpreted as a size expressed in points. The points used by CSS2 are equal to 1/72th of an inch.

pc

The value must be interpreted as a size expressed in picas. 1 pica is equal to 12 points.

default_value

This argument specifies a value that is used by default if the attribute value is missing. This argument is optional.

Example: *attr* Function

Consider the following XML instance:

```
<sample>
  <para bg_color="#AAAAFF">Blue paragraph.</para>
  <para bg_color="red">Red paragraph.</para>
  <para bg_color="red" font_size="2">Red paragraph with large font.</para>
  <para bg_color="#00AA00" font_size="0.8" space="4">
    Green paragraph with small font and margin.</para>
</sample>
```

The `<para>` elements have `@bg_color` attributes with RGB color values (such as `#AAAAFF`). You can use the `attr()` function to change the elements appearance in the editor based on the value of this attribute:

```
background-color:attr(bg_color, color);
```

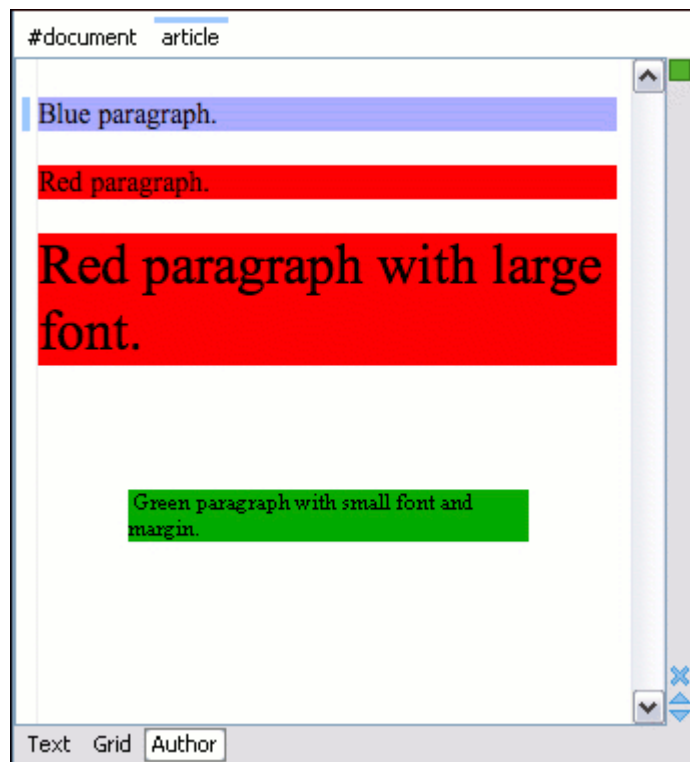

The `font_size` represents the font size in *em* units. You can use this value to change the style of the element:

```
font-size:attr(font_size, em);
```

The complete CSS rule is:

```
para{
  display:block;
  background-color:attr(bg_color, color);
  font-size:attr(font_size, em);
  margin:attr(space, em);
}
```

The document is rendered as:

CSS Level 3 *target-counter()* and *target-counters()* Functions

The CSS Level 3 functions *target-counter* and *target-counters* can be used as values for the `content` property to retrieve counter values and display information obtained from a target at the end of a link.

The *target-counter* Function

This function retrieves the value of the innermost counter with a given name.

```
target-counter ( <fragment> , <counter-name> [ , <counter-style> ] ? )
```

fragment

The URI fragment pointing to the ID of the target element.

counter-name

The name of the counter. This argument is required.

counter-style

This optional argument can be used to format the result.

Example:

HTML:

```

<nav>
  <ol>
    <li class="frontmatter"><a href="#pref_01">Preface</a></li>
    <li class="frontmatter"><a href="#intr_01">Introduction</a></li>
    <li class="bodymatter"><a href="#chap_01">Chapter One</a></li>
  </ol>
</nav>

```

CSS:

```

.frontmatter a::after { content: leader('.') target-counter(attr(href), page, lower-roman) }
.bodymatter a::after { content: leader('.') target-counter(attr(href), page, decimal) }

```

Result:

```

Preface.....vii
Introduction.....xi
Chapter One.....1

```

The *target-counters* Function

This function fetches the value of all counters of a given name from the end of a link and formats them by inserting a given string between the value of each nested counter.

```
target-counter ( <fragment> , <counter-name> , <delimiter> [ , <counter-style> ] ? )
```

fragment

The URI fragment pointing to the ID of the target element.

counter-name

The name of the counter. This argument is required.

delimiter

The string to be inserted between the value of each nested counter. This argument is required.

counter-style

This optional argument can be used to format the result.

<https://www.w3.org/TR/css-gcpm-3/#target-counter>

<https://www.w3.org/TR/css-gcpm-3/#target-counters>

calc() Function

The `calc()` function allows mathematical expressions with addition (+), subtraction (-), multiplication (*), division (/) to be used as component values. Percentages are solved relative to the dimensions of the containing parent block. It can be used when length values are accepted:

```
elem {  
  width: calc(100% - 1em);  
}
```

For more information, see: <https://drafts.csswg.org/css-values-3/#calc-notation>

Custom CSS Properties (CSS Variables)

Custom properties (also referred to as *CSS variables*) are properties defined by CSS authors that contain specific values to be reused throughout a document.

Complex websites have many CSS rules, often with a lot of repeated values. For example, the same color might be used in dozens of different places, requiring a global search-and-replace operation if that color needs to be changed. Custom properties allow a value to be stored in one place, then referenced in multiple other places. An additional benefit is semantic identifiers. For example, `--main-text-color` is easier to understand than `#00ff00`, especially if this same color is also used in other contexts.

Custom properties follow the same rules as other CSS properties, so you are able to define and use them at multiple levels, following standard CSS cascading and specificity rules.

Usage

A custom property name begins with a double hyphen (`--`) and its value that can be any valid CSS value. You use the custom property value by specifying your custom property name inside the `var()` function, in place of a regular property value:

Defining a Custom Property

```
element {  
  --main-bg-color: brown;  
  background-color: var(--main-bg-color);  
}
```

**Note:**

Custom property names are case sensitive: `--my-color` will be treated as a separate custom property from `--My-color`.

Inheritance of Custom Properties

If you define a custom property on an element, you will be able to access it on all of its descendants.

Inheritance

```

<one>
  <two>
    <three/>
    <four/>
  </two>
</one>

one {
  --color:green;
}

three {
  --color:red;
}

* {
  color: var(--color);
}

```

Result:

- `<one>` has the color green.
- `<two>` has the color green.
- `<three>` has the color red.
- `<four>` has the color green.

Custom Properties Fallback Values

The `var()` function has two arguments. The first argument is the name of the custom property to be substituted. The second argument (optional) is a fallback value, which is used as the substitution value when the referenced custom property is invalid or undefined.

Specifying a Fallback Value

```

one {
  color: var(--color, blue);
}

one {
  color: var(--color, var(--fallback-color, red));
}

```

Dependencies

A custom property can reference the value of another custom property through the `var()` function.

A Custom Property Safely Using a Variable

```
:root {
  --border-color: red;
  --main-border: 1px solid var(--border-color, green);
}

p {
  border: var(--main-border);
}
```

Combining Custom Variables with `calc()`

```
:root {
  --foo: 10px;
  --bar: calc(var(--foo) + 10px);
}

p {
  font-size: var(--bar);
}
```

CAUTION:

This can create cyclic dependencies where two or more custom properties each attempt to reference each other.

An Invalid Situation of Variables Depending on Each Other

```
:root {
  --color: var(--bg-color);
  --bg-color: var(--color);
}
```

CSS Extensions

CSS stylesheets provide support for displaying documents. When editing non-standard documents, Oxygen XML Editor Eclipse plugin CSS extensions are useful.

Examples of how they can be used:

- Property for marking *foldable elements* (on page 2679) in large files.
- Enforcing a display mode for the XML tags, regardless of the current mode selected by the user.

- Constructing a URL from a relative path location.
- String processing functions.

Built-in CSS Selectors

When Oxygen XML Editor Eclipse plugin renders content in the **Author** mode, it adds built-in CSS selectors (in addition to the CSS stylesheets linked in the XML or specified in the document type associated to the XML document). These built-in CSS selectors are processed before all other CSS content, but they can be overwritten if the CSS developer wants to modify a default behavior.

}

mml|math mml|*{
    display:none !important;
    white-space: normal !important;
}

/*Text direction attributes*/
*[dir='rtl'] { direction:rtl; unicode-bidi:embed; }
*[dir='rlo'] { direction:rtl; unicode-bidi:bidi-override; }

*[dir='ltr'] { direction:ltr; unicode-bidi:embed; }
*[dir='lro'] { direction:ltr; unicode-bidi:bidi-override; }

@media oxygen-high-contrast-black, oxygen-dark-theme{

```

```

    xi|include:before,
    xi|include:after{
        color:#808080 !important;
    }
}

/*
 * EXM-40349
 *
 * In DIFF these place holder PIs are not handled so we treat them as normal PIs with a bit of
 * styling.
 */
oxy|processing-instruction[oxy-placeholder] {
    visibility:-oxy-collapse-text;
    -oxy-display-tags:none;
}

oxy|processing-instruction[oxy-placeholder]:before {
    background-color: rgba(192, 192, 192, 0.2) !important;
    color: rgba(0, 0, 0, 0.6) !important;
    font-weight:bold;
    /* When there isn't an associated CSS the NO_CSS rules hide the PIs. @see
    AuthorViewport.CSS_ERROR_END */
    display:-oxy-morph;
    content: attr(content) !important;
}

@media oxygen-high-contrast-black, oxygen-dark-theme{
    oxy|processing-instruction[oxy-placeholder]:before {
        background-color: rgba(0, 0, 0, 0.15) !important;
        color: rgb(156, 156, 156) !important;
    }
    /* =====
    *
    * built-in oxygen elements
    *
    */
    oxy|comment {
        color: #a2a2a2 !important;
        background-color: transparent !important;
    }
}

```

```
oxy|reference,
oxy|entity {
    background-color: rgb(100, 100, 100) !important;
}
}
```

Example:

To show all entities in the **Author** mode as transparent, without a gray background, first define in your CSS after all imports the namespace:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";
```

and then add the following selector:

```
oxy|entity {
    background-color: inherit !important;
}
```

Additional CSS Selectors

Oxygen XML Editor Eclipse plugin provides support for selecting additional types of nodes. These custom selectors apply to: *document*, *doctype*, *processing-instruction*, *comment*, *CDATA sections*, *entities*, and *reference sections*. *Processing-instructions* are not displayed by default. To display them, [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Author**, and select **Show processing instructions**.

**Note:**

The custom selectors are presented in the default CSS for **Author** mode and all of their properties are marked with the *!important* flag. For this reason, you have to set the *!important* flag on each property of the custom selectors from your CSS to be applicable.

For the custom selectors to work in your CSS stylesheets, declare the **Author** mode extensions namespace at the beginning of the stylesheet documents:

```
@namespace oxy url('http://www.oxygenxml.com/extensions/author');
```

- **oxy|document** - The `oxy|document` selector matches the entire document:

```
oxy|document {
    display:block !important;
}
```

- **oxy|doctype** - The following example changes the rendering of `doctype` sections:

```
oxy|doctype {
    display:block !important;
    color:blue !important;
```

```
background-color:transparent !important;
}
```

- **oxy|processing-instruction** - To match the processing instructions, you can use the `oxy|processing-instruction` selector:

```
oxy|processing-instruction {
    display:block !important;
    color:purple !important;
    background-color:transparent !important;
}
```

A processing instruction usually has a target and one or more pseudo attributes:

```
<?target_name data="b"?>
```

You can match a processing instruction with a particular target from the CSS using the following construct:

```
oxy|processing-instruction[target_name]
```

You can also match the processing instructions having a certain target and pseudo attribute value, such as:

```
oxy|processing-instruction[target_name][data="b"]
```

- **oxy|comment** - The XML comments displayed in **Author** mode can be changed using the `oxy|comment` selector:

```
oxy|comment {
    display:block !important;
    color:green !important;
    background-color:transparent !important;
}
```

- **oxy|cdata** - The `oxy|cdata` selector matches CDATA sections:

```
oxy|cdata{
    display:block !important;
    color:gray !important;
    background-color:transparent !important;
}
```

- **oxy|entity** - The `oxy|entity` selector matches the entity content:

```
oxy|entity {
    display:morph !important;
    editable:false !important;
    color:orange !important;
}
```

```
background-color:transparent !important;
}
```

To match particular entities, use the `oxy|entity` selector in expressions such as:

```
oxy|entity[name='amp'],
oxy|entity[name='lt'],
oxy|entity[name='gt'],
oxy|entity[name='quot'],
oxy|entity[name='apos'],
oxy|entity[name^='#']{
  -oxy-display-tags: none;
}
```

- **oxy|reference** - The *references to entities*, *XInclude*, and DITA `@conref` and `@conkeyref` attributes are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are displayed inside the element or entity that references them.

You can use the `reference` property to customize the way these references are rendered in **Author** mode:

```
oxy|reference {
  border:1px solid gray !important;
}
```

In the **Author** mode, content is highlighted when text contains [comments \(on page 416\)](#) and changes (if [Track Changes \(on page 416\)](#) was active when the content was modified).

If this content is referenced, the **Author** mode does not display the highlighted areas in the new context. If you want to mark the existence of the comments and changes, you can use the `oxy|reference[comments]`, `oxy|reference[changeTracking]`, and `oxy|reference[changeTracking][comments]` selectors.

Note:

Two artificial attributes (`comments` and `changeTracking`) are set on the reference node, containing information about the number of comments and tracked changes in the content.

- The following example represents the customization of the reference fragments that contain comments:

```
oxy|reference[comments]:before {
  content: "Comments: " attr(comments) !important;
}
```

- To match reference fragments based on the fact that they contain tracked changes inside, use the `oxy|reference[changeTracking]` selector:

```
oxy|reference[changeTracking]:before {
    content: "Change tracking: " attr(changeTracking) !important;
}
```

- Here is an example of how you can set a custom color for the reference containing both tracked changes and comments:

```
oxy|reference[changeTracking][comments]:before {
    content: "Change tracking: " attr(changeTracking)
           " and comments: " attr(comments) !important;
}
```

Figure 540. Example: A Document Rendered Using these Rules

The screenshot shows the Oxygen XML Editor interface with a document rendered using custom CSS rules. The document content is as follows:

```
<!DOCTYPE SAMPLE [
<!ENTITY ent "Some entity">
<!ENTITY % xinclude SYSTEM "http://www.docbook.org/xml/4.4/xinclude.mod" >
%xinclude;
]>
xml-stylesheet type="text/css" href="sample.css"
Some Text
▷Some entity◀
▷ Comment ◀
▷CDATA section◀
📄 sample1.xml referred
Referred text.
📄 sample1.xml referred-with-comment
Comments: 2
Referred text with comments.
📄 sample1.xml referred-with-track-changes
Change tracking: 2
Referred text with changes.
📄 sample1.xml referred-with-comment-and-track-changes
Change tracking: 1 and comments: 1
Referred text with comments and changes.
```

The rendered output shows the following styling:

- The root element is labeled "root".
- The DOCTYPE declaration is rendered in blue.
- The entity declarations are rendered in blue.
- The XML-stylesheet declaration is rendered in purple.
- The text "Some Text" is rendered in black.
- The entity reference "Some entity" is rendered in orange.
- The comment "Comment" is rendered in green.
- The CDATA section is rendered in blue.
- The reffered document "sample1.xml" is rendered in black with a document icon.
- The reffered text "Referred text." is rendered in black.
- The reffered document "sample1.xml" is rendered in black with a document icon.
- The comments "Comments: 2" are rendered in blue.
- The reffered text "Referred text with comments." is rendered in black.
- The reffered document "sample1.xml" is rendered in black with a document icon.
- The change tracking "Change tracking: 2" is rendered in blue.
- The reffered text "Referred text with changes." is rendered in black.
- The reffered document "sample1.xml" is rendered in black with a document icon.
- The change tracking and comments "Change tracking: 1 and comments: 1" are rendered in blue.
- The reffered text "Referred text with comments and changes." is rendered in black.

Additional CSS Properties

Oxygen XML Editor Eclipse plugin provides various additional CSS properties to extend the standard CSS properties.

Append Content Properties: `-oxy-append-content` / `-oxy-prepend-content`

Used to append specified content.

`-oxy-append-content` Property

This property appends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-append-content` property adds content to that generated by the lesser specificity rules into a new compound content.

Example:

```
element:before{
    content: "Hello";
}
element:before{
    -oxy-append-content: " World!";
}
```

The content shown before the `element` will be `Hello World!`.

`-oxy-prepend-content` Property

Prepends the specified content to the content generated by other matching CSS rules of lesser specificity. Unlike the `content` property, where only the value from the rule with the greatest specificity is taken into account, the `-oxy-prepend-content` prepends content to that generated by the lesser specificity rules into a new compound content.

Example:

```
element:before{
    content: "Hello!";
}
element:before{
    -oxy-prepend-content: "said: ";
}
element:before{
    -oxy-prepend-content: "I ";
}
```

The content shown before the `element` will be `I said: Hello!`.

Collapse Text: `-oxy-collapse-text` Property Value

Used to collapse the content of an element.

Oxygen XML Editor Eclipse plugin allows you to set the value of the `visibility` property to `-oxy-collapse-text`, meaning that the content of that element is not rendered. If an element is marked as `-oxy-collapse-text` you are not able to position the cursor inside it and edit it. The purpose of `-oxy-collapse-text` is to make the text value of an element editable only through a form control.

Example: `visibility` Property

The text value of an XML element will be edited using a text field form control. In this case, the text content is not directly present in the **Author** visual editing mode:

```
title{
  content: oxy_textfield(edit, '#text', columns, 40);
  visibility:-oxy-collapse-text;
}
```

Cyrillic Counters: `-oxy-lower-cyrillic` Property Values

Used to style lists with Cyrillic counters.

Oxygen XML Editor Eclipse plugin allows you to set the value of the `list-style-type` property to Cyrillic counters. For example, `-oxy-lower-cyrillic-ru`, `-oxy-lower-cyrillic-uk`, `-oxy-upper-cyrillic-ru` or `-oxy-upper-cyrillic-uk`, meaning that you can have Russian and Ukrainian counters.

Example: Cyrillic Counters

Counting list items with Cyrillic symbols:

```
li{
  display:list-item;
  list-style-type:-oxy-lower-cyrillic-ru;
}
```

Display Tag Markers: `-oxy-display-tags` Property

Used to specify whether or not tag markers are displayed.

Oxygen XML Editor Eclipse plugin allows you to choose whether tag markers of an element should never be presented or the current display mode should be respected. This is especially useful when working with `:before` and `:after` pseudo-elements, in which case the element range is already visually defined so the tag markers are redundant.

The property is named `-oxy-display-tags`, with the following possible values:

- **none** - Tags markers will not be presented regardless of the current [display mode \(on page 372\)](#).
- **default** - The tag markers will be created depending on the current [display mode \(on page 372\)](#).
- **inherit** - The value of the property is inherited from an ancestor element.

```
-oxy-display-tags
  Value: none | default | inherit
  Initial: default
  Applies to: all nodes(comments, elements, CDATA, etc.)
  Inherited: false
  Media: all
```

Example: -oxy-display-tags Property

In this example, the **para** element from DocBook uses a `:before` and `:after` element and its tag markers will not be visible.

```
para:before{
  content: "{";
}

para:after{
  content: "}";
}

para{
  -oxy-display-tags: none;
  display:block;
  margin: 0.5em 0;
}
```

Editable: -oxy-editable Property

Used to inhibit editing the content of a particular element.

If you want to inhibit the editing of the content of a certain element, you can set the `-oxy-editable` CSS property to `false` (the deprecated `editable` property is also supported).

Floating Toolbar: -oxy-floating-toolbar Property

Used to display a configured floating toolbar in **Author** mode.

The `-oxy-floating-toolbar` property is used to configure and display a floating toolbar in **Author** mode. It accepts a space-separated list of the following functions:

- `oxy_button`
- `oxy_buttonGroup`
- `oxy_textfield`
- `oxy_combobox`
- `oxy_label`

**Note:**

The " | " text value can be used to add a separator between elements of the toolbar.

It must be used in conjunction with the `-oxy-selected` and `-oxy-selection-inside` pseudo-classes. The `-oxy-selected` pseudo-class is automatically set on an element that is fully selected and the `-oxy-selection-inside` pseudo-class is automatically set on an element that has a selection inside.

Example 1:

```
p:-oxy-selection-inside {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'bold')
    oxy_button(actionID, 'italic')
    oxy_button(actionID, 'underline')
}
```

This results in a floating toolbar that contains bold, italic, and underline actions presented in **Author** mode every time text inside a paragraph element is selected.

Example 2:

```
p:-oxy-selected {
  -oxy-floating-toolbar:
    oxy_label(text, "Platform: ")
    oxy_combobox(
      edit, '@platform',
      editable, false,
      values, 'windows, mac, linux',
      labels, 'Windows, MacOS, Linux'
    )
}
```

This results in a floating toolbar that contains a *Platform:* label and a drop-down menu used to change the value of the `@platform` profiling attribute. This is presented in **Author** mode every time a paragraph element is fully selected.

Example 3:

```
[conref]:-oxy-selected, [conkeyref]:-oxy-selected {
  -oxy-floating-toolbar:
    oxy_button(actionID, 'add_edit_content_reference')
    oxy_button(actionID, 'remove_content_reference')
    " | "
    oxy_button(actionID, 'conref.replace')
}
```

This results in a floating toolbar that contains **Edit Content Reference**, **Remove Content Reference**, and **Replace Reference with Content** actions presented in **Author** mode every time an element with a `@conref` or `@conkeyref` attribute is fully selected.

Folding Elements: `-oxy-foldable` / `-oxy-folded` / `-oxy-not-foldable-child`

Used to configure whether or not the content of an element can be expanded or collapsed.

Oxygen XML Editor Eclipse plugin allows you to declare some elements to be *foldable* (on page 2679). This is especially useful when working with large documents organized in logical blocks, editing a large DocBook article or book, for instance. Oxygen XML Editor Eclipse plugin marks the *foldable* content with a small blue triangle. When you hover with your mouse pointer over this marker, a dotted line borders the collapsible content. The following actions are available in the **Folding** submenu of the contextual menu:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

`-oxy-foldable` Property

This property defines whether or not the content for an element can be *folded* by the user. To define that an element's content can be *folded*, use the `-oxy-foldable:true` property.

`-oxy-folded` Property

This property is used in conjunction with the `-oxy-foldable` property and it defines the elements that are *folded* by default. To define an element to be *folded* by default, use the `-oxy-folded:true` property.

Note:

Since the `-oxy-folded` property works in conjunction with the `-oxy-foldable` property, the `-oxy-folded` property is ignored if the `-oxy-foldable` property is not set on the same element.

`-oxy-not-foldable-child` Property

When collapsing an element, it is useful to keep some of its content visible (for example, a short description of the collapsed region). The `-oxy-not-foldable-child` property is used to identify the child element that is

kept visible. As its value, it accepts an element name or a list of comma-separated element names. The first occurrence of each child element specified in the list of element names will be identified as the *not-foldable* child and displayed. If the element is marked as *foldable* (`-oxy-foldable:true;`) but it does not have the `-oxy-not-foldable-child` property or none of the specified *non-foldable* children exist, then the element is still *foldable*. In this case, the element kept visible when *folded* will be the `before` pseudo-element.

Example: Folding DocBook Elements

All the elements below can have a `<title>` child element and are considered to be logical sections. You mark them as being *foldable* leaving the `<title>` element visible.

```
set,
book,
part,
reference,
chapter,
preface,
article,
sect1,
sect2,
sect3,
sect4,
section,
appendix,
figure,
example,
table {
  -oxy-foldable:true;
  -oxy-not-foldable-child: title;
}
```

Note:

The `foldable`, `folded`, and `not-foldable-child` properties are deprecated and the equivalent with the `-oxy` prefix should be used instead.

Links: -oxy-link Property

Used to specify that a particular element should be considered a link.

Oxygen XML Editor Eclipse plugin allows you to declare some elements to be *links*. This is especially useful when working with many documents that reference each other. The links allow for an easy way to get from one document to another. Clicking the link marker will open the referenced resource in an editor.

To define the element that should be considered a link, you must use the `-oxy-link` property on the `:before` or `:after` pseudo-element. The value of the property indicates the location of the linked resource. Since links are usually indicated by the value of an attribute in most cases it will have a value similar to `attr(href)`

Example: DocBook Link Elements

The following elements are defined to be links on the `:before` pseudo-element and their values are defined by the value of an attribute.

```
*[href]:before{
  -oxy-link:attr(href);
  content: "Click " attr(href) " for opening" ;
}

ulink[url]:before{
  -oxy-link:attr(url);
  content: "Click to open: " attr(url);
}

olink[targetdoc]:before{
  -oxy-link: attr(targetdoc);
  content: "Click to open: " attr(targetdoc);
}
```

Link Navigation: -oxy-link-activation-trigger Property

Used to specify how hyperlinks are handled in **Author** mode.

The `-oxy-link-activation-trigger` property is used to specify when hyperlinks are clickable in **Author** mode. This is helpful for those who are used to the hyperlink activation procedure in other applications (for example, apps that use **Ctrl+Click** (**Command+Click** on macOS) to activate hyperlinks.

The possible values are:

- **click** - Hyperlinks are opened when a user mouse-clicks the link icon or text.
- **modifier-click** - Hyperlinks are opened when a user holds down **Ctrl** (**Command** on macOS) and mouse-clicks the link icon or text.
- **auto** - The hyperlink strategy is determined automatically, depending on the context.
- **inherit** - The value is inherited from the parent element.

Morph Elements: -oxy-morph Property Value

Used to specify that an element should be displayed inline.

Oxygen XML Editor Eclipse plugin allows you to specify that an element has an `-oxy-morph` display type (deprecated `morph` property is also supported), meaning that the element is *inline* (on page 2679) if all its children are *inline*.

Example: -oxy-morph Property Value

Suppose you have a *wrapper* XML element that allows users to set a number of attributes on all sub-elements. This element should have an *inline* (on page 2679) or *block* (on page 2676) behavior, depending on the behavior of its child elements:

```
wrapper{
  display: -oxy-morph;
}
```

Placeholders for Empty Elements: -oxy-placeholder-content Property

Used to configure placeholders for empty elements.

Oxygen XML Editor Eclipse plugin displays the element name as pseudo-content for empty elements if the **Show placeholders for empty elements** option (on page 137) is selected in the **Author** preferences page and there is no *before* or *after* content set in the CSS for this type of element. There are two CSS properties that can be used to control the placeholders (`-oxy-placeholder-content` and `-oxy-show-placeholder`).

-oxy-placeholder-content CSS Property

To control the displayed pseudo-content for empty elements, you can use the `-oxy-placeholder-content` CSS property.

The following example would change the `<keyword>` element to be displayed as `key`:

```
keyword{
  -oxy-placeholder-content: "key";
}
```

Note:

This CSS property accepts the `$(i18n(key))` (on page 225) localization editor variable, as in the following example:

```
-oxy-placeholder-content: "${i18n(id)}";
```

-oxy-show-placeholder CSS Property

The `-oxy-show-placeholder` property allows you to decide whether or not the placeholder will be shown. The possible values are:

- **always** - Always display placeholders.
- **default** - Always display placeholders if *before* or *after* content is not set in the CSS.
- **inherit** - The placeholders are displayed according to the **Show placeholders for empty elements** option (on page 137) (if *before* and *after* content is not declared).
- **no** - Never display placeholders.

**Note:**

Deprecated properties `show-placeholder` and `placeholder-content` are also supported.

Related information

[Using Placeholders in Document Templates \(on page 255\)](#)

Style Elements: `-oxy-style` Property

Used to configure the style of particular elements.

Oxygen XML Editor Eclipse plugin allows you to specify the style for an XML element. This is helpful if you want to embed CSS styling to XML elements directly in the XML file you are editing without having to edit the CSS files that are normally attached to the XML files. The property should have an XPath function for the value.

Example: `-oxy-style` Property

The following code snippet should be added in the CSS file that renders the files for your framework customization:

```
*{
  -oxy-style:attr(style);
}
```

Suppose you want to display the `<title>` elements in your XML document in the color red. You could add the following snippet directly in the XML document:

```
<title style="color:red;">My Memoirs</title>
```

**Tip:**

The `@style` attribute is supported by default in HTML5 documents.

Tags Color: `-oxy-tags-color` Property

Used to configure the background or foreground colors of tags.

By default, Oxygen XML Editor Eclipse plugin does not display element tags. You can use the **Partial Tags** button from the **Author** toolbar to control the amount of [displayed markup \(on page 372\)](#).

To configure the default background and foreground colors of the tags, [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Edit modes > Author**, and set the desired colors in the **Tags background color (on page 139)** and **Tags foreground color (on page 139)** options.

If you want to be more specific and configure the colors using a CSS, the `-oxy-tags-background-color` and `-oxy-tags-color` properties allow you to control the background and foreground colors for any particular XML element.

Example:

```

para {
    -oxy-tags-color:white;
    -oxy-tags-background-color:green;
}
title {
    -oxy-tags-color:yellow;
    -oxy-tags-background-color:black;
}

```

Custom CSS Functions

Oxygen XML Editor Eclipse plugin provides a wide range of custom CSS extension functions that can be used to customize the visual **Author** editing mode.

Arithmetic Functions

Arithmetic Functions that are supported.

You can use any of the arithmetic functions implemented in the *java.lang.Math* class (<http://download.oracle.com/javase/6/docs/api/java/lang/Math.html>).

In addition, the following functions are available:

Syntax	Details
oxy_add (<i>param1</i> , ... , <i>paramN</i> , ' <i>returnType</i> ')	Adds the values of all parameters from <i>param1</i> to <i>paramN</i> .
oxy_subtract (<i>param1</i> , <i>param2</i> , ... , <i>paramN</i> , ' <i>returnType</i> ')	Subtracts the values of parameters <i>param2</i> to <i>paramN</i> from <i>param1</i> .
oxy_multiply (<i>param1</i> , ... , <i>paramN</i> , ' <i>returnType</i> ')	Multiplies the values of parameters from <i>param1</i> to <i>paramN</i> .
oxy_divide (<i>param1</i> , <i>param2</i> , ' <i>returnType</i> ')	Performs the division of <i>param1</i> to <i>param2</i> .
oxy_modulo (<i>param1</i> , <i>param2</i> , ' <i>returnType</i> ')	Returns the remainder of the division of <i>param1</i> to <i>param2</i> .

**Note:**

The *returnType* can be '*integer*', '*number*', or any of the supported CSS measuring types.

Example: oxy_multiply Function

If you have an image with **width** and **height** specified on it, this will compute the number of pixels on it:

```
image:before{
  content: "Number of pixels: " oxy_multiply(attr(width), attr(height), "px");
}
```

Actions: oxy_action() Function

This function allows you to define actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action()` function is frequently used from the `oxy_button()` function ([on page 2189](#)) that provides a graphical button for invoking a custom action. The action is normally defined in the associated Document Type (*framework* configuration) but the `oxy_action()` function allows you to define it directly in the CSS instead of the *framework* configuration.

The arguments received by the `oxy_action()` function are a list of properties that define an action. The following properties are supported:

- **name** - The name of the action. It will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action.
- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an *editor variable* ([on page 218](#)).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of [predefined operations](#) ([on page 1962](#)) that can be used.

Note:
