

Oxygen XML Editor Eclipse Plugin 26.1

User Guide

Contents

Chapter 1. Introduction.....	22
Chapter 2. Getting Started.....	23
What is Oxygen XML Editor Eclipse plugin.....	23
Getting Familiar with the Interface.....	23
Supported Document Types.....	24
Resources to Help You Get Started Using Oxygen XML Editor Eclipse plugin	25
Your First Document or Project.....	27
Your First XML Document.....	27
Getting Started with DITA.....	32
Creating a New Project.....	39
Getting Help.....	40
Help Menu.....	40
Chapter 3. Installation.....	44
Installing Oxygen as an Eclipse Plugin.....	45
Site-Wide Deployment.....	46
Licensing.....	47
License Types.....	48
Installing License Servers.....	55
Managing License Servers.....	60
Common Problems: License Server Errors.....	65
Upgrading.....	66
Upgrading Oxygen XML Editor Eclipse plugin on Windows/Linux.....	67
Upgrading Oxygen XML Editor Eclipse plugin on macOS.....	68
Uninstalling.....	68
Chapter 4. Configuration.....	70
Preferences.....	70
Oxygen XML Editor Eclipse plugin License.....	71
Archive Preferences.....	71
CSS Validator Preferences.....	73
Custom Editor Variables Preferences.....	73
Data Sources Preferences.....	74

DIFF Preferences.....	80
DITA Preferences.....	81
Document Templates Preferences.....	87
Document Type Association Preferences.....	88
Editor Preferences.....	117
Fonts Preferences.....	177
Markdown Preferences.....	177
Network Connection Settings Preferences.....	178
Scenarios Management Preferences.....	179
View Preferences.....	180
XML Preferences.....	181
XML Structure Outline Preferences.....	214
Configuring Options.....	214
Customizing Default Options.....	215
Importing/Exporting/Resetting Global Options.....	216
Configuring a Dark Color Theme.....	217
Import/Export Transformation or Validation Scenarios.....	217
Editor Variables.....	218
Custom Editor Variables.....	227
Custom System Properties.....	227
Localizing of the User Interface.....	232
Chapter 5. Perspectives.....	234
Oxygen XML Perspective.....	234
Oxygen XSLT Debugger Perspective.....	236
Oxygen XQuery Debugger Perspective	237
Oxygen DB Perspective	238
Chapter 6. Editing Modes.....	241
Text Editing Mode.....	241
Grid Editing Mode.....	242
Author Editing Mode.....	242
Design Editing Mode (Schema Diagram Editor).....	243
Chapter 7. Working With Documents.....	246
Creating, Opening, Saving, and Closing Documents.....	246

Creating New Documents and Templates.....	246
Opening Documents.....	259
Saving Documents.....	260
Closing Documents.....	260
Working with Remote Documents.....	260
Open URL.....	261
Changing File Permissions on a Remote FTP Server.....	262
WebDAV over HTTPS.....	263
HTTP Authentication Schemes.....	265
Contextual Menu of the Current Editor Tab.....	266
Viewing File Properties.....	266
Simple Text Editor.....	267
Using Projects to Group Documents.....	268
Creating a New Project.....	268
Project Explorer View.....	269
Contextual Project Operations Using 'Main Files' Support.....	278
Search and Find/Replace Features.....	281
Find All Elements Dialog Box.....	282
Regular Expressions Syntax.....	283
Spell Checking.....	284
Spell Check Dictionaries and Term Lists.....	286
Learned Words.....	292
Ignored Words (Elements).....	293
Automatic Spell Check.....	293
Spell Check Multiple Files.....	294
AutoCorrect Misspelled Words.....	295
Add Dictionaries for the AutoCorrect Feature.....	297
Working with Special Characters and Encoding.....	297
Unicode Support.....	299
Opening and Saving Documents with Unsupported Characters.....	299
Unicode Fallback Font Support.....	299
Inserting Special Characters with the Character Map.....	301
Handling Read-Only Files.....	304

Viewing Status Information.....	304
Editor Highlights.....	304
Chapter 8. Editing Supported Document Types.....	306
Editing XML Documents.....	306
Editing XML Documents in Text Mode.....	307
Editing XML Documents in Grid Mode.....	357
Editing XML Documents in Author Mode.....	367
Validating XML Documents.....	544
XML Quick Fixes.....	581
Associating a Schema to XML Documents.....	584
Working with XML Catalogs.....	594
Modular Contextual XML Editing Using 'Main Files' Support.....	597
Search and Refactoring Actions for IDs and IDREFS.....	598
XML Referenced/Dependent Resources View.....	600
Combining XML Content Using DTD Entities and XInclude.....	603
Refactoring XML Documents.....	608
XML Digital Signatures.....	645
Editing XSLT Stylesheets.....	653
Modular Contextual XSLT Editing Using 'Main Files' Support	654
Validating XSLT Stylesheets.....	654
XSLT Quick Fix Support	657
Content Completion in XSLT Stylesheets.....	659
Syntax Highlighting in XSLT.....	666
XSLT Outline View.....	667
XSLT Input View.....	671
XSLT Referenced/Dependent Resources View.....	673
XSLT Component Dependencies View.....	676
Highlight Component Occurrences.....	678
Finding XSLT References and Declarations.....	678
XSLT Stylesheet Component Documentation Support.....	679
XSLT 3.0 Text Value Templates.....	681
XSLT 3.0 Packages (xsl:package Element).....	681
XSLT Refactoring Actions.....	682

XSLT Quick Assist Support.....	687
XSLT Unit Test (XSpec).....	689
Generating Documentation for an XSLT Stylesheet.....	691
Compiling an XSL Stylesheet for Saxon.....	698
Editing XML Schemas (XSD).....	700
XML Schema Design Mode (XML Schema Diagram Editor).....	701
Editing XML Schema in Text Editing Mode.....	742
Modular Contextual XML Schema Editing Using 'Main Files' Support.....	742
Validating XML Schema Documents.....	743
Quick Fixes for DTD, XSD, and Relax NG Errors.....	743
Content Completion in XML Schema.....	744
Syntax Highlighting in XML Schema.....	745
XML Schema Outline View.....	746
XML Schema Attributes View.....	748
XML Schema Referenced/Dependent Resources View.....	750
XML Schema Component Dependencies View.....	753
Highlight Component Occurrences.....	755
Searching and Refactoring Actions in XML Schemas.....	755
XML Schema Quick Assist Support.....	757
Generating Sample XML Files.....	758
Generating Documentation for an XML Schema.....	764
Converting Schema to Another Schema Language.....	774
Converting Database to XML Schema.....	777
Flatten an XML Schema.....	778
XML Schema Regular Expressions Builder Tool.....	780
XML Schema 1.1.....	781
Setting the XML Schema Version.....	783
Editing XQuery Documents.....	784
XQuery Validation.....	785
Content Completion in XQuery.....	786
Syntax Highlighting in XQuery.....	787
Formatting and Indenting XQuery Documents.....	787
Folding in XQuery Documents.....	787

XQuery Outline View.....	788
XQuery Builder View.....	790
XQuery Input View.....	793
Generating HTML Documentation for an XQuery Document.....	795
Transforming XML Documents Using XQuery.....	797
XQuery Unit Test (XSpec).....	801
Editing WSDL Documents (Deprecated).....	802
Modular Contextual WSDL Editing Using 'Main Files' Support.....	803
Validating WSDL Documents.....	804
Content Completion Assistance in WSDL Documents.....	804
WSDL Syntax Highlighting.....	805
WSDL Outline View.....	806
WSDL Referenced/Dependent Resources View in WSDL Documents.....	810
WSDL Component Dependencies View.....	813
Highlight Component Occurrences in WSDL Documents.....	814
Searching and Refactoring Operations in WSDL Documents.....	815
Quick Assist Support in WSDL Documents.....	817
Generating Documentation for WSDL Documents (Deprecated).....	818
WSDL SOAP Analyzer Tool (Deprecated).....	823
Editing CSS Stylesheets.....	825
Validating CSS Stylesheets.....	826
Content Completion in CSS Stylesheets.....	827
Syntax Highlighting in CSS Files.....	827
CSS Outline View.....	828
Folding in CSS Stylesheets.....	829
Formatting and Indenting CSS Stylesheets (Pretty Print).....	829
Minifying CSS Stylesheets.....	829
Editing Relax NG Schemas.....	830
Modular Contextual Relax NG Schema Editing Using 'Main Files' Support.....	830
Relax NG Schema Diagram Editor.....	831
Validating Relax NG Schema Documents.....	835
Content Completion in Relax NG Schemas.....	836
Syntax Highlighting in Relax NG Schemas.....	837

Quick Fixes for DTD, XSD, and Relax NG Errors.....	837
Relax NG Outline View.....	838
RNG Referenced/Dependent Resources View.....	841
Relax NG Schema Component Dependencies View.....	844
Searching and Refactoring Actions in RNG Schemas.....	846
RNG Quick Assist Support.....	847
Configuring a Custom Datatype Library for a RELAX NG Schema.....	849
Editing NVDL Schemas.....	849
NVDL Schema Diagram.....	849
Validating NVDL Schema Documents.....	852
Content Completion in NVDL Schemas.....	852
Syntax Highlighting in NVDL Schemas.....	853
NVDL Outline View.....	854
NVDL Schema Component Dependencies View.....	854
Searching and Refactoring Actions in NVDL Schemas.....	855
Editing JSON Documents.....	857
JSON Editor.....	857
Navigating References in JSON Documents.....	861
Validating JSON Documents.....	863
Content Completion Assistant in JSON.....	870
Associating a Schema to JSON Documents.....	872
Syntax Highlighting in JSON Documents.....	877
Folding in JSON.....	878
JSON Outline View.....	878
JSON to XML Converter.....	881
XML to JSON Converter.....	883
JSON to YAML Converter.....	887
YAML to JSON Converter.....	887
Contextual Menu Actions in JSON Documents.....	888
Transforming and Querying JSON Documents.....	889
Editing JSON Schema Documents.....	892
JSON Schema Editor.....	892
JSON Schema Design Mode (JSON Schema Diagram Editor).....	894

Generating JSON Schema from a JSON File.....	915
Generating Sample JSON Files from a JSON Schema.....	917
JSON Schema Converter.....	918
Validating JSON Schema Documents.....	919
Syntax Highlighting in JSON Schema Documents.....	921
Flatten JSON Schema.....	921
Editing JSON Lines Documents.....	921
Editing JSON5 Documents.....	922
Editing YAML Documents.....	923
YAML Editor.....	923
Validating YAML Documents.....	923
Content Completion Assistant in YAML.....	928
Syntax Highlighting in YAML Documents.....	928
Folding in YAML Documents.....	929
Formatting/Indenting YAML Documents.....	929
YAML Outline View.....	929
YAML to JSON Converter.....	931
JSON to YAML Converter.....	932
Contextual Menu Actions in YAML Documents.....	933
Editing XLIFF Documents.....	933
Editing JavaScript Documents.....	934
JavaScript Editing Actions.....	934
Validating JavaScript Files.....	936
Content Completion in JavaScript Documents.....	937
Syntax Highlighting in JavaScript Documents.....	938
JavaScript Outline View.....	938
Editing XProc Scripts.....	939
Editing Schematron Schemas.....	941
Examples of Schematron Rules and Quick Fixes.....	943
Modular Contextual Schematron Editing Using 'Main Files' Support.....	955
Presenting Schematron Validation Issues.....	956
Integrating Schematron Rules in a Framework and Sharing Them.....	957
Validating Schematron Documents.....	958

Content Completion in Schematron Documents.....	958
Syntax Highlighting in Schematron.....	959
Embedding Schematron Rules in XML Schema or RELAX NG.....	960
Schematron Outline View.....	961
Schematron Referenced/Dependent Resources View.....	963
Highlight Component Occurrences in Schematron Documents.....	965
Searching and Refactoring Operations in Schematron Documents.....	966
Quick Assist Support in Schematron Documents.....	968
Schematron Unit Test (XSpec).....	969
Editing Schematron Quick Fixes.....	970
Examples of Schematron Rules and Quick Fixes.....	971
Defining Schematron Quick Fixes.....	983
Integrating SQF in a Framework and Sharing Them.....	993
Validating Schematron Quick Fixes.....	994
Content Completion in SQF.....	995
Highlight Quick Fix Occurrences in SQF.....	995
Searching and Refactoring Operations in SQF.....	996
Embedding Schematron Quick Fixes in Relax NG or XML Schema.....	997
Editing HTML Documents.....	998
HTML Editor.....	999
HTML Validation.....	1001
HTML Content Completion Assistant.....	1002
Syntax Highlighting in HTML Documents.....	1003
Folding in HTML.....	1003
Minifying HTML Documents.....	1003
HTML Outline View.....	1004
Querying HTML Documents with XPath.....	1005
Associating a CSS with an HTML Document.....	1005
Editing Markdown Documents.....	1005
Markdown Editor.....	1006
Creating New Markdown Documents.....	1008
Actions Available in the Markdown Editor.....	1008
Syntax Highlighting in the Markdown Editor.....	1011

Automatic Validation in Markdown Documents.....	1012
Working with Markdown Documents in DITA.....	1013
Markdown Editor Syntax Rules and Specifications.....	1016
Other Supported Document Types.....	1028
Chapter 9. Built-in Frameworks (Document Types).....	1030
DocBook 4 Document Type (Framework).....	1030
DocBook 4 Author Mode Actions.....	1032
Inserting an Olink in DocBook Documents.....	1048
DocBook 5 Document Type (Framework).....	1051
DocBook 5 Author Mode Actions.....	1053
Inserting an Olink in DocBook Documents.....	1069
DocBook Assembly (5.1 and Later).....	1073
DocBook Topic (5.1 and Later).....	1074
DocBook Targetset Document Type (Framework).....	1075
DITA Topics Document Type (Framework).....	1075
DITA Topic Author Mode Actions.....	1077
DITA Map Document Type (Framework).....	1099
DITA Map Author Mode Actions.....	1101
XHTML Document Type (Framework).....	1112
XHTML Validation.....	1113
XHTML Author Mode Actions.....	1113
TEI P5 Document Type (Framework).....	1125
TEI P5 Author Mode Actions.....	1127
How to Install a TEI Framework with the Latest Schema and Stylesheets.....	1137
TEI ODD Document Type (Framework).....	1138
TEI ODD Author Mode Actions.....	1139
jTEI Document Type (Framework).....	1150
JATS Document Type (Framework).....	1151
JATS Author Mode Actions.....	1152
EPUB Document Type (Framework).....	1163
OpenAPI (Swagger) Document Type (Framework).....	1164
OpenAPI Test Scenario Document Type (Framework).....	1166
AsyncAPI Document Type (Framework).....	1166

JSON-LD Document Type (Framework).....	1167
Chapter 10. Additional XML Editing Frameworks (Document Types).....	1169
S1000D Document Type (Framework).....	1169
Chapter 11. Publishing.....	1171
Transformation Scenarios.....	1171
Built-in Transformation Scenarios.....	1173
Creating New Transformation Scenarios.....	1206
Editing a Transformation Scenario.....	1297
Duplicating a Transformation Scenario.....	1299
Applying Associated Transformation Scenarios.....	1299
Configure Transformation Scenario(s) Dialog Box.....	1300
Batch Transformations.....	1305
Sharing Transformation Scenarios.....	1306
Transformation Scenarios View.....	1306
WebHelp Output Customization.....	1310
WebHelp Responsive Output for DITA.....	1311
WebHelp Classic Output for DocBook (Deprecated).....	1503
DITA to PDF Output Customization.....	1537
CSS-based PDF Customization.....	1537
XSL-FO to PDF Customization.....	1803
DocBook to PDF Output Customization.....	1815
Chapter 12. Working with XPath Expressions.....	1817
XPath Builder View.....	1817
XPath Expression Results View.....	1821
XPath and XML Catalogs.....	1823
XPath Prefix Mapping.....	1823
Chapter 13. Working with Archives.....	1825
Browsing Archives.....	1825
Working with Archive Files.....	1827
Creating an Archive.....	1829
Editing and Saving Files Inside an Archive.....	1829
Migrating Archives to DITA or TEI.....	1829
Chapter 14. Databases and SharePoint.....	1831

Working with Databases.....	1831
Data Source Explorer View.....	1831
Table Explorer View.....	1833
Database Connection Support.....	1835
WebDAV Connections.....	1879
SQL Execution Support.....	1882
XQuery and Databases.....	1885
Integration with Microsoft SharePoint.....	1892
How to Configure a SharePoint Connection.....	1893
SharePoint Contextual Menu Actions.....	1897
Chapter 15. Importing Data.....	1901
Import from Text Files.....	1901
Import from MS Excel Files.....	1903
Import Database Data as an XML Document.....	1906
Import from HTML Files.....	1909
Import Content Dynamically.....	1910
Chapter 16. XSLT/XQuery Debugging.....	1913
Debugger Layout.....	1914
Control Toolbar.....	1915
Debugging Information Views.....	1918
Multiple Output Documents in XSLT 2.0 and XSLT 3.0.....	1931
Steps in a Typical Debugging Process.....	1931
Identify the XSLT / XQuery Expression that Generated Particular Output.....	1932
Using Breakpoints.....	1934
Performance Profiling of XSLT Stylesheets and XQuery Documents.....	1935
Invocation Tree View.....	1937
Hotspots View.....	1938
Debugging XSLT that Call Java Extensions.....	1939
Debugging Java Extensions.....	1940
Supported Processors for XSLT / XQuery Debugging.....	1940
Chapter 17. Framework and Author Mode Customization.....	1941
Creating and Configuring Custom Frameworks.....	1941
Creating a Framework through the Configuration Dialog.....	1941

Creating a Framework Using an Extension Script.....	1942
Author Mode Customization.....	1955
Content Completion Assistant.....	2001
Transformation Scenarios.....	2027
Validation Scenarios.....	2029
Document Templates.....	2038
XML Catalogs.....	2039
Localization.....	2040
Java Extensibility Guide.....	2042
Sharing a Framework.....	2099
Basic Framework Customization Tutorial.....	2100
Overview.....	2100
Creating and Configuring a Custom Framework.....	2107
CSS Support in Author Mode.....	2117
Associating a CSS with an XML Document.....	2117
Handling CSS Imports.....	2118
Displaying Processing Instructions from Other XML Editors.....	2119
Specifying Media Types in the CSS	2119
CSS At-Rules.....	2120
Standard W3C CSS Supported Features.....	2122
CSS Extensions.....	2143
Debugging CSS Stylesheets.....	2220
Chapter 18. Extension Points for the Oxygen Eclipse Plugin.....	2221
How to Use a Custom View with the Oxygen XML Editor Eclipse plugin Distribution.....	2222
Chapter 19. Tools.....	2224
XML Refactoring.....	2224
Built-in Refactoring Operations.....	2227
Custom Refactoring Operations.....	2239
Storing and Sharing Refactoring Operations.....	2254
Localizing XML Refactoring Operations.....	2255
Generate Sample XML Files.....	2256
Generate/Convert Schema.....	2262
Convert DB Structure to XML Schema.....	2264

Compile XSL Stylesheet for Saxon.....	2265
JSON Tools.....	2268
Generate Sample JSON Files.....	2268
Generate JSON Schema.....	2269
JSON to YAML.....	2271
YAML to JSON.....	2271
JSON to XML.....	2272
XML to JSON.....	2275
JSON Schema Converter.....	2278
Generate Documentation.....	2279
XML Schema Documentation Generator.....	2279
XSLT Stylesheet Documentation Generator.....	2283
XQuery Documentation Generator.....	2287
WSDL Documentation Generator (Deprecated).....	2288
Canonicalize.....	2292
Sign.....	2293
Verify Signature.....	2296
WSDL SOAP Analyzer (Deprecated).....	2296
Testing Remote WSDL Files.....	2298
XML Schema Regular Expressions Builder.....	2298
Comparison Tools.....	2300
File Comparison Tool.....	2300
Chapter 20. Troubleshooting.....	2306
Performance Problems and Solutions.....	2306
Out of Memory on External Processes.....	2306
Performance Issues with Large Documents.....	2306
Misc Problems and Solutions.....	2307
Address Family Not Supported by Protocol Family.....	2307
Application Takes Several Minutes to Start.....	2308
Blank Window is Shown When Starting the App Over an RDP Connection on Linux.....	2308
Cannot Open Files from Desktop/Downloads/OneDrive on macOS.....	2309
Compatibility Issue Between Java and Certain Graphics Card Drivers.....	2309
Damaged File Associations on macOS.....	2309

Details to Submit in a Request for Technical Support Using the Online Form.....	2310
Dialog Boxes Cannot Be Resized on Mac.....	2312
DITA Map Transformation Fails (Cannot Connect to External Location).....	2312
DITA Map WebHelp Transformation Fails (Duplicate Topic References Found).....	2312
DITA-OT Transformation Takes a Long Time to Process.....	2313
DITA PDF Transformation Fails.....	2314
DITA PDF Processing Common Errors.....	2314
DITA PDF CSS-based Processing Common Errors.....	2316
DITA to CHM Transformation Fails - Cannot Open File.....	2316
DITA to CHM Transformation Fails - Compilation Failed.....	2317
Eclipse Error Messages.....	2318
Error After Switching Oxygen Products in Eclipse.....	2318
Format and Indent Fails.....	2319
Hunspell Spell Checker is Unusable on Your Platform Error.....	2319
High Resolution Scaling Issues.....	2319
Images Appear Stretched Out in the PDF Output.....	2320
Increasing the Memory for the Ant Process.....	2321
JPEG CMYK Color Space Issues.....	2321
Mac Touch Bar Function Keys Do Not Work.....	2321
Server Signature Mismatch Error.....	2322
MSXML 4.0 Transformation Issues.....	2323
Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive.....	2323
References Outside the Main DITA Map Folder.....	2323
Syntax Highlights Not Available in Eclipse Plugin.....	2324
TocJS Transformation Does not Generate All Files for a Tree-Like TOC.....	2325
Text Rendering Issues on macOS.....	2325
XSLT Debugger Is Very Slow.....	2326
Chapter 21. DITA Authoring.....	2327
Getting Started with DITA.....	2328
Working with Projects in DITA.....	2335
Working with DITA Maps.....	2335
DITA Maps Manager.....	2337
Creating a Map.....	2353

Managing DITA Maps.....	2356
Chunking DITA Topics.....	2382
DITA Map Validation and Completeness Check.....	2382
DITA Map Author Mode Actions.....	2388
Opening a DITA Map With Topic Content Resolved.....	2399
Working with DITA Topics.....	2400
Creating a New DITA Topic.....	2402
Fast Create Multiple DITA Topics.....	2405
Editing DITA Topics.....	2408
Converting DITA Topics to Another Type.....	2411
Changing the Look of DITA Documents in Author Mode Using the Styles Menu.....	2414
Working with Images in DITA Topics.....	2416
Adding Video, Audio, and Embedded HTML Resources in DITA Topics.....	2419
Working with Image Maps in DITA.....	2422
Adding Tables in DITA Topics.....	2429
Adding MathML Equations in DITA Topics.....	2443
Adding LaTeX Equations in DITA Topics.....	2443
DITA Questions and Answers Topic Type.....	2444
DITA Topic Author Mode Actions.....	2444
Working with Markdown Documents in DITA.....	2467
Working with DITA-Compatible Documents.....	2470
Working with Keys in DITA.....	2471
Working with a Glossary of Terms in DITA.....	2473
Reusing DITA Content.....	2475
Reusing DITA Topics in Multiple Maps.....	2478
Working with Content References.....	2480
Working with Code References.....	2496
Working with the Conref Push Mechanism.....	2497
Working with Reusable Components.....	2499
Working with Variable Text in DITA.....	2501
Working with DITA 1.3 Key Scopes.....	2503
Working with DITA 1.3 Branch Filtering.....	2505
DITA Reusable Components View.....	2506

Linking in DITA.....	2513
Hierarchical Linking in DITA Maps.....	2514
Linking in DITA Topics.....	2515
Linking with Relationship Tables in DITA.....	2521
Content Completion in DITA.....	2523
Publishing DITA Output.....	2524
Built-in DITA Map Transformation Scenarios.....	2525
Built-in DITA Topic Transformation Scenarios.....	2549
Running a DITA Transformation Scenario.....	2550
Creating or Editing a DITA-OT Transformation.....	2550
Customizing DITA Transformations.....	2565
Publishing with a DITA-OT Project File.....	2570
Dynamic Word, Excel, OpenAPI, HTML, Markdown to DITA Conversion.....	2571
Troubleshooting DITA Transformation Problems.....	2573
DITA Profiling / Conditional Text.....	2580
Creating and Editing Profiling Attributes in DITA.....	2581
Applying Profiling Attributes in DITA.....	2584
Creating and Editing Profiling Condition Sets in DITA.....	2586
Applying Profiling Condition Sets in DITA.....	2588
Showing and Filtering Profiled Content in DITA.....	2590
Customizing Colors and Styles for Rendering Profiling in Author Mode.....	2593
Conditional Profiling Attribute Groups.....	2595
Customizing Profiling Values with a Subject Scheme Map.....	2597
Filtering Profiling Values with a DITAVAL File.....	2602
Styling the Rendering of Profiled Content Using a DITAVAL File.....	2604
Publishing Profiled DITA Content.....	2605
Conditional Processing to Generate Multiple Deliverables.....	2606
DITA Open Toolkit Support.....	2606
DITA-OT Plugins.....	2606
Using an External DITA Open Toolkit in Oxygen XML Editor Eclipse plugin.....	2617
DITA Open Toolkit Project.....	2617
DITA Specialization Support.....	2623
Integrating a DITA Specialization.....	2623

Editing DITA Map Specializations.....	2625
Editing DITA Topic Specializations.....	2626
Translating DITA Projects Overview.....	2626
Main Files Support in DITA.....	2628
DITA Referenced/Dependent Resources View.....	2630
Search and Rename Actions for IDs in DITA.....	2633
Metadata.....	2634
Migrating MS Office Documents to DITA.....	2634
Migrating Various Document Formats to and from DITA.....	2636
How to Count Words in DITA Topics or Maps.....	2638
DITA 1.3 Support.....	2638
DITA 2.0 Support.....	2640
Chapter 22. Scripting Oxygen.....	2642
DITA Validate and Check For Completeness.....	2642
Transform.....	2643
Validate.....	2644
XML Refactoring.....	2648
DITA Translation Package Builder.....	2649
Batch Converter.....	2651
Compile Framework Script.....	2652
XSLT Stylesheets Documentation.....	2653
XML Schema Documentation.....	2654
JSON Schema Documentation.....	2654
OpenAPI Documentation.....	2656
WSDL Documentation (Deprecated).....	2658
XML Instance Generator.....	2659
Flatten XML Schema.....	2660
Compare Directories.....	2660
Compare Files.....	2665
Merge Files with Change Tracking Highlights.....	2669
Merge Directories with Change Tracking Highlights.....	2671
Format and Indent Files.....	2674
Chapter 23. Glossary.....	2676

Introduction

Welcome to the User Manual of Oxygen XML Editor Eclipse plugin 26.1.

Oxygen XML Editor Eclipse plugin is a cross-platform application designed to accommodate all of your XML editing, authoring, developing, and publishing needs. It is the best XML editor available for document development using structured mark-up languages such as XML, XSD, Relax NG, XSL, DTD. It is a comprehensive solution for authors who want to edit XML documents visually, with or without extensive knowledge about XML and XML-related technologies. The WYSIWYG-like editor is driven by CSS stylesheets associated with the XML documents and offers many innovative, user-friendly authoring features that make XML authoring easy and powerful.

It offers developers and authors a powerful **Integrated Development Environment** and the intuitive **Graphical User Interface** of Oxygen XML Editor Eclipse plugin is easy to use and provides robust functionality for content editing, project management, and validation of structured mark-up sources. Coupled with *XSLT* and *FOP* transformation technologies, Oxygen XML Editor Eclipse plugin offers support for generating output to multiple target formats, including: *PDF*, *PS*, *TXT*, *HTML*, *JavaHelp*, *WebHelp*, and *XML*.

This user guide is focused on describing features, functionality, the application interface, and to help you quickly get started. It also includes a vast amount of advanced technical information and instructional topics that are designed to teach you how to use Oxygen XML Editor Eclipse plugin to accomplish your tasks. It is assumed that you are familiar with the use of your operating system and the concepts related to XML technologies and structured mark-up.

2.

Getting Started

This section provides a variety of resources to help you get the most out of the application. Typically, the first step of getting started with Oxygen XML Editor Eclipse plugin would be to install the software. For detailed information about that process, see the [Installation chapter \(on page 44\)](#).

After installation, when you launch Oxygen XML Editor Eclipse plugin for the first time, you are greeted with a **Welcome** dialog box. It presents upcoming events, useful video demonstrations, helpful resources, the tip of the day, and also gives you easy access to recently used files and projects and to create new ones.

What is Oxygen XML Editor Eclipse plugin

Oxygen XML Editor Eclipse plugin is the best XML editor available and is a complete XML development and authoring solution. It is designed to accommodate a large number of users, ranging from beginners to XML experts. It is the only XML tool that supports all of the XML schema languages and provides a large variety of powerful tools for editing and publishing XML documents.

You can use Oxygen XML Editor Eclipse plugin to work with most XML-based standards and technologies. It is a cross-platform application available on all the major operating systems (Windows, macOS, Linux, Solaris) and can be used either as a standalone application or as an Eclipse plugin.

For a list of many of the features and technologies that are included in Oxygen XML Editor Eclipse plugin, see the [Oxygen Website](#).

Getting Familiar with the Interface

Oxygen XML Editor Eclipse plugin includes several [perspectives \(on page 2680\)](#) and [editing modes \(on page 241\)](#) to help you accomplish a wide range of tasks. Each *perspective* and editing mode also includes a large variety of helper views, menu actions, toolbars, and contextual menu functions.

Regardless of the [perspective \(on page 2680\)](#) or editing mode that you are working with, the default layout consists of the following areas:

Menus

Menu-driven access to all the features and functions available in Oxygen XML Editor Eclipse plugin. Most of the menus are common for all types of documents, but Oxygen XML Editor Eclipse plugin also includes some context-sensitive and *framework*-specific menus and actions that are only available for a specific context or type of document.

Toolbars

Easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Some of the toolbars are common for all *perspectives*, editing

modes, and types of documents, while others are specific to the particular *perspective* or mode. Some toolbars are also *framework*-specific, depending on the type of document that is being edited.

Helper Views

Oxygen XML Editor Eclipse plugin includes a large variety of *dockable* (on page 2677) views to assist you with editing, viewing, searching, validating, transforming, and organizing your documents. Many of the views also contain useful contextual menu actions, toolbar buttons, or menus. The most commonly used views for each *perspective* and editing mode are displayed by default and you can choose to display others to suit your specific needs.

Editor Pane

The main editing area in the center of the application. Each editing mode provides a main editor pane where you spend most of your time reading, editing, applying markup, and validating your documents. The editor pane in each editing mode also includes various contextual menu actions and other features to help streamline your editing tasks. Each file that has been opened has a tab at the top of the editing pane.

Perspectives

Oxygen XML Editor Eclipse plugin includes *several different perspectives* (on page 234) that you can use to work with your documents. The **Oxygen XML perspective** is the most commonly used *perspective* used for displaying and editing the content of your XML documents, and it is the default *perspective* when you start Oxygen XML Editor Eclipse plugin for the first time. Oxygen XML Editor Eclipse plugin also includes a **Database perspective** that allows you to manage databases and their connections and a few debugging *perspectives* that allow you to detect problems in XSLT or XQuery transformations.

Supported Document Types

You can use the main editing pane in Oxygen XML Editor Eclipse plugin to edit a large variety of document types. You can see the type of document association by the special icons displayed in the tabs of the editor title bar.

The supported document types include the following:

-  - XML documents
-  - XSLT stylesheets
-  - XML Schema
-  - DTD (Document Type Definition) schemas
-  - RELAX NG full syntax schemas
-  - RELAX NG compact syntax schemas
-  - NVDL (Namespace-based Validation Dispatching Language) schemas
-  - XSL:FO documents
-  - XQuery documents

-  - WSDL documents (Deprecated)
 -  - Schematron documents
 -  - JavaScript documents
 -  - Python documents
 -  - CSS documents
 -  - XProc scripts
 -  - SQL documents
 -  - JSON documents
 -  - JSON Schema documents
 -  - YAML documents
 -  - Ant build scripts
 -  - Markdown documents
- Additional supported document types include: Text, Java, Properties, Batch, Shell, PowerShell, Dockerfile, and PHP.

Resources to Help You Get Started Using Oxygen XML Editor Eclipse plugin

Configuring Oxygen XML Editor Eclipse plugin

There are numerous ways that you can configure Oxygen XML Editor Eclipse plugin to accommodate your specific needs.

See the [Configuring Oxygen section \(on page 70\)](#) for details on the various ways that you can configure the application and its features.

Video Tutorials and Webinars

The Oxygen XML Editor Eclipse plugin website includes numerous video demonstrations and webinars that present many of the features that are available in Oxygen XML Editor Eclipse plugin and show you how to complete specific tasks or how to use the various features.

Go to the [Oxygen Videos page](#) to see the list of video tutorials.

Go to the [Oxygen Events page](#) to see all the upcoming and past webinars, conferences, and other events.

Oxygen XML Editor Eclipse plugin Documentation

The Oxygen XML Editor Eclipse plugin documentation includes a plethora of sections and topics to provide you with a variety of information, ranging from basic authoring tasks to advanced developer techniques. You can, of course, search through the documentation using standard search mechanisms, but you can also place the cursor in any particular position in the interface and use the **F1** key to open a dialog box that presents a section in the documentation that is appropriate for the context of the current cursor position. Aside from the

other topics in this *Getting Started* section, the following are links to other sections of the documentation that might be helpful for your specific needs:

- **Text Editing Mode Section (on page 241)** - Provides information about the **Text** editor.
- **Author Editing Mode Section (on page 242)** - Provides information about the visual WYSIWYG-like **Author** editing mode.
- **XML Schema Diagram Editor (on page 243)** - Provides information about the schema design mode.
- **Editing Specific Document Types Chapter (on page 306)** - Includes information about editing numerous different types of documents.
- **DITA Authoring Chapter (on page 2327)** - Provides information about using DITA to edit and structure your content.
- **Publishing Chapter (on page 1171)** - Provides information about the various ways that you can publish content.
- **Importing Data Chapter (on page 1901)** - Provides information about importing data from text files, MS Excel files, database data, and HTML files.
- **Tools Chapter (on page 2224)** - Details about the various built-in tools that are available in Oxygen XML Editor Eclipse plugin.

Sample Documents

Your installation of Oxygen XML Editor Eclipse plugin includes a large variety of sample documents and projects that you can use as templates to get started and to experiment with the various features and technologies. They are located in the **samples** folder that is located in the installation directory of Oxygen XML Editor Eclipse plugin. You will find files and folders for various types of documents, including the following:

- **Sample project file (sample.xpr)** - A sample project file that will allow you to experiment with how projects can be structured and used. When you open this project file, you will be able to see all the sample files and folders in the **Project Explorer view (on page 269)**.
- **Sample files (personal.xml, etc.)** - A collection of interrelated sample files that will allow you to experiment with the structure and relationship between files, stylesheets, and schemas.
- **Various document type folders** - The various folders contain sample files for numerous document types, such as CSS, DITA, DocBook, ePub, TEI, XHTML, and many others.

Other Resources

The following list includes links to various other resources that will help you get started using the features of Oxygen XML Editor Eclipse plugin:

- See the [Oxygen XML Editor Eclipse plugin Blog Site](#) for a large variety of current and archived blogs regarding numerous features, requests, and instructional topics.
- Take advantage of the [Oxygen XML Editor Eclipse plugin Forum](#) to see various announcements and learn more about specific issues that other users have experienced.
- If you are using DITA, see the incredibly helpful [DITA Style Guide Best Practices for Authors](#).

- To learn about the WebHelp features in Oxygen XML Editor Eclipse plugin, see the [Publishing DITA and DocBook to WebHelp](#) section of the website.
- For more information about various additional tools that are integrated into Oxygen XML Editor Eclipse plugin, see the [Tools section \(on page 2224\)](#).
- See the [External Resource Page](#) for links to various other helpful resources, such as discussion lists, external tutorials, and more.
- See the [Oxygen SDK](#) section for details about the SDK that allows you to extend and develop Oxygen XML Editor Eclipse plugin [frameworks \(on page 2679\)](#) and [plugins \(on page 2681\)](#), and to integrate Eclipse plugins.
- For a list of new features that were implemented in the latest version of Oxygen XML Editor Eclipse plugin, see the [What's New Section on the website](#).

Your First Document or Project

This section includes several topics that will help you get started with your first document or project.

Your First XML Document

To create your first XML document, select **File > New > Other > Oxygen** or click the  **New** button on the toolbar. The [New document wizard \(on page 246\)](#) is displayed:

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting **File > New > New from Templates** and choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there.

For some document types, you may find a lot of different templates. For example, there are numerous templates for DocBook documents, and DITA topic types and maps. Choose the template that best meets your needs.

Writing Your First Document

Depending on the type of document you choose, the Oxygen XML Editor Eclipse plugin interface changes to support editing that document type. This may include new menus, toolbar buttons, and items in the contextual menus.

Also, depending on the type of document you choose, Oxygen XML Editor Eclipse plugin may open your document in **Text (on page 241)** or **Author (on page 242)** mode. **Text** mode shows the raw XML source file, while **Author** mode shows a graphical view of the document.

The availability of **Author** mode for your document type depends on the type you choose and if there is a CSS stylesheet available to create the **Author** mode. Oxygen XML Editor Eclipse plugin includes default **Author** mode views for most of the document types it supports. If your company has created its own document types, **Author** mode stylesheets may have also been created for that type. However, if you create a plain XML file, or

one based on a schema that is not included in the Oxygen XML Editor Eclipse plugin built-in support, you need to edit it in **Text** mode or [create your own Author mode CSS \(on page 2117\)](#) for it.

You can switch back and forth between **Author** mode and **Text** mode at any time by clicking the buttons at the bottom left of the editor window. You do not lose any formatting when switching from **Author** to **Text** mode. **Text** and **Author** modes are just different views for the same XML document.

There is also a **Grid mode (on page 242)** available that displays all content in an XML document as a structured grid of nested tables. This is useful for certain kinds of documents, particularly those that are structured like databases. You can also use it when you want to display XML content in a table-like manner (for example, if you need to [extract XML content to a spreadsheet \(on page 366\)](#)).

If you use **Author** mode, you might find that it is similar to word processors that you are used to. Likewise, the **Text** mode is similar to many other typical text editors. If you are new to XML, the biggest difference is that XML documents have a particular structure that you have to follow. Oxygen XML Editor Eclipse plugin assists you with a continuous validation of the XML markup.

Structuring Your First Document

Each XML document type has a particular structure that you have to follow as you write and edit the document. Some document types give you a lot of choices, while others give you very few. In either case, you need to make sure that your document follows the particular structure for the document type you are creating. This means:

- At any given location in the document, there are only certain XML elements allowed. Oxygen XML Editor Eclipse plugin helps you determine which elements are allowed. In **Author** mode, when you press **Enter**, Oxygen XML Editor Eclipse plugin assumes that you want to enter a new element and shows you a list of elements that can be created in this location. Keep typing until the element you want is highlighted and press **Enter** to insert the element. If you want to view the overall structure of a document and see what is allowed (and where), you can use the **Model view (on page 331) (Window > Show View > Model)**.
- When you create certain elements, you may find that your text gets a jagged red underline and you get a warning that your content is invalid. This is usually because the element you have just created requires certain other elements inside of it. Your document will be invalid until you create those elements. Oxygen XML Editor Eclipse plugin helps you with this. If there is only one possible element that can go inside the element you just created, Oxygen XML Editor Eclipse plugin creates it for you. However, if there is more than one possibility, you have to create the appropriate elements yourself. In many cases, Oxygen XML Editor Eclipse plugin presents **XML Quick Fixes (on page 581)** that help you resolve errors by offering proposals to quickly fix problems such as missing required attributes or invalid elements.

Editing Your First Document

Once you have completed the first draft of your document, you may need to edit it. As with any editor, Oxygen XML Editor Eclipse plugin provides the normal cut, copy, and paste options as well as drag and drop editing.

However, when you are editing an XML document, you have to make sure that your edits respect the structure of the XML document type. In fact, you are often editing the structure as well as the content of your document.

Oxygen XML Editor Eclipse plugin provides many tools to help you edit your structure and to keep your structure valid while editing text.

The Document Breadcrumbs

Across the top of the editor window (in **Text** mode), there is a set of breadcrumbs that shows you exactly where the insertion point is in the structure of the document. You can click any element in the breadcrumbs to select that entire element in the document.

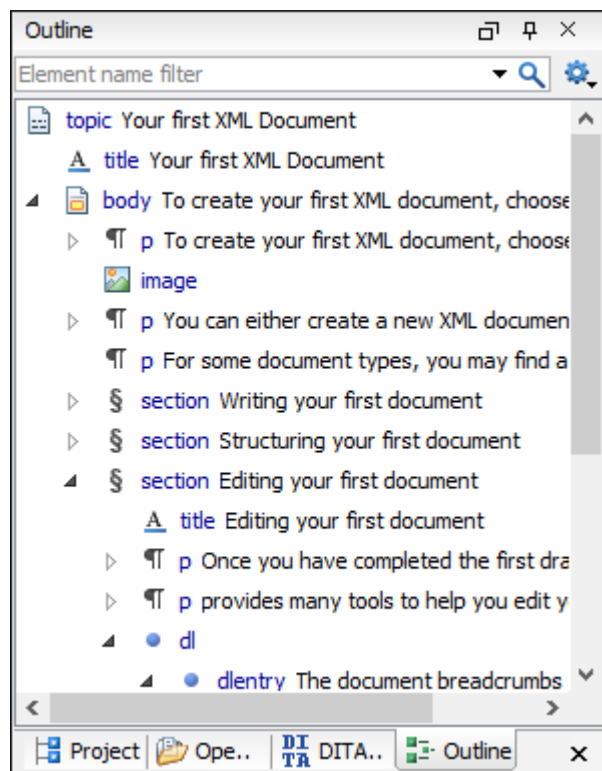

Showing Tags

To see exactly where you are in the structure of the document, you can show the tags graphically in the **Author** view. There are several levels of tag visibility that you can choose using the  **Tags Display Mode** drop-down menu (on page 372) on the toolbar (the button may look a little different than this, as it changes to reflect the level of tags currently displayed).

Outline View

The **Outline** view (on page 326) shows you the structure of your document in outline format. You can use it to select elements, or to move elements around in the document.

Figure 1. Outline View

You can configure the **Outline** view to determine what is shown, such as element names, attributes, and comments. Certain choices may work better for particular document types. You can also filter the **Outline** view to show only elements with a certain name.

Figure 2. Outline View Filtered to only Show Element Names

Cut and Paste, Drag and Drop

You can cut and paste or drag and drop text, just as you would in any other editor. However, when you do this in **Author** view, it is important to remember that you are actually moving blocks of XML. When you cut and paste or drag and drop a block of XML, the result has to be valid both where the content is inserted, and where it is removed from.

A big part of doing this correctly is to make sure that you pick up the right block of text in the first place. Using the breadcrumbs or **Outline** view, or showing tags and using them to select content, can help ensure that you are selecting the right chunk of XML.

If you do try to paste or drop a chunk of XML somewhere that is not valid, Oxygen XML Editor Eclipse plugin warns you and tries to suggest actions that make it valid (such as by removing surrounding elements from the chunk you are moving, by creating a new element at the destination, or by inserting it in a nearby location).

If you are using **Author** mode, you can also switch to **Text** mode to see exactly which bits of XML you are selecting and moving.

Refactoring actions

You can perform many common structure edits, such as renaming an element or wrapping text in an element, using the actions in the **Refactoring** menu of the contextual menu. More advanced refactoring operations are also available using the **XML Refactoring tool** (*on page 608*) that is available in the **XML Tools** menu.

Validating Your First Document

Validation is the process of making sure that an XML document abides by the rules of its schema. If Oxygen XML Editor Eclipse plugin knows how to find the schema, it validates the document for you as you type. Oxygen XML Editor Eclipse plugin finds the schema automatically for most of the document types created from templates. However, in some cases, you may have to [tell it how to find the schema \(on page 546\)](#).

When Oxygen XML Editor Eclipse plugin validates as you type, there is a small bar at the right edge of the editor that shows you if the document is invalid and where errors are found. If the indicator at the top of that bar is green, your document is valid. If the document is invalid, the indicator turns red and a red flag shows you

where the errors are found. Click that flag to jump to the error. Remember that sometimes your document is invalid simply because the structure you are creating is not yet complete.

In addition to problems with the validity of the XML document itself, Oxygen XML Editor Eclipse plugin also reports warnings for a number of conditions, such as if your document contains a cross reference that cannot be resolved, or if Oxygen XML Editor Eclipse plugin cannot find the schema specified by the document. The location of these warnings is marked in yellow on the validation bar. If the document contains warnings, but no errors, the validity indicator turns yellow.

You can also validate your document at any time by selecting the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. When you validate in this manner, if errors are found, the validation result opens in a new pane at the bottom of the editor that shows each validation error on a separate line. Clicking the error takes you to the location in your document where the error was detected.

**Note:**

Be aware that the problem is sometimes in a different location from where the validator detects the error. To get more information about a validation error, right-click a validation error message, and select **Show Message**.

Proofing Your First Document

Oxygen XML Editor Eclipse plugin includes an [automatic \(as-you-type\) spell checking feature \(on page 293\)](#), as well as a manual spell checking action. To check the spelling of your document manually, use the  **Check Spelling** action on the toolbar.

Transforming Your First Document

An XML document must be transformed to be published. Transformations are specific to the particular type of document you have created. For example, a DITA transformation cannot be used on a DocBook file, or vice versa. A single document type may have many multiple transformations that produce different kinds of outputs. For some document types, such a DITA, many different content files may be combined together by a transformation. You need to locate and launch a transformation that is appropriate for your document type and the kind of output you want to generate.

Oxygen XML Editor Eclipse plugin uses [transformation scenarios \(on page 1171\)](#) to control the transformation process. Depending on the document type you have created, there may be several transformation scenarios already configured for your use. This may include the default transformation scenarios supplied by Oxygen XML Editor Eclipse plugin or ones created by your organization.

To see the list of transformations available for your document, select the  **Apply Transformation Scenario(s)** action from the toolbar or the **XML** menu. A list of available transformation scenarios is displayed. Choose one or more scenarios to apply, and click **Apply associated**. Exactly how your transformed content appears depends on how the transformation scenario is configured.

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor Eclipse plugin. Oxygen XML Editor Eclipse plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor Eclipse plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor Eclipse plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor Eclipse plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor Eclipse plugin, along with the features of DITA, in a variety of ways.

Creating a DITA Topic in Oxygen XML Editor Eclipse plugin

To create a DITA topic ([on page 2402](#)):

1. Select **File > New > Other > Oxygen XML Editor Eclipse plugin**, or click the  **New** button on the toolbar, and select **New from Templates**.

Step Result: The **New from Templates Wizard** ([on page 246](#)) is displayed:

Figure 3. New DITA Document from Templates Wizard

2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create, then click **Next**.

**Note:**

If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click **Finish**.

Result: Your document is opened in the editor. Eventually, you will need to [add a reference to it in your DITA map \(on page 35\)](#).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents (on page 27) also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides additional specific DITA-related support for working with DITA topics (on page 2400), their associated DITA maps (on page 2335), and for creating DITA output (on page 2524).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a DITA map (on page 2678). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor Eclipse plugin

To create a map (on page 2353):

1. Select **File > New > Other > Oxygen XML Editor Eclipse plugin**, or click the  **New** button on the toolbar, and select **New from Templates**.
2. Go to **Framework templates > DITA Map > map** and select the type of map you want to create.
3. Choose whether you want to open the map in the **Editor** or in the **DITA Maps Manager** (on page 2337). Usually, opening it in the **DITA Maps Manager** is the best choice. The **DITA Maps Manager** presents a view of the DITA map that is similar to a table of contents.

Figure 4. DITA Maps Manager View

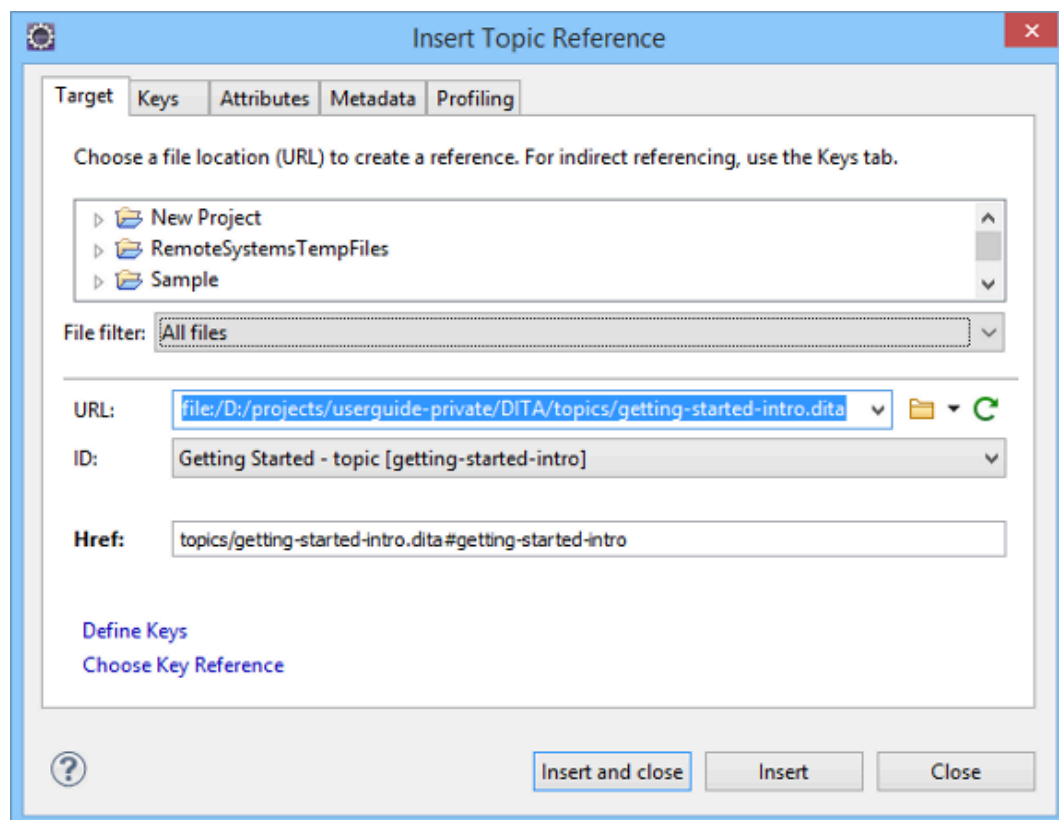

Adding Existing Topics to a Map in Oxygen XML Editor Eclipse plugin

There are several ways to [add a topic reference to a map \(on page 2357\)](#). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the *DITA map* in the **DITA Maps Manager** view [\(on page 2337\)](#) and choose **Reference to the currently edited file** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

Step Result: This opens the **Insert Reference** dialog box [\(on page 2363\)](#) with all of the required fields already filled in for you.

Figure 5. Insert Reference Dialog Box

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the *DITA map*.

Adding New Topics to a Map in Oxygen XML Editor Eclipse plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To [add a new topic to a map \(on page 2357\)](#), follow these steps:

1. In the **DITA Maps Manager** ([on page 2337](#)), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
 - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Note:**

The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the [DITA > Topics preferences page \(on page 86\)](#) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a `<topicref>`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.

3. Save the *DITA map*.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Adding Submaps in Oxygen XML Editor Eclipse plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can [break up the content into smaller submaps \(on page 2355\)](#). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To [add a child map to the current map \(on page 2355\)](#):

1. Right-click the parent *DITA map* in the **DITA Maps Manager view (on page 2337)** and choose **Append child > Map reference**.

Step Result: This opens the **Insert Reference dialog box (on page 2363)** with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select **Insert and close** to add a reference to your submap in the main map.
4. Save the main *DITA map*.

Validating a Map in Oxygen XML Editor Eclipse plugin

Just as it is with your individual topics, it is important to [validate your maps \(on page 2382\)](#). Oxygen XML Editor Eclipse plugin provides a validation function for *DITA maps* that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the  **Validate and Check for Completeness** button in the **DITA Maps Manager view (on page 2337)**.

Step Result: This opens the **DITA Map Completeness Check dialog box (on page 2383)**.

2. Select any of the various options you want to check.
3. Click **Check** to run the validation process.

Publishing Your Topics in Oxygen XML Editor Eclipse plugin

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you [create published output \(on page 2524\)](#) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default,

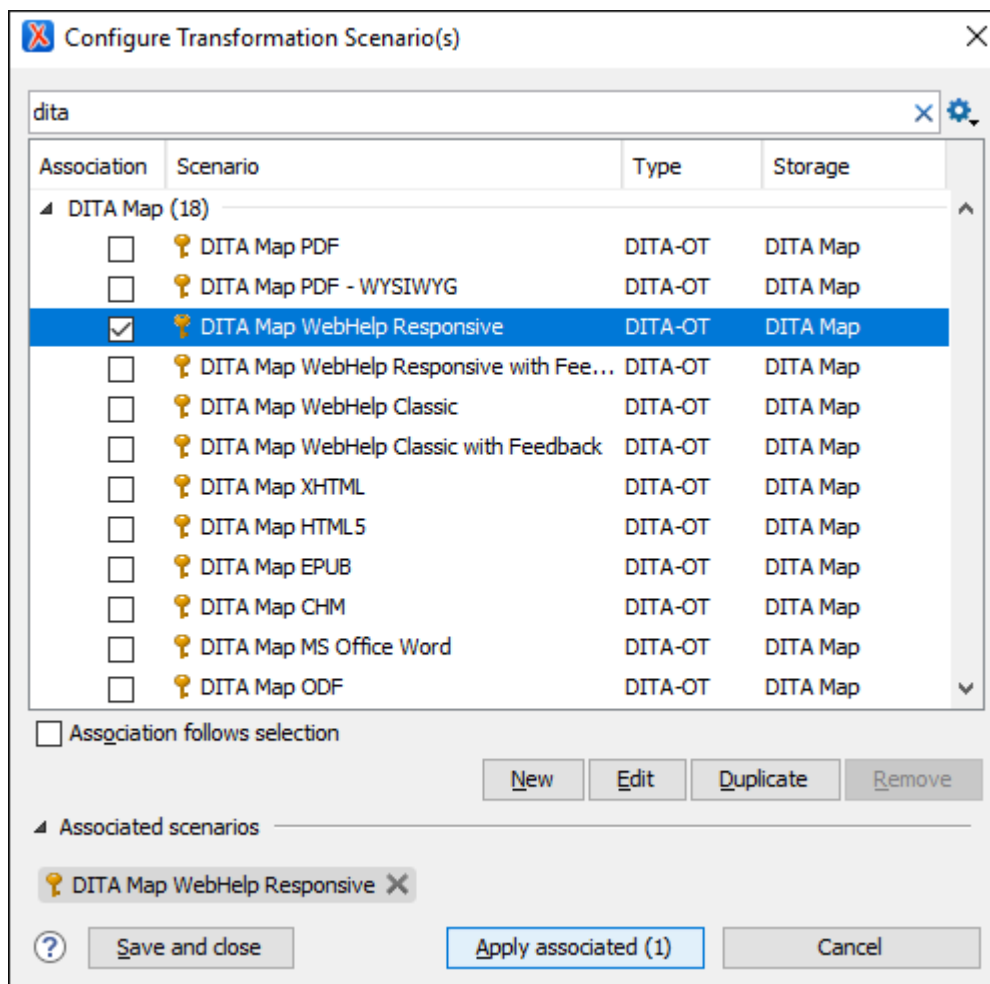

Oxygen XML Editor Eclipse plugin uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor Eclipse plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the  **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view (on page 2337).

Step Result: This opens the **Configure Transformation Scenario(s)** dialog box (on page 1300).

Figure 6. Configure Transformation Scenarios Dialog Box

2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.
4. Click **Apply associated**.

Result: Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

[Doctales - DITA Introduction](#)

Creating a New Project

Oxygen XML Editor Eclipse plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the [Project Explorer view \(on page 269\)](#) to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select **New > XML Project** or **New > Sample XML Project** from the contextual menu or **File** menu.

This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the **Project Explorer** view.

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting **File > New > New from Templates** and choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there.

Adding Items to the Project

To add items to the project, select the desired document type or folder from the **New** menu of the contextual menu, when invoked from the **Project Explorer** view (or from the **File** menu). You can also create a document from a template by selecting **New > New from Templates** from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the

 **Refresh (F5)** action from the project contextual menu and the [Project Explorer view \(on page 269\)](#) will

display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting **New > Folder > Advanced**. The linked folders presented in the **Project Explorer view** (on page 269) are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select **New > File** (you can use the **Advanced** button to link to a file in the local file system).

**Note:**

Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project Explorer View](#) (on page 269).

Related information

[Using Projects to Group Documents](#) (on page 268)

Getting Help

If you run into specific problems while using Oxygen XML Editor Eclipse plugin you can take advantage of a variety of support related resources. Those resources include the following:

- [The Oxygen XML Editor Eclipse plugin Support Section of the Website](#)
- [The Oxygen XML Editor Eclipse plugin Forum](#)
- [The Oxygen XML Editor Eclipse plugin Video Tutorials](#)
- [The Common Problems and Solutions Section of the User Manual](#) (on page 2306)
- [The Online Technical Support Form](#)

The application also includes various specific help-related resources in the **Help** menu.

Help Menu

The Oxygen XML Editor Eclipse plugin **Help** menu provides various resources to assist you with your tasks.

This menu includes the following actions or options:

Welcome

This option opens the **Welcome** screen that includes some resources to assist you with using Oxygen XML Editor Eclipse plugin.

Help Contents

Use this action to open a dialog box that presents Eclipse help topics and it includes a section that is specific to Oxygen XML Editor Eclipse plugin. Also, you can use the **F1** key to open a **Help**

view that presents a section in the User Manual that is appropriate for the context of the current cursor position.

Report Oxygen problem

You can use this option to open a dialog box that allows you to write the description of a problem that was encountered while using the application. You can also select additional information to be sent to the technical support team in the five tabs:

- **General info** - You can edit your contact details in case you want to be contacted for further details or to be notified of a resolution.
- **Class Loader URLs** - You can choose whether or not to include the listed *Class Loader URLs* with your report.
- **System properties** - You can choose whether or not to include the listed system property details with your report.

Tip:

You are able to change the URL where the reported problem is sent by using the `com.oxygenxml.report.problems.url` system property. The report is sent in XML format through the `report` parameter of the POST HTTP method.

- **Plugins** - You can choose whether or not to include details about your installed *plugins* ([on page 2681](#)) with your report.
- **Frameworks** - You can choose whether or not to include details about your installed *frameworks* ([on page 2679](#)) with your report.

Support Tools > Randomize XML text content

Use this action when you need to send samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data. For more information, see [Randomize XML Text Content \(on page 42\)](#).

Warning:

Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then process this operation on the copies instead of the original files. Otherwise, you may lose your original content.

About Eclipse

Use this option and then click the Oxygen XML Editor Eclipse plugin icon to open a dialog box that contains information about Oxygen XML Editor Eclipse plugin and the installed version.

Related information

[Details to Submit in a Request for Technical Support Using the Online Form \(on page 2310\)](#)

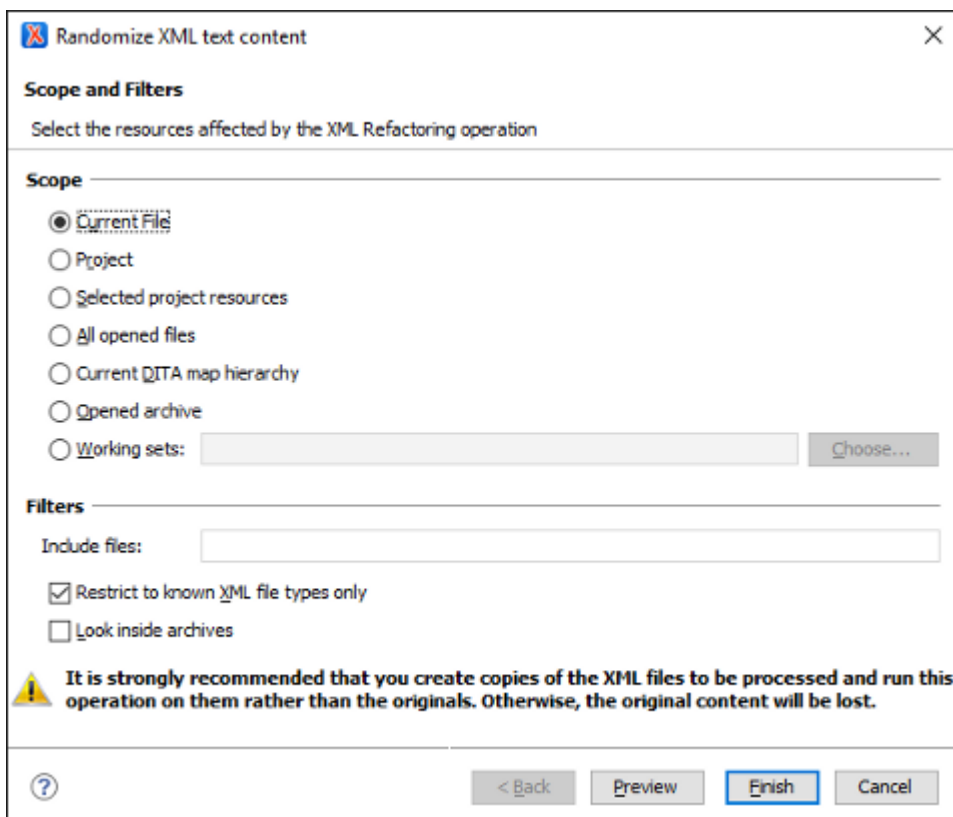

Randomize XML Text Content

Oxygen XML Editor Eclipse plugin includes an action that randomizes the text content of an XML document. This action is available in the **Help > Support Tools** menu. It is helpful if you need to send XML samples to the *Oxygen* support team and you want to keep the text content confidential. It opens a dialog box that allows you to select the resources that will have the text content randomized. You can then save the resources and send them to the *Oxygen* support team without fear of compromising sensitive or private data.

**Warning:**

Before using this action, it is highly recommended that you copy the XML resources to be processed, save them in a separate folder, and then perform this operation on the copies instead of the original files. Otherwise, you may lose your original content.

Figure 7. Randomize XML Text Content Dialog Box

The **Randomize XML Text Content** dialog box includes the following options:

Scope

Allows you to select the set of files whose text content will be randomized by the operation. You can select from predefined resource sets (such as the current file, your whole project, the current

DITA map (on page 2678) hierarchy for DITA projects, etc.) or you can define your own set of resources by creating a *working set (on page 2683)*.

Filters

This section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

3.

Installation

Oxygen XML Editor Eclipse plugin is available on Windows, Linux, and macOS and there are a variety of methods and options for installing and running Oxygen XML Editor Eclipse plugin on your system or server. This section also includes information about registering, transferring, or releasing licenses, upgrading, installing *add-ons*, and uninstalling.

Choosing How Oxygen XML Editor Eclipse plugin Runs

You can install Oxygen XML Editor Eclipse plugin to run in several ways:

- As a desktop application (running standalone or as an Eclipse plugin) on Windows, Linux, or macOS.
- As a desktop application (running standalone or as an Eclipse plugin) on a Unix or Linux server or on Windows Terminal Server.

Choosing an Installer

You also have a choice of several different installers:

- The native installer for your platform (Windows, Linux, or macOS).
- On Windows and Linux, the native installer can also run in unattended mode.
- The [Update Site installer \(on page 45\)](#).
- The [Zip archive installer \(on page 46\)](#).

Choosing a License Option

You must [obtain and register a license \(on page 48\)](#) to run Oxygen XML Editor Eclipse plugin.

You can choose from two types of licenses:

- A named-user license, which can be used by a single person on multiple computers.
- A floating license, which can be used by different people at different times. Only one person can use a floating license at a time.

Upgrading, Transferring, and Uninstalling.

You can also [upgrade \(on page 66\)](#) Oxygen XML Editor Eclipse plugin, [transfer a license \(on page 50\)](#), or [uninstall \(on page 68\)](#) Oxygen XML Editor Eclipse plugin.

Getting Help With Installation

If you need help, email support at: support@oxygenxml.com.

Installing Oxygen as an Eclipse Plugin

System Requirements

Operating Systems

- Windows 7, Windows 8, Windows 10, Windows 11, Windows Server 2008, Windows Server 2012
- macOS version 10.11 64-bit or later
- Any Unix/Linux distribution with an available Java SE Runtime Environment version 11 from Oracle

CPU

- Minimum - 1 GHz processor
- Recommended - Dual-core class processor

Memory

- Minimum - 2 GB of RAM
- Recommended - 4 GB of RAM

Storage

- Minimum - 400 MB free disk space
- Recommended - 1 GB free disk space

Java

Java 17 from Oracle.

On Eclipse, Oxygen XML Editor Eclipse plugin uses the same Java Virtual Machine as the copy of Eclipse it is running in.

Eclipse

The following Eclipse versions are officially supported: 4.5-4.31.

Update Site Method

To install the Eclipse plugin using the *Update Site* method, follow this procedure:

1. Start Eclipse.
2. Go to **Help > Install New Software > Available Software**.
3. Click **Add** in the **Available Software** dialog box.
4. Enter <https://www.oxygenxml.com/InstData/Editor/Eclipse/site.xml> into the **Location** field of the **Add Site** dialog box.
5. Click **OK**.

6. Select the **Oxygen XML Editor Eclipse plugin** checkbox.
7. Click **Next** and continue with the rest of the installation wizard.
8. Restart Eclipse when prompted.
9. Verify that Oxygen XML Editor Eclipse plugin is installed correctly by creating a new XML Project. Go to **File > New > Other** and choose **Oxygen XML Editor Eclipse plugin > XML Project**.
10. When prompted for a license key, enter the license information received in the registration email.

Note:

If you already have a native version of Oxygen XML Editor Eclipse plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Zip Archive Method

To install the Eclipse plugin using the *Zip Archive* method, follow this procedure:

1. [Download](#) the zip archive with the Eclipse plugin.
2. Unzip the downloaded zip archive in the **dropins** subdirectory of the Eclipse installation directory.
3. Restart Eclipse.
4. Verify that Oxygen XML Editor Eclipse plugin is installed correctly by creating a new XML Project. Go to **File > New > Other** and choose **Oxygen XML Editor Eclipse plugin > XML Project**.
5. When prompted for a license key, enter the license information received in the registration email.

Note:

If you already have a native version of Oxygen XML Editor Eclipse plugin installed on your computer, you will not be prompted for a license key for the Eclipse version. The existing license key will be used automatically.

Eclipse Marketplace

It is also possible to install Oxygen XML Editor Eclipse plugin from the Eclipse Marketplace. Simply search for **Oxygen** and use the **Install** button that has instructions when you hover over the button.

Site-Wide Deployment

If you are deploying Oxygen XML Editor Eclipse plugin for a group, there are various things you can do to customize Oxygen XML Editor Eclipse plugin for your users and to make the deployment more efficient.

Creating custom default options

You can [create a custom set of default options \(on page 215\)](#) for Oxygen XML Editor Eclipse plugin. These will become the default options for each of your users, replacing the normal default settings. Users can still set options to suit themselves in their own copies of Oxygen

XML Editor Eclipse plugin, but if they choose to reset their options to defaults, the custom defaults that you set will be used.

Creating default project files

Oxygen XML Editor Eclipse plugin project files (*on page 268*) are used to configure a project. You can [create and deploy default project files \(on page 268\)](#) for your projects so that your users will have a preconfigured project file to begin work with.

Using floating licenses

If you have a number of people using Oxygen XML Editor Eclipse plugin on a part-time basis or in different time zones, you can use a [floating license \(on page 52\)](#) so that multiple people can share a license.

Licensing

This section contains information about licensing Oxygen XML Editor Eclipse plugin, including details about the types of licenses that are available, managing licenses, using a license server to manage licenses for an organization, and information about managing license servers.

Installing a License Server to Manage Licenses

If you are using floating licenses or a large number of user-based licenses (20 or more) for **Oxygen XML Editor/Author/Developer**, you must [set up an Oxygen License Server \(on page 55\)](#).

Registering License Keys

To help you comply with the **Oxygen** EULA (terms of licensing), all floating or named-user licenses must be registered. This means that the license key will be locked to a particular license server deployment and no multiple uses of the same license key are possible.

During the activation process, a code that uniquely identifies your deployment of the license server is sent to the **Oxygen** servers. The servers will then sign the license key.

Splitting or Combining License Keys to Work with Your License Servers

A license server can only manage one license key. If you have multiple license keys for the same version of **Oxygen XML Editor/Author/Developer** and you want to have all of them managed by the same server, or if you have a multiple-user floating license and you want to split it between two or more license servers, [contact the Oxygen support team](#) and ask for a new license key.

You can obtain a license key for Oxygen XML Editor Eclipse plugin in one of the following ways:

- You can purchase one or more licenses from the Oxygen XML Editor Eclipse plugin website at <https://www.oxygenxml.com/buy.html> or through one of the [authorized resellers](#). A license key will be sent to you by email.
- If your company or organization has already purchased licenses, contact your license administrator to obtain a license key or configuration details to connect to a license server.

- If you purchased a subscription and you received a registration code, you can use it to obtain a license key from <https://www.oxygenxml.com/registerCode.html>. A license key will be sent to you by email.
- If you want to evaluate the product, you can obtain a trial license key for 30 days from the Oxygen XML Editor Eclipse plugin website at <https://www.oxygenxml.com/register.html>.

License Types

Oxygen XML Editor Eclipse plugin is not free software. To activate and use Oxygen XML Editor Eclipse plugin, you need a license.

The following license types are available:

- A **Named-User License** (*on page 49*) may be used by a single *Named User* on one or more computers. Named-user licenses are not transferable to a new *Named User*. If you order multiple named-user licenses, you will receive a single license key good for a specified number of *named users*. It is your responsibility to keep track of the *named users* that each license is assigned to.
- A **Floating License** (*on page 52*) may be used by any user on any machine. However, the total number of copies of Oxygen XML Editor Eclipse plugin in use at one time must not be more than the number of floating licenses available. A user who runs two different distributions of Oxygen XML Editor Eclipse plugin (for example, Standalone and Eclipse Plugin) at the same time on the same computer, consumes a single floating license.
- A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.
- A special **Academic Group License** (*Classroom, Department, or Site license*) may be used by students and teachers in academic institutions. These licenses provide a cost effective way of getting access to Oxygen XML Editor Eclipse plugin for learning purposes.

For demonstration and evaluation purposes, a time-limited license is available upon request at <https://www.oxygenxml.com/register.html>. This license is supplied at no cost for a period of 30 days from the date of issue. During this period, the software is fully functional, enabling you to test all its functionality. To continue using the software after the trial period, you must purchase a permanent license.

For definitions and legal details of the license types, consult the End-User License Agreement available at <https://www.oxygenxml.com/eula.html>.

Named-User Licenses

A **Named-User License** can be used by a single *Named User* on one or more computers. Named-user licenses cannot be transferred to another *named user*. If you purchase multiple named-user licenses, you will receive a single license key that is valid for a specified number of *named users*. It is your responsibility to keep track of which *named users* are assigned to each license.

Registering a Named-User License

To register a *Named-User License* on a machine owned by the *Named User*, follow these steps:

1. Purchase a license from the [Oxygen XML Editor Eclipse plugin website](#). You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Open an XML document in the Oxygen XML Editor Eclipse plugin.

If this is a new installation of Oxygen XML Editor Eclipse plugin, the registration dialog box is displayed.

If the registration dialog box is not displayed, go to **Window (Eclipse on macOSX)** and choose **Preferences > Oxygen XML Editor Eclipse plugin** and click the **Register** button.

Figure 8. License Registration Dialog Box

4. Select **Use a license key** as the licensing method.

Note:

If your license key has 20 or more licenses, you must use a [license server \(on page 47\)](#) instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Click **OK**.

Related information

[Oxygen XML Editor Eclipse plugin End-User License Agreement](#)

Transferring a License Key

If you want to transfer your Oxygen XML Editor Eclipse plugin license key to another computer (for example, if you are disposing of your old computer or transferring it to another person), you must first unregister your license. You can then register your license on the new computer in the normal way.

To unregister a license, prior to transferring it, follow this procedure:

1. Open the **Preferences** dialog box (*on page 70*) and click **Register**.

The license registration dialog box is displayed.

2. Make sure the **Use a license key** option is selected.
3. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
4. Click the **Remove** button at the bottom-right corner of the dialog box.

A confirmation message is displayed asking if you want to remove your license key.

5. Select between:

- **Yes** - Removes your license key from your user account on the current computer.
- **No** - Falls back to your previous license key, if applicable.

Subscription Licenses

A **Subscription** license that allows you to use the application for a specific period of time (either 6 months or 1 year). This type of license is user-based and is covered by a Support and Maintenance Pack, which means that during the subscription period you will get free upgrades to all major and minor releases and priority technical support.

Registering a Subscription License

To register a *Subscription License*, follow these steps:

1. Purchase a license from the [Oxygen XML Editor Eclipse plugin website](#). You will receive an email that contains your license key.
2. Save a backup copy of your email message that contains the new license key.
3. Open an XML document in the Oxygen XML Editor Eclipse plugin.

If this is a new installation of Oxygen XML Editor Eclipse plugin, the registration dialog box is displayed.

If the registration dialog box is not displayed, go to **Window (Eclipse on macOSX)** and choose **Preferences > Oxygen XML Editor Eclipse plugin** and click the **Register** button.

Figure 9. License Registration Dialog Box

4. Select **Use a license key** as the licensing method.

**Note:**

If your license key has 20 or more licenses, you must use a [license server \(on page 47\)](#) instead.

5. Paste your license key into the registration dialog box. The license key is composed of nine lines of text between two text markers.
6. Click **OK**.

Related information

[Oxygen XML Editor Eclipse plugin End-User License Agreement](#)

Automatic Subscription Renewal

The **Oxygen License Server** has a mechanism that tries to detect when you purchase a renewal of your current subscription and automatically updates the license key.

To determine that a license key you purchased is a renewal of the license key you have currently installed in the License Server, it uses the **Previous order reference number** if you inserted it in the checkout process.

This automatic renewal mechanism makes an HTTP request to https://oxygenxml.com/subscription_management/check_renewal.php and passes the following as parameters:

- The SGN field of the existing license key.
- The server signature that uniquely identifies the License Server installation.

This request is made by the License Server automatically (or manually by pressing the **Check now** link).

This mechanism can be disabled by deselecting the **Automatically check for subscription renewal** checkbox.

Floating Licenses

The floating license type is commonly used by organizations that have a large number of infrequent users who do not require simultaneous access to the application. Instead of each user having their own individual license key, a pool of licenses is available for use on demand, one at a time.

To use floating licenses, a license server is required and the license key needs to be activated. Your system administrator will most likely be responsible for [setting up the license server \(on page 55\)](#). Then you will need to [request a floating license from the server \(on page 52\)](#). This process is designed to ensure compliance with the *Oxygen End-User License Agreement (EULA)*. This means that the license key will be locked to a particular license server deployment, and the same license key cannot be used with any other license server.

For information about releasing and returning a floating license to the pool for other users, see [Releasing a Floating License \(on page 53\)](#).

For information about reserving (or locking) a floating license so that it does not get returned to the pool, see [Reserving a Floating License \(on page 54\)](#).

Requesting a Floating License from a License Server

How to Request a Floating License

To request a floating license from an HTTP license server, follow this procedure:

1. Contact your server administrator to make sure the license server has already been set up and get network address and login details for the license server.
2. Start the Eclipse platform.
3. Open the **Preferences** dialog box ([on page 70](#)) and click **Register**.

Step Result: The license registration dialog box is displayed.

4. Choose **Use a license server** as licensing method.
5. Select **HTTP/HTTPS Server** as server type.
6. In the *URL* field, enter the address of the license server. The URL address has the following format:
`http://hostName:port/oxygenLicenseServlet/license-servlet.`
7. Complete the *User* and *Password* fields.
8. Click the **OK** button.

Result: If a floating license is available, it is registered in Oxygen XML Editor Eclipse plugin. To display the license details, [open the Preferences dialog box \(on page 70\)](#). If a floating license is not available, you will get a message listing the users currently using floating licenses.

How to Register Floating Licenses for Multiple Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Editor Eclipse plugin on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Editor Eclipse plugin:
 - a. [Open the Preferences dialog box \(on page 70\)](#) and click **Register**.
 - b. Click **OK** without entering any information in this dialog box.
 - c. Click **Reset** and restart the application.
2. Register the license using one of the [floating license registration procedures \(on page 52\)](#).

Step Result: A `license.xml` file is created.

3. Copy the `license.xml` file from the [preferences directory \(on page 71\)](#) and place it in the `lib` subfolder of the installation directory (e.g. `[ECLIPSE-INSTALL-DIR]\plugins\com.oxygenxml.editor_22.1.0.v*\lib`).

Related information

[Installing License Servers \(on page 55\)](#)

Releasing a Floating License

The floating license you are using will be released and returned to the pool if any of the following occur:

- The connection with the license server is lost.
- The Oxygen XML Editor Eclipse plugin will consume one license from the server's pool of licenses if at least one *Oxygen* editor window is opened (not necessarily focused). In other words, if a user wants to release a license, all *Oxygen* editor windows must be closed.
- You exit the application running on your machine, and no other copies of Oxygen XML Editor Eclipse plugin running on your machine are using your floating license.
- You register a *Named User* license with your copy of Oxygen XML Editor Eclipse plugin, and no other copies of Oxygen XML Editor Eclipse plugin running on your machine are using your floating license.
- Your computer idles for more than 2 hours.
- Your system administrator [manually revokes the license \(on page 61\)](#).

Tip:

To prevent your floating license from being released, you can use the **Lock floating license** action available in the **Preferences** dialog box (go to **Window (Eclipse on macOS)** and choose **Preferences >**

Oxygen XML Editor Eclipse plugin. You can use the same action to unlock the license. Note that your system administrator can also unlock your license ([on page 61](#)).

To release a floating license on demand, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and click **Register**.

The license registration dialog box is displayed.

2. The license key field should be empty (this is normal). If it is not empty, delete any text in the field.
3. Make sure the **Use a license key** option is selected.
4. Click **OK**.

A dialog box is displayed asking if you want to reset your license key.

5. Select between:

- **Use the last one** - Falls back to your previous license key. Use this option if you want to release a floating license and revert to a *Named User* license.
- **Reset** - Removes your license key from your user account on the current computer.

The **Reset** button erases all the licensing information. To complete the reset operation, close and restart Oxygen XML Editor Eclipse plugin.

Reserving a Floating License

There may be times when you need to reserve or lock a floating license. For example, you could lock a floating license if you want to use your floating license offline while traveling.

To reserve/lock a floating license, follow these steps:

1. **Important:** The license server must be configured by the server administrator to allow license locking. See [License Server Management and Statistics - Configuration \(on page 61\)](#).
2. Select **Lock floating license** from the **Preferences** dialog box (go to **Window (Eclipse)** on macOSX) and choose **Preferences > Oxygen XML Editor Eclipse plugin**.
3. Click **OK**.

Your floating license is now locked. You can use the same action to unlock the license or you can contact your system administrator to unlock it.

Note:

A locked floating license uses one license from the license pool for the entire period it remains locked.

Registering Floating Licenses for Multiple Users

If you are an administrator and you want to register floating licenses for multiple users without having to open Oxygen XML Editor Eclipse plugin on each machine to manually configure the registration details one by one, you can use the following procedure:

1. Reset the registration details in Oxygen XML Editor Eclipse plugin:
 - a. Open the **Preferences** dialog box (on page 70) and click **Register**.
 - b. Click **OK** without entering any information in this dialog box.
 - c. Click **Reset** and restart the application.
2. Register the license using one of the [floating license registration procedures](#) (on page 52).

Step Result: A `license.xml` file is created.

3. Copy the `license.xml` file from the [preferences directory](#) (on page 71) and place it in the `lib` subfolder of the installation directory (e.g. `[ECLIPSE-INSTALL-DIR]\plugins\com.oxygenxml.editor_22.1.0.v*\lib`).

Related information

[Requesting a Floating License from a License Server](#) (on page 52)

[Installing License Servers](#) (on page 55)

Installing License Servers

If you are using floating licenses or a large number of user-based licenses (20 or more) for **Oxygen XML Editor/Author/Developer**, you must set up an **Oxygen License Server**.

The HTTP License Server is available in several distributions, tailored for covering various deployment configurations:

- **Windows installer** - Easy-to-use Windows installation wizard. Requires elevated permissions to run it.
- **All-platform distribution** - Script-based deployment that does not require elevated permissions to run it. Provides scripts for Windows, macOS, and Linux.
- **Web Archive (WAR) distribution** - Provides more flexibility in your deployment configuration, but it requires an existing HTTP server (such as Apache Tomcat).

HTTP License Server System Requirements

Table 1. Minimum Requirements

Hardware	Specification
CPU	1 core
RAM	512 MB/Linux OS, 1 GB/Windows OS (256 MB available memory)
Hard Disk Space	500 MB
Network Requirements	Network interfaces stay unchanged (static MAC addresses) after activation

Table 1. Minimum Requirements (continued)

Hardware	Specification
Server OS Requirements	<ul style="list-style-type: none"> • Linux • Windows (Server 2022 is supported)
Antivirus and Firewall Requirements	Allow access to the configured TCP port (default 8080)

**Note:**

Oxygen XML Editor/Author/Developer version 17 or higher requires a license server version 17 or higher. License servers version 20.1 or higher can be used with any version of a floating or named-user license key.

**Restriction:**

The floating license server does not work with *Docker* containers.

Manual License Activation Procedure

If you cannot access the License Server administration page from a browser that has internet access (therefore, the license cannot be activated automatically during the installation), you can manually activate the license by following these steps:

1. Access the HTTP license server management page in a web browser.
2. Copy the machine signature code.

**Note:**

The machine signature is displayed on the page as long as the license key has not yet been activated. If you are trying to update/replace an already activated license key, the machine signature can be found by clicking on **Remove/Replace License**, then selecting **Replace** on the next page.

3. Go to the activation page at: <http://www.oxygenxml.com/activation/>.
4. Enter or paste the machine signature code and the license key, then click **Activate**.

Step Result: The activated license key is displayed on-screen.

5. Copy the activated license key and paste it in the license registration page of the HTTP server.

Backup License Server Information

If you want to use a backup license server, the setup instructions are the same as the procedures for a main license server, but it requires its own separate license key. Contact the [Oxygen support team](#) to find out more details about the backup license pricing and availability.

Related information

[Troubleshooting: Server Signature Mismatch Errors \(on page 65\)](#)

Installing the License Server Distribution for Windows

1. Download the HTTP license server installer from the [HTTP License Server website](#).
2. Run the installer and follow the on-screen instructions.
3. You must configure two sets of credentials:
 - a. **Administrator credentials** - Used for accessing the **Oxygen** license server administrative interface.
 - b. **Standard user credentials** - Used by an **Oxygen** application to connect to the license server.
4. You can choose to change the default 8080 port the server runs on. If you need to change the port after the installation, you can edit the following *vmoptions* file: `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.
5. Optionally, you can choose to install the server as a Windows service. In this case, you can choose the name of the Windows service.

Tip:

In case you run into issues, the license server log file is located in:

`[Installation_Directory]\work\logs\oXygenLicenseServlet.log`.

Installing the License Server All-Platform Distribution

1. **[Prerequisite]** Java 11 or later must be installed.
2. Download the HTTP license server all-platform archive from the [HTTP License Server website](#).
3. Unpack the archive.
4. Run the license server scripts suitable for your operating system (`licenseServer.bat` for Windows or `licenseServer.sh` for Linux and macOS).

Note:

To specify a port other than the default 8080, you can pass a new port number as an argument to the scripts (for example, `licenseServer.bat 8082`). You can also change the port by editing the *vmoptions* file located at `oXygen HTTP License Server\Windows Service\oXygenHTTPLicenseServer.vmoptions`.

5. On the first run, you are prompted to set two sets of credentials:

- a. **Administrator credentials** - Used for accessing the **Oxygen** license server administrative interface.
- b. **Standard user credentials** - Used by an **Oxygen** application to connect to the license server.

**Tip:**

If you want to manually install, start, stop, or uninstall the server as a Windows service, run the following scripts from a command line as an Administrator:

- `installWindowsService.bat [serviceName]` - Installs the server as a Windows service with the name `serviceName`. The parameters for the license key folder and the server port can be set in the `oXygenLicenseServer.voptions` file.
- `startWindowsService.bat [serviceName]` - Starts the Windows service.
- `stopWindowsService.bat [serviceName]` - Stops the Windows service.
- `uninstallWindowsService.bat [serviceName]` - Uninstalls the Windows service.

If you do not provide the `serviceName` argument, the default name `oXygenLicenseServer` is used.

If the license server is installed as a Windows service, the error messages are redirected to the `errLicenseServer.log` file in `oXygen HTTP License Server\work\Windows Service` folder.

Installing the License Server WAR Distribution

1. Make sure that you have Java Servlet Container installed on the server you have selected to be the license server. Apache Tomcat 5.5 through 9.x is recommended (available at <http://tomcat.apache.org>). Tomcat 9.x is officially supported.

**Note:**

Tomcat 10.x and later will not work with the license server.

**Important:**

By default, the license server stores the statistics database and other data in the Java Servlet Container's temporary directory. If you are not using Apache Tomcat, this directory may be deleted when the server is stopped or restarted. However, you can set the `oxygen.license.server.work.dir` system property to specify a different path for the directory where the database is stored.

2. Download the HTTP license server **Web Archive** (.war) from the [HTTP License Server website](#).
3. Configure three user roles in your installation of the Java Servlet Container (such as Apache Tomcat):

- a. One user with the role *user*, used by an **Oxygen** application to connect to the license server. In the subsequent example, this user name is **John**.
- b. Another user with the role *admin*, used for accessing the HTTP License Server administrative interface and the management interface. In the subsequent example, this user name is **Mary**.

For example, in Apache Tomcat, a typical way to achieve this is to edit the `tomcat-users.xml` file from your Tomcat installation (if using a Tomcat **zip/tar.gz** distribution, by default this configuration file is found in the `/TomcatInstallFolder/conf/` directory). After adding the three users, the configuration file might look like this:

```
<tomcat-users xmlns="http://tomcat.apache.org/xml"
              xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
              xsi:schemaLocation="http://tomcat.apache.org/xml tomcat-users.xsd"
              version="1.0">
  <!-- ... other user and role definitions ... -->
  <role rolename="user"/>
  <role rolename="admin"/>
  <user username="John" password="user_pass" roles="user"/>
  <user username="Mary" password="admin_pass" roles="admin"/>
</tomcat-users>
```

4. Deploy the WAR file.

For example, in Apache Tomcat, go to the Web Application Manager page and log in with the user you configured with the *admin* role (*Mary* in the example above). In the **WAR file to deploy** section, choose the WAR file and click the **Deploy** button. The `oxygenLicenseServlet` application is now up and running, but the license key is not yet registered.

5. Go to the HTTP License Server administration page. By default, the address of this page is `http://<server-address>/oxygenLicenseServlet`. In Apache Tomcat, you can also open this page by clicking the `oxygenLicenseServlet` link in the manager page.

You need to authenticate with the user configured with the *admin* role (*Mary* in the example above).

6. **Activate the license key.** This process involves binding your license key to your license server deployment. The browser used in the activation process needs to have Internet access.

Note:

If you cannot access the internet during the deployment, you can manually activate the license key.

Once the process is completed you cannot activate the license on another license server. Follow these steps to activate the license:

- a. Paste your license key into the form and click **Register/Activate**.

Step Result: You will be redirected to an online form hosted on the **Oxygen** website. This form is pre-filled with an activation code that uniquely identifies your license server deployment, and your license key.

- b. Click **Register/Activate**.

If the activation process is successfully completed, your license server is running. Follow the on-screen instructions to configure the Oxygen XML Editor Eclipse plugin client applications.

7. The application's log file location is specified by the `log4j.appender.R2.File` property from the `WEB-INF/lib/log4j.properties` configuration file.

For example, in Apache Tomcat, the configuration file is located at: `TomcatInstallDir/webapps/oXygenLicenseServlet/WEB-INF/lib/log4j.properties` and the default log file location is `TomcatInstallDir/logs/oxygenLicenseServlet.log`.

Installing Multiple Instances of WAR Distribution on a Tomcat Web Server

For organizations that have multiple sets of licenses (for example, an integrator with multiple clients might host a different license server for each client), use this procedure to install multiple instances of the *Oxygen License Servlet* on a Tomcat web server:

1. Rename the license server WAR file according to your needs. For example, you could use the customer name and a number (e.g. `client23415`).
2. Go to your Tomcat license server manager (e.g. `http://my.tomcatserver.com:port/manager/`) and enter your credentials.
3. Scroll to **WAR file to deploy** and press **Browse** button.
4. Locate the WAR file from step 1 and press the **Open** button.
5. Press the **Deploy** button.
6. Check that the newly deployed license server is running (it must be in the **Applications** table).

Managing License Servers

This section includes information about managing the your license server.

License Server Management and Statistics Pages

A system administrator can manage and access information about the license server at: `http://hostName:port/oXygenLicenseServlet`.

This page provides access to several statistics reports and management tasks. It also displays the current status of the server and provides additional instructions for using the license server with **Oxygen XML Editor/Author/Developer**.

This page includes the following links for accessing statistics or managing tasks:

- **Current Allocated Licenses** - Opens the **Allocated License Report** page (*on page 61*).
- **Usage Statistics** (Available only for floating licenses) - Opens the **License Usage Statistics** page (*on page 61*).
- **View License Key** - Use this link to open a page where you can see details about the license key.
- **Replace/Remove License Key** - Use this link if you need to [replace or remove the current license key](#) (*on page 63*).
- **Configuration** - Opens a page where you can configure notification settings and set up the mail server used for sending emails whenever license requests from users are rejected. This page also contains a **Allow users to lock licenses** option. Enabling this option allows the users to [lock/reserve a floating license](#) (*on page 54*).
- **Users management** (Available only for named-user licenses) - Opens a page where you can manage the list of users who are entitled to use the license key.
- **Allowed users list** (Available only for named-user licenses) - Opens a page where you can see the allowed users list (if one has already been configured), along with instructions for configuring one.

Allocated License Report Page

This report page provides a system administrator the ability to revoke or unlock current running instances of licenses and includes the following information:

- **License load** - A graphical indicator that shows how many licenses are available.
- **License server status** - General information about the license server status, such as start time, license counts, rejected and acknowledged requests, average usage time, license refresh and timeout intervals, location of the license key, and the server version.
- **Current running instances** - Lists all currently acknowledged users, including user name, date and time when the license was granted, IP and MAC address of the computer where **Oxygen** runs, and lock status.
 - **Revoke** - A system administrator can click on the  **Revoke** icon next to a user name to release that particular license and return it to the pool.
 - **Unlock** - If a user has locked their license, the system administrator can also unlock it from this page.

Note:

This report is also available in XML format at: `http://hostName:port/oxygenLicenseServlet/license-servlet/report-xml`.

License Usage Statistics Page (Floating License Only)

This report page provides some usage statistics for the floating licenses. It is helpful for determining the number of licenses that are needed and monitoring times when licenses are consumed. It includes the following information:

- **Maximum number of concurrent licenses** - Shows the maximum number of floating licenses that can be consumed at any given time.
- **Concurrent license consumption per day** - A chart that shows the peak number of licenses that were consumed and the total number of users that were rejected, on a daily basis. This chart can be used to detect the amount of concurrent licenses that are needed to avoid having rejected users.

i Tip:
You can click on any bar to see the license consumption per hour for that particular day.

Figure 10. Concurrent License Consumption per Day Chart

- **Concurrent license consumption per hour** - A chart that shows the peak number of licenses that were consumed per hour throughout that particular month. This is useful for identifying the time of day when the most licenses were consumed.

Figure 11. Concurrent License Consumption per Hour Chart

Users Management Page (Named-User License Only)

When a named-user license key is used, the license server allocates available licenses in the order they are requested until the maximum number is reached. Any additional users attempting to obtain a license key will be rejected.

This page provides access to the list of registered users and allows the server admin to:

- Revoke a user's right to use a license.
- Reactivate a previously deactivated user.

Figure 12. Users List Management Page

The screenshot displays the 'XML License Server User Management' interface. At the top, it shows the title '<oxygen/> XML License Server User Management' and a link '< Back to main page'. Below this is a section titled 'License server status' containing a table with the following data:

Total licenses	6
Used licenses	5
Available licenses	1

Below the status table, it indicates 'Users: 6' and presents a table of users with a 'Deactivated' column. The 'bogdan_d' user is selected, indicated by a checked checkbox.

User Name	Deactivated
andrei	<input type="checkbox"/>
bogdan	<input type="checkbox"/>
bogdan_d	<input checked="" type="checkbox"/>
mihaela	<input type="checkbox"/>
mircea	<input type="checkbox"/>
teodor	<input type="checkbox"/>

Replacing or Removing a License Key in an HTTP License Server

The following procedure assumes that your HTTP license server contains a previously activated license key and provides instructions for replacing it with another one or removing it completely.

This is useful if, for instance, you want to upgrade your existing license to the latest version or if you receive a new license key [that accommodates a different number of users \(on page 47\)](#).

Replacing a License Key

To replace a license key that is activated on your HTTP license server with a new one, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your **admin** credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Replace** button.
4. Paste the new license key in the displayed form.
5. Click **Register/Activate**. The browser used in the process needs to have Internet access.

Step Result: You will be redirected to an online form hosted on the **Oxygen** website. This form is pre-filled with an activation code that uniquely identifies your license server deployment and your license key.

Note:

If you cannot access the online activation form, you can [manually activate the license key \(on page 56\)](#).

Result: If the activation process is completed successfully, your license server is now running using the new license key. You can click **View license key** to inspect the key currently used by the license server.

Removing a License Key

To remove a license key that is activated on your HTTP license server, follow these steps:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page and log in using your **admin** credentials.
2. Click the **Replace/Remove license key** link. This will open a page that contains details about the license currently in use.
3. Click the **Remove** button to begin the license deletion procedure.
4. Click the **Remove** button in the confirmation page.

Important:

The removal process is irreversible. Once the process is complete, you cannot restore the license key.

Upgrading Your HTTP License Server

The goal of the following procedure is to help you minimize the downtime when you upgrade the HTTP License Server to its latest version:

1. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the **admin** credentials.
2. Click the **View license key** link and copy the displayed license key to a file for later use.

3. Go to the Tomcat Web Application Manager page, log in with the user you configured with the **admin** role, and *Undeploy* the license server.
4. [Download the Web Archive \(WAR\) distribution of HTTP license server.](#)
5. Deploy the downloaded license server.
6. Access the license server by following the link provided by the Tomcat Web Application Manager page. If prompted for authentication, use the credentials configured for the **admin** user.
7. Paste your license key into the form and register it.

Configuring a License Server to Only Allow Certain Users

A system administrator can configure the license server to only allow specific users to request a license. This is available only for named-user licenses (not floating licenses) and is managed using an *Allowed Users List*.

To configure an *Allowed Users List*:

1. Create a text file named **allowed-users.txt**.
2. Enter the user name for each allowed user on a separate line.
3. Save the file in the license server work directory. You can go to the license server management page, and under *Management Tasks*, click the **Allowed users list** link to open a page where you can see the exact directory where it needs to be stored.

Note:

If the `allowed-users.txt` file is present but it is empty, all users are allowed to request a license.

In the license server management page, there is a link to the **Allowed users list** under *Management Tasks*. Also, in the **Current Allocated Licenses** page, there is a **Show allowed users** button. Both of them direct you to a page where you can see the *Allowed Users List* (if one has already been configured), along with instructions for configuring one. The list updates automatically between license requests every 30 seconds if the file is changed.

Common Problems: License Server Errors

This section includes some common problems that may appear when setting up a license server.

Server Signature Mismatch Error

Problem

I receive an error indicating that *the current license was already activated on a License Server* or that the *License Server's Signature does not match*.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Server*

Signature) is sent to the **Oxygen** servers, which in turn will sign the license key. The *Server Signature* is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your *Server Signature* does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the [Oxygen support team](#).

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (`/usr/local/apache-tomcat-V.V.V`) with a symbolic link to the typical folder (`/usr/local/tomcat`). The server can be restarted from either location, but it is recommended to always restart from the typical folder (`/usr/local/tomcat`) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

Upgrading

From time to time, upgrades and patch versions of Oxygen XML Editor Eclipse plugin are released to provide enhancements that fix problems and add new features.

Upgrading Oxygen XML Editor Eclipse plugin on Windows/Linux

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor Eclipse plugin, some data is preserved and some is overwritten. If there is a previous version of Oxygen XML Editor Eclipse plugin already installed on your computer, it can coexist with the new one, which means you do not have to uninstall it.

If you install over a previously installed version:

- All the files from its install directory will be removed, including any modification in *framework* (on page 2679) files, XSLT stylesheets, *XML Catalogs* (on page 2683), and templates.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* (on page 2679) that were stored outside the installation directory (as configured in **Document type associations > Locations** (on page 90)) will be preserved and will be found by the new installation.

If you install in a new directory:

- All the files from the old install directory will be preserved, including any modification in *framework* (on page 2679) files, XSLT stylesheets, *XML Catalogs* (on page 2683), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* (on page 2679) that were stored outside the installation directory (as configured in **Document type associations > Locations** (on page 90)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor Eclipse plugin on Windows or Linux

1. Uninstall the current version of Oxygen XML Editor Eclipse plugin (on page 68).
2. Download and install the new version according to the instructions for your platform and the type of installer you selected.
3. Restart Oxygen XML Editor Eclipse plugin.
4. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version, you will need to enter a new license for the new version into the registration dialog box that is displayed when the plugin is started.

Upgrading Oxygen XML Editor Eclipse plugin on macOS

What is Preserved During an Upgrade?

When you install a new version of Oxygen XML Editor Eclipse plugin, first you need to remove or rename the old installation directory. By renaming the directory, it can coexist with the new installation and the following data will be preserved:

- All the files from the old install directory will be preserved, including any modification in *framework* (on page 2679) files, XSLT stylesheets, *XML Catalogs* (on page 2683), and templates. However, these modifications will not be automatically imported into the new installation.
- All global user preferences are preserved in the new version.
- All project preferences will be preserved in their project files.
- Any custom *frameworks* (on page 2679) that were stored outside the installation directory (as configured in **Document type associations > Locations** (on page 90)) will be preserved and will be found by the new installation.

How to Upgrade Oxygen XML Editor Eclipse plugin on macOS

1. [Uninstall the current version of Oxygen XML Editor Eclipse plugin \(on page 68\)](#) or rename the installation directory.
2. Download and install the new version in an empty folder according to the instructions for your platform and the type of installer you selected.
3. Restart Oxygen XML Editor Eclipse plugin.
4. If you are upgrading from a minor version to a major version (for example, from 16.1 to 17.0) and you did not purchase a Maintenance Pack that covers the new major version, you will need to enter a new license for the new version into the registration dialog box that is displayed when the plugin is started.

Uninstalling

How to Uninstall Oxygen XML Editor Eclipse plugin

CAUTION:

The following procedure will remove Oxygen XML Editor Eclipse plugin from your system. It will not remove the Eclipse platform. If you want to uninstall Eclipse, refer to its uninstall instructions.

1. Choose the menu option **Help > About > Installation Details**.
2. Select Oxygen XML Editor Eclipse plugin from the list of plugins.
3. Choose **Uninstall**.
4. Accept the Eclipse restart.
5. If you want to remove the user preferences:

- **Windows** - Remove the directory: `%APPDATA%\com.oxygenxml`. Note that the `AppData` directory is hidden. If you cannot locate it, type `%APPDATA%` in the File Explorer address bar and click `ENTER` (`%APPDATA%` expands to `[user-home-dir]\AppData\Roaming`).
- **macOS** - Remove the directory: `Library/Preferences/com.oxygenxml` of the user home folder.
- **On Linux**, remove the directory: `.com.oxygenxml` from the user home directory.

4.

Configuring Oxygen XML Editor Eclipse plugin

This chapter presents all the user preferences and options that allow you to configure various features and aspects of the application itself. It also includes information about storing and sharing options, importing and exporting options or scenarios, customizing system properties, setting startup parameters, and the [editor variables \(on page 218\)](#) that are available for customizing user-defined commands.

Preferences

You can configure Oxygen XML Editor Eclipse plugin options using the **Preferences** dialog box.

To open the preferences dialog box, go to go to **Window (Eclipse on macOSX)** and choose **Preferences > Oxygen XML Editor Eclipse plugin**.

Figure 13. Eclipse Preferences Dialog Box

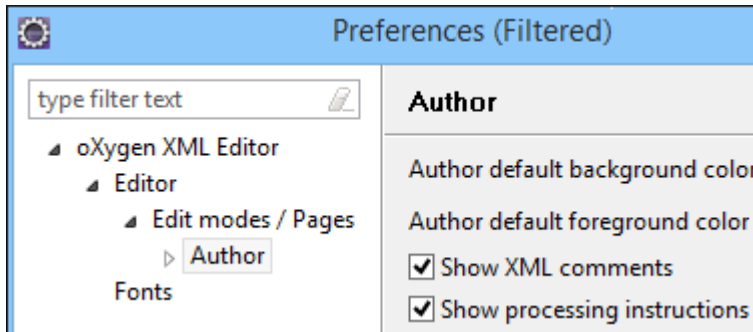

Click the  icon or press **F1** for help on any preferences page.

You can restore options to their default values by pressing the **Restore Defaults** button, available in each preferences page.

A filtered version of the **Preferences** dialog box is available by selecting **Options** from the contextual menu in the editor. It displays an appropriate preferences page according to the context where the action was invoked and filters the tree on the left according to where the preference page is located in the hierarchy.

Figure 14. Eclipse Preferences Dialog Box - Filtered Version

Preferences Directory Location

A variety of resources (such as global options, license information, and history files) are stored in a preferences directory (`com.oxygenxml`) that is in the following locations:

- **Windows (7, 8, 10)** - `[user_home_directory]\AppData\Roaming\com.oxygenxml`
- **macOS** - `[user_home_directory]/Library/Preferences/com.oxygenxml`
- **Linux/Unix** - `[user_home_directory]/.com.oxygenxml`

Oxygen XML Editor Eclipse plugin License

To configure the license options, open the **Preferences** dialog box (on page 70). This preferences page presents the details of the license key that enables the Oxygen XML Editor Eclipse plugin plugin, such as registration name, category and number of purchased licenses, encrypted signature of the license key. Clicking the **Register** button opens the Oxygen XML Editor Eclipse plugin **License** dialog box that allows you to insert a new license key.

Archive Preferences

To configure *Archive* options, open the **Preferences** dialog box (on page 70) and go to **Archive**.

The following options are available in the **Archive** preferences page:

Archive backup options

Controls if the application makes backup copies of the modified archives. The following options are available:

- **Always create backup copies of modified archives** - When you modify an archive, its content is backed up.
- **Never create backup copies of modified archives** - No backup copy is created.
- **Ask for each archive once per session** - Once per application session for each modified archive, user confirmation is required to create the backup. This is the default setting.

Note:

Backup files have the name `originalArchiveFileName.bak` and are located in the same folder as the original archive.

Show archive backup dialog box

Select this option if you want to be notified for backup when modifying in archives. The last backup option you chose will always be used as the default one.

Archive types

This table contains all known archive extensions mapped to known archive formats. Each row maps a list of extensions to an archive type supported in Oxygen XML Editor Eclipse plugin. You can use the **Edit** button at the bottom of the table to edit an existing mapping or the **New** button to create a new one and associate your own list of extensions to an archive format.

Figure 15. Edit Archive Extension Mappings

Important:

You have to restart Oxygen XML Editor Eclipse plugin after removing an extension from the table for that extension to not be recognized as an archive extension.

Store Unicode file names in Zip archives

Use this option when you archive files that contain international (non-English) characters in file names or file comments. If this option is selected and an archive is modified in any way, UTF-8 characters are used in the names of all files in the archive.

CSS Validator Preferences

To configure the **CSS Validator** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **CSS Validator**.

You can configure the following options for the built-in **CSS Validator** of Oxygen XML Editor Eclipse plugin:

- **Profile** - Selects one of the available validation profiles: **CSS 1, CSS 2, CSS 2.1, CSS 3, CSS 3 + SVG, CSS 3 with Oxygen extensions, SVG, SVG Basic, SVG Tiny, Mobile, TV Profile, ATSC TV Profile**.
The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen \(on page 2143\)](#) that can be used in [Author mode \(on page 242\)](#). That means all **Oxygen**-specific extensions are accepted in a CSS stylesheet by [the built-in CSS validator \(on page 826\)](#) when this profile is selected.
- **Media type** - Selects one of the available mediums: **all, aural, braille, embossed, handheld, print, projection, screen, tty, tv, presentation, oxygen**.
- **Warning level** - Sets the minimum severity level for reported validation warnings. Can be one of: **All, Normal, Most Important, No Warnings**.
- **Ignore properties** - You can type comma separated patterns that match the names of CSS properties that will be ignored at validation. The following vendor extensions are specified as ignored by default: **-ro-*** (*PDFreactor*), **-ah-*** (*Antenna House*), **prince-*** (*Prince*). As wildcards you can use:
 - * to match any string.
 - ? to match any character.
- **Recognize browser CSS extensions (also applies to content completion)** - If selected, Oxygen XML Editor Eclipse plugin recognizes browser-specific CSS properties (no validation is performed). The [Content Completion Assistant \(on page 2677\)](#) lists these properties at the end of its list, prefixed with the following particles:
 - **-moz-** for *Mozilla*.
 - **-ms-** for *Edge*.
 - **-o-** for *Opera*.
 - **-webkit-** for *Safari/Webkit*.

Custom Editor Variables Preferences

An [editor variable \(on page 218\)](#) is useful for making a transformation scenario, validation scenario, or other tool independent of its file path. An editor variable is specified as a parameter in a transformation scenario, validation scenario, or command line of an external tool. Such a variable is defined by a name, a string value, and a text description. A custom editor variable is defined by the user and can be used in the same expressions as the [built-in editor variables \(on page 218\)](#).

Custom editor variables are created and configured in the **Custom Editor Variables** preferences page. To access this page, [open the Preferences dialog box \(on page 70\)](#) and go to **Custom Editor Variables**.

This preferences page displays a table of all the custom editor variables that have been defined. The table includes three columns for the editor variable **Name**, its **Value**, and its **Description**. To create a new variable, click the **+ New** button at the bottom of the table and define your custom editor variable in the subsequent

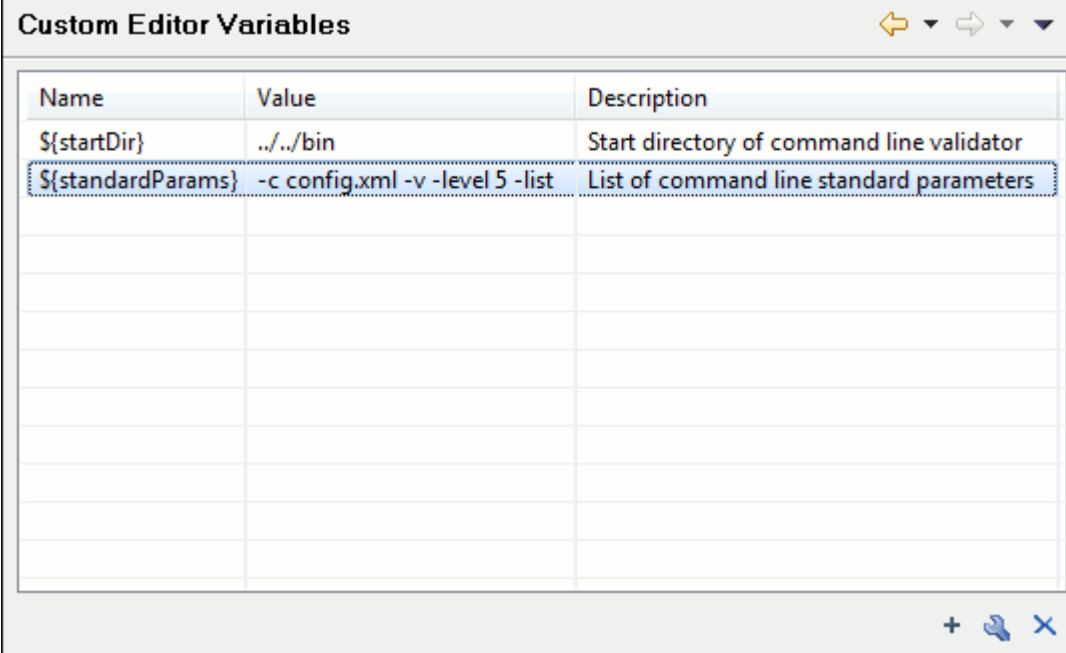

dialog box. To edit an existing custom editor variable, click the  **Edit** button and configure the variable in the subsequent dialog box. You can also use the  **Delete** button to remove custom editor variables that are no longer needed.

Figure 16. Custom Editor Variables Table

Name	Value	Description
<code>\${startDir}</code>	<code>../bin</code>	Start directory of command line validator
<code>\${standardParams}</code>	<code>-c config.xml -v -level 5 -list</code>	List of command line standard parameters

Data Sources Preferences

To configure the **Data Sources** preferences, open the **Preferences** dialog box ([on page 70](#)) and go to **Data Sources**. This preferences page allows you to configure data sources and connections to relational and native XML databases. For a list of drivers that are available for the major database servers, see [Download Links for Database Drivers](#) ([on page 79](#)).

Connection Wizards Section

Create eXist-db XML connection

Click this link to open the dedicated [Create eXist-db XML connection](#) dialog box ([on page 1852](#)) that provides a quick way to create an eXist connection.

Data Sources Section

This section allows you to add and configure data sources.

Figure 17. Data Sources Preferences Panel

The following buttons are available at the bottom of the **Data Sources** panel:

+ New

Opens the **Data Sources Drivers** dialog box that allows you to configure a new database driver.

Figure 18. Data Sources Drivers Dialog Box

The following options are available in the **Data Source Drivers** dialog box:

- **Name** - The name of the new data source driver that will be used for creating connections to the database.
- **Type** - Selects the data source type from the supported driver types.
-  **Help button** - Opens the User Manual at [the list of the sections \(on page 79\)](#) where the configuration of supported data sources is explained and the URLs for downloading the database drivers are specified.
- **Driver files (JAR, ZIP)** - Lists [download links for database drivers \(on page 79\)](#) that are necessary for accessing databases in Oxygen XML Editor Eclipse plugin.
- **Add Files** - Adds the driver class library.
- **Add Recursively** - Adds driver files recursively.
- **Remove** - Removes the selected driver class library from the list.
- **Detect** - Detects driver file candidates.
- **Stop** - Stops the detection of the driver candidates.
- **Driver class** - Specifies the driver class for the data source driver.

Edit

Opens the **Data Sources Drivers** dialog box for editing the selected driver. See above the specifications for the **Data Sources Drivers** dialog box. To edit a data source, there must be no connections using that data source driver.

Duplicate

Creates a copy of the selected data source.

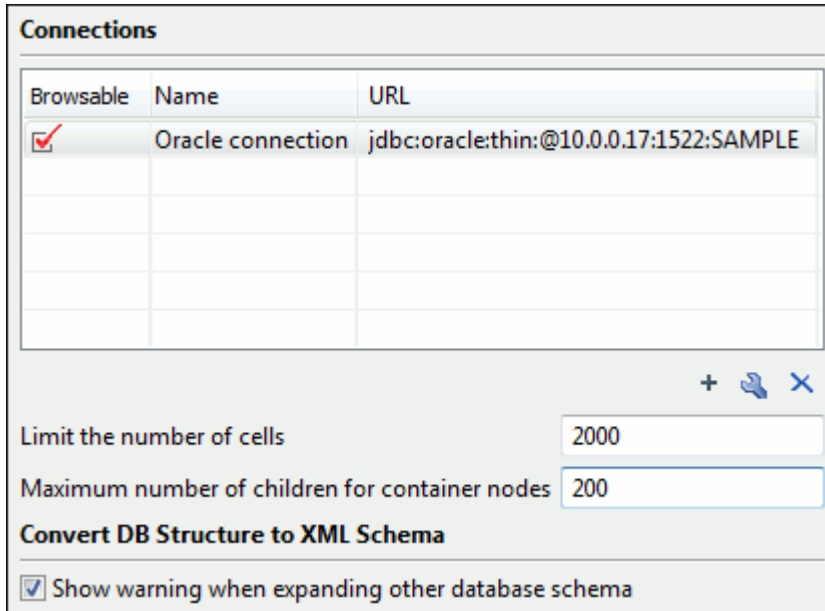

Delete

Deletes the selected driver. To delete a data source, there must be no connections using that data source driver.

Connections Section

This section allows you to add and configure data source connections.

Figure 19. Connections Preferences Panel

The following buttons and options are available at the bottom of the **Connections** panel:

+ New

Opens the **Connection** dialog box that allows you to configure a new database connection.

Figure 20. Connection Dialog Box

The following options are available in the **Connection** dialog box:

- **Name** - The name of the new connection that will be used in transformation scenarios and validation scenarios.
- **Data Source** - Allows selecting a data source defined in the **Data Source Drivers** dialog box.

Depending upon the selected data source, you can set some of the following parameters in the **Connection details** area:

- **URL** - The URL for connecting to the database server.
- **User** - The user name for connecting to the database server.
- **Password** - The password of the specified user name.
- **Host** - The host address of the server.
- **Port** - The port where the server accepts the connection.
- **XML DB URI** - The database URI.
- **Database** - The initial database name.
- **Collection** - One of the available collections for the specified data source.
- **Use a secure HTTPS connection (SSL)** - Allows you to establish a secure connection to an eXist database through the SSL protocol.

Edit

Opens the **Connection** dialog box, allowing you to edit the selected connection. See above the specifications for the **Connection** dialog box.

Duplicate

Creates a copy of the selected connection.

Delete

Deletes the selected connection.

Move Up

Moves the selected connection up one row in the list.

Move Down

Moves the selected connection down one row in the list.

Limit the number of cells

For performance issues, you can set the maximum number of cells that will be displayed in the **Table Explorer view (on page 1833)** for a database table. Leave this field empty if you want the entire content of the table to be displayed. By default, this field is set to 2000. If a table that has more cells than the value set here is displayed in the **Table Explorer view (on page 1833)**, a warning dialog box will inform you that the table is only partially shown.

Maximum number of children for container nodes

In Oracle XML, a container can hold millions of resources. If the node corresponding to such a container in the **Data Source Explorer view (on page 1831)** would display all the contained

resources at the same time, the performance of the view would be very slow. To prevent this, only a limited number of the contained resources is displayed as child nodes of the container node. You can navigate to other contained resources from the same container by using the *Up* and *Down* buttons in the **Data Source Explorer** view (*on page 1831*). This limited number is set in the field. The default value is 200 nodes.

Show warning when expanding other database schema

Controls if a warning message will be displayed when expanding another database schema and there are tables selected in the current, expanded one. This applies to the **Select database table** dialog box in the **Import Database Data to XML** wizard (*on page 1906*) and the **Select database table** section of the **Convert DB Structure to XML Schema** dialog box (*on page 777*).

Table Filters Preferences

The **Table Filters** preferences page allows you to choose the types of tables to be shown in the **Data Source Explorer** view (*on page 1831*). To open this preferences page, open the **Preferences** dialog box (*on page 70*) and go to **Data Sources > Table Filters**.

You can choose to display the following types of tables:

- **Alias**
- **Global Temporary**
- **Local Temporary**
- **Synonym**
- **System Table**
- **Table**
- **View**

Download Links for Database Drivers

For a list of major relational databases and the drivers that are available for them, see https://www.oxygenxml.com/database_drivers.html.

In addition, the following is a list of other popular databases along with instructions for getting the drivers that are necessary to access the databases in Oxygen XML Editor Eclipse plugin:

- **IBM DB2 Pure XML database** (Deprecated) - Go to the [IBM website](#) and in the *DB2 Clients and Development Tools* category select the *DB2 Driver for JDBC and SQLJ* download link. Fill out the download form and download the zip file. Unzip the zip file and use the `db2jcc.jar` and `db2jcc_license_cu.jar` files in Oxygen XML Editor Eclipse plugin for [configuring a DB2 data source](#) (*on page 1876*).
- **eXist database** - Copy the *jar* files from the eXist database install directory to the Oxygen XML Editor Eclipse plugin install directory as described in [the procedure for configuring an eXist data source](#) (*on page 1853*).
- **MarkLogic database** (Deprecated) - Download the MarkLogic driver from [MarkLogic Community site](#).

- **Oracle 11g database** (Deprecated) - Go to <http://www.oracle.com/technetwork/database/enterprise-edition/jdbc-112010-090769.html> and download the Oracle 11g JDBC driver called `ojdbc6.jar`.
- **PostgreSQL database** (Deprecated) - Go to <https://jdbc.postgresql.org/download/> and download the PostgreSQL JDBC driver specific for your server version.
- **Microsoft SQL Server 2019 database** (Deprecated) - Download the appropriate MS SQL JDBC driver from the [Microsoft website](#).

DIFF Preferences

To access the **DIFF** preferences page, go to **Window (Eclipse on macOS)** and choose **Preferences > Oxygen XML Editor Eclipse plugin > DIFF**. This preferences page includes the following sections and options:

Enable file comparison in Text mode

When selected, the text-based comparison mode is available when comparing XML files.

Enable file comparison in Author mode

When selected, the visual comparison mode is available when comparing XML files.

Two-Way Diff section

Default algorithm

The default algorithm used for comparing two files. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Three-Way Diff section

Default algorithm

The default algorithm used for performing a three-way comparison. The following options are available:

- **Auto** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

Algorithm strength

Controls the amount of resources allocated to the application to perform the comparison. The algorithm stops searching more differences when reaches the maximum allowed resources. A dialog box is displayed when this limit is reached and partial results are displayed. Four settings are available: **Low**, **Medium** (default), **High** and **Very High**.

Show pseudo conflicts

Specifies whether or not the file comparison displays pseudo-conflicts. A pseudo-conflict occurs when two users make the same change (for example, when they both add or remove the same line of code).

XML Diff section

In this section, you can choose to ignore **Namespaces**, **Prefixes**, **Namespace declarations**, and the **Attribute order**.

Appearance Preferences

To configure the appearance options for the visual file comparison tool, go to **Window (Eclipse on macOSX)** and choose **Preferences > Oxygen XML Editor Eclipse plugin > DIFF > Appearance**. This preferences page includes the following sections and options:

Incoming color

Specifies the color used on the vertical bar for incoming changes.

Outgoing color

Specifies the color used on the vertical bar for outgoing changes.

Conflict color

Specifies the color used on the vertical bar for conflicts between the compared files.

DITA Preferences

To access the DITA Preferences page, [open the Preferences dialog box \(on page 70\)](#) and go to **DITA**. This preferences page includes the following sections and options:

DITA Open Toolkit section

This section allows you to specify the default directory of the DITA Open Toolkit distribution (bundled with the Oxygen XML Editor Eclipse plugin installation) to be used for validating and publishing DITA content. You can select from the following:

Built-in Oxygen Publishing Engine (based on DITA-OT 4.x)

Oxygen XML Editor Eclipse plugin comes bundled with the **Oxygen Publishing Engine** (based on DITA-OT 4.1.2). By default, all defined DITA transformation/validation scenarios will run with this version. The default publishing engine directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`.

Custom

Allows you to specify a custom directory for your DITA-OT distribution.

Location

You can either provide a new file path for the specific DITA-OT that you want to use or select a previously used one from the drop-down list. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Important:

Using a custom DITA Open Toolkit may disable certain features in the application. Examples of features that may not work properly:

- If the custom DITA-OT is missing certain publishing plugins, default transformation scenarios such as [DITA Map WebHelp Responsive \(on page 2525\)](#) or [DITA Map PDF - based on HTML5 & CSS \(on page 2540\)](#) may no longer work properly.
- Validation of Markdown documents using Schematron may not work because it is based on a certain DITA Open Toolkit plugin.
- The DITA framework (defined in the **Preferences > Document Type Associations** page) will use the XML catalogs specified in the DITA-OT configured in the **Preferences > DITA** page to perform the validation of all DITA topic types. If this DITA-OT is different from the one that comes bundled with the Oxygen XML Editor Eclipse plugin default distribution, you might encounter validation-related issues.

CAUTION:

Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or

inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Enable DITA 2.0 editing support (Experimental)

If selected, you will have access to a **DITA 2.0** folder in the [New Document Wizard \(on page 246\)](#) where you can find new document templates for creating DITA 2.0 maps or topics based on the DITA 2.0 standard DTDs. For example, in a DITA topic based on the DITA 2.0 DTDs, you can insert an `<include>` element that is not found in the DITA 1.3 DTDs.

DITA Logging Preferences

To access the DITA Logging preferences page, [open the Preferences dialog box \(on page 70\)](#) and go to **DITA > Logging**. This preferences page includes the following sections and options:

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Show the following types of messages in a new tab

This section allows you to specify which types of messages will be displayed in separate tabs in the message panel at the bottom of the editor if a DITA transformation results in errors or warnings. You can choose whether or not to display the following types of messages:

- DITA-OT errors
- DITA-OT warnings
- DITA-OT info
- FOP errors
- FOP warnings
- FOP info
- XSLT problems

DITA Maps Preferences

To access the *DITA Maps* preferences page, [open the Preferences dialog box \(on page 70\)](#) and go to **DITA > Maps**. This preferences page includes the following options:

Expand references to other maps when opening a map in Author mode

Enabling this option will improve performance (decrease the loading time) when opening maps in **Author** mode (particularly maps that contain a large amount of submaps). This option is disabled by default.

**Note:**

You must close and reopen the map to see the effects of enabling/disabling this option.

DITA Maps Manager section**Only display items related to currently open maps in the Context drop-down list**

If selected, only the currently open maps and contexts that are relevant to the currently open maps are displayed in the **Context** map drop-down menu in the DITA Maps Manager. This is helpful if you are working with multiple DITA-OT projects and DITA maps set as *Main Files* since it helps you narrow down the relevant contexts.

Prefer using the navigation title for rendering topic references

If selected and there is a `@navtitle` attribute set on a `<topicref>`, then the `@navtitle` is used to render the title of the topic in the **DITA Maps Manager** (*on page 2337*).

Allow referenced submaps to be edited

If selected, all DITA maps referenced directly or indirectly in a DITA map that is open in the **DITA Maps Manager** view will be fully editable. You will be able to add new topic references, modify properties, and move topic references from one submap to another. Saving the main DITA map will also save the contents of the modified submaps.

**Attention:**

The documents must be reopened to apply a change to this option.

Local files only

If selected, only submaps that are located on local disk drives will be editable. As for maps located in remote locations (e.g. content management systems), the save operation might not work on all submaps. This checkbox is selected by default.

Inserting Topic References section**Always set values for the following attributes**

Allows you to specify that when inserting a topic reference (using the **Insert Reference dialog box** (*on page 2363*) and **Edit Properties dialog box** (*on page 2373*)), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `@format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `@scope` attribute will always be automatically populated with a detected value.

- **Type** - If selected, the `@type` attribute will always be automatically populated with a detected value.
- **Navigation title** - If selected, the `@navtitle` attribute will always be automatically populated with a detected value.

Use the file name as the value of the "keys" attribute

If selected, when inserting a topic reference into a map, the file name will be used as the value of the `@keys` attribute for the new `<topicref>`. The key is not defined on the `<topicref>` for references to DITA maps. This option has a slightly different effect depending on the method used for inserting the topic reference:

- **Drag/Drop or Copy/Paste in the DITA Maps Manager** - If you drag or copy a resource from another view (or outside Oxygen XML Editor Eclipse plugin) and drop or paste it into the **DITA Maps Manager** and a key is already defined for that resource, a `@keyref` attribute will be inserted instead. This even works for two consecutive drag/drop or copy/paste operations without saving the file and it works for multiple selections of topic references.
- **Drag/Drop or Copy/Paste in a Map opened in Author Mode** - If you drag or copy a resource from another view (or outside Oxygen XML Editor Eclipse plugin) and drop or paste it into a map that is open in **Author** mode and a key is already defined for that resource, a `@keyref` attribute will be inserted instead.

Restriction:

In this particular scenario, if you perform two identical, consecutive drag/drop or copy/paste operations without saving the file between operations, the value of the `@keys` attribute will be the same for both inserted topic references. The workaround for this limitation is to simply save the map after each drag/drop or copy/paste operation.

- **Using the Fast Create Topics or Duplicate Actions** - If you use the **Fast Create Topics** feature (on page 2405) or **Duplicate** action (on page 2402) to insert topic references, the newly created `<topicref>` elements will contain the `@keys` attribute with its value set depending on the file name.
- **Using the Insert Topic Reference Dialog Box from the DITA Maps Manager** - If you use an action in the **DITA Maps Manager** to insert topic references (e.g. **Append Child > Reference**), a `@keys` attribute will be set for each inserted topic reference and the value depends on the file name. You can see the value in the **Define keys** field from the **Keys** tab of the **Insert Reference** dialog box (on page 2363) and you can change it.

Note:

This option also has an effect on image references. When inserting a reference to an image in a DITA map and this option is selected, a `<keydef>` element is created if it is allowed by the schema. If it is not allowed (or this option is deselected), a specific

topic reference element is created with the value of the `@processing-role` attribute set to **resource-only**.

Prefer adding key references to already referenced resources

If selected, when a topic reference is inserted into a map and a key is already defined for that resource, a `@keyref` attribute is inserted for the new `<topicref>`. If not selected, an `@href` attribute is inserted instead.

Dynamic conversion of specific non-DITA resources

If selected (default), non-DITA documents are dynamically converted to DITA when they are chosen in the **Insert Reference dialog box** (on page 2363) and the IDs from the resulting DITA content are presented in the dialog box. If not selected, non-DITA documents (Word, Excel, Markdown, OpenAPI, and HTML) are not dynamically converted when they are chosen in the dialog box.

DITA Publishing Preferences

To access the DITA Publishing preferences page, open the **Preferences dialog box** (on page 70) and go to **DITA > Publishing**. You can also open this page by clicking the **Configure Publishing Templates Gallery** link in the **Templates** tab of the transformation scenario dialog box for **WebHelp Responsive** transformations.

You can use this preferences page to specify additional directories where custom publishing templates are stored. The templates stored in these directories will appear in the preview pane in the **Templates** tab of the transformation scenario dialog box, along with all the built-in templates.

DITA New Topics Preferences

To access the DITA New Topics preferences page, open the **Preferences dialog box** (on page 70) and go to **DITA > New Topics**. This preferences page includes the following options:

New Topics section

Use the title to generate the file name

This option (and its sub-options) pertain to the rules that will be used to generate file names in the *New DITA File dialog box* (on page 2402). Select this option to use the text entered in the **Title** field to automatically generate a file name (the generated name can be seen in the **Save as** field). By default, the generated name will replace spaces with underscores (`_`), all illegal characters will be removed, and all upper case characters changed to lower case, but you can use the sub-options to change this.

Replace non-alphanumeric characters with

If selected, the file name generation mechanism will replace all non-alphanumeric characters in the title with the character entered in this option.

Lower case only

If selected, the file name generation mechanism will only use lower case letters.

Use camel case

If selected, the file name generation mechanism will convert the title to a file name using the *camel case* convention where the first word starts with a lower case letter and all subsequent words begin with upper case (for example, `myFileName`).

Upper case first letter

Select this option if you want the file name generation mechanism to convert the title to a file name using the *camel case* convention but with an upper case letter for the first word (for example, `MyFileName`).

Use the file name as the value of the root ID attribute

If selected, when creating a new topic, the file name (as seen in the **Save as** field but without the file extension) will be used as the value of the root `@id` attribute for the new topic.

Inserting Links section

Always set values for the following attributes

Allows you to specify that when a link reference is inserted (using actions in the  **Link** drop-down menu), the values for certain attributes will always be automatically populated with a detected value (based on the specifications), even if it is the same as the default value. You can choose to always populate the values for the following attributes:

- **Format** - If selected, the `@format` attribute will always be automatically populated with a detected value.
- **Scope** - If selected, the `@scope` attribute will always be automatically populated with a detected value.
- **Type** - If selected, the `@type` attribute will always be automatically populated with a detected value.

Use '!' instead of the ID of the parent topic (DITA 1.3)

When addressing a non-topic element within the topic that contains the URI reference, the URI reference can use an abbreviated fragment-identifier syntax that replaces the topic ID with ". " (`#!/elementId`). For more information, see <https://www.oxygenxml.com/dita/1.3/specs/index.html#archSpec/base/uri-based-addressing.html>.

Document Templates Preferences

Oxygen XML Editor Eclipse plugin provides a variety of built-in document templates that make it easier to create new documents in various formats. The list of available templates is presented in the **New Document**

wizard (on page 246) when you create a new document ( **New** toolbar button or **File > New > New from Templates**).

You can also [create your own templates \(on page 253\)](#) and share them with others. You can store your custom document templates in the existing `templates` folder in the Oxygen XML Editor Eclipse plugin installation directory or store them in a custom directory. If you store them in a custom directory, you need to use this **Document Templates** preferences page to add that directory to the list of template directories that Oxygen XML Editor Eclipse plugin makes available in the **New Document** wizard.

To add a template directory, follow these steps:

1. open the **Preferences** dialog box (on page 70) and go to **Document Templates**.
2. Use the **+ New** button to select a location of the new document template folder.
3. You can also use the **Edit** or **Delete** buttons to manage folders in the list, and you can alter the order that Oxygen XML Editor Eclipse plugin looks in these directories by using the **Up** and **Down** buttons.

Result: This will add the folder to the list in this preferences page and it will now appear in the **New from templates wizard (on page 253)** in a category based upon the folder path you specified.

Note:

For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you [customize the template \(on page 255\)](#), you need to set the `type` property to `dita` in the corresponding properties file.

Document Type Association Preferences

Oxygen XML Editor Eclipse plugin uses [document type associations \(on page 2678\)](#) to associate a [document type \(on page 1030\)](#) with a set of functionality provided by a [framework \(on page 2679\)](#). To configure the **Document Type Association** options, [open the Preferences dialog box \(on page 70\)](#) and go to **Document Type Association**.

The following actions are available in this preferences page:

Discover more frameworks by using add-ons update sites

Click on this link to specify URLs for *framework* add-on update sites.

Document Type Table

This table presents the currently defined [frameworks \(on page 2679\)](#) ([document type associations \(on page 2678\)](#)), sorted by priority and alphabetically. Each edited document type has a [set of association rules \(on page 92\)](#) (used by the application to detect the proper document type association to use for an open XML document).

Disable all

Disables all document types listed in the table.

New

Opens a **Document type** configuration dialog box (on page 90) that allows you to add a new *framework*.

Edit

Opens a **Document type** configuration dialog box (on page 90) that allows you to edit an existing *framework*.

Note:

If you try to edit an existing *framework* when you do not have write permissions to its storage location, a dialog box will be shown asking if you want to extend it.

Duplicate

Opens a **Document type** configuration dialog box (on page 90) that allows you to duplicate the configuration of an existing *framework*. This will create a snapshot of the *framework* in its current form. It is merely a copy of the document type and will not *evolve* along with the base document type as the **Extend** action does.

Extend

Opens a **Document type** configuration dialog box (on page 90) that allows you to extend an existing *framework*. You can add or remove functionality starting from a base document type. All of these changes will be saved as a patch. When the base document type is modified and evolves (for example, from one application version to another) the extension will evolve along with the base document type, allowing it to use the new actions added in the base document type.

Delete

Deletes the selected *framework* (document type).

Enable DTD/XML Schema processing in document type detection

When this option is selected (default value), the matching process also examines the DTD/XML Schema associated with the document. For example, the fixed attributes declared in the DTD for the root element are also analyzed, if this is specified in the association rules. This is especially useful if you are writing DITA customizations. DITA topics and maps are also matched by looking for the `@DITAArchVersion` attribute of the root element. This attribute is specified as `default` in the DTD and it is detected in the root element, helping Oxygen XML Editor Eclipse plugin to correctly match the DITA customization.

Only for local DTDs/XML Schemas

When this option is selected (default value), only the local DTDs / XML Schemas will be processed.

Enable DTD/XML Schema caching

When this option is selected (default value), the associated DTDs or XML Schema are cached when parsed for the first time, improving performance when opening new documents with similar schema associations.

Related information

[Sharing a Framework \(on page 2099\)](#)

Locations Preferences

Oxygen XML Editor Eclipse plugin allows you to change the location where [frameworks \(on page 2679\)](#) (document types) are stored, and to specify additional *framework* directories. The **Locations** preferences page allows you to specify the main *frameworks* folder location. You can choose between the **Default** directory (`[OXYGEN_INSTALL_DIR]/frameworks`) or a **Custom** specified directory. You can also change the current *frameworks* folder location value using the `com.oxygenxml.editor.frameworks.url` system property.

A list of additional *frameworks* directories can also be specified. The application will look in each of those folders for additional document type configurations to load. Use the **Add**, **Edit** and **Delete** buttons to manage the list of folders.

A document type configuration (*framework*) can be loaded from the following locations:

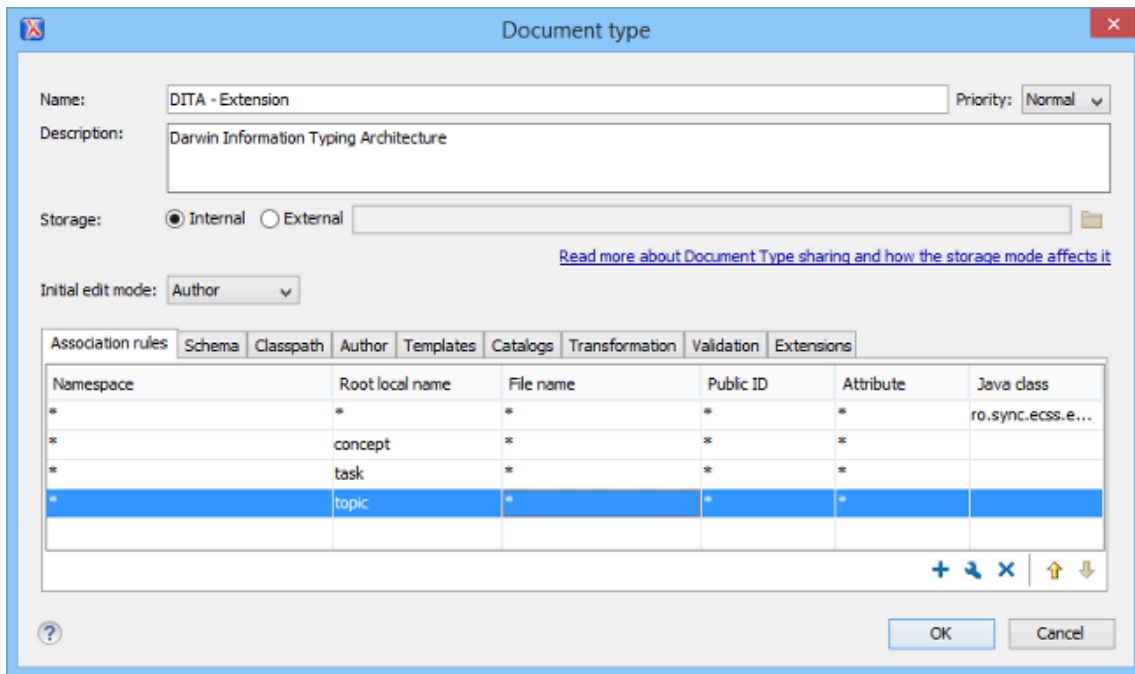

- **Internal preferences** - The document type configuration is stored in the application **Internal preferences (on page 91)**.
- **Additional *framework* directories** - The document type configuration is loaded from one of the specified **Additional frameworks directories** list.
- **The *frameworks* folder** - The main folder containing *framework* configurations.

All loaded document type configurations are first sorted by priority, then by document type name and then by load location (in the exact order specified above). When an XML document is opened, the application chooses the first document type configuration from the sorted list that matches the specific document.

All loaded document type configurations are first sorted by priority, then by document type.

Document Type Configuration Dialog Box

The **Document Type Configuration** dialog box allows you to create or edit a [framework \(on page 2679\)](#) (document type). It is displayed when you use the **New**, **Edit**, **Duplicate**, or **Extend** buttons in the **Document Type Association** preferences page ([on page 88](#)) (open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association**).

Figure 21. Document Type Configuration Dialog Box

The configuration dialog box includes the following fields and sections:

Name

The name of the *framework*. This will be displayed as its name in the **Document Type** column in the **Document Type Association** preferences page (*on page 88*).

Priority

Depending on the priority level, Oxygen XML Editor Eclipse plugin establishes the order that the existing *frameworks* are evaluated to determine the type of a document you are opening. It can be one of the following: Lowest, Low, Normal, High, or Highest. You can set a higher priority for *frameworks* you want to be evaluated first.

Note:

The built-in document types are set to Low priority by default. *Frameworks* that have the same priority are sorted alphabetically.

Description

The document type description displayed as a tooltip in the **Document Type Association** preferences page (*on page 88*).

Storage

The location where the framework is saved. If you select the **External** storage option, the framework is saved in a specified file with a mandatory extension (located in a subdirectory of your current framework directory. If you select the **Internal** storage option, the framework configuration data is saved in the Oxygen XML Editor Eclipse plugin internal options file.

Initial edit mode

Sets the default edit mode when you open a document for the first time: **Editor specific**, **Text**, **Author**, **Grid** and **Design** (available for the W3C XML Schema editor). If the **Editor specific** option is selected, the initial editing mode is determined based upon the document type. You can find the mapping between editors and edit modes in the [Edit modes preferences page](#). (on page 135) You can impose an initial mode for opening files that match the association rules of the document type. For example, if the files are usually edited in the **Author** mode, you can set it in the **Initial edit mode** combo box.

**Note:**

You can also customize the initial mode for a document type in the **Edit modes** preferences page. Open the **Preferences** dialog box (on page 70) and go to **Editor > Edit modes**.

Configuration Tabs

The bottom section of the dialog box includes various tabs where you can configure numerous options for the *framework*.

Related information

[Creating and Configuring Custom Frameworks \(on page 1941\)](#)

[Sharing a Framework \(on page 2099\)](#)

[Localizing Frameworks \(on page 2040\)](#)

Association Rules Tab

To open the **Association Rules** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), and click on the **Association Rules** tab.

In the **Association rules** tab, you can perform the following actions:

 **New**

Opens the **Document type rule** dialog box allowing you to create *association rules*.

 **Edit**

Opens the **Document type rule** dialog box allowing you to edit the properties of the currently selected *association rule*.

 **Delete**

Deletes the currently selected *association rules* from the list.

 **Move Up**

Moves the selected *association rule* up one spot in the list.

 **Move Down**

Moves the selected *association rule* down one spot in the list.

By combining multiple association rules you can instruct Oxygen XML Editor Eclipse plugin to identify the type of a document. Oxygen XML Editor Eclipse plugin identifies the type of a document when the document matches at least one of the *association rules*. This tab gives you access to a **Document type rule** dialog box that you can use to create *association rules* that activate on any document matching all the criteria defined in the dialog box.

To create a new association rule, click the **+** **New** button at the bottom of the **Association Rules** tab, or to edit an existing rule, click the **🔗** **Edit** button.

Figure 22. Document Type Rule Dialog Box

The screenshot shows a dialog box titled "Document type rule" with a close button (X) in the top right corner. Below the title bar, there is a header: "Activates on any document matching ALL the following criteria:". The dialog contains the following fields and controls:

- Namespace:** A text box containing "http://docbook.org/ns/docbook".
- Root local name:** A text box containing "*".
- File name:** A text box containing "*".
- Public ID:** A text box containing "*".
- Attribute:** A section with three sub-fields:
 - Local name:** A text box containing "*".
 - Namespace:** A text box containing "*".
 - Value:** A text box containing "*".
- Java class:** A text box that is currently empty.
- Buttons:** "Choose", "Reset", "OK", and "Cancel".
- Help:** A question mark icon (?) in the bottom left corner.

The **Document type rule** dialog box includes the following fields and options:

Namespace

Specifies the namespace of the root element from the association rules set (* (*any*) by default). If you want to apply the rule only when the root element has no namespace, leave this field empty (remove the **ANY_VALUE** string).

Root local name

Specifies the local name of the root element (* (*any*) by default).

File name

Specifies the name of the file (* (*any*) by default).

Public ID

Represents the Public ID of the matched document.

Attribute Local name

Specifies the local name of the attributes for the root element (* (*any*) by default).

Attribute Namespace

Specifies the namespace of the attributes for the root element (* (*any*) by default).

Attribute Value

Specifies the value of the attributes for the root element (* (*any*) by default).

Java class

Presents the name of the Java class that is used to determine if a document matches the rule. This Java class should implement the

`ro.sync.ecss.extensions.api.DocumentTypeCustomRuleMatcher` interface.

Tip:

You can use wildcards (? and *) or [editor variables \(on page 218\)](#) in the **Document Type Rule** dialog box, and you can enter multiple values by separating them with a comma.

Schema Tab

In the **Schema** tab, you can specify a default schema for Oxygen XML Editor Eclipse plugin to use if a document does not contain a schema declaration and no default validation scenario is associated with it.

To open the **Schema** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(on page 70\)](#), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button [\(on page 88\)](#), and click on the **Schema** tab.

This tab includes the following options for defining a schema to be used if no schema is detected in the XML file:

Schema type

Use this drop-down list to select the type of schema.

Schema URI

You can specify the URI of the schema file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** [\(on page 218\)](#) button, or the browsing actions in the  **Browse** drop-down list.

Tip:

It is a good practice to store all resources in the *framework* directory and use the `${framework}` editor variable [\(on page 225\)](#) to reference them. This is a recommended approach to designing a self-contained document type that can be easily maintained and shared between multiple users.

Classpath Tab

The **Classpath** tab displays a list of folders and *JAR* (on page 2679) libraries that hold implementations for API extensions, implementations for custom **Author** mode operations, various resources (such as stylesheets), and *framework* (on page 2679) translation files. Oxygen XML Editor Eclipse plugin loads the resources looking in the folders in the order they appear in the list (from top to bottom).

To open the **Classpath** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), and click on the **Classpath** tab.

The **Classpath** tab includes the following actions:

+ New

Opens a dialog box that allows you to add a resource to the table in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Tip:

The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

Edit

Opens a dialog box that allows you to edit a resource in the **Classpath** tab. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Tip:

The path can also contain wildcards (for example, `${framework}/lib/*.jar`).

Delete

Deletes the currently selected resource from the list.

Move Up

Moves the selected resource up one spot in the list.

Move Down

Moves the selected resource down one spot in the list.

Related information

[Extensions Tab \(on page 117\)](#)

[Author Tab \(on page 96\)](#)

[Localizing Frameworks \(on page 2040\)](#)

Author Tab

The **Author** tab is a container that holds information regarding the CSS file used to render a document in the **Author** mode, and regarding *framework* (on page 2679)-specific actions, menus, contextual menus, toolbars, and content completion list of proposals.

To open the **Author** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 88), and click on the **Author** tab.

The options that you configure in the **Author** tab are grouped in subtabs.

CSS Subtab

The **CSS** subtab contains the CSS files that Oxygen XML Editor Eclipse plugin uses to render a document in the **Author** mode. In this subtab, you can set *main* and *alternate* CSS files. When you are editing a document in the **Author** mode, you can switch between these CSS files from the **Styles** drop-down menu on the **Author Styles** toolbar.

To open the **CSS** subtab, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 88), click on the **Author** tab, and then the **CSS** subtab.

The following actions are available in the **CSS** subtab:

New

Opens a dialog box that allows you to add a CSS file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit the current selection.

Delete

Deletes the currently selected CSS file.

Move Up

Moves the selected CSS file up in the list.

Move Down

Moves the selected CSS file down in the list.

Enable multiple selection of alternate CSSs

Allows users to apply multiple alternate styles, as layers, over the main CSS style. This option is selected by default for DITA document types.

If there are CSSs specified in the document then

You can choose between the following options for controlling how the CSS files that are set in this subtab will be handled if a CSS is specified in the document itself:

- **Ignore CSSs from the associated document type** - The CSS files set in this CSS subtab are overwritten by the CSS files specified in the document itself.
- **Merge them with CSSs from the associated document type** - The CSS files set in this CSS subtab are merged with the CSS files specified in the document itself.

[Associating a CSS with an XML Document \(on page 2117\)](#)

[Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#)

Actions Subtab

The **Actions** subtab of the **Document Type Configuration** dialog box contains a sortable table with all the **Author** mode actions that are configured for the specific *framework (on page 2679)*. Each action has a unique ID, a name, a description, and a shortcut key.

To open the **Actions** subtab, [open the Preferences dialog box \(on page 70\)](#), go to **Document Type Association**, select your framework, use the **Duplicate** or **Extend** button to create an extension of the framework (or the **Edit** button for an already extended framework), click on the **Author** tab, and then the **Actions** subtab.

The following features are available in this subtab:

Export existing actions (📁)

It is possible to export existing actions to use them in other frameworks. Each exported action is extracted from the framework configuration file and exported as an individual XML file.

To export actions, the **Storage option (on page 91)** in the top part of the **Document Type Configuration** dialog box must be set to **External** and the external location must be a subdirectory of your current framework directory.

The 📁 **Export** action is found by right-clicking an action or a selection of multiple actions (the 📁 **Export** button is also located below the table of actions). If you choose to export a single action, a resulting dialog box will allow you to select the destination path for the new XML file that contains the configuration details of the action. If you export multiple actions, they will automatically be saved as individual XML files inside a newly created folder (it will have **_externalAuthorActions** at the end of the folder name) inside your current framework directory.

Result: Exported actions will display the 📁 icon in the first column in the table.

**Important:**

The newly created files for the exported actions will not appear on disk until you click **OK** several times to confirm your changes and exit the **Preferences** dialog box.

**Tip:**

If you want to create a new XML file for an action, there is a document template called **Author Actions** in the **New from templates wizard** (*on page 253*) to help you get started.

**Note:**

You can add or edit the action files outside of Oxygen XML Editor Eclipse plugin, but you will need to restart the application each time to reload the changes.

For more information, see [Creating or Editing Actions Using an Individual XML File for Each Action](#) (*on page 1958*).

Open in editor

For exported actions, there is a **Open in editor** action in the contextual menu that will open the file for that action in the main editor.

Create a new action

Use the **New** button (located underneath the table of actions) to open the **Action dialog box** (*on page 98*) where you can configure a new action.

Duplicate an existing action

Use the **Duplicate** action (found in the contextual menu and underneath the table of actions) to duplicate the selected action.

Edit an existing action

Use the **Edit** button (found in the contextual menu and underneath the table of actions) to open the **Action dialog box** (*on page 98*) where you can edit the selected action.

Delete an existing action

Use the **Delete** button (found in the contextual menu and underneath the table of actions) to delete the selected action.

Author Action Dialog Box

To edit an existing document type action or create a new one, [open the Preferences dialog box](#) (*on page 70*), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (*on page 88*), click on the **Author** tab, and then the **Actions** subtab. At the bottom of this subtab, click **New** to create a new action, or **Edit** to modify an existing one.

Figure 23. Action Dialog Box

The screenshot shows the 'Action' dialog box with the following details:

- ID:** bold
- Name:** \${18n(bold)}
- Menu access key:** B
- Large icon (24x24):** /images/Bold24.png
- Small icon (16x16):** /images/Bold16.png
- Shortcut key:** M1+B
- Description:** \${18n(bold_description)}
- Operations:**
 - 1
 - Activation XPath: (empty)
 - Operation: ro.sync.ecss.extensions.commons.Operation
 - Arguments:

Name	Description	Type	Value
element	The element to surround with.	Fragment	
schemaAware	This argument applies only on the sun	ConstantList	true

The following options are available in the **Action** dialog box:

ID

Specifies a unique action identifier.

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip:

You can use the `${18n('key')}` editor variable (on page 225) to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *letter* that is underlined in the name of the menu. Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *letter* in the name of the action that can be used to access the action.

Description

A description of the action. This description is displayed as a tooltip when hovering over the action.

**Tip:**

You can use the `$(i18n('key'))` editor variable ([on page 225](#)) to allow for multiple translations of the description.

How to translate frameworks link

Use this link to see more information about [Localizing Frameworks \(on page 2040\)](#).

Large icon

Allows you to select an image for the icon that Oxygen XML Editor Eclipse plugin uses for the toolbar action.

**Tip:**

A good practice is to store the image files inside the *framework* directory and use the `${frameworks}` editor variable ([on page 225](#)) to make the image relative to the *framework* location. If the images are bundled in a *jar* archive (for instance, along with some Java operations implementation), it is convenient to reference the images by their relative path location in the *class-path*.

Small icon

Allows you to select an image for the icon that Oxygen XML Editor Eclipse plugin uses for the contextual menu action.

**Note:**

If you are using a Retina or HiDPI display, Oxygen XML Editor Eclipse plugin automatically searches for higher resolution icons in the path specified in both the **Large icon** and **Small icon** options. For more information, see [Using Retina/HiDPI Icons for the Actions from a Framework \(on page 1992\)](#).

Shortcut key

This field allows you to configure a shortcut key for the action that you are editing. The `+` character separates the keys.

Enable platform-independent shortcut keys

If this checkbox is selected, the shortcut that you specify in this field is platform-independent and the following modifiers are used:

- **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
- **M2** represents the **Shift** key.
- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.

Operations section

In this section of the **Action** dialog box, you configure the functionality of the action that you are editing. An action has one or more operation modes. The evaluation of an XPath expression activates an operation mode. The first selected operation mode is activated when you trigger the action. The scope of the XPath expression must consist only of element nodes and attribute nodes of the edited document. Otherwise, the XPath expression does not return a match and does not fire the action. For more details see: [Controlling Which Author Operations Gets Executed Through XPath Expressions \(on page 102\)](#).

The following options are available in this section:

Activation XPath

An XPath 2.0 expression that applies to elements and attributes. For more details see: [Controlling Which Author Operations Gets Executed Through XPath Expressions \(on page 102\)](#).

Operation

Specifies the invoked operation that can be a [default operation \(on page 1962\)](#) or a [custom operation \(on page 1988\)](#).

Arguments

Specifies the arguments of the invoked operation. The  **Edit** at the bottom of the table allows you to edit the arguments of the operation.

Operation priority

Increases or decreases the priority of an operation. The operations are invoked in the order of their priority. If multiple XPath expressions are true, the operation with the highest priority is invoked.

-  **Add** - Adds an operation.
-  **Remove** - Removes an operation.
-  **Duplicate** - Duplicates an operation.

Evaluate activation XPath expressions even in read-only contexts

If this checkbox is selected, the action can be invoked even when the cursor is placed in a read-only location.

Related information

[Localizing Frameworks \(on page 2040\)](#)

Controlling Which Author Operations Gets Executed Through XPath Expressions

An **Author** mode action can have multiple operation modes, each one invoking an [Author operation \(on page 1962\)](#) with certain configured parameters. Each operation mode has an XPath 2.0 expression for activating it.

For each operation mode of an action, the application will check if the XPath expression is fulfilled (when it returns a non-empty node set or a **true** result). Only the first operation whose XPath operation is fulfilled will be executed.

The following special XPath extension functions are provided:

- [oxy:allows-child-element\(\) \(on page 102\)](#) - Use this function to check whether or not an element is valid child element in the current context, according to the associated schema.
- [oxy:allows-global-element\(\) \(on page 104\)](#) - Use this function to check whether or not an element is a valid global element for the current [framework \(on page 2679\)](#), according to the associated schema.
- [oxy:current-selected-element\(\) \(on page 105\)](#) - Use this function to get the currently selected element.
- [oxy:selected-elements\(\) \(on page 106\)](#) - Use this function to get the selected elements.
- [oxy:is-required-element\(\) \(on page 106\)](#) - Use this function to check if the element returned by the given XPath expression is required (based on the rules declared in the schema).
- [oxy:platform\(\) \(on page 106\)](#) - Use this function to get the current platform in cases where you want to enable or disable an action depending on the platform. Possible values include: *eclipse*, *standalone* and *webapp*.

oxy:allows-child-element() Function

The **oxy:allows-child-element()** function allows you to check whether or not an element that matches the arguments of the function is valid as a child of the element at the current cursor position, according to the associated schema. It is evaluated at the cursor position and has the following signature:

```
oxy:allows-child-element($childName, ($attributeName, $defaultAttributeValue, $contains?))
```

The following parameters are supported:

childName

The name of the element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The child element with the specified local name that belongs to the default namespace.

```
oxy:allows-child-element("para")
```

The above example verifies if the `<para>` element (of the default namespace) is allowed in the current context.

- The child element with the local name specified by any namespace.

```
oxy:allows-child-element( "*" :para )
```

The above example verifies if the `<para>` element (of any namespace) is allowed in the current context.

- A prefix-qualified name of an element.

```
oxy:allows-child-element( "prefix:para" )
```

The prefix is resolved in the context of the element where the cursor is located. The function matches on the element with the `para` local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-child-element( "{namespaceURI}para" )
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current context.

- Any element.

```
oxy:allows-child-element( "*" )
```

The above function verifies if any element is allowed in the current context.

Note:

A common use case of `oxy:allows-child-element("*")` is in combination with the `attributeName` parameter.

attributeName

The attribute of an element that you want to check if it is valid in the current context. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-child-element( "*", "class", " topic/topic " )
```

The above example verifies if an element with the `@class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current context.

- The attribute with the local name specified by any namespace.

```
oxy:allows-child-element( "*", " *:localname", " topic/topic " )
```

- A qualified name of an attribute.

```
oxy:allows-child-element( "*", "prefix:localname", " topic/topic ")
```

The prefix is resolved in the context of the element where the cursor is located. If the prefix is not resolved to a namespace, the function returns a value of `false`.

`defaultAttributeValue`

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

`contains`

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

`oxy:allows-global-element()` Function

The `oxy:allows-global-element()` function allows you to check whether or not an element that matches the arguments of the function is valid for the current *framework* (on page 2679), according to the associated schema. It has the following signature:

```
oxy:allows-global-element($elementName, ($attributeName, $defaultAttributeValue, $contains?))?
```

The following parameters are supported:

`elementName`

The name of the element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The element with the specified local name that belongs to the default namespace.

```
oxy:allows-global-element("para")
```

The above example verifies if the `<para>` element (of the default namespace) is allowed in the current *framework*.

- The element with the local name specified by any namespace.

```
oxy:allows-global-element("*:para")
```

The above example verifies if the `<para>` element (of any namespace) is allowed in the current *framework*.

- A prefix-qualified name of an element.

```
oxy:allows-global-element("prefix:para")
```

The prefix is resolved in the context of the *framework*. The function matches on the element with the `para` local name from the previously resolved namespace. If the prefix is not resolved to a namespace, the function returns a value of `false`.

- A specified namespace-URI-qualified name of an element.

```
oxy:allows-global-element( "{namespaceURI}para" )
```

The `namespaceURI` is the namespace of the element. The above example verifies if the `<para>` element (of the specified namespace) is allowed in the current *framework*.

- Any element.

```
oxy:allows-global-element( "*" )
```

The above function verifies if any element is allowed in the current *framework*.

`attributeName`

The attribute of an element that you want to check if it is valid in the current *framework*. Its value is a string that supports the following forms:

- The attribute with the specified name from no namespace.

```
oxy:allows-global-element( "*", "class", " topic/topic " )
```

The above example verifies if an element with the `class` attribute and the default value of this attribute (that contains the `topic/topic` string) is allowed in the current *framework*.

- The attribute with the local name specified by any namespace.

```
oxy:allows-global-element( "*", " *:localname", " topic/topic " )
```

- A qualified name of an attribute.

```
oxy:allows-global-element( "*", "prefix:localname", " topic/topic " )
```

The prefix is resolved in the context of the *framework*. If the prefix is not resolved to a namespace, the function returns a value of `false`.

`defaultAttributeValue`

A string that represents the default value of the attribute. Depending on the value of the next parameter, the default value of the attribute must either contain this value or be equal to it.

`contains`

An optional boolean. The default value is `true`. For the `true` value, the default value of the attribute must contain the `defaultAttributeValue` parameter. If the value is `false`, the two values must be the same.

`oxy:current-selected-element()` Function

This function returns the fully selected element. If no element is selected, the function returns an empty sequence.

Example: `oxy:current-selected-element` Function

```
oxy:current-selected-element()[self::p]/b
```

This example returns the `` elements that are children of the currently selected `<p>` element.

oxy:selected-elements() Function

This function returns the selected elements from **Author** mode.

Example: *oxy:selected-elements* Function

```
oxy:selected-elements()[self::para][@audience="novice"]
```

This example would activate an action when at least one of the selected elements is a `<para>` element with the `@novice` attribute defined.

oxy:is-required-element() Function

This function checks if the element returned by the given XPath expression is required (based on the rules declared in the schema). It has only one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: *oxy:is-required-element* Function

```
oxy:is-required-element(.)
```

This example would check to see if the current element is required by the schema.

oxy:is-editable-element() Function

This function checks if the element returned by the given XPath expression is editable (content can be inserted in it), meaning both that the entire XML file is editable and that the current context where the element is placed is editable. For example, if the element is inside an *xi:included* section, it is not editable.

It only has one argument, an XPath expression, and the XPath expression must be written in such a way that it returns a single element.

Example: *oxy:is-editable-element* Function

```
oxy:is-editable-element(ancestor-or-self::table)
```

This example would return *true* if the cursor is placed inside a table and it is editable or *false* if it is not editable.

oxy:platform() Function

This function returns the current platform. You can use this if you want to enable or disable an action depending on the platform. The possible values are: **standalone**, **eclipse**, or **webapp**.

Example: *oxy:platform* Function

```
oxy:platform()="standalone"
```

This example would keep the action activated for the *standalone* distribution of Oxygen XML Editor Eclipse plugin, but disable it for the *Eclipse* and *Web Author* distributions.

Menu Subtab

In the **Menu** subtab, you can configure which actions will appear in the *framework* (on page 2679)-specific menu. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Menu** subtab, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), click on the **Author** tab, and then the **Menu** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor Eclipse plugin menu. To add an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button. To add an image in this section as a child of the currently selected action, use the  **Add as child** button.

The following actions are available in the **Current actions** section:

Edit

Edits an item.

Remove

Removes an item.

Move Up

Moves an item up.

Move Down

Moves an item down.

Contextual Menu Subtab

In the **Contextual menu** subtab you configure what *framework* (on page 2679)-specific action the *Content Completion Assistant* (on page 2677) proposes. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Contextual Menu** subtab, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), click on the **Author** tab, and then the **Contextual Menu** subtab.

Figure 24. Contextual Menu Subtab

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section contains the actions that are displayed in the contextual menu for documents that belong to the edited *framework*.

The following actions are available in this subtab:

Add as sibling

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a sibling of the selected action.

Add as child

Adds the selected action or submenu from the **Available actions** section to the **Current actions** section as a child of the selected action.

Edit

This option is available for container (submenu) items that are listed in the **Current actions** section. It opens a configuration dialog box that allows you to edit the selected container (submenu).

Figure 25. Menu Action Configuration Dialog Box

The following options are available in this dialog box:

Name

Specifies the name of the action. This name is displayed as a tooltip or as a menu item.

Tip:

You can use the `#{18n('key')}` editor variable ([on page 225](#)) to allow for multiple translations of the name.

Menu access key

In Windows, you can access menus by holding down **Alt** and pressing the keyboard key that corresponds to the *letter* that is underlined in the name of the menu.

Then, while still holding down **Alt**, you can select submenus and menu action the same way by pressing subsequent corresponding keys. You can use this option to specify the *letter* in the name of the action that can be used to access the action.

Menu icon

Allows you to select an image for the icon that Oxygen XML Editor Eclipse plugin uses for the container (submenu).

Promote items when in a table context

If this option is selected, when invoking the contextual menu from within a table, all the actions in this container (submenu) will be promoted to the main level in the contextual menu. Actions and submenus that are not promoted are still available in the **Other actions** submenu when invoking the contextual menu within a table.

Remove

Removes the selected action or submenu from the **Current actions** section.

Move Up

Moves the selected item up in the list.

Move Down

Moves the selected item down in the list.

Toolbar Subtab

In the **Toolbar** subtab you configure what *framework* ([on page 2679](#))-specific action the Oxygen XML Editor Eclipse plugin toolbar holds. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Toolbar** subtab, [open the Preferences dialog box](#) ([on page 70](#)), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button ([on page 88](#)), click on the **Author** tab, and then the **Toolbar** subtab.

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that are displayed in the Oxygen XML Editor Eclipse plugin toolbar when you work with a document belonging to the edited *framework*. To add

an action in this section as a sibling of the currently selected action, use the  **Add as sibling** button. To add an action in this section as a child of the currently selected action, use the  **Add as child** button.

The following actions are available in the **Current actions** section:

 **Edit**

Edits an item.

 **Remove**

Removes an item.

 **Move Up**

Moves an item up.

 **Move Down**

Moves an item down.

Content Completion Subtab

In the **Content Completion** subtab you configure what *framework* (on page 2679)-specific the *Content Completion Assistant* (on page 2677) proposes. The subtab is divided into two sections: **Available actions** and **Current actions**.

To open the **Content Completion** subtab, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 88), click on the **Author** tab, and then the **Content Completion** subtab.

Available and Current Actions

The **Available actions** section presents a table that displays the actions defined in the **Actions** subtab, along with their icon, ID, and name. The **Current actions** section holds the actions that the *Content Completion Assistant* proposes when you work with a document that belongs to the edited *framework*.

To add the selected available action as a sibling of the currently selected action in the **Current actions** section, use the  **Add as sibling** button. To add it as a child of the currently selected action, use the  **Add as child** button. To edit an existing action, select it and use the  **Edit** button. To remove an existing action, use the  **Remove** button. You can also move items up and down the list using the  **Move Up** or  **Move Down** buttons.

Adding an action (or editing an existing one) opens the **Content Completion Item** dialog box.

Figure 26. Content Completion Item Dialog Box

Use this dialog box to configure the action:

Action

Displays the name of the selected action.

Display name

You can use the drop-down menu to choose between displaying the action name or the replaced element name, or you can enter another name to be displayed.

Replacement for

Use this section to replace an existing element with the configured action:

- **Element name** and **Namespace** - The name (and namespace, if needed) of the replaced element. The original element no longer needs to be excluded using the [Filter - Remove content completion items table \(on page 112\)](#).
- **Display item only when element is allowed at cursor** - The configured action is contributed in the UI components selected in the **Contribute to** section only if the associated schema allows the original element at the current location in the document. This is equivalent to defining activation XPath expressions in the [Author Action dialog box \(on page 98\)](#) using the `oxy:allows-child-element()` XPath extension function. Activation XPath expressions for the action are still checked when the action is invoked.

Contribute to

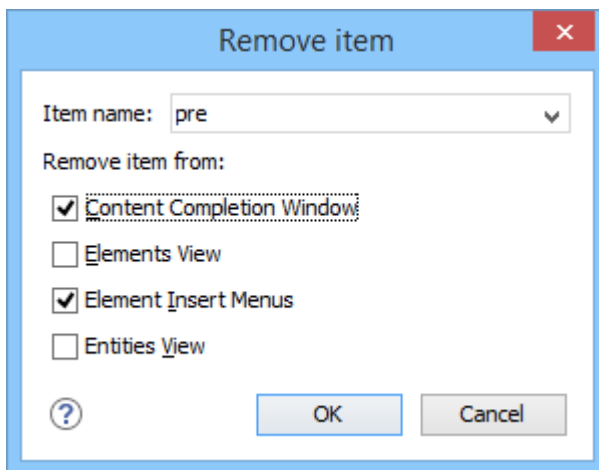

Use this section to specify where to display the configured item in the interface:

- **Content Completion Window** - The configured item will appear in the *Content Completion Assistant* (on page 2677).
- **Elements View** - The configured item will appear in the **Elements** view.
- **Element Insert Menus** - The configured item will appear in the **Append Child, Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).

Filter Table

The **Filter** section presents a table that allows you to add elements to be filtered from the *Content Completion Assistant* or from some specific helper views or menus. Use the **+** **Add** button to add more filters to the table, the **✎** **Edit** button to modify an existing item in the table, or the **✕** **Remove** button to remove a filtered item. The **+** **Add** and **✎** **Edit** buttons open a **Remove item** dialog box.

Figure 27. Remove Item Dialog Box

Use this dialog box to add or configure the elements that will be filtered:

Item name

Use this text field to enter the name of the element to be filtered. The drop-down list also includes a few special content completion actions that can be filtered:

- **<SPLIT> [elementName]** - Filters split entries for elements that have the form **Split elementName** or **New elementName**.
- **<SPLIT>** - Filters split entries for all elements.
- **<ENTER>** - Filters **Insert New Line** entries that appear in elements where whitespace is significant.

The filter list can be used to remove only content completion items contributed by the schema associated to the document and it does not remove actions added to the content completion list via the framework configuration. The element name specified in the filter is not namespace aware, it matches the name of the element defined in the associated schema exactly as it would appear rendered in the content completion window.

**Note:**

If you try to insert an element in an invalid position (for example, using the content completion assistant), the editor will attempt to make the insertion valid. This may mean finding an alternate position for the insertion or splitting the element at the current position. If a **<SPLIT>** entry is added in the filter list for an element, the editor will never split that element.

Remove item from

You can choose to filter the element from any of the following:

- **Content Completion Window** - The element will not appear in the *Content Completion Assistant* (on page 2677).
- **Elements View** - The element will not appear in the **Elements** view.
- **Element Insert Menus** - The element will not appear in the **Append Child**, **Insert Before**, or **Insert After** menus that are available in certain contextual menus (for example, the contextual menu of the **Outline** view).
- **Entities View** - The element will not appear in the **Entities view** (on page 334).

Templates Tab

The **Templates** tab specifies a list of directories where new document templates are located for this particular framework. These directories, along with the document templates that are saved inside them, will appear in the **New from templates wizard** (on page 253) inside the **Framework templates** category according to your framework and the directory path you specify in this tab.

To open the **Templates** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), and click on the **Templates** tab.

The **Templates** tab includes the following actions:

+ New

Opens a dialog box that allows you to specify the path to a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

**Tip:**

The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

Edit

Opens a dialog box that allows you to edit the path of a directory that contains document templates for this framework. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 218) button, or the browsing actions in the **Browse** drop-down list.

**Tip:**

The path can also contain wildcards. For example, using `${frameworkDir}/templates/*` would add all the template folders found inside the `templates` directory.

Delete

Deletes the currently selected template directory from the list.

Move Up

Moves the selected template directory up one spot in the list.

Move Down

Moves the selected template directory down one spot in the list.

[Sharing Custom Document Templates \(on page 259\)](#)

Catalogs Tab

The **Catalogs** tab specifies a list of *XML Catalogs*, specifically for the edited *framework* (on page 2679), that are added to list of catalogs that Oxygen XML Editor Eclipse plugin uses to resolve resources.

To open the **Catalogs** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), and click on the **Catalogs** tab.

You can perform the following actions:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the **Insert Editor Variables** (on page 218) button, or the browsing actions in the **Browse** drop-down list.

 **Edit**

Opens a dialog box that allows you to edit the path of an existing catalog.

 **Delete**

Deletes the currently selected catalog from the list.

 **Move Up**

Moves the selected catalog up one spot in the list.

 **Move Down**

Moves the selected catalog down one spot in the list.

Transformation Tab

In the **Transformation** tab, you can configure the transformation scenarios associated with the particular *framework* (on page 2679) you are editing. These transformation scenarios are presented in the **Configure Transformation Scenarios** dialog box (on page 1300) when transforming a document and you can specify which scenarios will be used by default for a particular document type.

To open the **Transformation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New, Edit, Duplicate, or Extend** button (on page 88), and click on the **Transformation** tab.

The **Transformation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default transformation scenario when another specific scenario is not specified. The scenarios that are set as default are rendered bold in the **Configure Transformation Scenarios** dialog box (on page 1300).

 **New**

Opens the **New scenario** dialog box allowing you to create a new transformation scenario for the particular document type (on page 1206).

 **Duplicate**

Allows you to duplicate the configuration of an existing transformation scenario. It opens the **Edit scenario** dialog box where you can **configure the properties of the duplicated scenario** (on page 1299).

 **Edit**

Opens the **Edit scenario** dialog box allowing you to **edit the properties of the currently selected transformation scenario** (on page 1297).

 **Delete**

Deletes the currently selected transformation scenario.

 **Import scenarios**

Imports transformation scenarios.

 **Export selected scenarios**

Export transformation scenarios.

 **Move Up**

Moves the selection to the previous scenario.

 **Move Down**

Moves the selection to the next scenario.

Validation Tab

In the **Validation** tab, you can configure the validation scenarios associated with the particular *framework* (on page 2679) you are editing. These validation scenarios are presented in the **Configure Validation Scenarios** dialog box when validating a document and you can specify which scenarios will be used by default for a particular document type.

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 597\)](#).

To open the **Validation** tab of the **Document type** configuration dialog box, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button (on page 88), and click on the **Validation** tab.

The **Validation** tab offers the following options:

Default checkbox

You can set one or more of the scenarios listed in this tab to be used as the default validation scenario when another specific scenario is not specified in the validation process. The scenarios that are set as default are rendered bold in the **Configure Validation Scenarios** dialog box.

 **New**

Opens the **New scenario** dialog box allowing you to create a new validation scenario.

 **Duplicate**

Allows you to duplicate the configuration of an existing validation scenario. It opens the **Edit scenario** dialog box where you can configure the properties of the duplicated scenario.

 **Edit**

Opens the **Edit scenario** dialog box allowing you to edit the properties of the currently selected validation scenario.

 **Delete**

Deletes the currently selected validation scenario.

 **Import scenarios**

Imports validation scenarios.

 **Export selected scenarios**

Export validation scenarios.

 **Move Up**

Moves the selected scenario up one spot in the list.

 **Move Down**

Moves the selected scenario down one spot in the list.

Extensions Tab

The **Extensions** tab specifies implementations of Java interfaces used to provide advanced functionality to the document type.

To open the **Extensions** tab of the **Document type** configuration dialog box, [open the Preferences dialog box \(on page 70\)](#), go to **Document Type Association**, use the **New**, **Edit**, **Duplicate**, or **Extend** button [\(on page 88\)](#), and click on the **Extensions** tab.

Libraries containing the implementations must be present in the *classpath* [\(on page 95\)](#) of your document type. The Javadoc available at <https://www.oxygenxml.com/InstData/Editor/SDK/javadoc/> contains details about how each API implementation functions.

Editor Preferences

Oxygen XML Editor Eclipse plugin offers the possibility to configure the appearance of various components and features of the main editor. To access these options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor** (or right-click in the editor window and choose **Preferences**).

The following options are available:

Editor background

Allows you to set the background color for text editors.

Completion proposal background

Allows you to set the background color of the *Content Completion Assistant* [\(on page 2677\)](#).

Completion proposal foreground

Allows you to set the color of the text in the *Content Completion Assistant (on page 2677)*.

Documentation window background

Allows you to set the background color of the documentation of elements suggested by the *Content Completion Assistant (on page 2677)*.

Documentation window foreground

Allows you to set the color of the text for the documentation of elements suggested by the *Content Completion Assistant (on page 2677)*.

Line wrap

If selected, long lines are automatically wrapped in edited documents. The line wrap does not alter the document content since the application does not use *new-line* characters to break long lines.

Enable folding when opening a new editor

If selected (default value), the vertical stripe that holds the *folding markers (on page 316)* is displayed in **Text** mode.

Beep on operation finished

Oxygen XML Editor Eclipse plugin emits a short beep when a validation, check well-formedness, or transformation action has ended.

Note:

When the validation or the transformation process of a document is successful, the beep signal has a higher audio frequency, as opposed to when the validation fails, and the beep signal has a lower audio frequency. On the Windows platform, for other operations, the default system sound (*Asterisk*) is used. You can configure it by changing the sound theme.

Display quick-assist and quick-fix side hints

Displays the *Quick Assist (on page 2681)* icon (💡) and *Quick Fix (on page 2682)* icon (🔧) in the line number stripe on the left side of the editor.

Highlight matching tag

If you place the cursor on a start or end tag, Oxygen XML Editor Eclipse plugin highlights the corresponding member of the pair.

Tip:

You can configure the colors and how various types of highlights are shown from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on macOS) > Preferences > General > Editors > Text Editors > Annotations**).

Minimum fold range

You can specify the minimum number of lines in a block that will have the *folding* (on page 2679) support become active. If you modify this value, the change takes effect next time you open the editor.

Content Completion Preferences

Oxygen XML Editor Eclipse plugin provides a *Content Completion Assistant* (on page 2677) that provides a list of available options at any point in a document and can auto-complete structures, elements, and attributes. To configure the **Content Completion** preferences, open the **Preferences** dialog box (on page 70) and go to **Editor > Content Completion**. These options control how the *Content Completion Assistant* works.

The following options are available:

Auto close the last opened tag

When selected, Oxygen XML Editor Eclipse plugin automatically closes the last open tag when you type `</`.

Automatically rename/delete/comment matching tags

If you rename, delete, or comment out a start tag, Oxygen XML Editor Eclipse plugin automatically renames, deletes, or comments out the matching end tag.

Note:

If you select **Toggle comment** for multiple starting tags and the matching end tags are on the same line as other start tags, the end tags are not commented.

Enable content completion

Toggles the content completion feature on or off.

Consider subsequent sibling elements

When this option is selected (default), the subsequent sibling elements of the current element are taken into account when using the *Content Completion Assistant*. For example, in DITA, if you invoke the content completion before an already inserted required element (e.g. a `<title>` element), the content completion mechanism will not offer a proposal to insert a title (since it was already inserted).

Close the inserted element

When you choose an entry from the *Content Completion Assistant* list of proposals, Oxygen XML Editor Eclipse plugin inserts both start and end tags. The following additional options are available with regard to closing the element:

- **If it has no matching tag** - The end tag of the inserted element is automatically added only if it is not already present in the document.
- **Add element content** - Oxygen XML Editor Eclipse plugin inserts the required elements specified in the DTD, XML Schema, or RELAX NG schema that is associated with the edited XML document.
 - **Add optional content** - If selected, Oxygen XML Editor Eclipse plugin inserts the optional elements specified in the DTD, XML Schema, or RELAX NG schema.
 - **Add first Choice particle** - If selected, Oxygen XML Editor Eclipse plugin inserts the first **choice** particle specified in the DTD, XML Schema, or RELAX NG schema.

Case sensitive search

When selected, the search in the *Content Completion Assistant* is case-sensitive when you type a character ('a' and 'A' are different characters).

Note:

This option is ignored when the current language itself is not case-sensitive. For example, the case is ignored in the CSS language.

Position cursor between tags

When selected, Oxygen XML Editor Eclipse plugin automatically moves the cursor between the start and end tag after inserting the element. This only applies to:

- Elements with only optional attributes or no attributes at all.
- Elements with required attributes, but only when the **Insert the required attributes option** ([on page 120](#)) is not selected.

Show all entities

Oxygen XML Editor Eclipse plugin displays a list with all the internal and external entities declared in the current document when you type the start character of an entity reference (for example, `&`).

Insert the required attributes

If selected, Oxygen XML Editor Eclipse plugin automatically inserts the required attributes taken from the DTD or XML Schema for an element inserted with the *Content Completion Assistant*. For ID attributes that are required, a unique value is automatically generated for each new ID.

Insert the fixed attributes

If selected, Oxygen XML Editor Eclipse plugin automatically inserts any `FIXED` attributes from the DTD or XML Schema for an element inserted with the *Content Completion Assistant*.

Show recently used items

When selected, Oxygen XML Editor Eclipse plugin remembers the last inserted items from the *Content Completion Assistant* window. The number of items to be remembered is limited by

the **Maximum number of recent items shown** list box. These most frequently used items are displayed on the top of the content completion window and their icons are decorated with a small red square..

Maximum number of recent items shown

Specifies the limit for the number of recently used items presented at the top of the *Content Completion Assistant* window.

Learn attributes values

When selected, Oxygen XML Editor Eclipse plugin learns the attribute values used in a document.

Learn on open document

Oxygen XML Editor Eclipse plugin automatically learns the document structure when the document is opened.

Learn words (Dynamic Abbreviations, available on **Ctrl+Space**)

When selected, Oxygen XML Editor Eclipse plugin learns the typed words and makes them available in a content completion fashion by pressing **Ctrl + Space** on your keyboard;

Note:

For the words to be learned, they need to be separated by space characters.

Activation delay of the proposals window (ms)

Delay in milliseconds from the last key press until the *Content Completion Assistant* is displayed.

Related information

[Configuring the Proposals for Attribute and Element Values \(on page 2011\)](#)

Annotations Preferences

Certain types of schemas (XML Schema, DTDs, Relax NG) can include annotations that document the various elements and attributes that they define. Oxygen XML Editor Eclipse plugin can display these annotations when offering content completion suggestions. To configure the **Annotations** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Content Completion > Annotations**.

The following options are available:

Show annotations in Content Completion Assistant

If selected, Oxygen XML Editor Eclipse plugin displays the schema annotations of an element, attribute, or attribute value currently selected in the *Content Completion Assistant (on page 2677)* proposals list.

Show annotations in tooltip

If selected, Oxygen XML Editor Eclipse plugin displays the annotation of elements and attributes as a tooltip when you hover over them with the cursor in the editing area or in the **Elements** view. If not selected, tooltips are disabled in all modes.

Show annotation in HTML format, if possible

This option allows you to view the annotations associated with an element or attribute in HTML format. It is available when editing XML documents that have associated an XML Schema or Relax NG schema. If this option is not selected, the annotations are converted and displayed as plain text.

Prefer DTD comments that start with "doc:" as annotations

To address the lack of dedicated annotation support in DTD documents, Oxygen XML Editor Eclipse plugin recommends prefixing with the `doc:` particle all comments intended to be shown to the developer who writes an XML validated against a DTD schema.

If this option is selected, Oxygen XML Editor Eclipse plugin uses the following mechanism to collect annotations:

- If at least one `doc:` comment is found in the entire DTD, only comments of this type are displayed as annotations.
- If no `doc:` comment is found in the entire DTD, all comments are considered annotations and displayed as such.

If not selected, all comments, regardless of their type, are considered annotations and displayed as such.

Use all Relax NG annotations as documentation

If selected, any element outside the Relax NG namespace, that is `http://relaxng.org/ns/structure/1.0`, is considered annotation and is displayed in the annotation window next to the *Content Completion Assistant (on page 2677)* window and in the **Model view (on page 331)**. When this option is not selected, only elements from the Relax NG annotations namespace, that is `http://relaxng.org/ns/compatibility/annotations/1.0` are considered annotations.

Code Templates Preferences

Code templates are code fragments that can be inserted at the current editing position. Oxygen XML Editor Eclipse plugin includes a set of built-in templates for CSS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also [define your own code templates \(on page 324\)](#) for any type of file and [share them with your colleagues \(on page 325\)](#) using the template export and import functions.

To configure **Code Templates**, open the **Preferences** dialog box [\(on page 70\)](#) and go to **Editor > Templates > Code Templates**.

This preferences page contains a list of all the available code templates (both built-in and custom created ones) and a code preview area. You can disable any code template by deselecting it.

The following actions are available:

New

Opens the **Code template** dialog box that allows you to define a new code template. You can define the following fields:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 2677)*. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
 - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
 - **M2** represents the **Shift** key.
 - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
 - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An *editor variable (on page 218)* can be inserted in the text box using the  **Insert Editor Variables** button.

Edit

Opens the **Code template** dialog box and allows you to edit an existing code template. You can edit the following fields:

- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 2677)*. HTML markup can be used for better rendering.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
 - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
 - **M2** represents the **Shift** key.

- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button.

Duplicate

Creates a duplicate of the currently selected code template.

Delete

Deletes the currently selected code template. This action is not available for the built-in code templates.

Export

Exports a file with code templates.

Import

Imports a file with code templates that was created by the **Export** action.

You can use the following [editor variables \(on page 218\)](#) when you define a code template in the **Content** text box:

- **`\${caret}** - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

Note:

The **`\${caret}** editor variable is available only for parameters that take XML content as values. It is replaced with the **`\${UNIQUE_CARET_MARKER_FOR_AUTHOR}** macro. The default Author operations process this macro and position the cursor at the designated offset.

Note:

The **`\${caret}** editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use **AuthorDocumentFilter** and inside the **insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)** method, use the **AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)** API on the given fragment.

- **`\${selection}** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **`\${ask('message', type, ('real_value1':'rendered_value1'; 'real_value2':'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the **ask('message', type,**

(*real_value1*:'rendered_value1'; *real_value2*:'rendered_value2'; ...), 'default-value') editor variable.

You can set the following parameters:

- **'message'** - The displayed message. Note the quotes that enclose the message.
- **'default-value'** - Optional parameter. Provides a default value.
- **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **`${answer(@id)}`** editor variable.
- **type** - Optional parameter (defaults to **generic**), with one of the following values:

Note:

The title of the dialog box will be determined by the type of parameter and as follows:

- For *url* and *relative_url* parameters, the title will be the name of the parameter and the value of the *'message'*.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Notice:

Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
${ask( 'Provide a date',generic,'${date(yyyy-MM-dd'T'HH:MM)}' ) }
```

Parameter	
generic (default)	Format: <code>\${ask('message', generic, 'default')}</code>
	Description: The input is considered to be generic text that requires no special handling.
	Example: <ul style="list-style-type: none"> ▪ <code>\${ask('Hello world')}</code> - The dialog box has a <i>Hello world!</i> message displayed. ▪ <code>\${ask('Hello world!', generic, 'Hello again')}</code> - The dialog box has a <i>Hello world!</i> message displayed and the value displayed in the input box is <i>Hello again!</i>.
url	Format: <code>\${ask('message', url, 'default_value')}</code>
	Description: Input is considered a URL. Oxygen XML Editor Eclipse plugin checks that the provided URL is valid.
	Example:

Parameter	
	<ul style="list-style-type: none"> ▪ <code>\${ask('Input URL', url)}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. ▪ <code>\${ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. The input field displays the default value <i>http://www.example.com</i>.
relative_url	<p>Format: <code>\${ask('message', relative_url, 'default')}</code></p> <p>Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Editor Eclipse plugin tries to make the URL relative to that of the document you are editing.</p> <div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin: 10px 0;"> <p> Note:</p> <p>If the <code>\$ask</code> editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Editor Eclipse plugin will transform it into an absolute URL.</p> </div> <p>Example:</p> <p><code>\${ask('File location', relative_url, 'C:/example.txt')}</code> - The dialog box has the name <i>File location</i>. The URL inserted in the input box is made relative to the currently edited document location.</p>
password	<p>Format: <code>\${ask('message', password, 'default')}</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Input password', password)}</code> - The displayed dialog box has the name <i>Input password</i> and the input is hidden with bullet symbols. ▪ <code>\${ask('Input password', password, 'abcd')}</code> - The displayed dialog box has the name <i>Input password</i> and the input hidden with bullet symbols. The input field already contains the default abcd value.
combobox	<p>Format: <code>\${ask('message', combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p>

Parameter	
	<div data-bbox="560 219 1437 394">  Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>\$(xpath_eval())</code>. </div> <div data-bbox="560 421 1437 595">  Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value. </div> <p data-bbox="560 656 671 685">Example:</p> <ul data-bbox="620 725 1422 936" style="list-style-type: none"> ▪ <code>\$(ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos'))</code> - The dialog box has the name <i>'Operating System'</i>. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <div data-bbox="639 972 1437 1330">  Note: In this example, the default value is indicated by the <i>osx</i> key. However, the same result could be obtained if the default value is indicated by <i>macOS</i>, as in the following example: <code>\$(ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macOS'))</code> </div> <ul data-bbox="620 1361 1437 1532" style="list-style-type: none"> ▪ <code>\$(ask('Mobile OS', combobox, ('ios':'iOS';'and':'Android'), 'Android'))</code> ▪ <code>\$(ask('Mobile OS', combobox, (\$(xpath_eval(for \$pair in ([['ios', 'iOS'], ['and', 'Android']) return "" \$pair?1 ":" \$pair?2 ";")), 'ios'))</code>
editable_combobox	<p data-bbox="560 1563 1422 1641">Format: <code>\$(ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default'))</code></p> <p data-bbox="560 1675 1422 1845">Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated real value (<i>real_value</i>) or the value inserted when you edit a list entry.</p> <div data-bbox="560 1877 1437 2047">  Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>\$(xpath_eval())</code>. </div>

Parameter	
	<div data-bbox="560 219 1441 394" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value. </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name <i>'Operating System'</i>. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ <code>\${ask('Operating System', editable_combobox, (\${xpath_eval(for \$pair in ([win', 'Microsoft Windows'], [macos', 'macOS'], [lnx', 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ",")), 'ios')}</code>
radio	<p>Format: <code>\${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a <i>'rendered_value'</i> and will return an associated <i>real_value</i>.</p> <div data-bbox="560 1211 1441 1386" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>\${xpath_eval()}</code>. </div> <div data-bbox="560 1417 1441 1592" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value. </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name <i>'Operating System'</i>. The radio button group allows you to choose between the three operating systems.

Parameter	
	<div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  Note: In this example, <code>macOS</code> is the default-selected value and if selected, it would return <code>macos</code> for the output. </div> <ul style="list-style-type: none"> ▪ <code>ask('Operating System', radio, (\$xpath_eval(for \$pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ";"))</code>, 'ios')

- **timeStamp** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **uuid** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java `UUID` class.
- **id** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.
- **cfn** - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- **cfne** - Current file name with extension. The current file is the one currently open and selected.
- **cf** - Current file as file path, that is the absolute file path of the currently edited document.
- **cfld** - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- **frameworksDir** - The path (as file path) of the `frameworks` directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main `frameworks` folder defined in the **Document Type Association > Locations** preferences page.
- **pd** - The file path to the folder that contains the current project file (`.xpr`).
- **oxygenInstallDir** - Oxygen XML Editor Eclipse plugin installation folder as file path.
- **homeDir** - The path (as file path) of the user home folder.
- **pn** - Current project name.
- **env(VAR_NAME)** - Value of the `VAR_NAME` environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **system(var.name)** editor variable.
- **system(var.name)** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **env(VAR_NAME)** editor variable instead.

- **`${date(pattern)}`** - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`.

**Note:**

This editor variable supports both the **`xs:date`** and **`xs:datetime`** parameters. For details about **`xs:date`**, go to: <http://www.w3.org/TR/xmlschema-2/#date>. For details about **`xs:datetime`**, go to: <http://www.w3.org/TR/xmlschema-2/#dateTime>.

Related information

[Code Templates \(on page 323\)](#)

JSON Preferences

Oxygen XML Editor Eclipse plugin can provide content completion suggestions when you are editing JSON files. To configure content completion support for JSON, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Content Completion > JSON**. You can configure the following options:

Generate required content

When invoking content completion over JSON files, all contextual required content is automatically generated according to the specifications from the associated JSON Schema.

Generate optional properties

If selected, optional properties that are defined in the associated JSON Schema will be added when using content completion in JSON files.

Generate additional content

If selected, additional properties (or additional items for arrays) that are defined in the associated JSON Schema will be added when using content completion in JSON files.

YAML Preferences

Oxygen XML Editor Eclipse plugin can provide content completion suggestions when you are editing YAML files. To configure content completion support for YAML, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Content Completion > YAML**. You can configure the following options:

Generate required content

When invoking content completion over YAML files, all contextual required content is automatically generated according to the specifications from the associated JSON schema.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, optional properties that are defined in the associated JSON schema will be added when using content completion in YAML files.

Generate additional content

If selected, additional properties (or additional items for arrays) that are defined in the associated JSON schema will be added when using content completion in YAML files.

XPath Preferences

Oxygen XML Editor Eclipse plugin provides content-completion support for XPath expressions. To configure the options for the content completion in XPath expressions, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Content Completion > XPath**.

The following options are available:

- **Enable content completion for XPath expressions** - Enables the *Content Completion Assistant in XPath expressions (on page 661)* that you enter in the `@match`, `@select`, and `@test` XSL attributes.
 - **Include XPath functions** - When this option is selected, XPath functions are included in the content completion suggestions.
 - **Include XSLT functions** - When this option is selected, XSLT functions are included in the content completion suggestions.
 - **Include axes** - When this option is selected, XSLT axes are included in the content completion suggestions.
- **Show signatures of XSLT / XPath functions** - Makes the editor indicate the signature of the XPath function located at the cursor position in a tooltip. See the [XPath Tooltip Helper \(on page 665\)](#) section for more information.

XSD Preferences

Oxygen XML Editor Eclipse plugin provides content completion assistance when you are writing XML Schema (XSD). To configure XSD preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Content Completion > XSD**. The option in this preferences page allows you to define additional elements to be suggested by the *Content Completion Assistant (on page 2677)* in `<xs:appinfo>` elements (in addition to the elements defined in the XML Schema).

The following option is available:

When in "xs:appinfo" context, also include elements declared in the schema

You can choose between the following:

- **None** - The *Content Completion Assistant* offers only the XML Schema schema information.
- **ISO Schematron** - The *Content Completion Assistant* also includes ISO Schematron elements in `<xs:appinfo>`.
- **Schematron 1.5** - The *Content Completion Assistant* also includes Schematron 1.5 elements in `<xs:appinfo>`.
- **Other** - The *Content Completion Assistant* also includes elements from an XML Schema identified by a URL in `<xs:appinfo>` elements.

XSLT Preferences

XSLT stylesheets are often used to create output in XHTML or XSL-FO. In addition to suggesting content completion options for XSLT stylesheet elements, Oxygen XML Editor Eclipse plugin can suggest elements from these vocabularies. To configure the XSLT content completion options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Content Completion > XSLT**.

The following options are available:

Include elements declared in the schema section

This section includes options with regard to detecting elements from the declared schema.

Automatically detect HTML or Formatting Objects

Detects if the output being generated is HTML or FO and provides content completion for those vocabularies. Oxygen XML Editor Eclipse plugin analyzes the namespaces declared in the root element to find an appropriate schema.

If the detection fails, Oxygen XML Editor Eclipse plugin uses one of the following options:

- **None** - The *Content Completion Assistant (on page 2677)* suggests only XSLT elements.
- **HTML** - The *Content Completion Assistant (on page 2677)* includes HTML elements, including HTML5 elements (such as `<video>`, `<canvas>`, etc.).
- **Formatting objects** - The *Content Completion Assistant (on page 2677)* includes Formatting Objects (XSL-FO) elements as substitutes for `<xsl:element>`.
- **Custom schema** - If you want content completion hints for another output vocabulary, you can use this option to specify the path to the schema for that vocabulary. The supported schema types are DTD, XML Schema, RNG schema, or NVDL schema for inserting elements from the target language of the stylesheet.

Documentation schema section

This section specifies an additional schema that will be used for documenting XSL stylesheets.

You can choose between the following:

- **Built-in schema** - Uses the built-in schema for documentation.
- **Custom schema** - Allows you to specify a custom schema for documentation. The supported schema types are XSD, RNG, RNC, DTD, and NVDL.

Document Validation Preferences

To configure document validation options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Document Validation**. This page contains preferences for configuring how a document is checked for both well-formedness and validation errors.

The following options are available:

Maximum number of validation highlights

If a validation generates more errors than the number specified in this option, only the errors up to this number are highlighted in the editor panel and on the stripe that is displayed at the right side of the editor panel. This option applies to both automatic validation and manual validation.

Include problem ID in description

If this option is selected, validation issues listed in the **Results** view or **Problems** view will include the problem ID (as provided by the validation engine) in the **Description** column.

Clear validation markers on close

If this option is selected, all the error markers added in the **Problems** view for that document are removed when the Oxygen XML Editor Eclipse plugin is closed.

Enable automatic validation

This causes the validation to be automatically executed in the background as the document is modified in Oxygen XML Editor Eclipse plugin.

Delay after the last key event (s)

The period of keyboard inactivity before starting a new validation (in seconds).

Custom Validation Engines Preferences

As the name implies, the **Custom Validation Engines** preferences page displays the list of custom validation engines that can be associated to a particular editor and used for validating documents. To access this page, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Document Validation > Custom Validation Engines**.

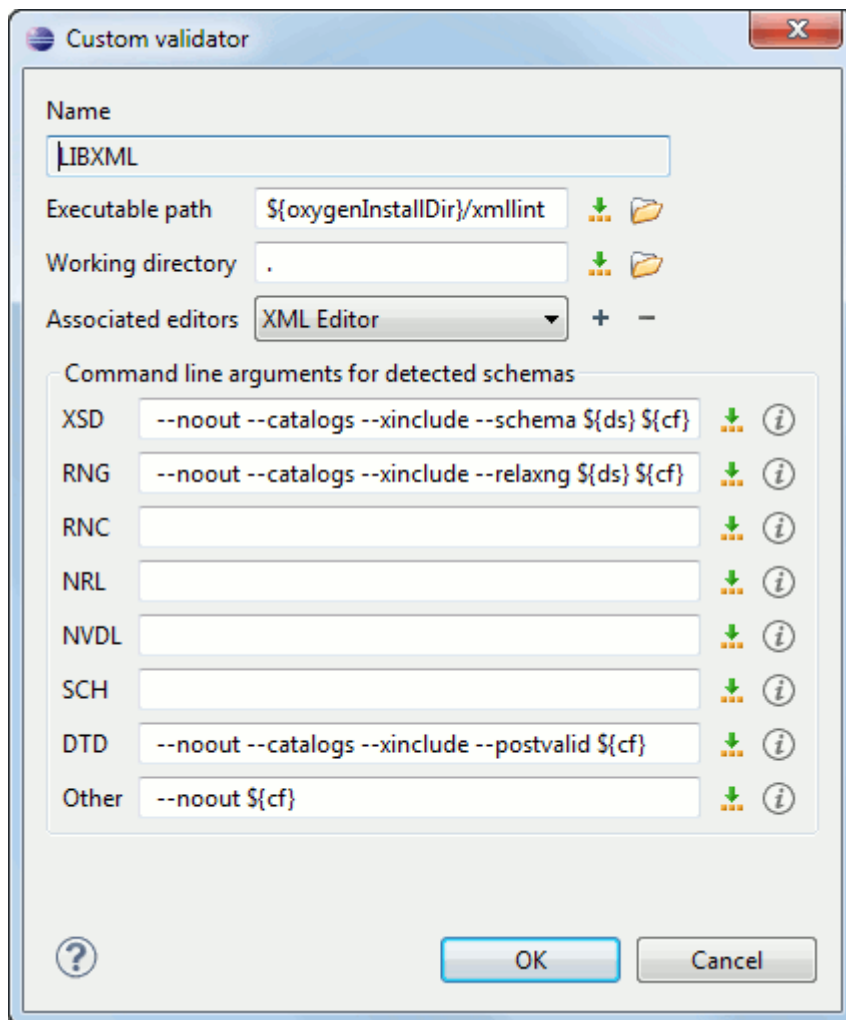

If you want to add a new custom validation tool or edit the properties of an existing one, you can use the **Custom Validator** dialog box displayed by pressing the  **New** or  **Edit** button.

Figure 28. Custom Validator Dialog Box

The **Custom Validator** dialog box allows you to configure the following parameters:

Name

Name of the custom validation engine that will be displayed in the  **Validation** toolbar drop-down menu.

Executable path

Path to the executable file of the custom validation tool. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Working directory

The working directory of the custom validation tool. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Associated editors

The editors that can perform validation with the external tool (XML editor, XSL editor, XSD editor, etc.)

Command-line arguments for detected schemas

Command-line arguments used in the commands that validate the currently edited file against various types of schema (XML Schema, Relax NG full syntax, Relax NG compact syntax, NVDL, Schematron, DTD, etc.) The arguments can include any custom switch (such as `-rng`) and the following [editor variables \(on page 218\)](#):

- **\${cf}** - Current file as file path, that is the absolute file path of the currently edited document.
- **\${currentFileURL}** - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- **\${ds}** - The path of the detected schema as a local file path for the current validated XML document.
- **\${dsu}** - The path of the detected schema as a URL for the current validated XML document.

Related information

[Editor Variables \(on page 218\)](#)

Increasing the Stack Size for Validation Engines

To prevent the appearance of a **StackOverflowException** error, use one of the following methods:

- Use the **com.oxygenxml.stack.size.validation.threads** property to increase the size of the stack for validation engines. The value of this property is specified in bytes. For example, to set a value of one megabyte specify `1x1024x1024=1048576`.

-  **Note:**
Increasing the value of the **-Xss** parameter affects all the threads of the application.

Edit Modes Preferences

Oxygen XML Editor Eclipse plugin lets you configure which edit mode a file is opened in the first time it is opened. This setting only applies the first time a file is opened. The current editing mode of each file is saved when the file is closed and restored the next time it is opened. To configure the options for editing modes, open the [Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit Modes** .

Allow Document Type specific edit mode setting to override the general mode setting

If selected, the initial edit mode setting set in the [Document Type configuration dialog box \(on page 90\)](#) overrides the general edit mode setting from the table below.

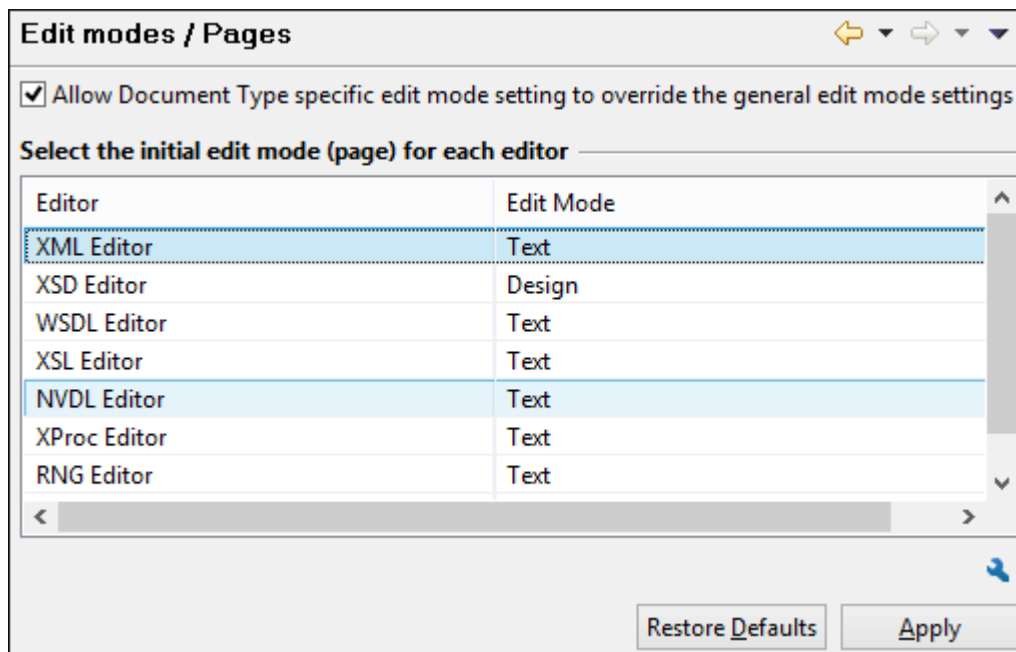

Select the initial edit mode (page) for each editor

This table specifies the default editing mode that will be opened for each type of document when the **Allow Document Type specific edit mode setting to override the general mode setting**

option is not selected. Use the  **Edit** button to change the initial edit mode for each type of document (editor). The initial edit mode can be one of the following:

- **Text**
- **Author**
- **Grid**
- **Design** (available only for the XSD editor).

Figure 29. Edit Modes Preferences Page

Author Preferences

Oxygen XML Editor Eclipse plugin provides an **Author** editing mode that provides a configurable graphical interface for editing documents. To configure the options for the **Author** mode, open the **Preferences** dialog box (on page 70) and go to **Editor > Edit modes > Author**.

The following options are available:

Author default background color

Sets the default background color of the **Author** editing mode. The `background-color` property set in the CSS file associated with the currently edited document overwrites this option.

Author default foreground color

Sets the default foreground color of the **Author** editing mode. The `color` property set in the CSS file associated with the currently edited document overwrites this option.

Show XML comments

When this option is selected, XML comments are displayed in **Author** mode. Otherwise, they are hidden.

Show placeholders for empty elements

When this option is selected, placeholders are displayed for elements with no content to make them clearly visible. The placeholder is rendered as a light gray box and displays the element name.

Show processing instructions

When this option is selected, XML processing instructions are displayed in **Author** mode. Otherwise, they are hidden.

Show Author layout messages

When this option is selected, all errors reported while rendering the document in **Author** mode are presented in the **Results** view ([on page 335](#)) at the bottom of the editor.

Show doctype

When this option is selected, the **doctype** declaration is displayed in **Author** mode. Otherwise, it is hidden.

Fast text layout

In certain cases, the widths computed in the **Author** visual editing mode for lines of text may be larger than expected, leading to an incorrect visual layout. Deactivating this option will improve the computation quality for character widths in the visual editing mode, but it may hinder overall performance for very large documents.

**Tip:**

For macOS users, some specific examples of this type of situation can be found here: [Text Rendering Issues on macOS \(on page 2325\)](#). Because of such problems, when an installation kit with Java 9 or newer is used on macOS, the checkbox is not selected by default.

Show floating contextual toolbar

When this option is selected (default), the *floating contextual toolbar* is displayed in the **Author** mode in certain situations. When not selected, the *floating contextual toolbar* is never displayed.

Images Section

The following options regarding images in **Author** mode are available in this section:

Auto-scale images wider than (pixels)

Sets the maximum width that an image will be displayed. Wider images will be scaled to fit.

Show very large images

When this option is selected, images larger than 6 megapixels are displayed in **Author** mode. Otherwise, they are not displayed.

**Important:**

If you select this option and your document contains many such images, Oxygen XML Editor Eclipse plugin may consume all available memory, throwing an **OutOfMemory error**. To resolve this, increase the available memory limit and restart the application.

Tags Section

In this section, you can configure the following options regarding tags that are displayed in **Author** mode:

Tags display mode

Sets the default display mode for element tags presented in **Author** mode. You can choose between the following:

**Full Tags with Attributes**

Displays full tag names with attributes for both *block* (on page 2676) and *inline elements* (on page 2679). Oxygen XML Editor Eclipse plugin

**Full Tags**

Displays full tag names without attributes for both *block elements* and *inline elements*.

**Block Tags**

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

**Block Tags without Element Names**

Displays tags for *block elements* but without element names for a more compact version of **Block Tags** mode. You can still see the element names by hovering over the tags.

**Inline Tags**

Displays full tag names for *inline elements*, while *block elements* are not displayed.

**Partial Tags**

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

**No Tags**

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Sort attributes alphabetically for "Full Tags with Attributes"

When selected, if you choose  **Full Tags with Attributes** for the **Tags Display Mode**, the attributes will be displayed in alphabetical order. Otherwise, they are displayed in the order that they appear in the XML source code.

Tags background color

Sets the **Author** mode tags background color.

Tags foreground color

Sets the **Author** mode tags foreground color.

Tags font

Allows you to change the font used to display tags text in the **Author** visual editing mode. The *default* font is computed based on the setting of the **Author** option in [the Fonts preferences page \(on page 177\)](#).

Compact tag layout

If this option is not selected, the **Author** mode displays the tags in a more decompressed layout, where block tags are displayed on separate lines.

References Section**Display referenced content (external entities, XInclude, DITA conref, etc.)**

When selected, the references (such as external entities, XInclude, DITA conrefs) also display the content of the resources they reference. When the option is not selected, the referenced resources are not automatically loaded and displayed, but the referenced content can be expanded on demand by using the small expansion button located next to each element that contains references. If you toggle this option while editing, you need to reload the file for the modification to take effect.

Allow referenced content to be edited

When selected, for a specific XML vocabulary that supports this feature, the content referenced from other files and presented in the **Author** visual editing mode can be edited in-place and saved. For now, if the feature is enabled and you use the  **Open Map in Editor with Resolved Topics** toolbar action in the **DITA Maps Manager** view, the referenced content in the opened document becomes editable in-place. Saving the document will save all other modified topics.

Local files only

When selected (default), the **Allow referenced content to be edited (Experimental)** option only works for local files. For files located in remote locations such as a CMS, additional steps might be necessary to save all modified content because this feature might not function properly with remote resources.

Whitespaces Section

The following option is available in this section:

Foreground color

Sets the foreground color of the white spaces in the **Author** mode. To enable this option, open the **Preferences** dialog box (*on page 70*), go to **General > Editors > Text Editors** and select **Show whitespaces characters**.

Enable mouse-wheel zooming

If selected, you can use **Ctrl + MouseWheelForward (Command + MouseWheelForward on macOS)** to increase the editor font (zoom in) or **Ctrl + MouseWheelBackwards (Command + MouseWheelBackwards on macOS)** to decrease the editor font (zoom out). It is enabled by default on Windows and Linux, while it is disabled by default on macOS, due to the way inertia affects the mouse wheel on this operating system.

Configure annotation tooltip

Click this link to open the [Annotations Preferences \(on page 121\)](#) page.

For advanced Author configuration see the Document Type Association settings

Click this link to open the [Document Type Association preferences page \(on page 88\)](#).

AutoCorrect Preferences

Oxygen XML Editor Eclipse plugin includes an option to automatically correct misspelled words as you type in **Author** mode. To enable and configure this *AutoCorrect* feature (*on page 295*), open the **Preferences** dialog box (*on page 70*) and go to **Editor > Edit Modes > Author > AutoCorrect**.

The following options are available:

Enable AutoCorrect

When selected (default state), while editing in **Author** mode, if you type anything that is listed in the **Replace** column of the Replacements table displayed in this preferences page, Oxygen XML Editor Eclipse plugin will automatically replace it with the value listed in the **With** column.

Use additional suggestions from the spell checker

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, Oxygen XML Editor Eclipse plugin will also use suggestions from the Spell Checker to automatically correct misspelled words. Suggestions from the Spell Checker will only be used if the misspelled word is not found in the Replacements table.

Note:

The *AutoCorrect* feature shares the same options configured in the [Language options \(on page 172\)](#) and [Ignore elements \(on page 174\)](#) sections in the **Spell Check** preferences page.

Include text-to-markup corrections based on the current document type

If selected, in addition to anything listed in the Replacements table displayed in this preferences page, the *AutoCorrect* mechanism will also include XML markup insertion rules specified in a configuration file for each document type. For example, for default DITA, DocBook, and TEI documents, entering a hyphen (-) followed by a space in an empty paragraph will automatically insert a list element with an empty list item element inside. The configuration file is located at: `[OXYGEN_INSTALL_DIR]/frameworks/[DOC_TYPE]/resources/structureAutocorrect.xml`.

Tip:

By default, the `structureAutocorrect.xml` file only exists for DITA, DocBook, and TEI frameworks, but it is possible to customize your own markup correction rules for your particular document type. For details, see [Customizing Text-to-Markup Shortcut Patterns \(on page 1997\)](#).

Spell Check options link

Use this link to navigate to the [Spell Check Preferences page \(on page 172\)](#).

Replacements Table section

The *AutoCorrect* feature uses the Replacements table to automatically replace anything that is listed in the **Replace** column with the value listed in the **With** column for each language.

Replacements for language drop-down menu

You can specify the language for the Replacements table, and for each language, you can configure the items listed in the table. The language selected in this page is not the language that will be used by the *AutoCorrect* feature. It is simply the language for the Replacements table.

Replacements Table

You can double-click on cells in either column to edit the listed items. Use the **Add** button to insert new items and the **Remove** button to delete rows from the table.

Note:

Any changes, additions, or deletions you make to this table are saved to a path that is specified in the [AutoCorrect Dictionaries preferences page \(on page 143\)](#).

Smart quotes section

You can also choose to automatically convert double and single quotes to a quotation character of your choice by using the following options in the **Smart quotes** section:

- **Replace "Single quotes"** - Replaces single quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.
- **Replace "Double quotes"** - Replaces double quotes with the quotation symbols you select with the **Start quote** and **End quote** buttons.

**Note:**

These **Smart quotes** options are ignored for content inside any element listed in the **Ignore elements** section of the **Spell Check preferences page** (*on page 174*).

Restore Defaults

Restores the options in this preferences page to their default values and **also deletes any changes you have made to the Replacements table** (*on page 141*).

AutoCorrect Dictionaries Preferences

To set the Dictionaries preferences for the *AutoCorrect* feature (*on page 295*), open the **Preferences** dialog box (*on page 70*) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries**. This page allows you to specify the location of the dictionaries that Oxygen XML Editor Eclipse plugin uses for the *AutoCorrect* feature and the location for saving user-defined replacements.

The following options are available in this preferences page:

Dictionaries default folder

Displays the default location where the dictionaries that Oxygen XML Editor Eclipse plugin uses for the *AutoCorrect* feature are stored.

Include dictionaries from

Selecting this option allows you to specify a location where you have stored *AutoCorrect* dictionaries that you want to include, along with the default ones.

**Important:**

Consider the following notes regarding this option:

- The *AutoCorrect* mechanism takes into account *AutoCorrect* dictionaries collected both from the default and custom locations and multiple dictionaries from the same language are merged (for example, `en_UK.dat` from the default location is merged with `en_US.dat` from a custom location).
- If you have a generic *AutoCorrect* dictionary file (one that just has a two-letter language code for its file name, such as `en.dat`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dat` and `en_US.dat`) will not be merged and the existing generic dictionary will simply be used instead.

- You can use a custom suffix in the dictionary file name after the language code. For example, `en_US_synopsys.dat` or `en_synopsys.dat`.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries link

Use this link to open a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to [add dictionaries for the *AutoCorrect* feature \(on page 297\)](#).

Save user-defined replacements in the following location

Specifies the target where added, edited, or deleted replacements are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Related information

[Add Dictionaries for the *AutoCorrect* Feature \(on page 297\)](#)

Cursor Navigation Preferences

Oxygen XML Editor Eclipse plugin allows you to configure the appearance and behavior of the cursor in the **Author** mode editor. To set cursor navigation preferences, [open the **Preferences** dialog box \(on page 70\)](#) and go to **Author > Cursor Navigation**.

The following options are available:

Highlight elements near cursor

When this option is selected, the element that contains the cursor is highlighted. If the cursor is between two elements, both of them are highlighted. You can use the color picker to choose the color of the highlight.

Show cursor position tooltip

Oxygen XML Editor Eclipse plugin uses [tooltips \(on page 374\)](#) in **Author** mode to indicate the position of the cursor in the element structure of the underlying document. Depending on context, the tooltips may show the current element name or the names of the elements before and after the current cursor position.

Show location tooltip on mouse move

When this option is selected, Oxygen XML Editor Eclipse plugin displays [Location Tooltips \(on page 375\)](#) when you are editing the document in certain tags display modes (**Inline Tags**, **Partial Tags**, **No Tags**) or when the mouse pointer is moved between [block elements \(on page 2676\)](#).

Quick up/down navigation

This option is deselected by default and this means that when you navigate using the up and down arrow keys in **Author** mode, the cursor is placed within each of the underlying XML elements between two blocks of text (the cursor changes to a horizontal line when it is between blocks of text). This allows you to easily insert elements and manage the structure of your XML content. However, if this option is selected, the cursor ignores the XML structure and jumps from one line of text to another, similar to how the cursor behaves in a word processor.

Quick navigation in tables

This option is selected by default and this means that when navigating between table cells with the arrow keys, the cursor jumps from one cell to another. If this option is not selected, the cursor navigates between XML nodes when navigating between table cells with the arrow keys.

Avoid positioning the cursor between blocks after a deletion

If selected (default), the cursor will not stay between block element sentinels after a deletion is performed.

Arrow keys move the cursor in the writing direction

This setting determines how the left and right arrow keys behave in **Author** mode for bidirectional (BIDI) text. When this option is selected (default value), the right arrow key advances the cursor in the reading direction and the left arrow moves it in the opposite direction. When this option is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

MathML Preferences

Oxygen XML Editor Eclipse plugin allows you to [edit MathML \(on page 521\)](#) equations and displays the results in a preview window. For a more advanced *MathML* editor, you can either [install *Wiris MathType* \(on page 523\)](#) (which is a commercial product that requires a separate license) or use an external *MathML* editor (e.g. the *LibreOffice* equation editor).

Using *MathFlow* for Editing and Rendering MathML Equations (Deprecated)

Important:

The *MathFlow* editor integration has been marked as deprecated and was replaced with a new [MathType integration \(on page 522\)](#).

To configure the *MathML* editor or to enter your *MathFlow* license information, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit Modes/Pages > Author > MathML**.

You can configure the following options:

Equation minimum font size

The minimum size of the font used for rendering mathematical symbols when editing in the **Author** mode.

MathFlow installation directory

The installation folder for the *MathFlow* components product (*MathFlow* SDK).

MathFlow license file

The license file for the *MathFlow* components product (*MathFlow* SDK).

MathFlow preferred editor

A *MathML* formula can be edited in one of three editors of *MathFlow* components product (*MathFlow* SDK).

- **Structure Editor** (default selection) - Targets professional XML workflow users.
- **Style Editor** - Tailored to the needs of content authors.
- **Simple Editor** - Designed for applications where end-users can enter mathematical equations without prior training and only the meaning of the math matters.

Save special characters

Specifies how special characters are saved in the XML file.

- **As entity names** - Saves the characters in `&name;` format. It refers to a character by the name of the entity that has the desired character as its replacement text. For example, the Greek *Omega* character is saved as `Ω`.
- **As character entities** (default selection) - Saves the characters in a hexadecimal value, using the `&#xNNN` format. For example, the Greek *Omega* character is saved as `Ω`.
- **As character values** - Saves the characters as the actual symbol. For example, the Greek *Omega* character is saved as `Ω`.

More documentation is available on the [Wiris MathFlow](#) website.

Using an External Tool for Editing MathML Equations

External application > Command line

You can use this option to specify an external MathML application for editing MathML equations.

For example, the following commands could be used to edit MathML equations with a LibreOffice application (depending on the O.S.):

- **Windows** - `"C:\Program Files\LibreOffice\program\smath.exe" --nologo "${cf}"`
- **macOS** - `/Applications/LibreOffice.app/Contents/MacOS/soffice --math --nologo "${cf}"`
- **Linux** - `/usr/lib/libreoffice/program/smath --nologo "${cf}"`

Profiling/Conditional Text Preferences

Oxygen XML Editor Eclipse plugin lets you configure how [profiling and conditional text \(on page 442\)](#) is displayed in **Author** mode. It has built-in support for the standard conditional text features of DITA and

DocBook that you can customize for your own projects. You can also add conditional support for other XML vocabularies, including your custom vocabularies.

To configure **Profiling/Conditional Text** options, open the **Preferences** dialog box (on page 70) and go to **Editor > Edit modes > Author > Profiling/Conditional Text**. There are several sub-pages in this section. This first parent page includes options for determining which types of profiled content is displayed:

Show profiling attributes

Toggles whether or not the **Show Profiling Attributes** option (on page 452) in the

Profiling / Conditional Text drop-down menu is enabled by default.

Show profiling attribute name

If selected, the names of the profiling attributes are displayed with their values. If unchecked, only the values are displayed.

Show profiling colors and styles

Toggles whether or not the **Show Profiling Colors and Styles** option (on page 452) in the

Profiling / Conditional Text drop-down menu is enabled by default.

Show excluded content

Toggles whether or not the **Show Excluded Content** option (on page 452) in the

Profiling / Conditional Text drop-down menu is enabled by default.

Attributes and Condition Sets Preferences

To configure profiling attributes and condition sets, open the **Preferences** dialog box (on page 70) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

Note:

Note the following when configuring these settings:

- This preferences page is used to define how profiled elements are treated in **Author** mode. It does not create profiling or conditional text attributes or values in the underlying XML vocabulary. It just changes how the editor displays them.
- This preferences page should be used for profiling / conditional text elements only. To change how other types of attributes are displayed in the text, use a CSS file.
- If you are using the DITA XML vocabulary and a DITA *subject scheme map* (on page 2682) is defined in the *root map* (on page 2682) of your document, it will be used in place of anything defined using this dialog box.

This preferences page contains the following options and sections:

Import from DITAVAL

This button allows you to import profiling attributes from [DITAVAL files \(on page 2602\)](#). You can merge these new profiling attributes with the existing ones, or replace them completely. If the imported attributes conflict with the existing ones, Oxygen XML Editor Eclipse plugin displays a dialog box that contains two tables. The first one previews the imported attributes and the second one previews the already defined attributes. You can choose to either keep the existing attributes or replace them with the imported ones.

Note:

When importing profiling attributes from DITAVAL files, Oxygen XML Editor Eclipse plugin automatically creates condition sets based on these files.

Profiling Attributes section

Allows you to specify a set of allowable values for each profiling or conditional attribute. You can use the **+** **New** button at the bottom of the table to [add profiling attributes \(on page 443\)](#), the **✎** **Edit** button to edit existing ones, or the **✕** **Delete** button to delete entries from the table. Use the **↑** **Up** and **↓** **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor Eclipse plugin uses the one that is positioned highest in the table.

Report invalid profiling attribute values (DITA only)

If selected, it means the following:

- In DITA, the automatic validation will display a warning when a value that is not defined is found in the document.
- In the DITA **Validate and Check for Completeness** dialog box, the [Report attributes and values that conflict with profiling preferences \(on page 2387\)](#) option is not displayed. This means that the validation will behave the same as if that option was selected and it will always report such values.

Allow contributing extra profiling attribute values

This option is selected by default, which means that users are allowed to add values that are not defined in preferences to profiling attributes. If a user inserts such a value, when invoking the **Edit Profiling Attributes** action from the contextual menu in **Author** mode (or for DITA topics, the **Edit Properties** action in the [DITA Maps Manager \(on page 2337\)](#)), the **Profiling Values Conflict** dialog box [\(on page 445\)](#) will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. If deselected, Oxygen XML Editor Eclipse plugin behaves as if the **Preserve the configuration** option has been chosen in the **Profiling Values Conflict** dialog box [\(on page 445\)](#) and that dialog box will never appear.

Configure profiling colors and styles link

Use this link to open the [profiling **Colors and Styles** preference page](#) (on page 148).

Profiling Condition Sets section

Allows you to specify a specific set of profiling attributes to be used to specify a particular build configuration for your content. You can use the **+** **New** button at the bottom of the table to [add condition sets](#) (on page 448), the **✎** **Edit** button to edit existing ones, or the **✕** **Delete** button to delete entries from the table. Use the **↑** **Up** and **↓** **Down** buttons to change the priority of the entries. If you have multiple entries with identical names that match the same document type, Oxygen XML Editor Eclipse plugin uses the one that is positioned highest in the table.

Related information

[Filtering Profiling Values with a DITAVAL File](#) (on page 2602)

[Styling the Rendering of Profiled Content Using a DITAVAL File](#) (on page 2604)

Colors and Styles Preferences

Oxygen XML Editor Eclipse plugin lets you set the colors and styles used to display [profiling / conditional text](#) (on page 145) in the **Author mode editor** (on page 242). To set Colors and Styles preferences, [open the Preferences dialog box](#) (on page 70) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.

The preference page includes the following options and sections:

Automatically apply colors and styles from DITAVAL files referenced in the Main Files folder

If this setting is enabled (default state is disabled) and **DITAVAL** filter files that define flagging conditions are referenced within the **Main Files** folder in the **Project** view, those conditions are automatically taken into account when the [Show Profiling Colors and Styles option](#) (on page 452) from the **Y** **Profiling / Conditional Text** toolbar drop-down menu in **Author** mode is enabled.

Import from DITAVAL

Allows you to import profiling styles from a `.ditaval` file. You can merge these new profiling styles with the existing ones, or replace them completely. If the imported styles conflict with the existing ones, Oxygen XML Editor Eclipse plugin displays a dialog box containing two tables. The first one previews the imported styles, while the second one previews the already defined styles. You can choose to either keep the existing styles or replace them with the imported ones. This feature works even if you use [profiling attribute groups to organize the attributes into subcategories](#) (on page 2595).

Profiling Colors and Styles Table

You can use buttons below this table to set specific colors and styles for the listed profiling attribute values. The table includes two categories:

- **Defined attributes values** - Contains the styles for profiling attribute values defined in the [Profiling / Conditional Text \(on page 145\)](#) preferences page. Each profiling attribute value has an associated style. To ease the process of customizing styles, the **Defined attributes values** category contains by default the list of empty styles. All you have to do is to adjust the colors and decorations, thus skipping the process of manually defining the association rules (document type, attribute name, and value). This is the reason why a style from this category can only be [reset \(on page 149\)](#), not deleted.
- **Other** - This category contains styles for attribute values that are not marked as profiling values, in the [Profiling / Conditional Text \(on page 145\)](#) preferences page. In this category are listed:
 - All the styles that were defined in other projects (with other profiling attribute value sets).
 - All the styles set for the profiling attributes defined in a [subject scheme map \(on page 2597\)](#).

Automatic styling button

If you click this button, Oxygen XML Editor Eclipse plugin will apply automatic styling to the profiling attribute values that do not have a style defined.

New button

Opens the **Add Profiling Style** dialog box that allows you to associate a set of coloring and styling properties to a profiling value.

Note:

You can define a default style for a specific attribute by setting the **Attribute value** field to `<ANY>`. This style is applied for attribute values that do not have a specific style associated with it.

Edit button

Open the **Edit Profiling Style** dialog box that allows you to edit the colors or style for an existing profiling value. You can also double-click the value to open this dialog box.

Clear style button

Resets the style for the selected value to its default setting (no color or decoration).

Delete button

Delete the selected style from the **Other** category.

Related information

[Filtering Profiling Values with a DITAVAL File \(on page 2602\)](#)

[Styling the Rendering of Profiled Content Using a DITAVAL File \(on page 2604\)](#)

Attributes Preferences

When the **Show Profiling Attributes** option ([on page 452](#)) is selected, the **Author** mode displays conditional text markers at the end of conditional text blocks. To configure the rendering of these text markers, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles > Attributes**.

The following options are available:

Background color

Sets the background color used to display the profiling attributes.

Attribute name foreground color

Sets the foreground color used to display the names of the profiling attributes.

Attribute values foreground color

Sets the foreground color used to display values of the profiling attributes.

Border color

Sets the color of the border of the block that displays the profiling attributes.

Review Preferences

Oxygen XML Editor Eclipse plugin allows you to [add review comments and track changes \(on page 416\)](#) in your documents. The **Review** preferences page allows you to control how the Oxygen XML Editor Eclipse plugin review features work. To configure these options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Author > Review**.

The available options are as follows:

Author

Specifies the name to be attached to all comments and to changes made while **Track Changes** is active. By default, Oxygen XML Editor Eclipse plugin uses the system user name.

Track Changes section (applies for all authors)

Initial state

Specifies whether or not the [Track Changes feature \(on page 2683\)](#) is enabled when you open a document. You may have the *Track Changes* feature enabled in some documents and disabled in others, or you can choose to always enable or disable the feature for all documents. You can choose between the following options:

- **Stored in document** - The current state of the *Track Changes* feature is stored in the document itself, meaning that it is on or off depending on the state the last time the document was saved. This is the recommended setting when multiple authors work on the same set of documents as it

will make it obvious to other authors that changes have been made in the document.

- **Always On** - The *Track Changes* feature is always on when you open a document. You can turn it off for an open document, but it will be turned on for the next document you open.
- **Always Off** - The *Track Changes* feature is always off when you open a document. You can turn it on for an open document, but it will be turned off for the next document you open.

Initial display mode

Specifies whether or not all tracked changes and comments are visible when you open a document in the **Author** visual editing mode. You can choose between the following options:

- **View All Changes/Comments** - All tracked changes and comments are visible in the **Author** visual editing mode.
- **View Final** - Comments are hidden, while insertion and deletion track changes are presented as if they would be accepted.

Display changed lines marker

A changed line maker is a vertical line on the left side of the editor window indicating where changes have been made in the document. To hide the changed lines marker, deselect this option.

Inserted content color

When the *Track Changes feature (on page 2683)* is on, the newly inserted content is highlighted with an *insertion marker* that uses a color to adjust the following display properties of the inserted content: *foreground*, *background*, and *underline*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor Eclipse plugin automatically assigns a color to each user who inserted content in the current document. The colors are picked from the **Colors for automatic assignment list (on page 152)**, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor Eclipse plugin uses the specified color for all insertion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor Eclipse plugin uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the inserted content.

- **Use same color for background** - If selected, Oxygen XML Editor Eclipse plugin uses the color defined above (**Automatic** or **Fixed**) to render the background of the inserted content. A slider control allows you to set the transparency level of the background.

Deleted content color

When the *Track Changes feature (on page 2683)* is on, the deleted content is highlighted with a *deletion marker* that uses a color to adjust the following display properties of the deleted content: *foreground*, *background*, and *strikethrough*. This section allows you to customize the following color options:

- **Automatic** - If this option is selected, Oxygen XML Editor Eclipse plugin automatically assigns a color to each user who deleted content in the current document. The colors are picked from the **Colors for automatic assignment list (on page 152)**, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor Eclipse plugin uses the specified color for all deletion markers, regardless of who the author is.
- **Use same color for text foreground** - If selected, Oxygen XML Editor Eclipse plugin uses the color defined above (**Automatic** or **Fixed**) to render the foreground of the deleted content.
- **Use same color for background** - If selected, Oxygen XML Editor Eclipse plugin uses the color defined above (**Automatic** or **Fixed**) to render the background of the deleted content. A slider control allows you to set the transparency level of the background.

Comments color section (applies for all authors)

Sets the background color of the text that is commented on. The options are:

- **Automatic** - If this option is selected, Oxygen XML Editor Eclipse plugin automatically assigns a color to each user who adds a comment in the current document. The colors are picked from the **Colors for automatic assignment list (on page 152)**, the priority being established by the type of change (deletion, insertion, or comment) and in the order that you see in the list.
- **Fixed** - If this option is selected, Oxygen XML Editor Eclipse plugin uses the specified color for all changes, regardless of who the author is. A slider control allows you to set the transparency level of the background.

Colors for automatic assignment list

These are the colors that will be automatically assigned for tracked insertions, tracked deletions, and comments if the **Automatic** option is selected in any of the sections in this preferences

page. The colors are assigned in the order that you see in this list. You can use the **+** **Add**, **Edit**, or **X** **Remove** buttons to modify the list of colors.

Related information

[Reviewing Documents \(on page 416\)](#)

Callouts Preferences

Oxygen XML Editor Eclipse plugin can display *callouts (on page 2677)* for *review items* such as comments and *tracked changes (on page 416)*. To customize options for review callouts, open the **Preferences** dialog box *(on page 70)* and go to **Editor > Edit modes > Author > Review > Callouts**.

The available options are as follows:

Show Review Callouts section

Comments

If selected, callouts are displayed for comments, including comments that are added to *tracked changes (on page 2683)*. This option is selected by default.

Track Changes deletions

If selected, callouts are displayed for *tracked change (on page 2683)* deletions and the following additional option becomes available:

Show deleted content in callout

If selected, the deleted content is also displayed in the callout.

Track Changes insertions

If selected, callouts are displayed for *tracked change (on page 2683)* insertions and the following additional option becomes available:

Show inserted content in callout

If selected, the inserted content is also displayed in the callout.

Rendering section

Show review time

When selected, timestamp information is displayed in callouts.

Show all connecting lines

When selected, lines are shown that connect the callout to the location of the change.

Initial width (px)

Specifies the initial width of the callouts each time the document is opened. The default is 250 pixels.

Text lines count limit

Specifies the maximum number of lines to be shown in the callouts. The default is 5 lines. Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it. To see the full comment, right-click on the callout and select  **Edit Comment** or  **Show Comment**.

Schema-Aware Preferences

Oxygen XML Editor Eclipse plugin can use the schema of your XML language to improve the way the **Author** mode editor handles your content. To configure the **Schema-Aware** options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Author > Schema-Aware**.

The following options are available:

Schema-aware normalization, format, and indent

When you open or save a document in **Author** mode, white space is normalized using the `display` property of the current CSS stylesheet and the values of the [settings \(on page 166\)](#) for **Preserve space elements**, **Default space elements**, and **Mixed content elements**. When this option is selected, the schema will also be used to normalize white space, based on the content model (*element-only*, *simple-content*, or *mixed*). Note that the schema information takes precedence.

Indent blocks-only content

To avoid accidentally introducing inappropriate white space around *inline elements (on page 2679)*, Oxygen XML Editor Eclipse plugin does not normally apply indenting to the source of an element with mixed content. If this option is selected, Oxygen XML Editor Eclipse plugin will apply indenting to the source of mixed content elements that only contain *block elements (on page 2676)*.

Schema-Aware Editing

The options in this section determine how Oxygen XML Editor Eclipse plugin will use the schema of a document to control the behavior of the **Author** mode.

- **On** - Enables all schema-aware editing options.
- **Off** - Disables all schema-aware editing options.
- **Custom** - Allows you to select custom schema-aware editing options from the following:

Schema-Aware Actions section**Delete element tags with backspace and delete**

Controls what happens when you attempt to delete an element tag. The two options are:

- **Smart delete** - If deleting the tag would make the document invalid, Oxygen XML Editor Eclipse plugin will attempt to make the document valid by unwrapping the current element or by appending it to an adjacent element where the result would be valid. For instance, if you delete a bold tag, the content can be unwrapped and become part of the surrounding paragraph, but if you delete a list item tag, the list item content cannot become part of the list container. However, the content could be appended to a preceding list item.
- **Reject action when its result is invalid** - A deletion that would leave the document in an invalid state is rejected.

Paste and Drag and Drop

Controls the behavior for paste and drag and drop actions. Available options are:

- **Smart paste and drag and drop** - If the content inserted by a paste or drop action is not valid at the cursor position, according to the schema, Oxygen XML Editor Eclipse plugin tries to find an appropriate insert position. The possibilities include:
 - Creating a sibling element that can accept the content (for example, if you tried to paste a paragraph into an existing paragraph).
 - Inserting the content into a parent or child element (for example, if you tried to paste a list item into an existing list item, or into the space above or below an existing list).
 - Inserting the content into an ancestor element where it would be valid.
- **Reject action when its result is invalid** - If selected, Oxygen XML Editor Eclipse plugin will not let you paste content into a position where it would be invalid.

Typing

Controls the behavior that takes place when typing. Available options are:

- **Smart typing** - If typed characters are not allowed in the element at the cursor position, but the previous element does allow text, then a similar element will be inserted, along with your content.
- **Reject action when its result is invalid** - If selected, and the result of the typing action is invalid, the action will not be performed.

Content Completion

Controls the behavior that takes place when inserting elements using the *Content Completion Assistant* in **Author** mode. Available options are:

- **Press ENTER to show available content completion proposals** - If selected, pressing **Enter** will open the *Content Completion Assistant*. If deselected, there are three possibilities:
 - The current element will be split (if possible).
 - A new element with the same name will be inserted (if possible).
 - Otherwise, a new paragraph will be inserted.
- **Show all possible elements in the content completion list** - If selected, the content completion list will show all the elements in the schema, even those that cannot be entered validly at the current position. If you select an element that is not valid at the current position, Oxygen XML Editor Eclipse plugin will attempt to find a valid location to insert it and may present you with several options.
- **Allow only insertion of valid elements and attributes** - If selected, you can only select elements in the content completion list that are valid (according to the schema) at the current position.
- **Allow only insertion of valid attribute values** - If selected, you cannot enter an attribute value that is not valid (according to the schema) in the [Attributes view \(on page 405\)](#) or [In-place Attributes Editor \(on page 386\)](#). If the attribute has a choice of values, you can select a possible value from a drop-down list in the combo box, but you cannot enter a value manually.

Warn on invalid content when performing action

A warning message will be displayed when performing an action that will result in invalid content. Available options are:

- **Delete Element Tags** - If selected, a warning message will be displayed if the [Delete Element Tags \(on page 531\)](#) action will result in an invalid document. You will be asked to confirm the deletion.
- **Join Elements** - If selected, a warning message will be displayed if the [Join Elements \(on page 531\)](#) action will result in an invalid document. You will be asked to confirm the join.

Automatically apply the best schema-aware insertion operation

If selected, Oxygen XML Editor Eclipse plugin automatically uses what it considers to be the best insertion solution, when there is an attempt to insert content that is not valid in a specific context. If not selected, Oxygen XML Editor Eclipse plugin will ask the user to choose from a list of proposed solutions.

Convert external content on paste

If selected, the [Smart Paste feature \(on page 390\)](#) is enabled when external content is pasted in **Author** mode.

Convert even when pasting inside space-preserve elements

If selected, the *Smart Paste* feature will be used even when external content is pasted inside a *space-preserve* element (such as a `<codeblock>`).

Convert pasted URLs to links

If selected, when a URL is pasted into **Author** mode, a link will be inserted (the type of link depends on the type of document). For example, in DITA documents, an `<xref>` is inserted.

Related information

[Smart Paste in Author Mode \(on page 390\)](#)

[Customizing Smart Paste Support \(on page 1999\)](#)

Serialization Preferences

To configure the serialization options for the **Author** mode, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Author > Serialization**.

The following options are available:

Format and indent

Use this option to specify what should be formatted and indented when you save a document (or switch from **Author** to **Text** mode). You can choose between the following two options:

Only the modified content

The **Save** operation only formats the nodes that were modified in the **Author** mode. The rest of the document preserves its original formatting.

Note:

This option also applies to the *DITA maps* opened in the [DITA Maps Manager \(on page 2337\)](#).

The entire document

The **Save** operation applies the formatting to the entire document regardless of the nodes that were modified in **Author** mode.

Also apply the format and indent options that are set for Text mode

If this option is selected, the result of the **Format and indent** operation will be the same as when it is applied in **Text** editing mode. Thus, the content of the document is formatted by applying the **Format and Indent** rules from the [Editor/Format \(on page 162\)](#) and [Editor/Format/XML \(on page 166\)](#) preference pages. You can use the **Format and indent options** link to navigate to those options.

Compatibility with other tools

Use this option to control how line breaks are handled when a document is serialized. This will help to obtain better compatibility with other tools. You can choose one of the following:

- **None** - Choose this option if compatibility with other tools can be ignored.
- **Do not break lines, do not indent** - Choose this option to avoid breaking lines after element start or end tags and indenting will not be used.

Note:

New lines that are added by the user in elements where the `@xml:space` attribute is set to `preserve` (such as `<pre>` elements in HTML, or `<codeblock>` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode option** (on page 157), since the formatting from **Text** mode does not take the CSS styles into account.

- **Break lines only after elements displayed as blocks, do not indent** - Choose this option to instruct Oxygen XML Editor Eclipse plugin to insert new lines only after elements that have a CSS display property set to anything other than `inline` or `none` (for example, `block`, `list-item`, `table`, etc.) and indenting will not be used. When selecting this option, the formatting is dictated by the CSS.

Note:

New lines that are added by the user in elements where the `@xml:space` attribute is set to `preserve` (such as `<pre>` elements in HTML, or `<codeblock>` elements in DITA) are still inserted. Also, selecting this option automatically disables the **Also apply the format and indent options that are set for Text mode option** (on page 157), since the formatting from **Text** mode does not take the CSS styles into account.

Grid Preferences

Oxygen XML Editor Eclipse plugin provides a **Grid view** (on page 242) of an XML document. To configure the **Grid** mode options, open the **Preferences** dialog box (on page 70) and go to **Editor > Edit modes > Grid**.

The following options are available:

Compact representation

If selected, the *compact representation* of the grid is used: a child element is displayed beside the parent element. In the *non-compact representation*, a child element is nested below the parent.

Format and indent when passing from grid to text or on save

If selected, the content of the document is formatted and indented each time you switch from the **Grid** view to the **Text** view.

Default column width (characters)

Sets the default width (in characters) of a table column of the grid. A column may contain the following:

- Element names
- Element text content
- Attribute names
- Attribute values

If the total width of the grid structure is too large you can resize any column by dragging the column margins with the mouse pointer, but the change is not persistent. To make it persistent, set the new column width with this option.

Active cell color

Allows you to set the background color for the *active cell* (on page 2676) of the grid. The keyboard input always goes to the *active cell* and the selection always contains it.

Selection color

Allows you to set the background color for the selected cells of the grid, except the *active cell* (on page 2676).

Border color

Allows you to set the color used for the lines that separate the grid cells.

Background color

Allows you to set the background color of grid cells that are not selected.

Foreground color

Allows you to set the text color of the information displayed in the grid cells.

Row header colors**Background color**

Allows you to set the background color of row headers that are not selected.

Active cell color

Allows you to set the background color of the row header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected rows.

Column header colors

The column headers are painted with two color gradients, one for the upper 1/3 part of the header and the other for the lower 2/3 part. The start and end colors of the first gradient are set

with the first two color buttons. The start and end colors of the second gradient are set with the last two color buttons.

Background color

Allows you to set the background color of column headers that are not selected.

Active cell color

Allows you to set the background color of the column header cell that is currently active.

Selection color

Allows you to set the background color of the header cells corresponding to the currently selected columns.

Schema Design Preferences

Oxygen XML Editor Eclipse plugin provides a [graphical schema design editor \(on page 243\)](#) to make editing XML Schema easier. To configure the **Schema Design** options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Schema Design**.

The following options are available in the **Schema Design** preferences page:

Show annotation in the diagram

When selected, Oxygen XML Editor Eclipse plugin displays the content of documentation in schema diagrams.

When trying to edit components from another schema

The schema diagram editor will combine schemas imported by the current schema file into a single schema diagram. You can choose what happens if you try to edit a component from an imported schema. The options are:

- **Always go to its definition** - Oxygen XML Editor Eclipse plugin opens the imported schema file so that you can edit it.
- **Never go to its definition** - The imported schema file is not opened and the component cannot be edited in place.
- **Always ask** - Oxygen XML Editor Eclipse plugin asks if you want to open the imported schema file.

XSD Properties Preferences

Oxygen XML Editor Eclipse plugin lets you control which properties to display for XML Schema components in the **XML Schema Design view (on page 243)**. To configure the schema design properties displayed, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Schema Design > XSD Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the XML Schema **Design** mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the XML Schema **Design** mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

JSON Schema Properties Preferences

Oxygen XML Editor Eclipse plugin lets you control which properties to display for JSON Schema components in the JSON Schema **Design** mode. To configure the JSON properties that are displayed, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Schema Design > JSON Schema Properties**.

This preferences page contains the following:

Show additional properties in the diagram

If this option is selected, the properties selected in the property table are shown in the JSON Schema **Design** mode. This option is selected by default.

Properties Table

Show

Use this column in the table to select the properties that you want to be displayed in the JSON Schema **Design** mode.

Only if specified

Use this column to select if you want the property to be displayed only if it is defined in the schema.

Text Diagram Preferences

For certain XML languages, Oxygen XML Editor Eclipse plugin provides a diagram view as part of the **Text** mode editor. To configure the **Diagram** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes / Pages > Text Diagram**.

The following options are available in this preference page:

Show Full Model XML Schema diagram

When this option is selected, the **Text** mode editor for XML Schemas includes a split-screen view that shows a diagram of the schema structure. This is useful for seeing the effects of schema changes you make. For editing a schema using a diagram instead of text, use the [schema Design view \(on page 243\)](#).

**Note:**

When handling very large schemas, displaying the schema diagram might affect the performance of your system. In such cases, disabling the schema diagram view improves the speed of navigation through the edited schema.

Enable Relax NG diagram and related views

Enables the Relax NG schema diagram and synchronization with the related views (**Attributes** *(on page 329)*, **Model** *(on page 331)*, **Elements** *(on page 333)*, **Outline** *(on page 838)*).

Show Relax NG diagram

Displays the Relax NG schema diagram in the split-screen views (**Full Model View** *(on page 831)* and **Logical Model View** *(on page 832)*).

Enable NVDL diagram and related views

Enables the NVDL schema diagram and synchronization with the related views (**Attributes** *(on page 329)*, **Model** *(on page 331)*, **Elements** *(on page 333)*, **Outline** *(on page 854)*).

Show NVDL diagram

Displays the NVDL schema diagram in the split-screen views (**Full Model View** *(on page 850)* and **Logical Model View** *(on page 851)*).

Location relative to editor

Allows you to specify the location of the schema diagram panel relative to the diagram **Text** editor.

Show/Hide Annotations link

Use this link to navigate to the **Schema Design** preferences page *(on page 160)* where you can choose to show or hide annotations in schema diagrams.

Format Preferences

This preferences page contains various formatting options that influence editing and formatting in both the **Text** *(on page 241)* and **Author** *(on page 242)* editing modes. To control additional options specifically for the **Author** mode editor, see *Whitespace Handling in Author Mode* *(on page 375)*.

**Note:**

These settings apply to the formatting of source documents. The formatting of output documents is determined by the **transformation scenarios that create them** *(on page 1171)*.

To configure the **Format** options, open the **Preferences** dialog box *(on page 70)* and go to **Editor > Format**.

The following options are available:

Detect indent on open

If selected, Oxygen XML Editor Eclipse plugin detects how a document is indented when it is opened. Oxygen XML Editor Eclipse plugin uses a heuristic method of detection by computing a weighted average indent value from the initial document content. You can deselect this setting if the detected value does not work for your particular case and you want to use a fixed-size indent for all the edited documents. If this option is selected, Oxygen XML Editor Eclipse plugin detects the following:

- When TAB characters are used to indent content, the size of the TAB characters is used for the indent size.
- Otherwise, the detected size of SPACE characters is used for the indent size.

Tip:

If you want to minimize the formatting differences created by the **Format and Indent** operation in a document edited in the **Text** edited mode, make sure that both the **Detect indent on open** and **Detect line width on open** ([on page 164](#)) options are selected.

Use zero-indent, if detected

By default, if no indent was detected in the document, the fixed-size indent is used. Select this option if all of your documents have no indentation and you want to keep them that way.

Indent with tabs

If selected, indents are created using TAB characters. If unchecked, lines are indented using space characters. Selecting this option automatically disables the **Detect indent on open** ([on page 162](#)) option.

Indent size

The meaning of this setting depends on the following:

- If the **Detect indent on open option** ([on page 162](#)) is selected and TAB characters are detected at the beginning of the line, the *indent size* is the width of a TAB character. Otherwise, the *indent size* value is ignored and Oxygen XML Editor Eclipse plugin uses the number of detected SPACE characters.
- If the **Indent with tabs option** ([on page 163](#)) is selected, the *indent size* is the width of a TAB character.
- If neither of these options are selected, the *indent size* is the number of SPACE characters used for indenting the text lines.

For additional information about changing the *indent size*, see [Setting an Indent Size to Zero](#) ([on page 343](#)).

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Editor Eclipse plugin](#) ([on page 165](#)).

Indent on enter

If selected, when you press **Enter** to insert a line break in the **Text** editing mode, an indentation will be added to the new line.

Enable smart enter

If selected, when you press the **Enter** key between a start and an end XML tag in the **Text** editing mode, the cursor is placed in an indented position on the empty line formed between the start and end tag.

Format and indent the document on open

If selected, an XML document is formatted and indented before opening it in Oxygen XML Editor Eclipse plugin.

Note:

Some specialized types of XML documents do not benefit from this feature, including Relax NG, XSD, XSL, and Ant. However, the feature is available for some non-XML types of documents, such as CSS and JSON.

Detect line width on open

If selected, Oxygen XML Editor Eclipse plugin automatically detects the line width when the document is opened.

Hard line wrap (Limit to "Line width - Format and Indent")

If selected, when typing content in the **Text** editing mode and the maximum line width is reached, a line break is automatically inserted.

Line width - Format and Indent

Defines the number of characters after which the **Format and Indent** (pretty-print) action performs hard line-wrapping. For example, if set to 100, after a **Format and Indent** action, the longest line will have a maximum of 100 characters.

Note:

To avoid having an indent that is longer than the line width setting and without having sufficient space available for the text content, the indent limit is actually set at half the value of the **Line width - Format and Indent** setting. The remaining space is reserved for text.

For information about when this setting is used, see [Where Indent Size and Line Width Settings are Used in Oxygen XML Editor \(on page 165\)](#).

Clear undo buffer before Format and Indent

The **Format and Indent** operation can be *undone*, but if used intensively, a considerable amount of the memory allocated for Oxygen XML Editor Eclipse plugin will be used for storing the undo

states. If this option is selected, Oxygen XML Editor Eclipse plugin empties the undo buffer before doing a **Format and Indent** operation. This means you will not be able to undo any changes you made before the format and indent operation. Select this option if you encounter out of memory problems (**OutOfMemoryError**) when performing the **Format and Indent** operation.

Where Indent Size and Line Width Settings are Used in Oxygen XML Editor Eclipse plugin

The values set in the **Indent Size** and **Line Width - Format and Indent** options are used in various places in the application, including the following:

- When the **Format and Indent** action is used in the **Text** editing mode.
- When you press **Enter** to break a line in the **Text** editing mode.
- When the **Hard line wrap (Limit to "Line width - Format and Indent")** option is selected and the maximum line width is reached while editing in the **Text** mode.
- When the XML is serialized by saving content in the **Author** editing mode.

Resources

For more information about the formatting options offered by Oxygen XML Editor Eclipse plugin, watch our video demonstration:

<https://www.youtube.com/embed/1plmdN0Cfso>

CSS Preferences

Oxygen XML Editor Eclipse plugin can format and indent your CSS files. To configure the **CSS** formatting options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Format > CSS**.

The following options control how your CSS files are formatted and indented:

Class body on new line

If selected, the *class* body (including the curly brackets) is placed on a new line. This option is not selected by default.

Indent class content

When selected (default state), the *class* content is indented.

Add space before the value of a CSS property

When selected (default state), whitespaces are added between the `:` (colon) and the value of a style property.

Add new line between classes

If selected, an empty line is added between two classes. This option is not selected by default.

Preserve empty lines

When selected (default state), the empty lines from the CSS content are preserved.

Allow formatting embedded CSS

When selected (default state), CSS content that is embedded in XML is also formatted when the XML content is formatted.

JavaScript Preferences

To configure the **JavaScript** format options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Format > JavaScript**.

The following options control the behavior of the **Format and Indent** action:

- **Start curly brace on new line** - Opening curly braces start on a new line.
- **Preserve empty lines** - Empty lines in the JavaScript code are preserved. This option is selected by default.
- **Allow formatting embedded JavaScript** - Applied only to XHTML documents, this option allows Oxygen XML Editor Eclipse plugin to format embedded JavaScript code, taking precedence over the [Schema-aware format and indent \(on page 169\)](#) option. This option is selected by default.

XML Preferences

To configure the **XML** Formatting options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Format > XML**.

The following options are available:

Format and Indent Section

This section includes the following drop-down boxes:

Preserve empty lines

The **Format and Indent** operation preserves all empty lines found in the document.

Preserve text as it is

The **Format and Indent** operation preserves text content as it is, without removing or adding any white space.

Preserve line breaks in attributes

Line breaks found in attribute values are preserved.

Note:

When this option is selected, the [Break long attributes option \(on page 166\)](#) is automatically disabled.

Break long attributes

The **Format and Indent** operation breaks long attribute values.

Indent inline elements

The *inline elements* are indented on separate lines if they are preceded by white spaces and they follow another element start or end tag. For example:

Original XML:

```
<root>
  text <parent> <child></child> </parent>
</root>
```

Indent inline elements selected:

```
<root> text <parent>
  <child/>
  </parent>
</root>
```

Indent inline elements not selected:

```
<root> text <parent> <child/> </parent> </root>
```

Expand empty elements

If not selected (default), the **Format and Indent** operation results in an empty XML element being serialized in a compact form (`<a atr1="v1"/>`). If selected, the same operation results in empty XML elements being serialized in expanded form (for example, `<a atr1="v1">`).

Notes:

- When using the **Format and Indent** operation in **Text** mode, if the **Schema-aware format and indent option** (*on page 169*) is enabled, Oxygen XML Editor Eclipse plugin will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema.
- When saving a document in **Author** mode, if the **Schema-aware normalization, format, and indent option** in the **Schema-Aware preferences page** (*on page 154*) is enabled, Oxygen XML Editor Eclipse plugin will use information from the associated schema and avoid expanding tags for elements that are defined as *empty* in the schema (therefore, text or other elements are not allowed inside them).

Sort attributes

The **Format and Indent** operation sorts the attributes of an element lexicographically.

Add space before slash in empty elements

Inserts a space character before the trailing / and > of empty elements.

Break line before an attribute name

When selected, the **Format and Indent** operation always breaks the line before any attribute name in an XML element. By default, the setting is not selected, which means that new lines might still be added before the attribute names but only if the line of content would overflow the maximum line width specified in the [Format preferences page \(on page 162\)](#).

Element Spacing Section

This section controls how the application handles whitespaces found in XML content. You can **Add** or **Remove** element names or simplified XPath expressions in the various tabs.

The XPath expressions can accept multiple attribute conditions and inside each condition you can use *AND/OR* boolean operators and parentheses to override the priority.

You can use one or more of the following attribute conditions (default attribute values are not taken into account):

- *element[@attr]*- Matches all instances of the specified element that include the specified attribute.
- *element[not(@attr)]*- Matches all instances of the specified element that do not include the specified attribute.
- *element[@attr = "value"]*- Matches all instances of the specified element that include the specified attribute with the given value.
- *element[@attr != "value"]*- Matches all instances of the specified element that include the specified attribute and its value is different than the one given.

Example: The following is an example of how you could use multiple boolean operators and parentheses inside an attribute condition:

```
*[@a and @b or @c and @d]
*[@a and (@b or @c) and @d]
```

The following are just examples of how simplified XPath expressions might look like:

- elementName
- //elementName
- /elementName1/elementName2/elementName3
- //xs:localName **Note:** The namespace prefixes (such as `xs`) are treated as part of the element name without taking its binding to a namespace into account.
- //xs:documentation[@lang="en"]

The tabs are as follows:

Preserve space

List of elements that will have the **Format and Indent** operation preserve the whitespaces (such as blanks, tabs, and newlines).

Default space

List of elements that will have the content normalized (multiple contiguous whitespaces are replaced by a single space), before applying the **Format and Indent** operation.

Mixed content

The elements from this list are treated as mixed content when applying the **Format and Indent** operation. The lines are split only when whitespaces are encountered.

Line break

List of elements that will have line breaks inserted, regardless of their content. You can choose to break the line *before* the element, *after*, or both.

Schema-aware format and indent

The **Format and Indent** operation takes the schema information into account with regard to the *space preserve*, *mixed*, or *element only* properties of an element.

Indent Section

Includes the following options:

Indent (when typing) in preserve space elements

Normally, the *Preserve space* elements (identified by the `xml:space` attribute set to `preserve` or by their presence in the **Preserve space tab of the Element Spacing list** ([on page 168](#))) are ignored by the **Format and Indent** operation. When this option is selected and you edit one of these elements, its content is formatted.

Indent on paste - sections with number of lines less than 300

When you paste a chunk of text that has fewer than 300 lines, the inserted content is indented. To keep the original indent style of the document you copy content from, deselect this option.

Whitespaces Preferences

When Oxygen XML Editor Eclipse plugin formats and indents XML documents, a whitespace normalization process is applied, thus replacing whitespace sequences with single space characters. Oxygen XML Editor Eclipse plugin allows you to configure which Unicode characters are treated as spaces during the normalization process.

To configure the **Whitespace** preferences, [open the Preferences dialog box](#) ([on page 70](#)) and go to **Editor > Format > XML > Whitespaces**.

This table lists the Unicode whitespace characters. Select any that you want to have treated as whitespace when formatting and indenting an XML document.

The whitespaces are normalized when:

- The **Format and Indent** action is applied on an XML document.
- You switch from **Text** mode to **Author** mode.
- You switch from **Author** mode to **Text** mode.

**Note:**

The whitespace normalization process replaces any sequence of characters declared as whitespaces in the **Whitespaces** table with a single space character (U+0020). If you want to be sure that a certain whitespace character will not be removed in the normalization process, deselect it in the **Whitespaces** table.

**Important:**

The characters with the codes U+0009 (TAB), U+000A (LF), U+000D (CR) and U+0020 (SPACE) are always considered to be whitespace characters and cannot be deselected.

XPath Preferences

To configure the **XPath** Formatting options, open the **Preferences** dialog box (on page 70) and go to **Editor > Format > XPath**.

The following option is available:

Format XPath code embedded in XSLT, XSD and Schematron files

If selected, the **Format and Indent** action applied on an XSD, XSLT, or Schematron document will perform an XPath-specific formatting on the values of the attributes that accept XPath expressions.

**Note:**

For XSLT documents, the formatting is not applied to *attribute value templates*.

XQuery Preferences

To configure the **XQuery** Formatting options, open the **Preferences** dialog box (on page 70) and go to **Editor > Format > XQuery**.

The following options are available:

- **Preserve line breaks** - All initial line breaks are preserved.
- **Break line before an attribute name** - Each attribute of an XML element is written on a new line and properly indented.

Mark Occurrences Preferences

This preferences page specifies which types of files will have the [Highlight IDs Occurrences \(on page 346\)](#) feature activated. To configure these options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Mark Occurrences**:

The following options are available in this preferences page:

Highlight component occurrences in the current file for:

- **XML files** - Activates the [Highlight IDs Occurrences \(on page 346\)](#) feature in XML files.
- **XSLT files** - Activates the [Highlight Component Occurrences \(on page 965\)](#) feature in XSLT files.
- **XML Schema files** - Activates the [Highlight Component Occurrences \(on page 965\)](#) feature in XSD files.
- **WSDL files** - Activates the [Highlight Component Occurrences \(on page 965\)](#) feature in WSDL files.
- **RNG files** - Activates the highlight component occurrences feature in RNG files.
- **Schematron files** - Activates the [Highlight Component Occurrences \(on page 965\)](#) feature in Schematron files.

Open/Save Preferences

Oxygen XML Editor Eclipse plugin lets you control how files are opened and saved. To configure the options for opening and saving documents, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Open/Save**.

The following options are available:

Open section

Format document when longest line exceeds

Oxygen XML Editor Eclipse plugin will create line breaks if the characters in a line exceed the specified value. You can choose one of the following:

- **Always format**
- **Never format**
- **Always ask**

Save section

Check errors on save

If selected, Oxygen XML Editor Eclipse plugin runs a validation that checks your document for errors before saving it.

Save all files before transformation or validation

Saves all open files before validating or transforming an XML document. This ensures that any dependencies are resolved when modifying the XML document and its XML Schema.

Performance section

Clear undo buffer on save

If selected, Oxygen XML Editor Eclipse plugin clears its undo buffer when you save a document. Thus, modifications made prior to saving the document cannot be undone. Select this option if you frequently encounter **out of memory** errors when editing large documents.

Spell Check Preferences

Oxygen XML Editor Eclipse plugin provides support for spell checking in the **Text** mode and **Author** mode. To configure the **Spell Check** options, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Spell Check**.

The following options are available:

Automatic spell check

This option is not selected by default. When selected, Oxygen XML Editor Eclipse plugin automatically checks the spelling as you type and highlights misspelled words in the document.

Select editors

You can select which editors (and therefore which file types) will automatically be spell checked. File types such as CSS and DTD are excluded by default since automatic spell checking is not usually helpful in these types of files.

Language options section

This section includes the following language options:

Default language

The default language list allows you to choose the language used by the spell check engine when the language is not specified in the source file. You can [add additional dictionaries to the spell check engines \(on page 284\)](#).

Use "lang" and "xml:lang" attributes

When this option is selected, the contents of an element with one of the `@lang` or `@xml:lang` attributes is checked in that language. Choose between the following two options for instances when these attributes are missing:

- **Use the default language** - If the `@lang` and `@xml:lang` attributes are missing, the selection in the **Default language** list (*on page 172*) is used.
- **Do not check** - If the `@lang` and `@xml:lang` attributes are missing, the element is not checked.

XML spell checking in section

You can choose to check the spelling inside the following XML items:

- **Comments**
- **Processing instructions**
- **Attribute values**
- **Text**
- **CDATA**

Options section

This section includes the following other options:

Check capitalization

When selected, the spell checker reports detected capitalization errors.

**Note:**

When such problems are reported, they cannot be learned and ignored by the application as words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive.

Check punctuation

When selected, the spell checker checks punctuation. Misplaced white space and unusual sequences, such as a period following a comma, are highlighted as errors.

Ignore mixed case words

When selected, the spell checker does not check words containing mixed case characters (for example, *SpellChecker*).

Ignore acronyms

Available only for the **Hunspell Spell Checker**. When selected, acronyms are not reported as errors.

Ignore words with digits

When selected, the spell checker does not check words containing digits (for example, *b2b*).

Ignore duplicates

When selected, the spell checker does not signal two successive identical words as an error.

Ignore URL

When selected, the spell checker ignores words recognized as URLs or file names (for example, *www.oxygenxml.com* or *c:\boot.ini*).

Allow compounds words

When selected, all words formed by concatenating multiple legal words with hyphens or underscores are accepted.

Allow file extensions

When selected, the spell checker accepts any word ending with recognized file extensions (for example, *myfile.txt* or *index.html*).

Ignore elements section

You can use the **Add** and **Remove** buttons to configure a list of element names or XPath expressions to be ignored by the spell checker. The following restricted set of XPath expressions are supported:

- '/' and '/'/' separators
- '*' wildcard

An example of an allowed XPath expression is: */a*/b*.

AutoCorrect options link

Use this link to navigate to the [AutoCorrect preferences page \(on page 140\)](#).

To change the color used by the spell check engine to highlight spelling errors, go to **Window (Eclipse on macOSX) and choose Preferences**. Then go to **General > Editors > Text Editors > Annotations** and change the color in the **Spell Check Annotation** option.

Spell Check Dictionaries Preferences

To set the Dictionaries preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Spell Check > Dictionaries**. This page allows you to configure the dictionaries (*.dic* files) and term lists (*.tdi* files) that Oxygen XML Editor Eclipse plugin uses and to choose where to save new learned words.

The following options are valid when Oxygen XML Editor Eclipse plugin uses the Hunspell spell checking engine:

Dictionaries and term lists default folder

Displays the default location where the dictionaries and term lists that Oxygen XML Editor Eclipse plugin uses are stored.

Include dictionaries and term list from

Selecting this option allows you to specify a location where you have stored dictionaries and term lists that you want to include, along with the default ones.

**Important:**

Consider the following notes regarding this option:

- The spell checker takes into account dictionaries and term lists collected both from the default and custom locations and multiple dictionaries and term lists from the same language are merged (for example, `en_UK.dic` from the default location is merged with `en_US.dic` from a custom location).
- If you have a generic dictionary file (one that just has a two-letter language code for its file name, such as `en.dic`) saved in either the default or custom location, the other more specific dictionaries (for example, `en_UK.dic` and `en_US.dic`) will not be merged and the existing generic dictionary will simply be used instead.
- If the additional location contains a file with the same name as one from the default location, the file in the additional location takes precedence over the file from the default location.

How to add more dictionaries and term lists link

Use this link to open a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to [add more dictionaries and term lists \(on page 287\)](#).

Save learned words in the following location

Specifies the target where the newly learned words are saved. By default, the target is the application preferences folder, but you can also choose a custom location.

Delete learned words

Opens the list of learned words, allowing you to select the items you want to remove, without deleting the dictionaries and term lists.

**Note:**

Words stored in dictionaries, term lists, and the list of learned words are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

[Adding Custom Spell Check Dictionaries \(on page 287\)](#)

[Adding Custom Spell Check Term Lists \(on page 290\)](#)

Syntax Highlight Preferences

Oxygen XML Editor Eclipse plugin supports syntax highlighting in the **Text** mode editors for numerous types of documents, including XML, XHTML, JavaScript, XQuery, XPath, PHP, PowerShell, CSS, LESS, Markdown, Text, DTD, RNC, Java, JSON, and more.

To configure syntax highlighting, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Syntax Highlight**.

To set syntax colors for a language, expand the listing for that language in the top panel to show the list of syntax items for that type of document. Use the color and style selectors to change how each syntax item is displayed. The results of your changes are displayed in the **Preview** panel. If you do not know the name of the syntax token that you want to configure, click that token in the **Preview** area to select it.

**Note:**

All default color sets come with a high-contrast variant that is automatically used when you switch to a black-background or white-background high-contrast theme in your Windows operating system settings. The high-contrast theme will not overwrite any default color you set in **Editor > Syntax Highlight** preferences page.

The settings for XML documents are also used in XSD, XSL, RNG documents and the **Preview** area has a separate tab for each of them when **XML** is selected in the top pane.

The **Enable nested syntax highlight** option controls whether or not content types that are nested in the same file (such as PHP, JS, or CSS scripts inside an HTML file) are highlighted according to the color schemes defined for each content type.

Elements/Attributes by Prefix Preferences

Oxygen XML Editor Eclipse plugin allows you to specify syntax highlighting colors for elements and attributes with specific namespace prefixes. To configure the **Elements/Attributes by Prefix** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Syntax Highlight > Elements/Attributes by Prefix**.

To change the syntax coloring for a specific namespace prefix, choose the prefix from the list, or add a new one using the **New** button, and use the color and style selectors to set the syntax highlighting style for that namespace prefix.

**Note:**

Syntax highlighting is based on the literal namespace prefix, not the namespace that the prefix is bound to in the document.

If you only want the prefix (and not the whole element or attribute name) to be styled with a particular color, select the **Draw only the prefix with a separate color** option.

Fonts Preferences

Oxygen XML Editor Eclipse plugin allows you to choose the fonts to be used in the **Text**, **Design**, and **Grid** editor modes, and fonts for the **Author** mode that are not specified in the associated CSS stylesheet. To configure the font options, [open the Preferences dialog box \(on page 70\)](#) and go to **Fonts**.

The following options are available:

Text

This option allows you to choose the font used in **Text** mode. There are two options available:

- **Map to text font** - Uses the same font for the basic text editor as the one set in **General > Appearance > Colors and Fonts**.
- **Customize** - Allows you to configure various font-related options.

Author

Allows you to configure various font-related options that will be used in **Author** mode. However, these font-related options will be overridden by rules specified in any CSS file associated with the open document.

Schema

Allows you to configure various font-related options that will be used in:

- The **Design** mode of the [XML Schema editor \(on page 700\)](#).
- Images with schema diagram fragments that are included in the HTML documentation generated from an XML Schema.

Note:

You must restart the application for your changes to be applied.

Markdown Preferences

The **Markdown** preferences page makes it possible to validate Markdown documents with Schematron. To access the page, [open the Preferences dialog box \(on page 70\)](#) and go to **Markdown**. This preferences page includes the following options:

Validate converted HTML content

If selected, converted HTML content will be validated using the Schematron file specified in this option.

Validate converted DITA content

If selected, converted DITA content will be validated using the Schematron file specified in this option.

**Note:**

It is also possible to create a Schematron association for Markdown documents by adding a [catalog mapping \(on page 594\)](#) for one of the following URIs:

- <http://www.oxygenxml.com/schematron/validation/markdown-as-html>
- <http://www.oxygenxml.com/schematron/validation/markdown-as-dita>

The catalog mapping is a fallback in case the validation is disabled in this preferences page or the path to the Schematron is empty. The associations configured in this preferences page take precedence.

Network Connection Settings Preferences

This section presents the options available in the **Network Connection Settings** preferences pages.

(S)FTP Preferences (Deprecated)

To configure the (S)FTP options, [open the Preferences dialog box \(on page 70\)](#) and go to **Network Connection Settings > (S)FTP**. You can customize the following options:

Encoding for FTP control connection

The encoding used to communicate with FTP servers: either ISO-8859-1 or UTF-8. If the server supports the UTF-8 encoding, Oxygen XML Editor Eclipse plugin will use it for communication. Otherwise, it will use ISO-8859-1. This section also includes a **Show hidden files** toggle option.

Public known hosts file

Specifies the file that contains the list of all SSH server host keys that you have determined are accurate. The default value is `${homeDir}/.ssh/known_hosts`.

Private key file

The path to the file that contains the private key used for the private key method of authentication of the secure FTP (SFTP) protocol. Only *RSA* private keys in *PEM* (Base64) and *PPK* (*PuTTY*) formats are supported. Other keys (such as *OpenSSH*) are not supported.

Passphrase

The passphrase used for the private key method of authentication of the secure FTP (SFTP) protocol.

Show SFTP certificate warning dialog

If selected, a warning dialog box will be displayed each time when the authenticity of the host cannot be established.

HTTP(S)/WebDAV Preferences

To set the **HTTP(S)/WebDAV** preferences, open the **Preferences** dialog box (on page 70) and go to **Network Connection Settings > HTTP(S)/WebDAV**. The following options are available:

Enable the HTTP(S)/WebDAV Protocols

Activates the HTTP(S)/WebDAV protocols bundled with Oxygen XML Editor Eclipse plugin. Any adjustment to this option requires a restart of the application.

Read Timeout (seconds)

The period (in seconds) after which the application considers that an HTTP server is unreachable if it does not receive any response from that server.

Automatically accept a security certificate, even if invalid

When selected, the HTTPS connections that Oxygen XML Editor Eclipse plugin attempts to establish with will accept all security certificates, even if they are invalid.

Important:

By accepting an invalid certificate, you accept (at your own risk) a potential security threat, since you cannot verify the integrity of the certificate's issuer.

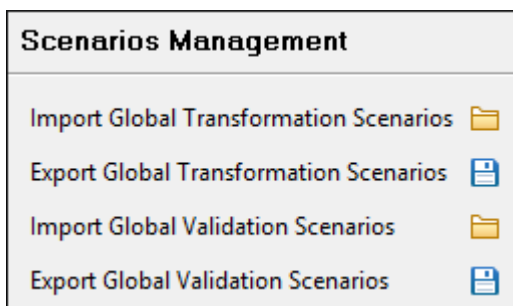

Lock WebDAV files on open

If selected, the files opened through WebDAV are locked on the server so that they cannot be edited by other users while the lock placed by the current user still exists on the server.

Scenarios Management Preferences

To configure Scenarios Management options, open the **Preferences** dialog box (on page 70) and go to **Scenarios Management**. This allows you to share the global transformation scenarios with other users by exporting them to an external file that can also be imported in this preferences panel.

Figure 30. Scenarios Management Preferences Panel

The actions available in this panel are as follows:

- **Import Global Transformation Scenarios** - Allows you to import all transformation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the **Configure Transformation Scenario** dialog box followed by (*import*). This way there are no scenario name conflicts.
- **Export Global Transformation Scenarios** - Allows you to export all global transformation scenarios available in the **Configure Transformation Scenario** dialog box.
- **Import Global Validation Scenarios** - Allows you to import all validation scenarios from a file created with the export scenario action. The names of the imported scenarios will appear in the **Configure Validation Scenario** dialog box followed by (*import*). This way there are no scenario name conflicts.
- **Export Global Validation Scenarios** - Allows you to export all global validation scenarios available in the **Configure Validation Scenario** dialog box.

View Preferences

The **View** preferences page allows you to configure some options regarding certain views. To edit these options, open the **Preferences** dialog box ([on page 70](#)) and go to **View**.

The following options are available:

Console section

Enable Oxygen consoles

If selected, various messages will be contributed to the **Console view** ([on page 304](#)) when certain events are triggered (such as *schema detection*, *validation*, or *transformation* events).

Fixed width console

If selected, a line in the **Console view** ([on page 304](#)) will be hard wrapped after the specified maximum numbers of characters allowed on a line is reached.

Limit console output

If selected, the content of the **Console view** ([on page 304](#)) will be limited to a configurable number of characters.

Console buffer

If the **Limit console output** option is selected, this specifies the maximum number of characters that can be written in the **Console view** ([on page 304](#)).

Tab width

Specifies the number of spaces used for depicting a tab character.

Elements view section

Show only allowed items

If selected, when editing in **Author** mode, only the elements that are allowed at the current cursor position will be listed in the **Elements view** (on page 410). If not selected, all elements allowed by the schema will be listed, even if they are already used.

XML Preferences

This section describes the panels that contain the user preferences related with XML.

Import Preferences

To configure importing options, open the **Preferences dialog box** (on page 70) and go to **XML > Import**.

This page allows you to configure how empty values and `null` values are handled when they are encountered in imported database tables or Excel sheets. Also you can configure the format of date / time values recognized in the imported database tables or Excel sheets.

The following options are available:

Create empty elements for empty values

If selected, an empty value from a database column or from a text file is imported as an empty element.

Create empty elements for null values

If selected, `null` values from a database column are imported as empty elements.

Escape XML content

Selected by default, this option instructs Oxygen XML Editor Eclipse plugin to escape the imported content to an XML-safe form.

Add annotations for generated XML Schema

If selected, the generated XML Schema contains an annotation for each of the imported table columns. The documentation inside the annotation tag contains the remarks of the database columns (if available) and also information about the conversion between the column type and the generated XML Schema type.

Date / Time Format section

Specifies the format used for importing date and time values from Excel spreadsheets or database tables, and in the generated XML schemas. You can choose from the following format types:

- **Unformatted** - The date and time formats specific to the database are used for import. When importing data from Excel a string representation of date or time values are used. The type used in the generated XML Schema is `xs:string`.
- **XML Schema date format** - The XML Schema-specific format ISO8601 is used for imported date / time data (`yyyy-MM-dd'T'HH:mm:ss` for `datetime`, `yyyy-MM-dd` for `date` and

HH:mm:ss for time). The types used in the generated XML Schema are `xs:datetime`, `xs:date` and `xs:time`.

- **Custom format** - If selected, you can define a custom format for timestamp, date, and time values or choose one of the predefined formats. A preview of the values is presented when a format is used. The type used in the generated XML Schema is `xs:string`.

Table 2. Pattern Letters

Letter	Date or Time Component	Presentation	Examples
G	Era designator	Text	AD
y	Year	Year	1996; 96
M	Month in year	Month	July; Jul; 07
w	Week in year	Number	27
W	Week in month	Number	2
D	Day in year	Number	189
d	Day in month	Number	10
F	Day of week in month	Number	2
E	Day in week	Text	Tuesday; Tue
a	Am / pm marker	Text	PM
H	Hour in day (0-23)	Number	0
k	Hour in day (1-24)	Number	24
K	Hour in am / pm (0-11)	Number	0
h	Hour in am / pm (1-12)	Number	12
m	Minute in hour	Number	30
s	Second in minute	Number	55
S	Millisecond	Number	978
z	Time zone	General time zone	PST; GMT-08:00
Z	Time zone	RFC 822 time zone	-0800

Pattern letters are usually repeated, as their number determines the exact presentation:

- **Text** - If the number of pattern letters is 4 or more, the full form is used. Otherwise, a short or abbreviated form is used if available.
- **Number** - The number of pattern letters is the minimum number of digits, and shorter numbers are zero-padded to this amount.

- **Year** - If the number of pattern letters is 2, the year is truncated to 2 digits. Otherwise, it is interpreted as a number.
- **Month** - If the number of pattern letters is 3 or more, the month is interpreted as text. Otherwise, it is interpreted as a number.
- **General time zone** - Time zones are interpreted as text if they have names. For time zones representing a GMT offset value, the following syntax is used:
 - **GMTOffsetTimeZone** - GMT Sign Hours: Minutes
 - **Sign** - one of + or -
 - **Hours** - one or two digits
 - **Minutes** - two digits
 - **Digit** - one of 0 1 2 3 4 5 6 7 8 9

Hours must be between 0 and 23, and Minutes must be between 00 and 59. The format is locale independent and digits must be taken from the Basic Latin block of the Unicode standard.

- **RFC 822 time zone**: The RFC 822 4-digit time zone format is used:
 - **RFC822TimeZone**
 - **TwoDigitHours** (must be between 00 and 23)

PDF Output Preferences

The **PDF Output** preferences page simply includes links to sub-pages for configuring PDF output options.

FO Processors Preferences

Oxygen XML Editor Eclipse plugin includes a built-in formatting objects processor (Apache FOP), but you can also configure other external processors and use them in the transformation scenarios for processing XSL-FO documents.

Oxygen XML Editor Eclipse plugin provides an easy way to add two of the most commonly used commercial FO processors: **RenderX XEP** and **Antenna House Formatter**. You can easily add *RenderX XEP* as an external FO processor if you have the XEP installed. Also, if you have the *Antenna House Formatter*, Oxygen XML Editor Eclipse plugin uses the environment variables set by the XSL formatter installation to detect and use it for XSL-FO transformations. If the environment variables are not set for the XSL formatter installation, you can browse and choose the executable file just as you would for XEP. You can use these two external FO processors for [DITA-OT transformations scenarios \(on page 1233\)](#) and [XML with XSLT transformation scenarios \(on page 1206\)](#).

To configure the options for the FO processors, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > PDF Output > FO Processors**. This preferences page includes the following options:

Apache FOP Section

In this section, you can configure options for the built-in Apache processor. The following options are available:

Use built-in Apache FOP

Instructs Oxygen XML Editor Eclipse plugin to use the built-in Apache FO processor. To see the version of the built-in XSL-FO processor for your installation, go to **Help > About > Libraries** and search for *Apache FOP*.

Use other Apache FOP

Instructs Oxygen XML Editor Eclipse plugin to use another Apache FO processor that is installed on your computer. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Enable the output of the built-in FOP

All Apache FOP output is displayed in a results pane at the bottom of the Oxygen XML Editor Eclipse plugin window, including warning messages about FO instructions not supported by Apache FOP.

Memory available to the Apache FOP

If your Apache FOP transformations fail with an Out of Memory error (**OutOfMemoryError**), use this combo box to select a larger value for the amount of memory reserved for Apache FOP transformations.

Configuration file for the built-in FOP

Use this option to specify the path to an Apache FOP configuration file (for example, to render to PDF a document containing Unicode content using a special *true type* font). You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Generates PDF/A-1b output

When selected, PDF/A-1b output is generated.

Notes:

- All fonts have to be embedded, even the implicit ones. More information about configuring metrics files for the embedded fonts can be found in [Add a font to the built-in FOP \(on page 1275\)](#).
- You cannot use the `<filterList>` key in the configuration file since the FOP would generate the following error: *The Filter key is prohibited when PDF/A-1 is active.*

External FO Processors Section

In this section, you can manage the external FO processors you want to use in transformation scenarios. You can use the two options at the bottom of the section to use the **RenderX XEP** or **Antenna House Formatter** commercial FO processors.

Add 'XEP' FO processor (executable file is needed)

If **RenderX XEP** is already installed on your computer, you can use this button to choose the XEP executable script (`xep.bat` for Windows, `xep` for Linux).

Add 'Antenna House' FO processor (executable file is needed)

If **Antenna House Formatter** is already installed on your computer, you can use this button to choose the Antenna House executable script (`AHFCmd.exe` or `XSLCmd.exe` for Windows, and `run.sh` for Linux/macOS).

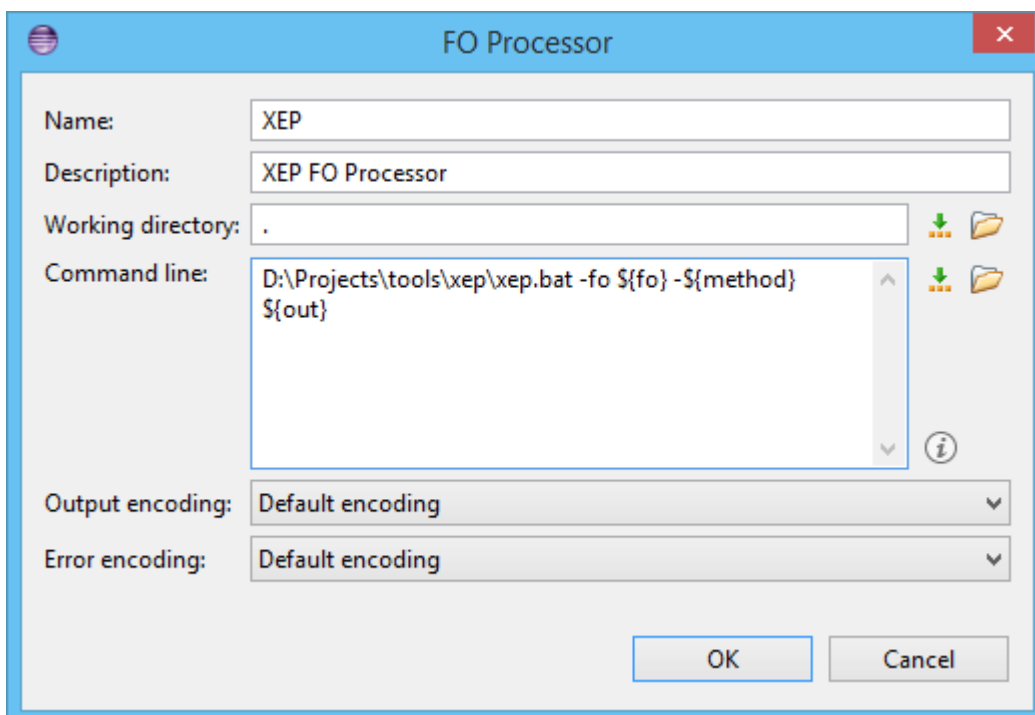

Note:

The built-in **Antenna House Formatter GUI** transformation scenario requires that you configure an external FO processor that runs `AHFormatter.exe` (Windows only). In the **external FO Processor configuration dialog box** (on page 185), you could use `"${env(AHF63_64_HOME)}\AHFormatter.exe" -d ${fo} -s` for the value in the **Command line** field, although the environment variable name changes for each version of the AH Formatter and for each system architecture (you can install multiple versions side-by-side). For more information, see <https://github.com/AntennaHouse/focheck/wiki/focheck>.

You can also add external processors or configure existing ones. Click the **+ New** button to open a configuration dialog box that allows you to add a new external FO processor. Use the other buttons (**Edit**, **Duplicate**, **Delete**) to configure existing external processors.

Figure 31. External FO Processor Configuration Dialog Box

The external **FO Processor** configuration dialog box includes the following options:

Name

The name that will be displayed in the list of available FO processors on the FOP tab of the transformation scenario dialog box.

Description

A textual description of the FO processor that will be displayed in the FO processors table and in tooltips of UI components where the processor is selected.

Working directory

The directory where the intermediate and final results of the processing are stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button. You can use one of the following *editor variables* (on page 218):

- **\${homeDir}** - The path to the user home directory.
- **\${cfd}** - The path of the current file directory. If the current file is not a local file, the target is the user desktop directory.
- **\${pd}** - The project directory.
- **\${oxygenInstallDir}** - The Oxygen XML Editor Eclipse plugin installation directory.

Command line

The command line that starts the FO processor, specific to each processor. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button. You can use one of the following *editor variables* (on page 218):

- **\${method}** - The FOP transformation method: **pdf**, **ps**, or **txt**.
- **\${fo}** - The input FO file.
- **\${out}** - The output file.
- **\${pd}** - The project directory.
- **\${frameworksDir}** - The path of the **frameworks** subdirectory of the Oxygen XML Editor Eclipse plugin installation directory.
- **\${oxygenInstallDir}** - The Oxygen XML Editor Eclipse plugin installation directory.
- **\${ps}** - The platform-specific path separator. It is used between the library files specified in the class path of the command line.

Output Encoding

The encoding of the FO processor output stream that is displayed in a **Results panel** (on page 335) at the bottom of the Oxygen XML Editor Eclipse plugin window.

Error Encoding

The encoding of the FO processor error stream that is displayed in a **Results panel** (on page 335) at the bottom of the Oxygen XML Editor Eclipse plugin window.

CSS-based Processors Preferences

Oxygen XML Editor Eclipse plugin includes a built-in **XML to PDF transformation with CSS** scenario type for generating PDF output using a CSS-based processor.

To configure the options for the CSS-based processors, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > PDF Output > CSS-based Processors**. This preferences page includes the following options:

Oxygen PDF Chemistry Section

Auto-detect

If selected, the directory of the **Chemistry** processor will be automatically detected. This is based on the system's PATH environmental variable. If none is detected, it will use the path of the built-in distribution.

Custom installation directory

Use this option to select an external directory of a custom installation of the **Chemistry** processor.

Memory available to the processor (MB)

Specifies the maximum amount of memory that is available for the transformation. If your transformations fail with an Out of Memory error (**OutOfMemoryError**), you can use this option to select a bigger value for the amount of memory reserved for the process.

Generates PDF/UA-1 output

Use this option to produce output that conforms with the PDF/UA-1 accessibility standards.

Note:

This mode has some special requirements. For example, all fonts have to be embedded and the title of documents must be marked using the metadata. For more information, see [Oxygen PDF Chemistry User Guide: Fully Accessible PDF \(PDF/UA1\)](#).

Show console output

Allows you to specify when to display the console output log in the message panel at the bottom of the editor. The following options are available:

- **When build fails** - Displays the console output log only if the build fails.
- **Always** - Displays the console output log, regardless of whether or not the build fails.

Sample XML Files Generator Preferences

The **Generate Sample XML Files tool (on page 758)** (available on the **XML Tools** menu) allows you to generate XML instance documents based on an XML Schema. There are various options that can be configured within the tool and these options are also available in the **Sample XML Files Generator** preferences

page. This allows you to set default values for these options. To configure the options for generating the XML files, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > Sample XML Files Generator**.

The following options are available:

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:

If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

- At least one of the restrictions is a `regexp`.
- The value generated after applying the `regexp` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xs:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xs:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xs:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xs:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xs:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Related information

[Generating Sample XML Files \(on page 758\)](#)

XML Catalog Preferences

To configure options that pertain to *XML Catalogs (on page 2683)*, open the **Preferences** dialog box (on *page 70*) and go to **XML > XML Catalog**.

The following options are available:

Prefer

Determines whether public identifiers specified in the catalog are used in favor of system identifiers supplied in the document. Suppose you have an entity in your document that has both a public identifier and a system identifier specified, and the catalog only contains a mapping for the public identifier (for example, a matching public catalog entry). You can choose between the following:

- **system** - If selected, the system identifier in the document is used.
- **public** - If selected, the URI supplied in the matching public catalog entry is used. Generally, the purpose of catalogs is to override the system identifiers in XML documents, so **public** should usually be used for your catalogs.

**Note:**

If the catalog contains a matching system catalog entry giving a mapping for the system identifier, that mapping would have been used, the public identifier would never have been considered, and this setting would be irrelevant.

Verbosity

When using catalogs, it is sometimes useful to see what catalog files are parsed, if they are valid, and what identifiers are resolved by the catalogs. This option selects the detail level of such logging messages of the *XML catalog* resolver that will be displayed in the **Catalogs** table at the bottom of the window. You can choose between the following:

- **None** - No message is displayed by the catalog resolver when it tries to resolve a URI reference, a SYSTEM one or a PUBLIC one with the *XML catalogs* specified in this panel.
- **Unresolved entities** - Only the logging messages that track the failed attempts to resolve references are displayed.
- **All messages** - The messages of both failed attempts and successful ones are displayed.

Resolve schema locations also through system mappings

If selected, Oxygen XML Editor Eclipse plugin analyzes both *uri* and *system* mappings to resolve the location of schema.

**Note:**

This option is not applicable for DTD schemas since the public and system catalog mappings are always considered.

Process "schemaLocation" namespaces through URI mappings for XML Schema

If selected, the target namespace of the imported XML Schema is resolved through the *uri* mappings. The namespace is taken into account only when the schema specified in the *schemaLocation* attribute was not resolved successfully. If not selected, the system IDs are used to resolve the schema location.

Use default catalog

If this option is selected and Oxygen XML Editor Eclipse plugin cannot resolve the catalog mapping with any other means, the default global catalog (listed below this checkbox) is used. For more information, see [How Oxygen XML Editor Eclipse plugin Determines which Catalog to Use \(on page 596\)](#).

Catalogs table

You can use this table to add or manage global user-defined catalogs. The following actions are available at the bottom of the table:

Add

Opens a dialog box that allows you to add a catalog to the list. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Edit

Opens a dialog box that allows you to edit an existing catalog. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Delete

Deletes the currently selected catalog from the list.

Up

Moves the selection to the previous resource.

Down

Moves the selection to the following resource.

Note:

When you add, delete, or edit a catalog in this table, you need to reopen the currently edited files that use the modified catalog or run a manual **Validate** action (on page 547) so that the changes take full effect.

You can also add or configure catalogs at *framework* level from the **Catalogs** tab (on page 114) in the **Document Type** configuration dialog box (on page 90).

Related information

[Controlling the Catalog Resolver](#)

[Working with XML Catalogs \(on page 594\)](#)

XML Parser Preferences

To configure the **XML Parser** options, open the **Preferences** dialog box (on page 70) and go to **XML > XML Parser**.

The configurable options of the built-in XML parser are as follows:

Enable parser caching (validation and content completion)

Enables re-use of internal models when validating and provides content completion in open XML files that reference the same schemas (grammars) such as DTD, XML Schema, or RelaxNG.

Enable system parameter entity expansion in other entity definitions

This security setting controls the expansion of the DTD system parameter entities (the ones that are loaded from disk or from remote sources). This option is off by default, to protect against XXE attacks. If you enable it, make sure the XML files you are opening or processing with the application come from a trusted source.

Ignore the DTD for validation if a schema is specified

Forces validation against a referenced schema (XML Schema, Relax NG schema) even if the document includes also a DTD DOCTYPE declaration. This option is useful when the DTD declaration is used only to declare DTD entities and the schema reference is used for validation against an XML Schema or a Relax NG schema.

Note:

Schematron schemas are treated as additional schemas. The validation of a document associated with a DTD and referencing a Schematron schema is executed against both the DTD and the Schematron schema, regardless of the value of the **Ignore the DTD for validation if a schema is specified** option.

Enable XInclude processing

Enables XInclude processing. If selected, the XInclude support in Oxygen XML Editor Eclipse plugin is turned on for validation, rendering in **Author** mode and transformation of XML documents.

Base URI fix-up

According to the specification for XInclude, processors must add an `@xml:base` attribute to elements included from locations with a different base URI. Without these attributes, the resulting infoset information would be incorrect.

Unfortunately, these attributes make XInclude processing to not be transparent to Schema validation. One solution to this is to modify your schema to allow `@xml:base` attributes to appear on elements that might be included from different base URIs.

If the addition of `@xml:base` and / or `@xml:lang` is not desired by your application, you can deselect this option.

Language fix-up

The processor will preserve language information on a top-level included element by adding an `@xml:lang` attribute if its included parent has a different [language] property. If the addition of `@xml:lang` is not allowed by your application, you can deselect this option.

DTD post-validation

Select this option to validate an XML file against the associated DTD, after all the content merged to the current XML file using *XInclude* was resolved. If you deselect this option, the current XML file is validated against the associated DTD before all the content merged to the current XML file using *XInclude* is resolved.

Relax NG Preferences

To configure options regarding Relax NG, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Parser > Relax NG**.

The following options are available in this page:

Check feasibly valid

Checks if Relax NG documents can be transformed into valid documents by inserting any number of attributes and child elements anywhere in the tree.

**Note:**

Selecting this option disables the **Check ID/IDREF** option.

Check ID/IDREF

Checks the ID/IDREF matches when a Relax NG document is validated.

Add default attribute values

Default values are given to the attributes of documents validated using Relax NG. These values are defined in the Relax NG schema.

Ignore "data-" attributes in XHTML

This option is selected by default, which means that when XHTML documents are validated with an RNG schema, any **data-** attributes detected in the document will not be taken into account by the validation engine.

Schematron Preferences

To configure options regarding Schematron, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Parser > Schematron**.

The following options are available in this preferences page:

ISO Schematron Section

Optimize (visit-no-attributes)

If your ISO Schematron assertion tests do not contain the attributes axis, you should select this option for faster ISO Schematron validation.

Allow foreign elements (allow-foreign)

Enables support for `allow-foreign` on ISO Schematron. This option is used to pass non-Schematron elements to the generated stylesheet.

Use associated XML Schema to expand default attribute values

When selected (default value), if the validated XML document has an XML Schema associated that contains default values for attributes defined in the XML content, the Schematron will be able to match on those default attributes.

Use Saxon EE (schema aware) for xslt2/xslt3 query language binding

When selected, Saxon EE is used for `xslt2/xslt3` query binding. If this option is not selected, Saxon PE is used.

Enable Schematron Quick Fixes (SQF) support

Allows you to enable or disable the support for [Quick Fixes \(on page 2682\)](#) in Schematron files. This option is selected by default.

Embedded rules query language binding

You can control the query language binding used by the ISO Schematron embedded rules. You can choose between: **xslt1**, **xslt2**, or **xslt3**.

Note:

To control the query language binding for standalone ISO Schematron, you need to set the query language to be used with a `@queryBinding` attribute on the schema root element.

Message language

This option allows you to specify the language to be used in Schematron validation messages. You can choose between the following:

- **Use the language defined in the application** - The language that is specified in [the application \(on page 232\)](#) will be used and only the validation messages that match that language will be presented. You can use the **Change application language** link to navigate to the preferences page where you can specify the language to be used in the application.
- **Use the "xml:lang" attribute set on the Schematron root** - The language specified in the `@xml:lang` attribute from the Schematron root will be used and only the validation message that match that language will be presented.

- **Ignore the language and show all message** - All messages are displayed in whatever language is defined within the Schematron schema.
- **Custom** - Use this option to specify a custom language to be used and only the messages that match the specified language will be presented.

**Note:**

In all cases, if the selected language is not available for a validation error or warning, all messages will be displayed in whatever language is defined within the Schematron schema.

Schematron 1.5 Section

XPath Version

Allows you to select the version of XPath for the expressions that are allowed in Schematron assertion tests. You can choose between: **1.0**, **2.0**, or **3.0**. This option is applied in both standalone Schematron 1.5 schemas and embedded Schematron 1.5 rules.

Security

Disable Schematron security checks

For security reasons, several security checks are performed on Schematron files that are not located inside a *framework* ([on page 2679](#)) or *plugin* ([on page 2681](#)). Select this option if your Schematron files are failing because of these security checks and you are unable to move them to a location recognized as safe (a framework or a plugin).

XML Schema Preferences

To configure options regarding XML Schema, [open the Preferences dialog box](#) ([on page 70](#)) and go to **XML > XML Parser > XML Schema**.

This preferences page allows you to configure the following options:

Default XML Schema version

Allows you to select the version of XML Schema to be used as the default. You can choose XML Schema **1.0** or XML Schema **1.1**.

**Note:**

You are also able to set the XML Schema version using the **Customize** option in the **New document wizard** ([on page 246](#)).

Default XML Schema validation engine

Allows you to select the default validation engine to be used for XML Schema. You can choose **Xerces** or **Saxon EE**.

Xerces validation features section

Enable full schema constraint checking

Sets the *schema-full-checking* feature to `true`. This enables a validation of the parsed XML document against a schema (XML Schema or DTD) while the document is parsed.

Enable honour all schema location feature

Sets the *honour-all-schema-location* feature to `true`. All the files that declare XML Schema components from the same namespace are used to compose the validation model. If this option is not selected, only the first XML Schema file that is encountered in the XML Schema import tree is taken into account.

Enable full XPath 2.0 for alternative types

When selected (default value), you can use the full XPath support in assertions and alternative types. Otherwise, only the XPath support offered by the Xerces engine is available.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used for defining an assertion in XSD 1.1.

Saxon EE validation features section

Multiple schema imports

Forces `<xs:import>` to fetch the referenced schema document. By default, the `<xs:import>` fetches the document only if no schema document for the given namespace has already been loaded. With this option in effect, the referenced schema document is loaded unless the absolute URI is the same as a schema document already loaded.

Assertions can see comments and processing instructions

Controls whether or not comments and processing instructions are visible to the XPath expression used to define an assertion. By default, they are not made visible (unlike Saxon 9.3).

XML Refactoring Preferences

To specify a folder for loading the custom XML refactoring operations, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Refactoring**. The following option is available in this preferences page:

Load additional refactoring operations from

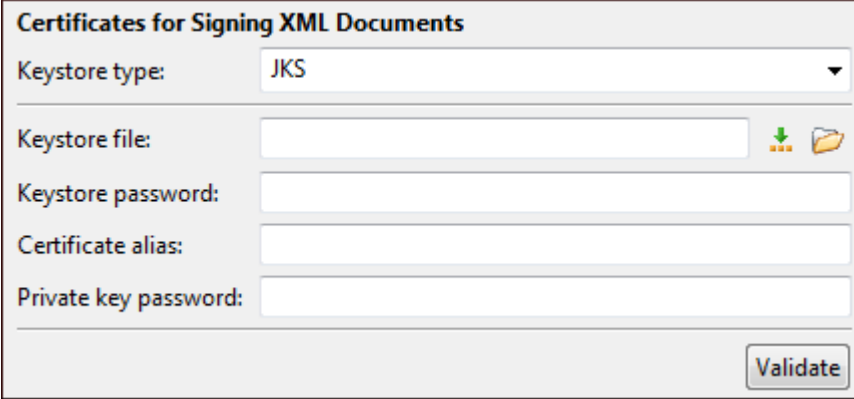

Use this text box to specify a folder for loading custom XML refactoring operations. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or

the  **Browse** button. Oxygen XML Editor Eclipse plugin looks for XML refactoring operations recursively in the specified folder, so they can be stored in descendant folders.

XML Signing Certificates Preferences

Oxygen XML Editor Eclipse plugin provides two types of *keystores* (on page 2680) for certificates that are used for digital signatures of XML documents: Java Keystore (**JKS**) and Public-Key Cryptography Standards version 12 (**PKCS-12**). A *keystore* file is protected by a password. To configure a certificate *keystore*, open the **Preferences dialog box** (on page 70) and go to **XML > XML Signing Certificates**. You can customize the following parameters of a *keystore*:

Figure 32. Certificates Preferences Panel

The screenshot shows a dialog box titled "Certificates for Signing XML Documents". It has the following fields and controls:

- Keystore type:** A dropdown menu currently showing "JKS".
- Keystore file:** A text input field with a "Browse" button (represented by a folder icon) to its right.
- Keystore password:** A text input field.
- Certificate alias:** A text input field.
- Private key password:** A text input field.
- Validate:** A button located at the bottom right of the dialog.

- **Keystore type** - The type of *keystore* (on page 2680) that Oxygen XML Editor Eclipse plugin uses (**JKS** or **PKCS-12**).
- **Keystore file** - The location of the imported file.
- **Keystore password** - The password that is used for protecting the privacy of the stored keys.
- **Certificate alias** - The alias used for storing the key entry (the certificate or the private key) inside the *keystore* (on page 2680).
- **Private key password** - The private key password of the certificate (required only for JKS *keystores* (on page 2680)).
- **Validate** - Click this button to verify the configured *keystore* (on page 2680) and the validity of the certificate.

XProc Preferences

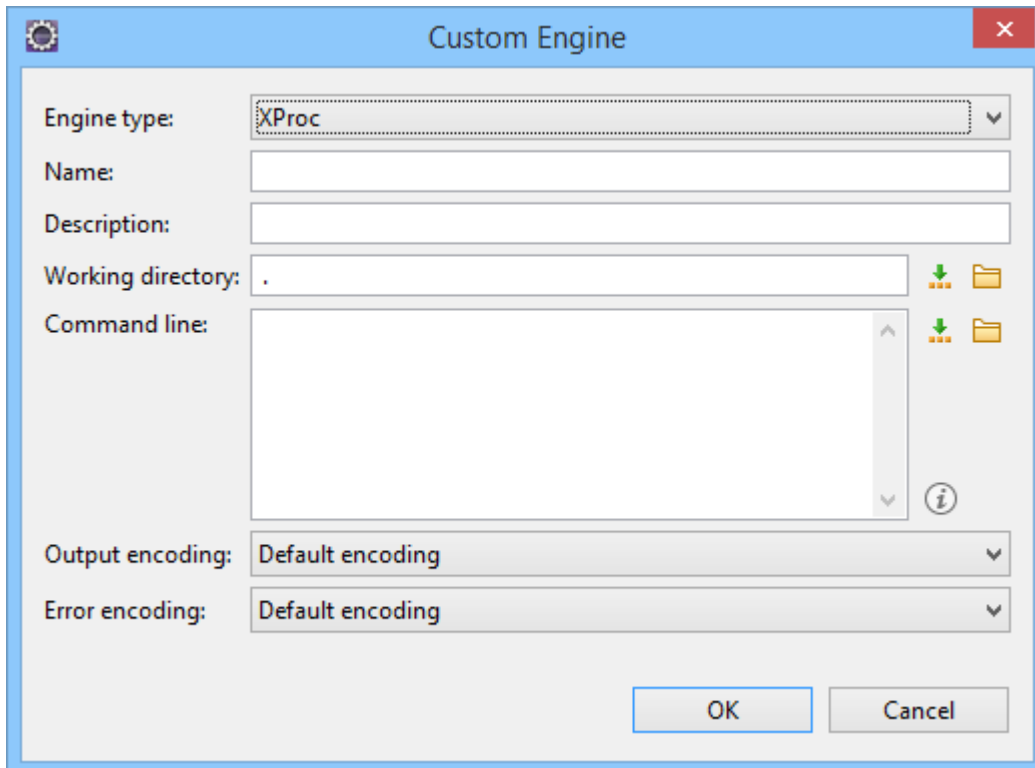

Oxygen XML Editor Eclipse plugin includes a bundled version of the *Calabash* XProc engine that can be used for XProc transformations and validation, but you also have several ways to integrate other external XProc engines.

If the external engine is Java-based, or it has validation support, or it can receive parameters or ports passed from the transformation, you need to [integrate the external XProc engine using a plugin extension procedure](#) (on page 1287).

If you do not need the engine to be used for automatic validation or pass parameters/ports and it is not Java-based, you can add an external XProc engine by using the **XProc** preferences page. [Open the Preferences dialog box \(on page 70\)](#) and go to **XML > XProc**.

To add an external engine, click the **New** button. To configure an existing engine, click the **Edit** button. This opens the **Custom Engine** dialog box that allows you to configure an external engine.

Figure 33. Creating an XProc external engine

The following options can be configured in this custom engine configuration dialog box:

- **Name** - The value of this field will be displayed in the XProc transformation scenario and in the command line that will start it.
- **Description** - A textual description that will appear as a tooltip where the XProc engine will be used.
- **Working directory** - The working directory for resolving relative paths. You can specify the path by using the text field, the  **Insert Editor Variables (on page 218)** button, or the  **Browse** button.
- **Command line** - The command line that will run the XProc engine as an external process. You can specify the path by using the text field, the  **Insert Editor Variables (on page 218)** button, or the  **Browse** button.
- **Output encoding** - The encoding for the output stream of the XProc engine, used for reading and displaying the output messages.
- **Error encoding** - The encoding for the error stream of the XProc engine, used for reading and displaying the messages from the error stream.

**Note:**

You can configure the built-in Calabash processor by using the `calabash.config` file. This file is located in `[OXYGEN_INSTALL_DIR]\lib\xproc\calabash\lib`. If that file does not exist, you have to create it.

The **Show XProc messages** option at the bottom of the **XProc** preferences page can be selected if you want all messages emitted by the XProc processor during a transformation to be presented in dedicated XProc **Results** view ([on page 335](#)).

XSLT/XQuery Preferences

To configure options regarding XSLT and XQuery processors, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery**. This panel contains only the most generic options for working with XSLT or XQuery processors. The more specific options are grouped in other panels linked as child nodes of this panel in the tree of this **Preferences** page.

There is only one generic option available:

Create transformation temporary files in system temporary directory

It should be selected only when the temporary files necessary for performing transformations are created in the same folder as the source of the transformation (the default behavior when this option is not selected) and this breaks the transformation. An example of breaking the transformation is when the transformation processes all the files located in the same folder as the source of the transformation (including the temporary files) and the result is incorrect or the transformation fails because of this.

Custom Engines Preferences

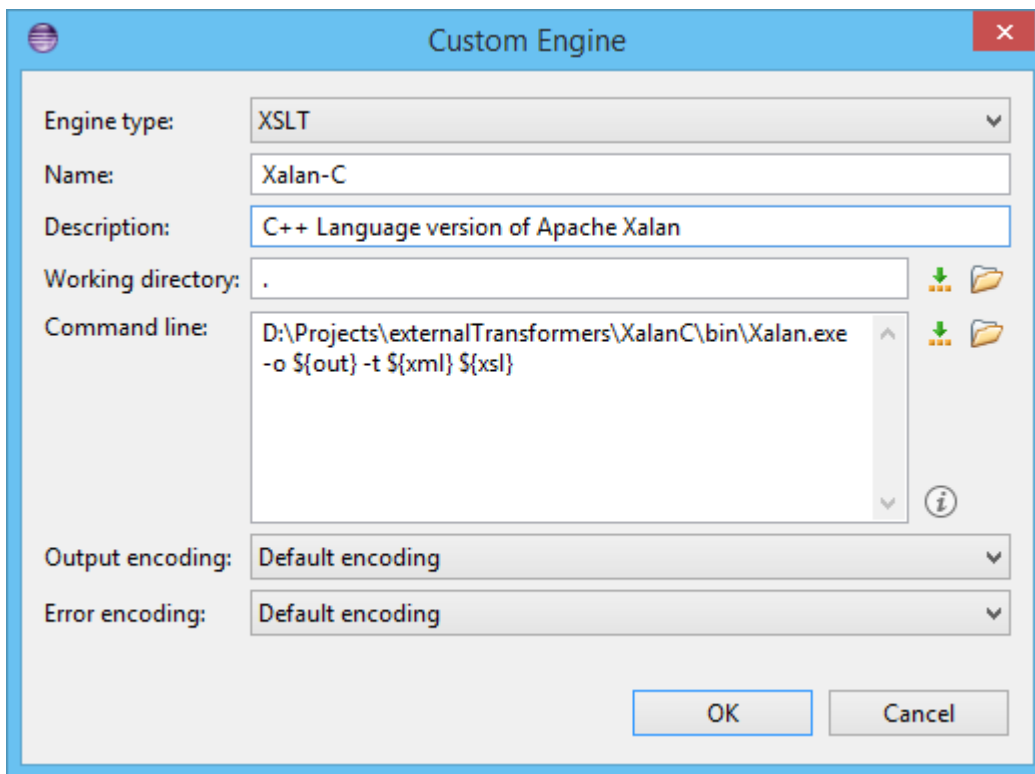

Oxygen XML Editor Eclipse plugin allows you to configure custom processors to be used for running XSLT and XQuery transformations.

**Note:**

You can not use these custom engines in [the Debugger perspective \(on page 1913\)](#).

To configure the **Custom Engines** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > Custom Engines**.

The table in this preferences page displays the custom engines that have been defined. Use the **+ New** or **Edit** button at the bottom of the table to open a dialog box that allows you to add or configure a custom engine.

Figure 34. Parameters of a Custom Engine

The following parameters can be configured for a custom engine:

Engine type

Specifies the transformer type. You can choose between XSLT and XQuery engines.

Name

The name of the transformer displayed in the dialog box for editing transformation scenarios.

Description

A textual description of the transformer.

Working directory

The start directory of the executable program for the transformer. The following [editor variables \(on page 218\)](#) are available for making the path to the working directory independent of the location of the input files:

- **\${homeDir}** - The user home directory in the operating system.
- **\${cfd}** - The path to the directory of the current file.
- **\${pd}** - The path to the directory of the current project.
- **\${oxygenInstallDir}** - The Oxygen XML Editor Eclipse plugin install directory.

Command line

The command line that must be executed by Oxygen XML Editor Eclipse plugin to perform a transformation with the engine. The following [editor variables \(on page 218\)](#) are available

for making the parameters in the command line (the transformer executable, the input files) independent of the location of the input files:

- **`\${xml}`** - The XML input document as a file path.
- **`\${xmlu}`** - The XML input document as a URL.
- **`\${xsl}`** - The XSL / XQuery input document as a file path.
- **`\${xslu}`** - The XSL / XQuery input document as a URL.
- **`\${out}`** - The output document as a file path.
- **`\${outu}`** - The output document as a URL.
- **`\${ps}`** - The platform separator that is used between library file names specified in the class path.

Output Encoding

The encoding of the transformer output stream.

Error Encoding

The encoding of the transformer error stream.

Debugger Preferences

To configure the **Debugger** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > Debugger**.

The following options are available:

Show xsl:result-document output

If selected, the debugger presents the output of `<xsl:result-document>` instructions into the debugger output view.

Infinite loop detection

Select this option to receive notifications when an infinite loop occurs during transformation.

Enable Saxon optimizations

This option is not selected by default and this means that the optimization for the debugging process is suppressed. This is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Maximum depth in templates stack

Allows you to set how many `<xsl:template>` instructions can appear on the current stack. This setting is used by the infinite loop detection.

Debugger layout

If you select the **Horizontal** layout, the stack of XML editors is presented on the left half of the editing area while the stack of XSL editors is on the right half. If you select the **Vertical** layout,

the stack of XML editors is presented on the upper half of the editing area while the stack of XSL editors is on the lower half.

XWatch evaluation timeout (seconds)

Allows you to specify the maximum time that Oxygen XML Editor Eclipse plugin allocates to the evaluation of XPath expressions while debugging.

Profiler Preferences

This section explains the settings available for the XSLT/XQuery Profiler. To access and modify these settings, open the **Preferences** dialog box ([on page 70](#)) and go to **XML > XSLT-XQuery > Profiler** (see [Debugger Preferences \(on page 201\)](#)).

The following profiler settings are available:

Show time

Shows the total time that was spent in the call.

Show inherent time

Shows the inherent time that was spent in the call. The inherent time is defined as the total time of a call minus the time of its child calls.

Show invocation count

Shows how many times the call was called in this particular call sequence.

Time scale

Determines the unit of time measurement. You can choose between milliseconds or microseconds.

Hotspot threshold

Hotspots are ignored below this specified amount (in milliseconds). For more information, see [Hotspots View \(on page 1938\)](#).

Ignore invocation less than

Invocations are ignored below this specified amount (in microseconds). For more information, see [Invocation Tree View \(on page 1937\)](#).

Percentage calculation

The percentage base that determines what time span percentages are calculated against. You can choose between the following:

- **Absolute** - Percentage values show the contribution to the total time.
- **Relative** - Percentage values show the contribution to the calling call.

XPath Preferences

To configure XPath options, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XPath**.

Oxygen XML Editor Eclipse plugin allows you to customize the following options:

Unescape XPath expression

If selected, the entities of an XPath expression that you type in the **XPath/XQuery Builder (on page 1817)** are unescaped during their execution. For example, the expression:

```
//varlistentry[starts-with(@os, '&#x73;')]
```

is equivalent to:

```
//varlistentry[starts-with(@os, 's')]
```

XPath Default Namespace (only for XPath version 2.0)

Specifies the default namespace to be used for unprefixed element names. You can choose between the following four options:

- **No namespace** - If selected, Oxygen XML Editor Eclipse plugin considers unprefixed element names of the evaluated XPath expressions as belonging to no namespace.
- **Use the default namespace from the root element** (default selection) - Oxygen XML Editor Eclipse plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the default namespace declared on the root element of the XML document you are querying.
- **Use the namespace of the root** - If selected, Oxygen XML Editor Eclipse plugin considers unprefixed element names of the evaluated XPath expressions as belonging to the same namespace as the root element of the XML document you are querying.
- **This namespace** - If selected, you can use the corresponding text field to enter the namespace of the unprefixed elements.

Default prefix-namespace mappings

You can use this table to associate prefixes with namespaces. Use these mappings when you want to define them globally (not for each document). Use the **New** button to add mappings to the list and the **Delete** button to remove mappings.

XQuery Preferences

To configure the **XQuery** options, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XQuery**.

The following generic XQuery preferences are available:

Validation engine

Allows you to select the processor that will be used to validate XQuery documents. If you are validating an XQuery file that has an associated validation scenario, Oxygen XML Editor Eclipse

plugin uses the processor specified in the scenario. If no validation scenario is associated, but the file has an associated transformation scenario, the processor specified in the scenario is used. If the processor does not support validation or if no scenario is associated, then the value from this combo box will be used as validation processor.

Size limit of Sequence view (MB)

When the result of an XQuery transformation is set as a sequence (**Present as a sequence option** *(on page 1229)*) in the transformation scenario, the size of one chunk of the result that is fetched from the database in lazy mode in one step is set in this option. If this limit is exceeded, go to the **Sequence view** *(on page 797)* and click **More results available** to extract more data from the database.

Format transformer output

Specifies whether or not the output of the transformer is formatted and indented (*pretty-print* *(on page 2681)*).

Note:

This option is ignored if you choose **Present as a sequence** *(on page 1229)* (lazy extract data from a database) from the associated transformation scenario.

Create structure indicating the type nodes

If selected, Oxygen XML Editor Eclipse plugin takes the results of a query and creates an XML document containing copies of all items in the sequence, suitably wrapped.

Note:

This option is ignored if you choose **Present as a sequence** *(on page 1229)* (lazy extract data from a database) from the associated transformation scenario.

Saxon-HE/PE/EE Preferences

To configure global options for XQuery transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, open the **Preferences** dialog box *(on page 70)* and go to **XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE**.

Oxygen XML Editor Eclipse plugin allows you to configure the following XQuery options for the Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important,

optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

The following option is available for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

The options available specifically for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated.

This option is available when the **Enable XQuery update** option is selected.

Saxon HE/PE/EE Advanced Preferences

To configure **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XQuery > Saxon-HE/PE/EE > Advanced**.

The advanced XQuery options that can be configured for the Saxon 12.3 XQuery transformer (all editions: Home Edition, Professional Edition, Enterprise Edition) are as follows:

- **URI Resolver class name** - Allows you to specify a custom implementation for the URI resolver used by the XQuery Saxon 12.3 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding *JAR* or class extension must be configured from [the dialog box for configuring the XQuery extension \(on page 1209\)](#) for the particular transformation scenario.

Note:

If your `URIResolver` implementation does not recognize the given resource, the `resolve(String href, String base)` method should return a `null` value. Otherwise, the given resource will not be resolved through the [XML Catalog \(on page 594\)](#).

- **Collection URI Resolver class name** - Allows you to specify a custom implementation for the Collection URI resolver used by the XQuery Saxon 12.3 transformer (the -cr option when run from the command line). The class name must be fully specified and the corresponding *JAR* or class extension must be configured from [the dialog box for configuring the XQuery extension \(on page 1209\)](#) for the particular transformation scenario.

XSLT Preferences

To configure the **XSLT** options, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XSLT**.

The XSLT preferences page allows you to customize options for the default XSLT validation engines. You can also specify the engine directly in a [validation scenario \(on page 568\)](#).

**Note:**

If no specific engine is specified in the validation scenario and the XSLT file has a transformation scenario associated, Oxygen XML Editor Eclipse plugin will use the engine specified in the transformation scenario.

The following options are available in this page:

Validation engine - XSLT 1.0

Allows you to select the XSLT engine to be used for validation of XSLT 1.0 documents.

Validation engine - XSLT 2.0

Allows you to select the XSLT engine to be used for validation of XSLT 2.0 documents.

Validation engine - XSLT 3.0

Allows you to select the XSLT engine to be used for validation of XSLT 3.0 documents.

**Note:**

Saxon-HE does not implement any XSLT 3.0 features. Saxon-PE implements a selection of XSLT 3.0 (and XPath 3.1) features, with the exception of schema-awareness and streaming. Saxon-EE implements additional features relating to streaming (processing of a source document without constructing a tree in memory. For further details about XSLT 3.0 conformance, go to <http://www.saxonica.com/documentation/index.html#!conformance/xslt30>.

XSLT Editor Content Completion Options link

Use this link to switch to the **XSLT Content Completion preferences page** (*on page 132*), where you can configure the XSLT content completion options.

MSXML Preferences (Deprecated)

To configure the MSXML options, open the **Preferences dialog box** (*on page 70*) and go to **XML > XSLT-XQuery > XSLT > MSXML (Legacy)**.

The options in this preferences page for the MSXML 3.0 and 4.0 processors are as follows:

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Start transformation in this mode

Although stylesheet execution usually begins in the empty mode, this default behavior may be changed by specifying another mode. Changing the start mode allows execution to jump directly to an alternate group of templates.

MSXML.NET Preferences (Deprecated)

To configure the **MSXML.NET** options, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XSLT > MSXML.NET (Legacy)**.

The options in this preferences page for the MSXML.NET processor are as follows:

Enable XInclude processing

If selected, XInclude references will be resolved when MSXML.NET is used as the transformer in the [XSLT transformation scenario \(on page 1171\)](#).

Validate documents during parse phase

If selected, and either the source or stylesheet document has a DTD or schema that its content can be checked against, validation is performed.

Do not resolve external definitions during parse phase

By default, MSXML instructs the parser to resolve external definitions such as document type definition (DTD), external subsets or external entity references when parsing the source and style sheet documents. If this option is selected, the resolution is disabled.

Strip non-significant whitespaces

If selected, strips non-significant white space from the input XML document during the load phase. Selecting this option can lower memory usage and improve transformation performance while, in most cases, creating equivalent output.

Show time information

If selected, the relative speed of various transformation steps can be measured, including:

- The time to load, parse, and build the input document.
- The time to load, parse, and build the stylesheet document.
- The time to compile the stylesheet in preparation for the transformation.
- The time to execute the stylesheet.

Forces ASCII output encoding

There is a known problem with the .NET 1.X XSLT processor (`System.Xml.Xsl.XslTransform` class). It does not support escaping of characters as XML character references when they cannot be represented in the output encoding. This means that it will be outputted as '?'. Usually this happens when output encoding is set to ASCII. If this option is selected, the output is forced to be ASCII encoded and all non-ASCII characters get escaped as XML character references (`&#nnnn;` form).

Allow multiple output documents

This option allows you to create multiple result documents using the `exsl:document` extension element.

Use named URI resolver class

This option allows you to specify a custom URI resolver class to resolve URI references in `<xsl:import>` and `<xsl:include>` instructions (during XSLT stylesheet loading phase) and in `document()` functions (during XSL transformation phase).

Assembly file name for URI resolver class

This option specifies a file name of the assembly where the specified resolver class can be found. The **Use named URI resolver class option (on page 209)** specifies a partially or fully qualified URI resolver class name (for example, `Acme.Resolvers.CacheResolver`). Such a name requires additional assembly specification using this option or the **Assembly GAC name for URI resolver class option (on page 209)**, but fully qualified class name (which always includes an assembly specifier) is *all-sufficient*.

Assembly GAC name for URI resolver class

This option specifies partially or fully qualified name of the assembly in the global assembly cache (GAC) where the specified resolver class can be found.

List of extension object class names

This option allows to specify extension object classes, whose public methods then can be used as extension functions in an XSLT stylesheet. It is a comma-separated list of namespace-qualified extension object class names. Each class name must be bound to a namespace URI using prefixes, similar to providing XSLT parameters.

Use specified EXSLT assembly

MSXML.NET supports a rich library of the EXSLT and EXSLT.NET extension functions embedded or in a *plugin* EXSLT.NET library. EXSLT support is enabled by default and cannot be disabled in this version. Use this option if you want to use an external EXSLT.NET implementation instead of a built-in one.

Credential loading source xml

This option allows you to specify user credentials to be used when loading XML source documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

Credential loading stylesheet

This option allows you to specify user credentials to be used when loading XSLT stylesheet documents. The credentials should be provided in the `username:password@domain` format (all parts are optional).

Saxon-HE/PE/EE Preferences

To configure global options for XSLT transformation and validation scenarios that use the **Saxon HE/PE/EE** engine, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE**.

Saxon-HE/PE/EE Options

Oxygen XML Editor Eclipse plugin allows you to configure the following XSLT options for the Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE):

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Debugger trace into XPath expressions (applies to debugging sessions)

Instructs the [XSLT Debugger \(on page 1931\)](#) to *step into* XPath expressions.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Line numbering ("-l")

Line numbers where errors occur are included in the output messages.

Expand attributes defaults ("-expand")

Specifies whether or not the attributes defined in the associated DTD or XML Schema are expanded in the output of the transformation you are executing.

DTD validation of the source ("-dtd")

Specifies whether or not the source document will be validated against their associated DTD. You can choose from the following:

- **On** - Requests DTD validation of the source file and of any files read using the `document()` function.
- **Off** - (default setting) Suppresses DTD validation.
- **Recover** - Performs DTD validation but treats the errors as non-fatal.

**Note:**

Any external DTD is likely to be read even if not used for validation, since DTDs can contain definitions of entities.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Saxon-PE/EE Options

The following options are available for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Register Saxon-JS extension functions and instructions

Registers the Saxon-CE extension functions and instructions when compiling a stylesheet using the Saxon 12.3 processors.

**Note:**

Saxon-CE, being JavaScript-based, was designed to run inside a web browser. This means that you will use Oxygen XML Editor Eclipse plugin only for developing the Saxon-CE stylesheet, leaving the execution part to a web browser. See more details about [executing such a stylesheet on Saxonica's website](#).

Allow calls on extension functions ("-ext")

If selected, the stylesheet is allowed to call external Java functions. This does not affect calls on integrated extension functions, including Saxon and EXSLT extension functions. This option is useful when loading an untrusted stylesheet (such as from a remote site using `http://[URL]`). It ensures that the stylesheet cannot call arbitrary Java methods and thus gain privileged access to resources on your machine.

Enable assertions ("-ea")

In XSLT 3.0, you can use the `<xsl:assert>` element to make assertions in the form of XPath expressions, causing a dynamic error if the assertion turns out to be false. If this option is selected, XSLT 3.0 `<xsl:assert>` instructions are enabled. If it is not selected (default), the assertions are ignored.

Saxon-EE Options

The options available specifically for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Saxon-HE/PE/EE Advanced Preferences

To configure the **Saxon HE/PE/EE Advanced** preferences, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon-HE/PE/EE > Advanced**.

You can configure the following advanced XSLT options for the Saxon 12.3 transformer (all three editions: Home Edition, Professional Edition, Enterprise Edition):

- **URI Resolver class name ("-r")** - Specifies a custom implementation for the URI resolver used by the XSLT Saxon 12.3 transformer (the -r option when run from the command line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from [the dialog box for configuring the XSLT extension \(on page 1209\)](#) for the particular transformation scenario.
- **Collection URI Resolver class name ("-cr")** - Specifies a custom implementation for the Collection URI resolver used by the XSLT Saxon 12.3 transformer (the -cr option when run from the command

line). The class name must be fully specified and the corresponding `jar` or `class` extension must be configured from [the dialog box for configuring the XSLT extension \(on page 1209\)](#) for the particular transformation scenario.

Saxon6 Preferences

To configure the **Saxon 6** options, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XSLT > Saxon > Saxon6**.

The built-in Saxon 6 XSLT processor can be configured with the following options:

- **Line numbering** - Specifies whether or not line numbers are maintained and reported in error messages for the XML source document.
- **Disable calls on extension functions** - If selected, external function calls are not allowed. Selecting this option is recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, since they carry similar security risks.
- **Handling of recoverable stylesheet errors** - Allows you to choose how dynamic errors are handled. One of the following options can be selected:
 - **recover silently** - Continue processing without reporting the error.
 - **recover with warnings** - Issue a warning but continue processing.
 - **signal the error and do not attempt recovery** - Issue an error and stop processing.

XSLTProc Preferences (Deprecated)

To configure **XSLTProc** options, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XSLT-XQuery > XSLT > XSLTProc**.

The following options are available in this preferences page:

- **Enable XInclude processing** - If selected, XInclude references will be resolved when XSLTProc is used as transformer in [XSLT transformation scenarios \(on page 1171\)](#).
- **Skip loading the document's DTD** - If selected, the DTD specified in the DOCTYPE declaration will not be loaded.
- **Do not apply default attributes from document's DTD** - If selected, the default attributes declared in the DTD and not specified in the document are not included in the transformed document.
- **Do not use Internet to fetch DTD's, entities or docs** - If selected, the remote references to DTD's and entities are not followed.
- **Maximum depth in templates stack** - If this limit of maximum templates depth is reached the transformation ends with an error.
- **Verbosity** - If selected, the transformation will output detailed status messages about the transformation process in the **Warnings** view.
- **Show version of libxml and libxslt used** - If selected, Oxygen XML Editor Eclipse plugin will display in the **Warnings** view the version of the **libxml** and **libxslt** libraries invoked by XSLTProc.

- **Show time information** - If selected, the **Warnings** view will display the time necessary for running the transformation.
- **Show debug information** - If selected, the **Warnings** view will display debug information about what templates are matched, parameter values, and so on.
- **Show all documents loaded during processing** - If selected, Oxygen XML Editor Eclipse plugin will display in the **Warnings** view the URL of all the files loaded during transformation.
- **Show profile information** - If selected, Oxygen XML Editor Eclipse plugin will display in the **Warnings** view a table with all the matched templates, and for each template will display: the match XPath expression, the template name, the number of template modes, the number of calls, the execution time.
- **Show the list of registered extensions** - If selected, Oxygen XML Editor Eclipse plugin will display in the **Warnings** view a list with all the registered extension functions, extension elements and extension modules.
- **Refuses to write to any file or resource** - If selected, the XSLTProc processor will not write any part of the transformation result to an external file on disk. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.
- **Refuses to create directories** - If selected, the XSLTProc processor will not create any directory during the transformation process. If such an operation is requested by the processed XSLT stylesheet the transformation ends with a runtime error.

XML Structure Outline Preferences

To configure options regarding the **Outline view** ([on page 326](#)), open the **Preferences** dialog box ([on page 70](#)) and go to **XML Structure Outline**. It contains the following options:

Preferred attribute names for display

The preferred attribute names when displaying the attributes of an element in the **Outline** view. If there is no preferred attribute name specified, the first attribute of an element is displayed.

Enable outline drag and drop

Drag and drop is disabled for the tree displayed in the **Outline** view only if there is a possibility to accidentally change the structure of the document by such operations.

Configuring Options

A set of options controls the behavior of Oxygen XML Editor Eclipse plugin, allowing you to configure most of the features. To offer you the highest degree of flexibility in customizing the application to fit the needs of your organization, Oxygen XML Editor Eclipse plugin includes several distinct layers of option values.

The option layers are as follows (sorted from high priority to low):

- **Global Options** ([on page 70](#))

Allows individual users to personalize Oxygen XML Editor Eclipse plugin according to their specific needs.

- **Customized Default Options** (*on page 215*)

Designed to customize the initial option values for a group of users, this layer allows an administrator to deploy the application preconfigured with a standardized set of option values.

**Note:**

Once this layer is set, it represents the initial state of Oxygen XML Editor Eclipse plugin when an end-user selects the [Restore defaults](#) (*on page 71*) or [Reset Global Options](#) (*on page 216*) actions.

- **Default Options**

The predefined default values, tuned so that Oxygen XML Editor Eclipse plugin behaves optimally in most working environments.

**Important:**

If you set a specific option in one of the layers, but it is not applied in the application, make sure that one of the higher priority layers does not overwrite it.

Customizing Default Options

Oxygen XML Editor Eclipse plugin has an extensive set of options that you can configure. When Oxygen XML Editor Eclipse plugin is installed, these options are set to default values. You can provide a different set of default values for an installation using an XML *options file*.

Creating an XML Options File

To create an *options file*, follow these steps:

1. It is recommended that you use a fresh install for this procedure, to make sure that you do not copy personal or local preferences.
2. Open Oxygen XML Editor Eclipse plugin and [open the Preferences dialog box](#) (*on page 70*).
3. Go through the options and set them to the desired defaults.
4. Go back to the main preferences page and click **Export Global Options** to create an XML options file.

Configuring an Installation to Use Customized Default Options

There are several methods that you can use to configure an Oxygen XML Editor Eclipse plugin installation to use the customized default options from the created XML options file.

The possible methods for using customized default options during an installation include:

• Copy the XML Options File to the Installation Directory

In the `[OXYGEN_INSTALL_DIR]`, create a folder called `preferences` and copy the created XML options file into it (for example: `[ECLIPSE-INSTALL-DIR]/plugins/com.oxygenxml.editor/preferences/default.xml`, or if the plugin was installed as a drop-in: `[ECLIPSE-INSTALL-DIR]/dropins/com.oxygenxml.editor/plugins/com.oxygenxml.editor/preferences/default.xml`).

• Specify a Path to the XML Options File in a Startup Parameter

Set the path to the XML options file as the value of the `com.oxygenxml.default.options` system property in the Eclipse configuration file (`[ECLIPSE-INSTALL-DIR]/configuration/config.ini`). The path can be specified with any of the following:

- A URL or file path relative to the application installation folder. For example:

```
com.oxygenxml.default.options=file\default.xml
```

This will make Oxygen XML Editor Eclipse plugin look for `default.xml` inside the installation folder (for example: `[ECLIPSE-INSTALL-DIR]/plugins/com.oxygenxml.editor/preferences/default.xml`, or if the plugin was installed as a drop-in: `[ECLIPSE-INSTALL-DIR]/dropins/com.oxygenxml.editor/plugins/com.oxygenxml.editor/preferences/default.xml`).

- A system variable that specifies the file path. For example:

```
com.oxygenxml.default.options=file\:${system(CONFIG)}/default.xml
```

- An environmental variable that specifies the file path. For example:

```
com.oxygenxml.default.options=file\:${env(CONFIG)}/default.xml
```

Note:

In the Eclipse configuration file, the backslash (`\`) is considered a special character. Therefore, use forward slashes for separators inside the file path.

Importing/Exporting/Resetting Global Options

Actions for importing, exporting, and resetting global options are available in the preferences page of the Oxygen XML Editor Eclipse plugin. To open this page, [open the Preferences dialog box \(on page 70\)](#).

The export operation allows you to save global preferences as an XML options file and the import operation allows you to load the options file. You can use this file to reload the options on your computer or to share with others.

The following buttons are available at the bottom of the preferences page:

Reset Global Options

Restores the preference to the factory defaults or to [customized defaults \(on page 215\)](#). This action also resets the transformation and validation scenarios to the default scenarios and clears recently used document templates.

Import Global Options

Allows you to import a set of *Global Options* from an exported XML properties file. You can also select a project file (`.xpr`) to import all the *Global Options* that are set in that project file. After you select a file, the **Import Global Options** dialog box is displayed, and it informs you that the operation will only override the options that are included in the imported file. You can select the **Reset all other options to their default values** option to reset all options to the default values before the file is imported.

Export Global Options

Allows you to export *Global Options* to an XML properties file. Some user-specific options that are private are not included. For example, passwords and the name of the *Review Author* is not included in the export operation.

Configuring a Dark Color Theme

The Eclipse platform supports setting a dark color theme in the **Preferences > General > Appearance** preferences page. This dark color theme mostly influences the general Eclipse toolbar.

To also use a dark theme for XML documents opened by the Oxygen XML Editor Eclipse plugin, the following special experimental [system property \(on page 232\)](#) must be added in the `eclipse.ini` configuration file:

```
-Dcom.oxygenxml.eclipse.dark.color.theme=true
```

Import/Export Transformation or Validation Scenarios

You can export global transformation and validation scenarios into specialized *scenarios* files. You can import transformation and validation scenarios from various sources (such as project files, [framework \(on page 2679\)](#) option files, or exported scenario files). To access these import and export actions, [open the Preferences dialog box \(on page 70\)](#) and go to **Scenarios Management**. The following actions are available:

Import Global Transformation Scenarios

Loads a set of transformation scenarios from a project file, *framework* options file, or exported scenarios file.

Export Global Transformation Scenarios

Stores a set of global transformation scenarios in a specialized *scenarios* file.

Import Global Validation Scenarios

Loads a set of validation scenarios from a project file, *framework* options file, or exported scenarios file.

Export Global Validation Scenarios

Stores a set of global validation scenarios in a specialized *scenarios* file.

The **Export Global Transformation Scenarios** and **Export Global Validation Scenarios** options are used to store all the scenarios in a separate file. Associations between document URLs and scenarios are also saved in this file. You can load the saved scenarios using the **Import Global Transformation Scenarios** and **Import Global Validation Scenarios** actions. To distinguish the existing scenarios and the imported ones, the names of the imported scenarios contain the word *import*.

Editor Variables

An editor variable is a shorthand notation for context-dependent information, such as a file or folder path, a time-stamp, or a date. It is used in the definition of a command (for example, the input URL of a transformation, the output file path of a transformation, or the command line of an external tool) to make a command or a parameter generic and re-usable with other input files. When the same command is applied to multiple files, the notation is expanded at the execution of the command so that the same command has different effects depending on the actual file.

Oxygen XML Editor Eclipse plugin includes a variety of built-in editor variables. You can also create your own custom editor variables by using the **Custom Editor Variables** preferences page ([on page 73](#)).

Editor variables are evaluated and automatically expanded in many places in the application, when:

- [Creating new documents from file templates \(on page 253\)](#).
- [Inserting code templates \(on page 253\)](#) in the **Text** or **Author** editor modes.
- Executing predefined [Built-in Author Mode Operations \(on page 1962\)](#) that have editor variables given as parameter values.
- Running [validation scenarios \(on page 568\)](#) that use editor variables inside to reference various resources.
- Executing transformation scenarios (of type ANT, [DITA-OT \(on page 2558\)](#), [XSLT \(on page 1206\)](#), etc.) that have editor variables set as parameter values or as values for references to various resources.
- [Expanding CSS imports \(on page 2118\)](#) for editing in the **Author** visual editing mode.
- Using specific Java API `UtilAccess.expandEditorVariables(String, URL)` from plugins and framework extensions.

You can use the following editor variables in Oxygen XML Editor Eclipse plugin commands of external engines or other external tools, and in various places in the application, such as in transformation scenarios, and validation scenarios:

- **\${activeConditionSet}** - Current active [profiling condition set \(on page 448\)](#) name. If there is no active condition set, the variable will be replaced with an *empty string*.
- **\${af}** - The local file path of the ZIP archive that includes the currently edited document.

- **`\${afd}** - The local directory path of the ZIP archive that includes the currently edited document.
- **`\${afdu}** - The URL path of the directory of the ZIP archive that includes the currently edited document.
- **`\${afn}** - The file name (without parent directory and without file extension) of the zip archive that includes the currently edited file.
- **`\${afne}** - The file name (with file extension, for example `.zip` or `.epub`, but without parent directory) of the zip archive that includes the currently edited file.
- **`\${afu}** - The URL path of the ZIP archive that includes the currently edited document.
- **`\${answer(@id)}** - Used in conjunction with the **`\${ask}** editor variable. The `@id` parameter is required and identifies the answer from the **`\${ask}** editor variable with the same ID.

Example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="topic_lcf_lc4_tdb">
  <title></title>
  <body>
    <data name="${ask('Set a data name', String, 'name', @name)}"></data>
    <p>The name is: ${answer(@name)}</p>
  </body>
</topic>
```

- **`\${ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default_value', @id)}** - To prompt for values at runtime, use the `ask('message', type, ('real_value1': 'rendered_value1'; 'real_value2': 'rendered_value2'; ...), 'default-value')` editor variable.

You can set the following parameters:

- **'message'** - The displayed message. Note the quotes that enclose the message.
- **'default-value'** - Optional parameter. Provides a default value.
- **@id** - Optional parameter. Used for identifying the variable to reuse the answer using the **`\${answer(@id)}** editor variable.
- **type** - Optional parameter (defaults to **generic**), with one of the following values:

Note:

The title of the dialog box will be determined by the type of parameter and as follows:

- For `url` and `relative_url` parameters, the title will be the name of the parameter and the value of the `'message'`.
- For the other parameters listed below, the title will be the name of that respective parameter.
- If no parameter is used, the title will be "Input".

Notice:

Editor variables that are used within a parameter of another editor variable must be escaped within single quotes for them to be properly expanded. For example:

```
${ask( 'Provide a date', generic, '${date(yyyy-MM-dd'T'HH:MM)}' ) }
```

Parameter	
generic (default)	Format: <code>\${ask('message', generic, 'default')}</code>
	Description: The input is considered to be generic text that requires no special handling.
	Example: <ul style="list-style-type: none"> ▪ <code>\${ask('Hello world!')}</code> - The dialog box has a <i>Hello world!</i> message displayed. ▪ <code>\${ask('Hello world!', generic, 'Hello again!')}</code> - The dialog box has a <i>Hello world!</i> message displayed and the value displayed in the input box is <i>Hello again!</i>.
url	Format: <code>\${ask('message', url, 'default_value')}</code>
	Description: Input is considered a URL. Oxygen XML Editor Eclipse plugin checks that the provided URL is valid.
	Example: <ul style="list-style-type: none"> ▪ <code>\${ask('Input URL', url)}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. ▪ <code>\${ask('Input URL', url, 'http://www.example.com')}</code> - The displayed dialog box has the name <i>Input URL</i>. The expected input type is URL. The input field displays the default value <i>http://www.example.com</i>.
relative_url	Format: <code>\${ask('message', relative_url, 'default')}</code>
	Description: Input is considered a URL. This parameter provides a file chooser, along with a text field. Oxygen XML Editor Eclipse plugin tries to make the URL relative to that of the document you are editing.
	<div style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #D9E1F2;"> <p> Note:</p> <p>If the <code>\$ask</code> editor variable is expanded in content that is not yet saved (such as an <i>untitled</i> file, whose path cannot be determined), then Oxygen XML Editor Eclipse plugin will transform it into an absolute URL.</p> </div>
	Example:

Parameter	
	<p><code>ask('File location', relative_url, 'C:/example.txt')</code> - The dialog box has the name <i>'File location'</i>. The URL inserted in the input box is made relative to the currently edited document location.</p>
password	<p>Format: <code>ask('message', password, 'default')</code></p> <p>Description: The input is hidden with bullet characters.</p> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>ask('Input password', password)</code> - The displayed dialog box has the name <i>'Input password'</i> and the input is hidden with bullet symbols. ▪ <code>ask('Input password', password, 'abcd')</code> - The displayed dialog box has the name <i>'Input password'</i> and the input hidden with bullet symbols. The input field already contains the default abcd value.
combobox	<p>Format: <code>ask('message', combobox, ('real_value1':'rendered_value1';...;','real_valueN':'rendered_valueN'), 'default')</code></p> <p>Description: Displays a dialog box that offers a drop-down menu. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated value (<i>real_value</i>).</p> <div data-bbox="560 1122 1437 1294" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>xpath_eval()</code>.</p> </div> <div data-bbox="560 1328 1437 1500" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>ask('Operating System', combobox, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos')</code> - The dialog box has the name <i>'Operating System'</i>. The drop-down menu displays the three given operating systems. The associated value will be returned based upon your selection. <div data-bbox="639 1877 1437 2020" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px;"> <p> Note: In this example, the default value is indicated by the <i>osx</i> key. However, the same result could be obtained if the de-</p> </div>

Parameter	
	<div data-bbox="638 219 1441 421" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;">  fault value is indicated by <i>macOS</i>, as in the following example: <code>\${ask('Operating System', combobox, ('win':'Microsoft Windows','macos':'macOS','lnx':'Linux/UNIX'), 'macOS')}</code> </div> <ul style="list-style-type: none"> ▪ <code>\${ask('Mobile OS', combobox, ('ios':'iOS','and':'Android'), 'Android')}</code> ▪ <code>\${ask('Mobile OS', combobox, (\$xpath_eval(for \$pair in ([ios, 'iOS'], [and, 'Android']) return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>
<p>editable_combobox</p>	<p>Format: <code>\${ask('message', editable_combobox, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p> <p>Description: Displays a dialog box that offers a drop-down menu with editable elements. The drop-down menu is populated with the given <i>rendered_value</i> values. Choosing such a value will return its associated real value (<i>real_value</i>) or the value inserted when you edit a list entry.</p> <div data-bbox="558 958 1441 1137" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The list of '<i>real_value</i>':'<i>rendered_value</i>' pairs can be computed using <code>\$xpath_eval()</code>.</p> </div> <div data-bbox="558 1164 1441 1344" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-bottom: 10px;"> <p> Note: The '<i>default</i>' parameter specifies the default-selected value and can match either a key or a value.</p> </div> <p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\${ask('Operating System', editable_combobox, ('win':'Microsoft Windows','macos':'macOS','lnx':'Linux/UNIX'), 'macos')}</code> - The dialog box has the name '<i>Operating System</i>'. The drop-down menu displays the three given operating systems and also allows you to edit the entry. The associated value will be returned based upon your selection or the text you input. ▪ <code>\${ask('Operating System', editable_combobox, (\$xpath_eval(for \$pair in ([win, 'Microsoft Windows'], [macos, 'macOS'], [lnx, 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ";")), 'ios')}</code>
<p>radio</p>	<p>Format: <code>\${ask('message', radio, ('real_value1':'rendered_value1';...;'real_valueN':'rendered_valueN'), 'default')}</code></p>

Parameter	
	<p>Description: Displays a dialog box that offers a series of radio buttons. Each radio button displays a <i>'rendered_value'</i> and will return an associated <i>real_value</i>.</p> <div data-bbox="560 387 1437 566" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #E6F2FF;"> <p> Note: The list of <i>'real_value':'rendered_value'</i> pairs can be computed using <code>\$(xpath_eval())</code>.</p> </div> <div data-bbox="560 595 1437 775" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #E6F2FF;"> <p> Note: The <i>'default'</i> parameter specifies the default-selected value and can match either a key or a value.</p> </div>
	<p>Example:</p> <ul style="list-style-type: none"> ▪ <code>\$(ask('Operating System', radio, ('win':'Microsoft Windows';'macos':'macOS';'lnx':'Linux/UNIX'), 'macos'))</code> - The dialog box has the name <i>'Operating System'</i>. The radio button group allows you to choose between the three operating systems. <div data-bbox="639 1099 1437 1279" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #E6F2FF;"> <p> Note: In this example, <code>macOS</code> is the default-selected value and if selected, it would return <code>macos</code> for the output.</p> </div> <ul style="list-style-type: none"> ▪ <code>\$(ask('Operating System', radio, (\$(xpath_eval(for \$pair in (['win', 'Microsoft Windows'], ['macos', 'macOS'], ['lnx', 'Linux/UNIX']) return "" \$pair?1 ":" \$pair?2 ";")), 'ios'))</code>

- `$(author.name)` - Expands to the current author name that is set in the [Review preferences page \(on page 150\)](#).
- `$(caret)` - The position where the cursor is located. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.

Note:

The `$(caret)` editor variable is available only for parameters that take XML content as values. It is replaced with the `$(UNIQUE_CARET_MARKER_FOR_AUTHOR)` macro. The default Author operations process this macro and position the cursor at the designated offset.

**Note:**

The `caret` editor variable can be used for setting a fixed cursor position inside an XML fragment. To set the cursor position depending on the fragment inserted in the document, you can use `AuthorDocumentFilter` and inside the `insertFragment(AuthorDocumentFilterBypass, int, AuthorDocumentFragment)` method, use the `AuthorDocumentFragment.setSuggestedRelativeCaretOffset(int)` API on the given fragment.

- `cf` - Current file as file path, that is the absolute file path of the currently edited document.
- `cfid` - Current file folder as file path, that is the path of the currently edited document up to the name of the parent folder.
- `cfdu` - Current file folder as URL, that is the path of the currently edited document up to the name of the parent folder, represented as a URL.
- `cfn` - Current file name without the extension and parent folder. The current file is the one currently open and selected.
- `cfne` - Current file name with extension. The current file is the one currently open and selected.
- `comma` - Used to display a comma when the actual comma symbol would be considered part of some sort of instruction or delimiter.
- `configured.ditaot.dir` - The default directory of the DITA Open Toolkit distribution, as configured in the [DITA preferences page \(on page 81\)](#).
- `cp` - Current page number. Used to display the current page number on each printed page in the **Editor / Print** Preferences page.
- `currentFileURL` - Current file as URL, that is the absolute file path of the currently edited document represented as URL.
- `date(pattern)` - Current date. The allowed patterns are equivalent to the ones in the [Java SimpleDateFormat class](#). **Example:** `yyyy-MM-dd`.

**Note:**

This editor variable supports both the `xs:date` and `xs:datetime` parameters. For details about `xs:date`, go to: <http://www.w3.org/TR/xmlschema-2/#date>. For details about `xs:datetime`, go to: <http://www.w3.org/TR/xmlschema-2/#dateTime>.

- `dbgXML` - The local file path to the XML document that is currently selected in the Debugger source combo box (for tools started from the XSLT/XQuery Debugger).
- `dbgXSL` - The local file path to the XSL/XQuery document that is currently selected in the Debugger stylesheet combo box (for tools started from the XSLT/XQuery Debugger).
- `dita.dir.url` - A special local contextual editor variable that gets expanded only in the **Libraries** dialog box that is accessible from the **Advanced** tab of DITA transformation scenarios. The **Libraries** dialog box allows you to specify additional libraries (*JAR (on page 2679)* files or additional class paths) to be used by the transformer. This `{dita.dir.url}` editor variable gets expanded to the value of the `dita.dir` parameter from the **Parameters** tab of the DITA transformation scenario.

- **`\${ds}`** - The path of the detected schema as a local file path for the current validated XML document.
- **`\${dsu}`** - The path of the detected schema as a URL for the current validated XML document.
- **`\${env(VAR_NAME)}`** - Value of the *VAR_NAME* environment variable. The environment variables are managed by the operating system. If you are looking for Java System Properties, use the **`\${system(var.name)}`** editor variable.
- **`\${framework(fr_name)}`** - The path (as URL) of the *fr_name* framework.
- **`\${framework}`** - The path (as URL) of the current *framework* directory.
- **`\${frameworkDir(fr_name)}`** - The path (as file path) of the *fr_name* framework.

Note:

Since multiple *frameworks* might have the same name (although it is not recommended), for both **`\${framework(fr_name)}`** and **`\${frameworkDir(fr_name)}`** editor variables Oxygen XML Editor Eclipse plugin employs the following algorithm when searching for a given *framework* name:

- All *frameworks* are sorted, from high to low, according to their **Priority** ([on page 91](#)) setting from the **Document Type** configuration dialog box ([on page 90](#)). Only *frameworks* that have the **Enabled** checkbox selected are taken into account.
- Next, if the two or more *frameworks* have the same name and priority, a further sorting based on the **Storage** setting is made, in the exact following order:
 - *Frameworks* stored in the internal Oxygen XML Editor Eclipse plugin options.
 - Additional *frameworks* added in the **Locations** preferences page ([on page 90](#)).
 - *Frameworks* installed using the add-ons support.
 - *Frameworks* found in the [main framework location](#) ([on page 90](#)) (**Default** or **Custom**).

- **`\${frameworkDir}`** - The path (as file path) of the current *framework* directory.
- **`\${frameworks}`** - The path (as URL) of the *frameworks* directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main frameworks folder defined in the **Document Type Association > Locations** preferences page.
- **`\${frameworksDir}`** - The path (as file path) of the *frameworks* directory. When used to define references inside a framework configuration, it expands to the parent folder of that specific framework folder. Otherwise, it expands to the main *frameworks* folder defined in the **Document Type Association > Locations** preferences page.
- **`\${home}`** - The path (as URL) of the user home folder.
- **`\${homeDir}`** - The path (as file path) of the user home folder.
- **`\${i18n(key)}`** - Editor variable used only at *framework*-level to allow translating names and descriptions of **Author** mode actions in multiple actions. For more details, see [Localizing Frameworks](#) ([on page 2040](#)).
- **`\${id}`** - Application-level unique identifier. It is a short sequence of 10-12 letters and digits that is not guaranteed to be universally unique.

- **`\${makeRelative(base,location)}`** - Takes two URL-like paths as parameters and tries to return a relative path. A use-case would be to insert content references to a certain reusable component when defining code templates.

Example:

```
${makeRelative(${currentFileURL}, ${dictionaryURL}#gogu)}
```

- **`\${oxygenHome}`** - Oxygen XML Editor Eclipse plugin installation folder as URL.c
- **`\${oxygenInstallDir}`** - Oxygen XML Editor Eclipse plugin installation folder as file path.
- **`\${pd}`** - The file path to the folder that contains the current project file (`.xpr`).
- **`\${pdu}`** - The URL path to the folder that contains the current project file (`.xpr`).
- **`\${pluginDir(pluginID)}`** - Each plugin has an ID specified in its `plugin.xml` file. This editor variable expands to the file path of the folder that contains the `plugin.xml` file where that specific plugin ID is located.
- **`\${pluginDirURL(pluginID)}`** - Each plugin has an ID specified in its `plugin.xml` file. This editor variable expands to the URL path of the folder that contains the `plugin.xml` file where that specific plugin ID is located.
- **`\${pn}`** - Current project name.
- **`\${ps}`** - Path separator, which is the separator that can be used on the current platform (Windows, macOS, Linux) between library files specified in the class path.
- **`\${rootMapDir}`** - Will be expanded to the current root map parent directory file path.
- **`\${rootMapDirURL}`** - Will be expanded to the current root map parent directory URL.
- **`\${rootMapFile}`** - Will be expanded to the current root map file path.
- **`\${rootMapURL}`** - Will be expanded to the current root map URL. For example, if in the main DITA Map you define a key with a certain value:

```
<keydef keys="test">
  <topicmeta><keywords><keyword>ABC</keyword></keywords></topicmeta>
</keydef>
```

you can modify a DITA-OT publishing parameter to have the value: `${xpath_eval(doc('${rootMapURL}')/keydef[@keys='test']/keywords/keyword/text())}`. It will be expanded to the value of that specified key name.

- **`\${selection}`** - The currently selected text content in the currently edited document. This variable can be used in a code template, in **Author** mode operations, or in a **selection plugin**.
- **`\${system(var.name)}`** - Value of the `var.name` Java System Property. The Java system properties can be specified in the command-line arguments of the Java runtime as `-Dvar.name=var.value`. If you are looking for operating system environment variables, use the **`\${env(VAR_NAME)}`** editor variable instead.
- **`\${timeStamp}`** - The timestamp, which is the current time in Unix format. For example, it can be used to save transformation results in multiple output files on each transformation.
- **`\${tp}`** - Total number of pages in the document. Used to display the total number of pages on each printed page in the **Editor / Print** Preferences page.
- **`\${tsf}`** - The transformation result file path. If the current opened file has an associated scenario that specifies a transformation output file, this variable expands to it.

- **`\${uuid}** - Universally unique identifier, a unique sequence of 32 hexadecimal digits generated by the Java [UUID](#) class.
- **`\${xmlCatalogFilesList}** - A list of file paths that point to all known XML catalog files, separated by semi-colons (;).
- **`\${xpath_eval(expression)}** - Evaluates an XPath expression. Depending on the context, the expression can be:
 - **static** - When executed in a non-XML context. For example, you can use such static expressions to perform string operations on other editor variables for composing the name of the output file in a transformation scenario's **Output** tab.

Example:

```
${xpath_eval(upper-case(substring('${cfn}', 1, 4)))}
```

- **dynamic** - When executed in an XML context. For example, you can use such dynamic expression in a code template or as a value of a parameter of an **Author** mode operation.

Example:

```
${ask('Set new ID attribute', generic, '${xpath_eval(@id)}')}
```

Custom Editor Variables

An [editor variable](#) ([on page 218](#)) can be created and included in any user-defined expression where a built-in editor variable is also allowed. For example, a custom editor variable may be necessary for configuring the command line of an external tool, the working directory of a custom validator, the command line of a custom XSLT engine, or a custom FO processor.

You can create or configure custom editor variables in the [Custom Editor Variables preferences page](#) ([on page 73](#)). To create a custom editor variable, follow these steps:

1. Open the [Preferences](#) dialog box ([on page 70](#)) and go to **Custom Editor Variables**.
2. Click the **+** **New** button at the bottom of the table.
3. Use the subsequent dialog box to specify the **Name**, **Value**, and **Description** for the new editor variable.
4. Click **OK** to save your configuration.

Related information

[Editor Variables](#) ([on page 218](#))

Custom System Properties

A variety of Java system properties can be set in the application to influence its behavior.

[com.oxygenxml.disable.http.protocol.handlers](#)

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** By default, Oxygen XML Editor Eclipse plugin uses the open source Apache HTTP Client software for HTTP(S) connections. If set to `True`, the default Java Sun HTTP(S) will be used instead. You will also lose **WebDAV** support and possibly other related features.

com.oxygenxml.present.license.reminders

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** When set to `false`, Oxygen XML Editor Eclipse plugin will not display the messages that remind you to renew your Support and Maintenance Pack that covers your current license.

com.oxygenxml.enable.content.reference.caching

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** Enables content reference caching.

com.oxygenxml.eclipse.remove.grid.editing.mode

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** When set to `false`, Oxygen XML Editor Eclipse plugin does not show the Grid editing mode when opening an XML document.

com.oxygenxml.default.java.accessibility

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** System property that can be set to `true` to force the default detection of java accessibility. If `com.sun.java.accessibility.AccessBridge` cannot be loaded, Oxygen XML Editor Eclipse plugin forces the Java accessibility to be disabled.

com.oxygenxml.floating.license.timeout

- **Allowed Values:** An integer (minutes)
- **Default Value:** `120`
- **Purpose:** Stores the time interval (in minutes) before floating licenses are released in case of application's inactivity.

com.oxygenxml.language

- **Allowed Values:** Language code (for example, `en-us`)
- **Default Value:** N/A
- **Purpose:** Property that holds the language code set during installation.

com.oxygenxml.default.options

- **Allowed Values:** A URL-type relative or absolute path.
- **Default Value:** N/A
- **Purpose:** Provides the path to an XML file containing default application options. For more details, see [Customizing Default Options \(on page 215\)](#).

com.oxygenxml.customOptionsDir

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Sets a folder to be used by the application to load and save preference files. The default location where the options are saved varies according to the operating system. For more details, see [Importing/Exporting/Resetting Global Options \(on page 216\)](#).

com.oxygenxml.ApplicationDataFolder (Windows only)

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** `%APPDATA%`
- **Purpose:** When the application runs on Windows, you can set this property to change the location where the application considers that the `APPDATA` folder is located.

com.oxygenxml.editor.frameworks.url

- **Allowed Values:** A URL-type absolute path.
- **Default Value:** `OXYGEN_DIR \frameworks`
- **Purpose:** Changes the folder where the application considers that the main *frameworks* are installed. It has the same effect as changing the custom *frameworks* directory value in the [Location preferences page \(on page 90\)](#).

com.oxygenxml.editor.plugins.dir

- **Allowed Values:** The path can be specified with any of the following:
 - A URL or file path that is relative to the application's installation folder (for example: `-Dcom.oxygenxml.editor.plugins.dir=my-plugins`).
 - A system variable that specifies the file path (for example: `-Dcom.oxygenxml.editor.plugins.dir=${system(CONFIG)}/plugins`).
 - An environmental variable that specifies the file path (for example: `-Dcom.oxygenxml.editor.plugins.dir=${env(CONFIG)}/plugins`).
- **Default Value:** N/A
- **Purpose:** Specifies the directory where the application finds *plugins* to load.

com.oxygenxml.MultipleInstances

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`
- **Purpose:** If set to `true`, multiple instances of the application are allowed to be started.

com.oxygenxml.xep.location

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** N/A
- **Purpose:** Points to a folder where RenderX XEP is installed. Has the same effect as configuring XEP in the **FO Processors** preferences page ([on page 183](#)).

com.oxygenxml.additional.classpath

- **Allowed Values:** A list of *JAR* ([on page 2679](#))-type resources separated by a classpath separator.
- **Default Value:** N/A
- **Purpose:** An additional list of libraries to be used in the application's internal class loader in addition to the libraries specified in the `lib` folder.

com.oxygenxml.user.home (Windows only)

- **Allowed Values:** A file system absolute path pointing to a folder.
- **Default Value:** `USERPROFILE` folder
- **Purpose:** Overwrites the user home directory that was implicitly detected for the application.

com.oxygenxml.use.late.delegation.for.author.extensions

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** All Java extensions in a *framework* configuration are instantiated in a separate class loader. When **true**, the *JAR* libraries used in a certain document type will have priority to resolve classes before delegating to the parent class loader. When **false**, the parent class loader will take precedence.

com.oxygenxml.stack.size.validation.threads

- **Allowed Values:** The number of bytes used for validation threads.
- **Default Value:** `5*1024*1024`
- **Purpose:** Some parts of the application (validation, content completion) that use the Relax NG parser sometimes require a larger *Thread* stack size to parse complex schemas. The default value should be more than enough.

com.oxygenxml.jing.skip.validation.xhtml.data.attrs

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** By default, the Relax NG validation was configured to skip validation for XHTML attributes that start with "data-", which should be skipped from validation according to the XHTML 5 specification.

com.oxygenxml.report.problems.url

- **Allowed Values:** User-defined URL
- **Default Value:** N/A
- **Purpose:** The URL where a problem reported through the **Report Problem** dialog box is sent. The report is sent in XML format using the **report** parameter with the POST HTTP method.

com.oxygenxml.parallel.title.computing.threads

- **Allowed Values:** Integers
- **Default Value:** `4`
- **Purpose:** The number of parallel threads that will be used to compute referenced topic titles. Increasing this value reduces the amount of time it takes to compute topic titles in the **DITA Maps Manager** view.

com.oxygenxml.hidpi.scaling

- **Allowed Values:** Numerical values between 1 and 2 (1, 1.5, and 2 have been tested, and for example, 1.5 is for 150% scaling)
- **Default Value:** N/A
- **Purpose:** Used to override the HiDPI scaling detection to force a specific scaling setting. This is helpful if you encounter scaling detection issues in Windows or Linux.

com.oxygenxml.prefer.plugin.classloader.context.loader

- **Allowed Values:** `true` or `false`
- **Default Value:** `true`
- **Purpose:** Used to instruct the application to use the plugin class loader when there is code that loads content (usually Xerces code) using the thread's class loader. For instance, if you have a plugin that specifies a certain Xerces version and you want to load that version instead of the one from **Oxygen's lib** directory.

com.oxygenxml.classic.file.output.stream.save

- **Allowed Values:** `true` or `false`
- **Default Value:** `false`

- **Purpose:** When set to `true`, the files are saved using a Java classic file output stream, which destroys the NTFS alternate data streams set on the file. However, this might prevent data loss in the rare occasions when Oxygen XML Editor Eclipse plugin saves empty file content over shared network drives.

com.oxygenxml.format.indent.files.parallel

- **Allowed Values:** `true` OR `false`
- **Default Value:** `false`
- **Purpose:** By default, when using the **Format and Indent Files** action from the **Project Explorer** view, only one thread will be used for the formatter. If the system property is enabled, up to four parallel threads are used by the operation, speeding up the processing when formatting very large or a large amount of documents.

com.oxygenxml.eclipse.dark.color.theme

- **Allowed Values:** `true` OR `false`
- **Default Value:** `false`
- **Purpose:** Set this property to `true` to enforce a dark color theme when opening XML documents.

Localizing of the User Interface

To localize the Oxygen XML Editor Eclipse plugin, you can use one of the following methods:

- **Localization through the update site:**

Start Eclipse, go to **Help > Install New Software**. Click **Add Site** in the **Available Software** tab of the **Software Updates** dialog box. Enter <https://www.oxygenxml.com/InstData/Editor/Eclipse/site.xml> in the location field of the **Add Site** dialog box. Click OK. Select the language pack checkbox.

- **Localization through the zip archive:**

Go to <https://www.oxygenxml.com/download.html> and download the zip archive with the plugin language pack. Unzip the downloaded zip archive in the `dropins` subdirectory of the Eclipse install directory. Restart Eclipse.

If your operating system is running in the language you want to start Eclipse in (for example, you are using Japanese version of Windows, and you want to start Eclipse in Japanese), Oxygen XML Editor Eclipse plugin matches the appropriate language from the language pack. However, if your operating system is running in a language other than the one you want to start Eclipse in (for example, you are using the English version of Windows, and you want to start Eclipse in Japanese, if you have the required operating system language support including the keyboard layouts and input method editors installed), specify the `-nl <locale>` command-line argument when you launch Eclipse. Oxygen XML Editor Eclipse plugin uses the translation file that matches the specified `<locale>`.

You can also localize the Eclipse plugin to a different language than the initial languages in the language pack. Duplicate the `plugin.properties` file from the Oxygen XML Editor Eclipse plugin installation directory, translate all the keys in the file and change its name to `plugin_<locale>.properties`.

5.

Perspectives

An Oxygen XML Editor Eclipse plugin *perspective* (on page 2680) is a layout geared towards a specific use. The Oxygen XML Editor Eclipse plugin interface uses standard interface conventions and components to provide a familiar and intuitive editing environment across all operating systems. There are several *perspectives* that you can use to work with documents in Oxygen XML Editor Eclipse plugin. You can change the *perspective* by selecting the respective icon in the top-right corner of Oxygen XML Editor Eclipse plugin or by selecting the *perspective* from the **Window > Perspective > Open Perspective** menu.

Oxygen XML Perspective

The **Oxygen XML** *perspective* (on page 2680) is the most commonly used *perspective* and it is the default *perspective* when you start Oxygen XML Editor Eclipse plugin for the first time. It is the *perspective* that you will use to edit the content of your XML documents.

To switch the focus to this *perspective*, select **Oxygen XML** from the **Window > Open Perspective** menu..

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in Oxygen XML Editor Eclipse plugin. Most of the menus are common for all types of documents. However, Oxygen XML Editor Eclipse plugin also includes some context-sensitive and *framework* (on page 2679)-specific menus that are only available for a specific context or type of document.

Toolbars

Provides easy access to common and frequently used functions. Each icon is a button that acts as a shortcut to a related function. Most of the toolbars are common for all types of documents. However, **Author** mode also includes *framework* (on page 2679)-specific toolbars, depending on the type of document that is being edited (for example, if you are editing a DITA document, a *DITA Author Custom Actions* toolbar is available that includes operations that are specific to DITA documents).

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Views

Oxygen XML Editor Eclipse plugin includes a large variety of *dockable* (on page 2677) views to assist you with editing, viewing, searching, validating, transforming, and organizing your

documents. The most commonly used views are displayed by default and you can choose to display others by selecting them from the **Window > Show View** menu.

When two or more views are displayed, the application provides divider bars. Divider bars can be dragged to a new position increasing the space occupied by one panel while decreasing it for the other.

As the majority of the work process centers around the Editor area, other views can be hidden using the toggle controls located on the top corner of the view (☐).

Some of the most helpful views in the **Oxygen XML perspective** include the following:

- **Project Explorer view** (on page 269) - Enables the definition of projects and logical management of the documents they contain.
- **DITA Maps Manager view** (on page 2337) - For DITA document types, this view helps you organize, manage, and edit DITA topics and maps.
- **Outline view** (on page 326) - It provides an XML tag overview and offers a variety of functions, such as modifications follow-up, document structure change, document tag selection, and elements filtering.
- **Results view** (on page 335) - Displays the messages generated as a result of user actions such as *validations* (on page 544), *transformation scenarios* (on page 1171), *spell checking in multiple files* (on page 294), search operations, and others. Each message is a link to the location related to the event that triggered the message.
- **Attributes view** (on page 329) - Presents all possible attributes of the current element and allows you to edit attribute values. You can also use this view to insert attributes in **Text** mode. **Author** mode also includes an *in-place attribute editor* (on page 407).
- **Model view** (on page 331) - Presents the currently edited element structure model and additional documentation as defined in the schema.
- **Elements view** (on page 333) - Presents a list of all defined elements that you can insert at the current cursor position according to the document's schema. In **Author mode this view** (on page 410) includes tabs that present additional information relative to the cursor location.
- **Entities view** (on page 334) - Displays a list with all entities declared in the current document as well as built-in ones.
- **Transformation Scenarios view** (on page 1306) - Displays a list with all currently configured transformation scenarios.
- **XPath/XQuery Builder view** (on page 1817) - Displays the results from running an XPath expression.
- **Text view** (on page 1218) - Displays the text output that is produced in XSLT transformations.
- **Browser view** (on page 1217) - Displays HTML output from XSLT transformations.
- **Problems view** - A general Eclipse view that displays system-generated errors, warnings, or information associated with a resource.

- **Console view** ([on page 304](#)) - Status information generated by the Schema detection, validation, and transformation threads.
- **WSDL SOAP Analyzer view** ([on page 823](#)) - Provides a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

Related information

[Editing Supported Document Types](#) ([on page 306](#))

[Editing Modes](#) ([on page 241](#))

Oxygen XSLT Debugger Perspective

The **XSLT Debugger perspective** ([on page 2680](#)) allows you to detect problems in an XSLT transformation by executing the process step by step in a controlled environment. To switch the focus to this *perspective*, select **Window > Open Perspective > Other > Oxygen XSLT Debugger**.

The workspace in this *perspective* is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can [split horizontally or vertically](#) ([on page 201](#)) in a stack of XML editor panels and a stack of XSLT editor panels. The XML files and XSL files can be edited in **Text mode** ([on page 241](#)) only.

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XSLT Debugger**.

Toolbars

Contains all actions needed to configure and control the debugging process.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XSL Source Pane

The editing pane where you can display and edit XSL stylesheets.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected stylesheet (XSL) to the transformer. The result of transformation is dynamically written as the transformation is processed. There are three types of views for the output: a text view (with XML syntax highlight), an XHTML view, and one text view for each `<xsl:result-document>` element used in the stylesheet (if it is an XSLT 2.0 / 3.0 stylesheet).

Debugging Information Views ([on page 1918](#))

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information

views. This allows you to obtain a clear view of the transformation progress. See the [Debugging Information Views \(on page 1918\)](#) topic for a list of all the information views (and links to more details on each view).

Note:

You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. In case you select an expression or a fragment of it and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Using **Watch expression** without selecting an expression displays the value of the attribute from the cursor position in the **XWatch** view. Variables detected at the cursor position are also displayed. Expressions displayed in the **XWatch** view are *normalized* (unnecessary white spaces are removed from the expression).

[Oxygen XQuery Debugger Perspective \(on page 237\)](#)

Oxygen XQuery Debugger Perspective

The **XQuery Debugger perspective (on page 2680)** allows you to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment and inspecting the information provided in the special views. To switch the focus to this *perspective*, select **Window > Open Perspective > Other > Oxygen XQuery Debugger**.

The workspace in this *perspective* is organized as an editing area assisted by special helper views. The editing area contains editor panels that you can [split horizontally or vertically \(on page 201\)](#) in a stack of XML editor panels and a stack of XQuery editor panels. The XML files and XQuery files can be edited in **Text mode (on page 241)** only.

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the **XQuery Debugger**.

Toolbars

Contains all actions needed to configure and control the debugging process.

XML Source Pane

The editing pane where you can display and edit data or document-oriented XML documents.

XQuery Source Pane

The editing pane where you can display and edit XQuery files.

Output View

Displays the transformed output that results from the input of a selected document (XML) and selected XQuery document to the XQuery transformer. The result of transformation is dynamically written as the transformation is processed. There are two types of views for the output: a text view (with XML syntax highlight) and an XHTML view.

Debugging Information Views *(on page 1918)*

Presented in two panes, they display various types of information that can be used to understand the transformation process. For each information type there is a corresponding tab. While running a transformation, relevant events are displayed in the various information views. This allows you to obtain a clear view of the transformation progress. See the [Debugging Information Views *\(on page 1918\)*](#) topic for a list of all the information views (and links to more details on each view).

**Note:**

You can add XPath expression automatically in the **XWatch** view using the **Watch expression** action from the contextual menu. If you select an expression, or a fragment of it, and then click **Watch expression** in the contextual menu, the entire selection is presented in the **XWatch** view. Expressions displayed in the **XWatch** view are normalized (unnecessary white spaces are removed from the expression).

[Oxygen XSLT Debugger Perspective *\(on page 236\)*](#)

Oxygen DB Perspective

The **Database perspective *(on page 2680)*** allows you to manage databases. To switch the focus to this *perspective*, select **Oxygen DB** from the **Window > Open perspective** menu.

The **Database perspective** offers various helpful features, including:

- Support for browsing multiple connections at the same time.
- Support for both *Relational* and *Native XML* databases.
- Browsing the structure of databases.
- Viewing tables from databases.
- Inspecting or modifying data.
- Specifying XML Schemas for XML fields.
- SQL execution.
- XQuery execution.
- Data export to XML.

Supported Databases

Oxygen XML Editor Eclipse plugin supports numerous types of databases, including:

- eXist XML Database
- IBM DB2 (Enterprise edition only)
- JDBC-ODBC Bridge
- MarkLogic (Enterprise edition only)
- MySQL
- Oracle 11g (Enterprise edition only)
- PostgreSQL (Enterprise edition only)
- SharePoint (CMS)
- Microsoft SQL Server 2005 and Microsoft SQL Server 2008 (Enterprise edition only) **(Deprecated)**

Note:

For the databases marked with "Enterprise edition only", the XML capabilities are only available in the Enterprise edition of Oxygen XML Editor Eclipse plugin. For a detailed feature matrix that compares the Academic, Professional, and Enterprise editions of Oxygen XML Editor Eclipse plugin [go to the Oxygen XML Editor Eclipse plugin website](#).

Supported Capabilities

The supported non-XML capabilities are as follows:

- Browsing the structure of the database instance.
- Opening a database table in the **Table Explorer** view (*on page 1833*).
- Handling the values from **XML Type** columns as String values.

Note:

The non-XML capabilities are available in the Enterprise, Academic, and Professional editions of Oxygen XML Editor Eclipse plugin by registering the database driver as a *Generic JDBC* type driver when defining the data source for accessing the database. For more information, see [Database Connection Support](#) (*on page 1835*).

The supported XML capabilities are as follows:

- Displaying an XML Schema node in the tree of the database structure (for databases with an XML-specific structure) with actions for opening, editing, and validating the schemas in an Oxygen XML Editor Eclipse plugin editor panel.
- Handling the values from **XML Type** columns as XML instance documents that can be opened and edited in an Oxygen XML Editor Eclipse plugin editor panel.
- Validating an XML instance document added to an XML Type (column of a table, etc.)

Tip:

Connections configured on relational data sources can be used to import data to XML or to generate XML schemas.

Layout of the Database Perspective

The layout of this *perspective* is composed of the following components:

Menus

Provides menu driven access to all the features and functions available in the perspective.

Toolbars

Contains all actions needed to configure and control the debugging process.

Editor Pane

The main editing pane where you spend most of your time reading, editing, applying markup, and validating your documents.

Data Source Explorer View *(on page 1831)*

Provides browsing support for the configured connections.

Table Explorer View *(on page 1833)*

Provides table content editing support for inserting new rows, deleting table rows, editing cell values, exporting to an XML file, and more.

6.

Editing Modes

The main editing area in Oxygen XML Editor Eclipse plugin includes several editing modes to suit the type of editing that you want to perform. You can easily switch between modes by clicking on the desired mode at the bottom of the main editing pane. Oxygen XML Editor Eclipse plugin offers the following editing modes:

- **Text** ([on page 241](#)) - This mode presents the source of the document.
- **Grid** ([on page 242](#)) - This mode displays the document as a structured grid of nested tables.
- **Author** ([on page 242](#)) - This mode enables you to edit in a WYSIWYG-like editor.
- **Design** ([on page 243](#)) - This mode is found in the schema editor and represents the schema as a diagram.

The default editing mode that will be initially opened for each type of document can be set in two ways:

- If the **Allow Document Type specific edit mode setting to override the general mode setting** option ([on page 135](#)) is selected in the **Edit Modes** preferences page, then the edit mode specified in the **Document Type** configuration dialog box ([on page 90](#)) is used when that particular type of document is initially opened.
- If the **Allow Document Type specific edit mode setting to override the general mode setting** option ([on page 135](#)) is not selected, then the edit mode specified in the table in the **Edit Modes** preferences page ([on page 135](#)) is used when that particular type of document is initially opened.

Text Editing Mode

The **Text** mode editor in Oxygen XML Editor Eclipse plugin is designed to be a simple, yet powerful, XML source editor. It provides support to help you edit, transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor Eclipse plugin also includes specialized editing actions, a powerful *Content Completion Assistant*, and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

For more information about working with XML documents in **Text** mode and all of the details about its features, see the **Editing XML Documents in Text Mode** section ([on page 307](#)).

Related information

[Editing XML Documents in Text Mode \(on page 307\)](#)

Grid Editing Mode

The Oxygen XML Editor Eclipse plugin **Grid** editing mode displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup. You can easily expand or collapse elements within the table and the document structure can be changed with simple drag/drop or copy/paste operations.

To switch to this mode, select **Grid** at the bottom of the editing area.

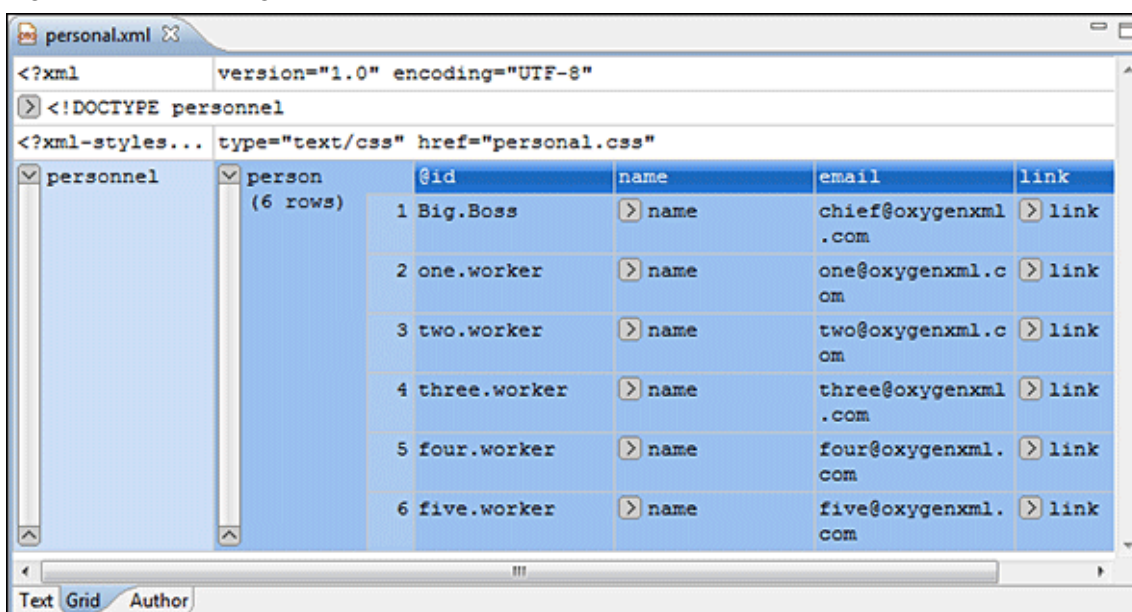

Figure 35. Grid Editing Mode

For more information about working with XML documents in **Grid** mode and all of the details about its features, see the [Editing XML Documents in Grid Mode](#) section (on page 357).

Related information

[Editing XML Documents in Grid Mode](#) (on page 357)

Author Editing Mode

The **Author** editing mode in Oxygen XML Editor Eclipse plugin allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. Oxygen XML Editor Eclipse plugin provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, DocBook, TEI, and XHTML. Adding text content is as simple as doing so in a standard text editor but the content is rendered similar to how you will see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output.

To switch to this mode, click the **Author** button at the bottom of the editing area.

For more information about working with XML documents in **Author** mode and all of the details about its features, see the [Editing XML Documents in Author Mode](#) section (on page 367).

Related information

[Editing XML Documents in Author Mode](#) (on page 367)

Design Editing Mode (Schema Diagram Editor)

Schemas allow document designers to specify the allowed structure and content of a document and to check if it is valid. Oxygen XML Editor Eclipse plugin provides a simple and expressive schema diagram editor (**Design** mode) for editing XML schemas or JSON schemas. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

The **Design** mode offers a diagram view of the schema document by rendering all the schema components. You can edit component features directly within the diagram (for instance, the component name, its type, etc.), you can quickly navigate to the referenced definitions (elements, attributes, types, groups, etc.), and you can use drag-and-drop operations to move, copy, or make references. It also features some specialized helper views (such as the **Palette** view and **Facets** view) to further enhance the diagram editor, various contextual menu actions, validation support, and much more.

To switch to this mode, select **Design** at the bottom of the editing area.

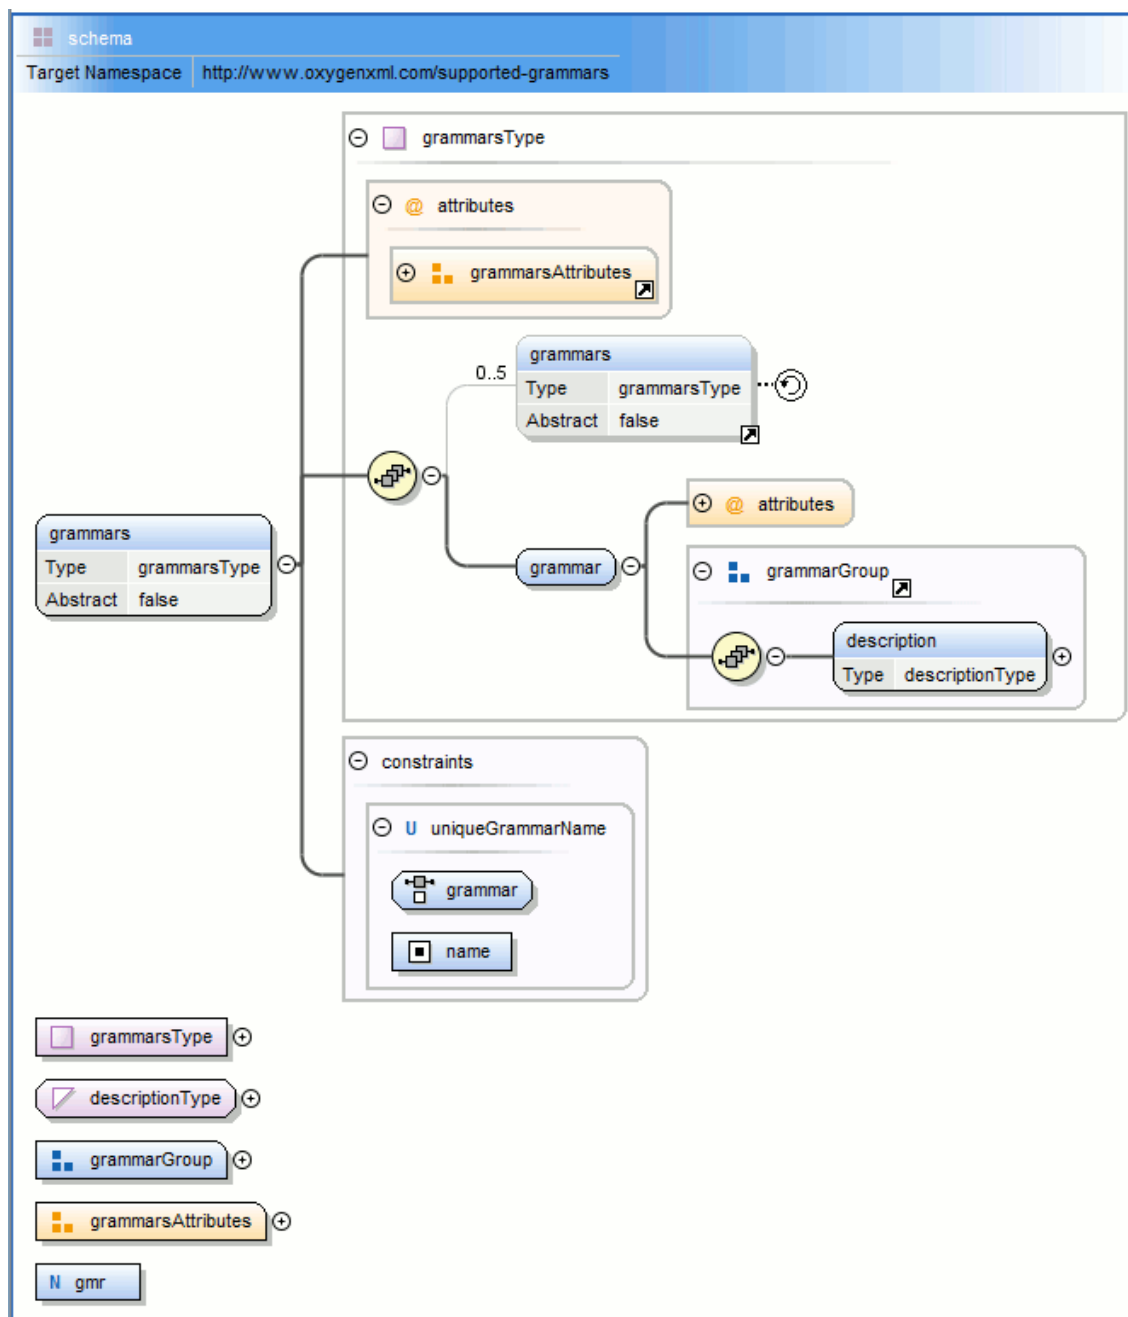

Figure 36. XML Schema Diagram

XML Schema Resources

For more information about designing and editing XML schemas, and all the details about the features that are available in the Oxygen XML Editor Eclipse plugin **Design** mode for XML schema documents, see the **Editing XML Schemas** section (on page 700) and the **XML Schema Design Mode (XML Schema Diagram Editor)** subsection (on page 701).

JSON Schema Resources

For more information about designing and editing JSON schemas, and all the details about the features that are available in the Oxygen XML Editor Eclipse plugin **Design** mode for JSON schema documents, see the

Editing JSON Schemas section (*on page 892*) and the **JSON Schema Design Mode (JSON Schema Diagram Editor)** subsection (*on page 894*).

7.

Working With Documents

Oxygen XML Editor Eclipse plugin includes a variety of general features that can be used when working with most types of documents. More specialized features are available when working with specific types of documents, such as the various types of XML documents, [CSS \(on page 825\)](#), [JavaScript \(on page 934\)](#), [Markdown \(on page 1005\)](#), and more. For details about those specialized features for specific types of documents, see [Editing Supported Document Types \(on page 306\)](#).

This chapter includes information about how to create and work with documents, working with projects, and various general editing features.

Creating, Opening, Saving, and Closing Documents

Oxygen XML Editor Eclipse plugin includes various features, actions, and wizards to assist you with creating new files and working with existing files. This section explains many of these features, including information on creating new documents, opening, saving, and closing existing files, searching documents, viewing file properties, and more.

Creating New Documents and Templates

Oxygen XML Editor Eclipse plugin includes a helpful **New Document** wizard that allows you to customize and create new files from a large list of document types and built-in templates. You can also [create your own templates \(on page 253\)](#) and [share them with others \(on page 259\)](#).

To create a new document:

1. Click the  **New** button on the toolbar or select **File > New > Other > Oxygen XML Editor Eclipse plugin**.
2. Select the type of document that you want to create.

Tip:

You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click the **Next** button, then **Finish**.

New Document Wizard

Oxygen XML Editor Eclipse plugin supports a wide range of document types. The **New Document** wizard presents the default associations between a file extension and the type of editor that opens the file. The **New Document** wizard creates a skeleton document that may contain a root element, the document prolog, and possibly other child elements depending on options that are specific for each schema type. The wizard also

provides access to the **New from Templates** option (*on page 253*) that opens a wizard where you can create a document based upon built-in templates or custom templates.

New Document Wizard

To create a new document in Oxygen XML Editor Eclipse plugin, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New > Other > Oxygen XML Editor Eclipse plugin**.

Result: The **New Document** wizard is displayed with all the supported document types.

2. Select the type of document that you want to create. Oxygen XML Editor Eclipse plugin includes a series of Eclipse wizards that help you create the new document based upon the type you choose.

Tip:

You can use the text filter field at the top of the dialog box to search for a specific template.

3. Click **Next**.

Result: The next wizard page allows you to select a path where you want to store the new file and for some document types it includes some customization options. If you selected  **XML File** or  **XML Schema (XSD) File** for the type of document, you need to select the storage path and click **Next** again to reach customization options.

Note:

For DITA documents, the dialog box includes some additional options for generating a title, file name, and root ID attribute. For more information, see [Creating a New DITA Topic \(on page 2402\)](#).

4. After configuring the options for the particular type of document, click **Finish** to create the file. If the **Open file for editing when done** option is selected, the new file will be opened in the appropriate editor.

New XML Document Wizard

Figure 37. New XML File Configuration Options

If you selected  **XML File** for the type of document you want to create, the wizard will include the following options:

URL

Specifies the path to the schema file. When you select a file, Oxygen XML Editor Eclipse plugin analyzes its content and tries to fill in the rest of the dialog box.

Schema Type

Allows you to select the schema type. The following options are available: XML Schema, DTD, RelaxNG XML syntax, RelaxNG compact syntax, and NVDL.

Public ID

Specifies the PUBLIC identifier declared in the document prolog.

Namespace

Specifies the document namespace.

Prefix

Specifies the prefix for the namespace of the document root.

Root Element

Populated with elements defined in the specified schema, enables selection of the element used as document root.

Description pane

A small description of the selected document root.

Add Optional Content

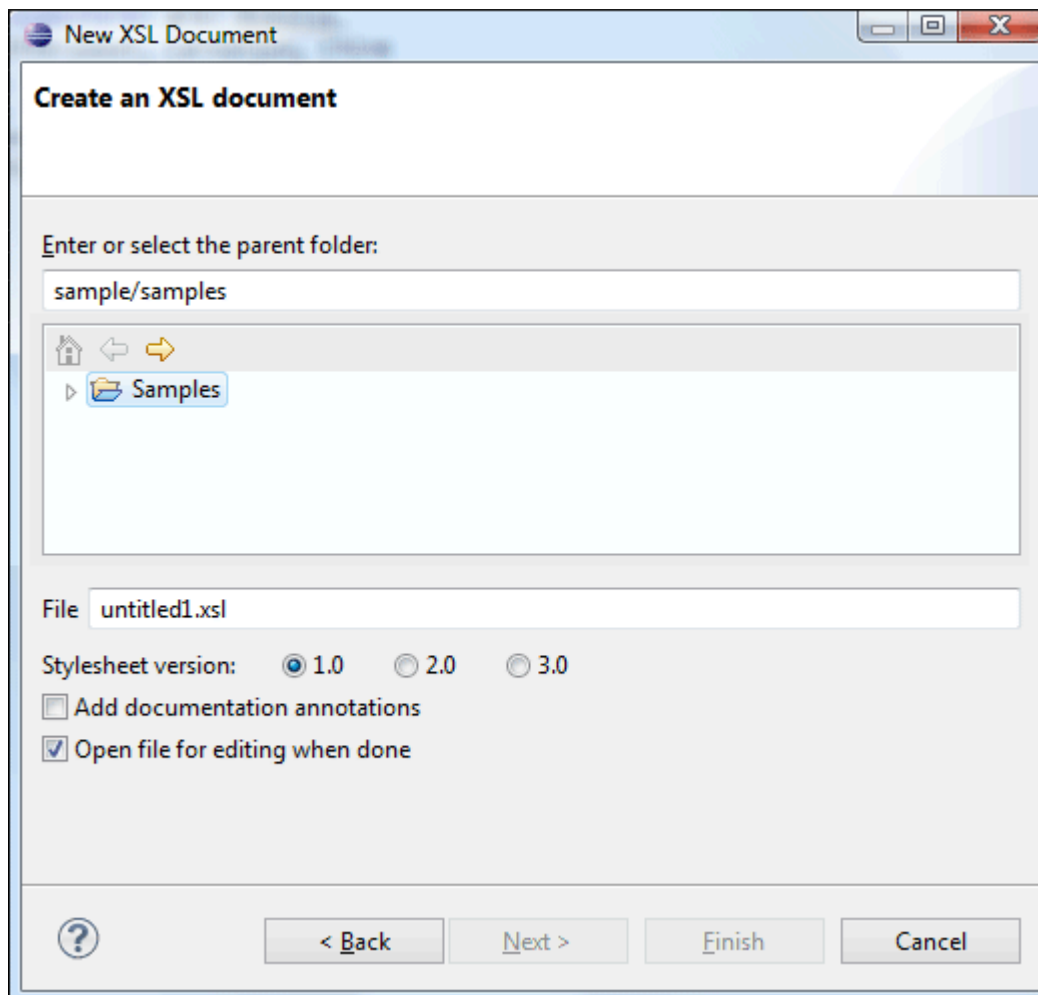

If you select this option, the elements and attributes defined in the XML Schema as optional are generated in the skeleton XML document.

Add First Choice Particle

If you select this option, Oxygen XML Editor Eclipse plugin generates the first element of an `<xs:choice>` schema element in the skeleton XML document. Oxygen XML Editor Eclipse plugin creates this document in a new editor panel when you click **Finish**.

XSL Document Wizard

Figure 38. New XSL Document Configuration Options

If you selected  **Stylesheet (XSL) File** for the type of file you want to create, the wizard will include the following options:

Stylesheet version

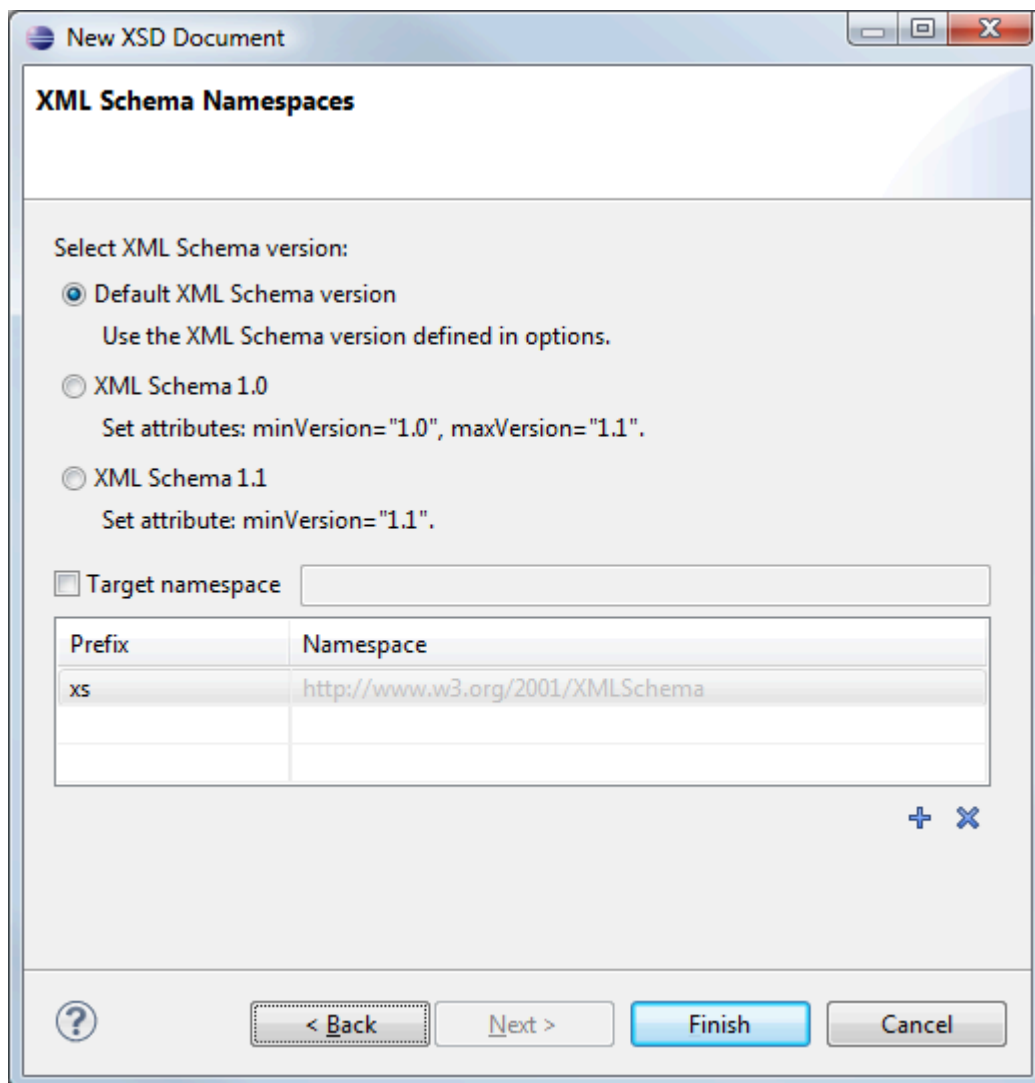

Allows you to select the **Stylesheet version** number. You can select from: 1.0, 2.0, and 3.0.

Add documentation annotations

Select this option to generate the stylesheet annotation documentation.

XML Schema (XSD) Document Wizard

Figure 39. New XML Schema Configuration Options

If you selected  **XML Schema (XSD) File** for the type of file you want to create, the wizard will include the following options:

Default XML Schema version

Select this option to use the XML Schema version defined in the [XML Schema preferences page \(on page 195\)](#).

XML Schema 1.0

Sets the `@minVersion` attribute to **1.0** and the `@maxVersion` attribute to **1.1**.

XML Schema 1.1

Sets the `@minVersion` attribute to **1.1**.

Target namespace

Allows you to specify the schema target namespace.

Namespace prefix declaration table

This table contains namespace prefix declarations. Table information can be managed using the **+ New** and **× Delete** buttons.

Tip:

For further details on how you can set the version of an XML Schema, go to [Setting the XML Schema Version \(on page 783\)](#).

Schematron Document Wizard

Figure 40. New Schematron Configuration Options

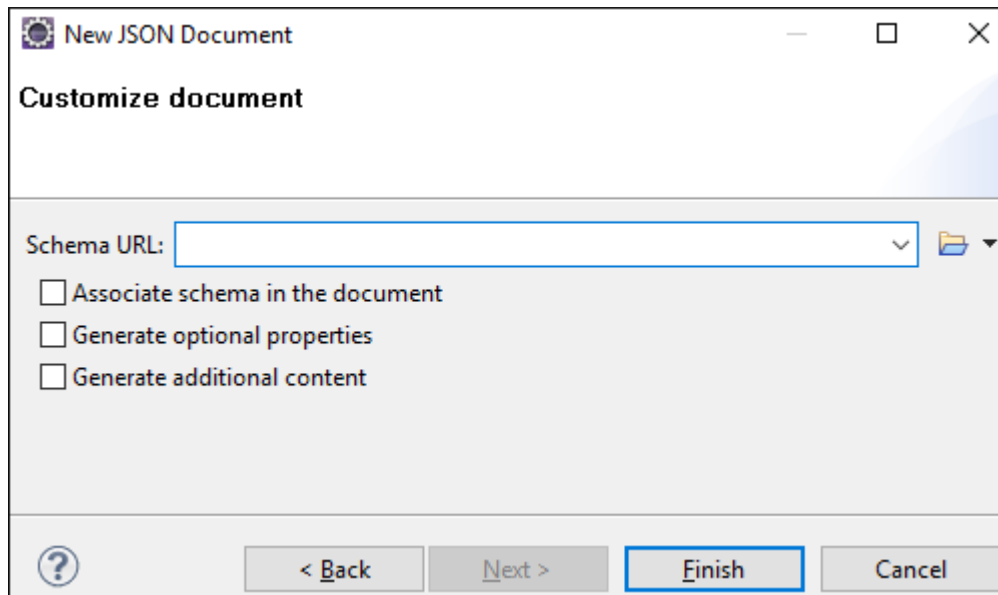

If you selected **Schematron File** for the type of file you want to create and selected the **Customize** option, the configuration dialog box will include the following option:

Schematron version

Specifies the Schematron version. Possible options: 1.5 (deprecated) and ISO.

**Note:**

Starting with version 16.0 of Oxygen XML Editor Eclipse plugin, the support for Schematron 1.5 is deprecated. It is recommended to use ISO Schematron instead.

JSON Document Configuration Page**Figure 41. New JSON Configuration Wizard Page**

If you select  **JSON** for the type of file you want to create and select the **Customize** option, the configuration dialog box will include the following options:

Schema URL

Specifies the path to a JSON Schema file that will be used to generate key-value pairs.

Associate Schema in the Document

If you select this option, the JSON instance will be generated with the JSON Schema associated directly in the document.

Generate Optional Properties

If you select this option, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate Additional Content

If you select this option, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

Creating New Documents Based on Templates

The **New from Templates** wizard (on page 246) allows you to select built-in templates or custom templates that you or other users created in previous sessions. You can access this wizard by selecting the **New from Templates** option in the **New Document** wizard (on page 246).

The categories of templates presented in the wizard include:

- **User-defined template directory** - You can add your own custom templates by [creating template files \(on page 253\)](#) in a directory and then add that directory to the list of template directories that Oxygen XML Editor Eclipse plugin uses in the **Document Templates preferences page (on page 87)**. This user-defined directory will appear in the **New from templates** wizard.
- **Global templates** - Contains a list of built-in templates as well as any [user-defined custom templates \(on page 253\)](#) that are saved in the `templates` directory of the Oxygen XML Editor Eclipse plugin installation folder (`[OXYGEN_INSTALL_DIR]/templates`).
- **Framework templates** - Contains the list of templates defined in the **Document Type** configuration dialog box (**Templates** tab) (on page 113) for each *framework* (on page 2679).

New from Templates Wizard

To create a new document using this wizard, follow these steps:

1. Click the  **New** button on the toolbar and select **New from Templates** (or select **File > New > Other > Oxygen XML Editor Eclipse plugin > New From Templates**).

Result: The **New from Templates** wizard is displayed where you to select various types of document templates.

2. Select the type of document that you want to create and click **Next**.
3. Choose the storage path and a file name for the new document.
4. Click the **Finish** button.

Result: The new file is created and if the **Open file for editing when done** option is selected, the new file will be opened in the appropriate type of editor.

Creating New Document Templates

Oxygen XML Editor Eclipse plugin allows you to create your own custom document templates and they will appear in the **New from templates** wizard (on page 253).

Creating a New Document Template

To create your own custom document template and have it appear in the new document wizard, follow these steps:

1. Create a new file (whatever type of document you need) and customize it to become a starting point for creating new files of this type.

**Tip:**

You can use [editor variables \(on page 218\)](#) in the template file content and they will be expanded when the files are opened. Also, see [Customizing Document Templates \(on page 255\)](#) for other template customization tips (for example, you could [add placeholders or hints \(on page 258\)](#) to assist authors).

2. Save the new document template and reference that location in Oxygen XML Editor Eclipse plugin.

There are several options for doing this:

- **Saving the new template in a specific framework's directory** - Save the new template in a directory (for example, called `templates`) within that specific framework directory (usually a [custom framework \(on page 1941\)](#)). Then open the **Document Type** configuration dialog box ([on page 90](#)) for that specific framework, go to the **Templates** tab ([on page 113](#)), and click the **+** button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
- **Saving the new template in the Oxygen installation directory** - Save the new template in the `templates` directory of the Oxygen XML Editor Eclipse plugin installation directory (`[OXYGEN_INSTALL_DIR]/templates`). Document templates saved in this directory will appear in the **Global templates** category in the **New from templates wizard (on page 253)**.
- **Saving the new template in a custom directory** - Save the new template in any directory of your choice and then add that directory to the list of templates in the **Document Templates preferences page (on page 87)**. This user-defined directory will appear in the **New from templates wizard (on page 253)** along with all the new document templates that you save inside it. Click **OK** or **Apply** to save your changes.

**Tip:**

If you want to create a new template for a binary file (e.g. a zip archive), you need to add `.bin` to the end of the file name (for example, `*.zip.bin` or `*.epub.bin`). Otherwise, the files will be treated as XML/text documents and you will be prompted to choose the editor type.

**Attention:**

The name that you use to save the template will be the name that appears in the new document wizard, including capitalization, space, and characters (for example, `My Custom Template1.xml` will appear in the new file wizard as **My Custom Template1**). You can also configure the displayed name in a properties file by following the procedure found in the [Configure the Displayed Names for Document Templates \(on page 257\)](#) section.

- Open the new document wizard ( **New** toolbar button or **File > New > New from Templates**) and you should see your custom template in the appropriate folder.

**Note:**

For DITA templates, they will also appear in the dialog box for creating new DITA topics from the **DITA Maps Manager**, but if you [customize the template \(on page 255\)](#), you need to set the `type` property to **dita** in the corresponding properties file.

Related information

[Customizing Document Templates \(on page 255\)](#)

[Sharing Custom Document Templates \(on page 259\)](#)

Customizing Document Templates

Oxygen XML Editor Eclipse plugin allows you to customize certain aspects of built-in or custom document templates. For example, you can customize the icons or specify a prefix/suffix that will be used for the proposed file name in the **New from templates wizard (on page 253)**.

Customizing the Icons for a Document Template

If you want to customize the icons to be used for document templates, use a properties file to specify the icons using the following procedure:

- Create a new properties file or edit an existing one following these guidelines:
 - If you want to create a new properties file, you can use the **Properties** template found in the **New Document** folder in the **New from templates wizard (on page 253)**. If you want to edit an existing template, you can find them within the subfolders in the `templates` folder for each framework (for example, the DITA topic properties file is located in: `OXYGEN_INSTALL_DIR/frameworks/dita/templates/topic/topic.properties`).
 - Use the same name as your custom template file except with a `.properties` extension (for example, `MyTemplate.properties`).
 - In this properties file, specify the paths to the icons that will be used in the new file wizard. The properties file should look like this:

```
type=general
smallIcon=../icons/Article_16.png
bigIcon=../icons/Article_48.png
```

**Tip:**

For DITA files, the `type` property must be set to **dita**. Otherwise, the template will not appear in the dialog box for creating new DITA topics from the **DITA Maps Manager (on page 2337)**. For all other types of files, set it to **general**. The icons specified in this

 properties file will only be used for the new file wizards and not in any other part of the interface.

 **Important:**

If you created a new template and chose to use a custom directory for the new template (in [step 2 of the new template procedure \(on page 254\)](#)), make sure that the path to the icons is relative to that directory.

2. Save the properties file in the same directory as your custom template.
3. Open the new file wizard (**File > New > New from Templates**) and you should see your custom icons next to the document template in the appropriate folder.

Add a Prefix or Suffix to File Names for a Document Template

You can use a properties file for each document template to add a prefix or suffix to the file name that is proposed in certain dialog boxes when you create a new file from that template. This applies to the following new document dialog boxes:

- The new document dialog box that appears when you click the  **New** button on the toolbar (or **File > New > Other > Oxygen XML Editor Eclipse plugin**). The prefix or suffix is added to the name of the file in the **File** field.
- The new document dialog box that appears when you select **New > New from Templates > [Template Name] > Next** from the contextual menu in the **Project Explorer** view ([on page 269](#)). The prefix or suffix is added to the name of the file in the **File** field.
- For DITA files, it also applies to the new document dialog box that appears when you select **Append Child > New, Insert Before > New, or Insert After > New** from the **DITA Maps Manager** ([on page 2337](#)). The prefix or suffix is added to the name of the file in the **Save as** field.
- For DITA files, it also applies to the **Fast Create Topics** dialog box ([on page 2405](#)) that you can use to create multiple skeleton topics at once.

To add a prefix or suffix to the file names for a document template, follow these steps:

1. Create a new properties file or edit an existing one.
 - If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`). This properties file specifies the prefix/suffix that will be used to propose the file name in the new file wizards.

When defining the prefix/suffix, the properties file should look something like this:

```
type=general
filenamePrefix=prod_
filenameSuffix=_test
```

**Important:**

For DITA files, the `type` property must be set to **dita**. For all other types of files, set it to **general**.

- If you edit an existing template, simply define the prefix/suffix as specified [above \(on page 256\)](#).
2. Save the properties file in the same directory as the document template.
 3. Open the new document wizard ([using the methods described above \(on page 256\)](#)) and when you select the appropriate template, you should see your prefix or suffix in the file name that is proposed in that dialog box.

**Note:**

The `filenamePrefix` and `filenameSuffix` properties can also have [editor variables \(on page 218\)](#) that do not require user interaction (i.e. editor variables that have `${ask() }` and `${answer() }` as values cannot be used).

Configure the Displayed Names for Document Templates

To change the name that is displayed for a document template, use the following procedure:

1. Create a new properties file or edit an existing one. If you create a new properties file, use the same name as the template file except with a `.properties` extension (for example, `MyTemplate.properties`).
2. Add a `displayName` property in the properties file:

```
displayName=My Template Name
```

**Tip:**

The names for [framework \(on page 2679\)](#)-specific document templates (such as DITA *Topic* or DocBook *Article*, as you would see in the **Framework templates** folder in the **New** file wizard) can be translated via the internationalization support. In this case, the properties file should contain something like:

```
displayName=${i18n(tag)}
```

where *tag* refers to an entry in the `translation.xml` file for that specific framework (for example, `OXYGEN_INSTALL_DIR/frameworks/dita/i18n/translation.xml` for DITA).

3. Save the properties file in the same directory as the document template.
4. Open the new file wizard (**File > New > New from Templates**) and you should see the new name for the template.

Adding Placeholders or Hints in a Document Template

If a document template contains empty elements, it may not be clear to the Author what should be inserted in them. You can define placeholders in document templates that provide hints for Authors to help them understand what type of content should be added in any particular empty element within the document. The placeholder text is specified using a processing instruction and the placeholders are removed when the Author inserts content in the corresponding element.

To define placeholders in a document template to provide authors with hints, follow this procedure:

1. Edit the document template.
2. Add placeholders in the form of processing instructions within the elements where you want hints to be displayed when an Author creates a document from the template. For example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="pi">
  <title><oxy-placeholder content="Enter a title"?></title>
  <shortdesc><oxy-placeholder content="Writing short descriptions
    induces the writer to clarify the main thesis of the topic.
    We recommended a 50 word limit."?></shortdesc>
  <body>
    <p><oxy-placeholder content="A paragraph element should be a self-contained
    unit dealing with one idea or point."?></p>
  </body>
</topic>
```

Important:

The elements that contain the placeholder processing instructions cannot contain other content/text, not even whitespace used for indentation. Otherwise, the placeholder will not be rendered properly.

3. Save the template file.
4. Use the **New from templates wizard** (*on page 253*) to create a new document using your customized template and you should see the hints in the open document.

Resources

To see a visual demonstration of how to customize document templates and to get more ideas for other advanced customization possibilities, watch our Webinar: **Working with DITA in Oxygen - Customizing the Editing Experience**.

Related information[Creating New Document Templates \(on page 253\)](#)[Sharing Custom Document Templates \(on page 259\)](#)

Sharing Custom Document Templates

Your [custom document templates \(on page 253\)](#) can be shared with the other members of your team so that they all have access to the templates in the [New from templates wizard \(on page 253\)](#). The best way to share them is by integrating them in an extended [framework \(on page 2679\)](#) (document type) configuration and then sharing the whole framework with the other users.

Sharing Custom Document Templates

To share custom document templates with other members of your team:

1. Create a custom framework by extending an existing one [\(on page 1941\)](#), if you have not already done so.
2. Create the new document template [\(on page 253\)](#), if you haven't already done so.
3. Save the new template in a directory (for example, called `templates`) within your custom framework directory. Then open the **Document Type** configuration dialog box [\(on page 90\)](#) for that specific framework, go to the **Templates** tab [\(on page 113\)](#), and click the **+** button in the bottom-right corner to add your new directory to the list. It is recommended that the reference be made relative to the framework directory (for example, `${frameworkDir}/templates`). You can also remove any existing entries in the list that aren't applicable or won't be used in your custom framework.
4. Click **OK** to close the configuration dialog box and then **OK** or **Apply** to save your changes.
5. All that remains is to share the entire framework with anyone who needs to have access to the custom templates. There are several methods for sharing frameworks and you can find details here: [Sharing a Framework \(on page 2099\)](#).

Related information[Sharing a Framework \(on page 2099\)](#)

Opening Documents

To open a document in Oxygen XML Editor Eclipse plugin, do one of the following:

- Go to **File > Open File** to display the **Open File** dialog box.
- Go to **File > Open URL** to display a dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the  **Browse for remote file** drop-down menu.
- Select the **Open** or **Open with** action from the contextual menu of the **Project Explorer** view [\(on page 269\)](#).

Opening the Current Document in a System Application

To open the currently edited document in the associated system application, use the  **View in Browser/System Application** action that is available in the **XML** menu. If you want to open XML files in a specific internet browser, instead of the associated system application, you can specify the internet browser to be used. To do so, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

Saving Documents

You can save the document you are editing with one of the following actions:

- **File >  Save.**
- **File > Save As** - Displays the **Save As** dialog box, used either to name and save an open document to a file or to save an existing file with a new name.
- **File > Save All** - Saves all open documents.

Closing Documents

To close open documents, you can simply click the close icon () for the particular editor tab or use one of the following actions that are available by right-clicking the current editor tab (or from the **File** menu):

Close (Ctrl + F4 (Command + F4 on macOS))

Closes the currently selected editor.

Close Others

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs except for the one you are currently viewing.

Close All (Ctrl + Shift + F4 (Command + Shift + F4 on macOS))

If multiple files are opened, this action is available to close all opened editors in the current group/stack of tabs. If this action is selected from the **File** menu, it closes all opened editors in **all** groups/stacks of tabs.

Working with Remote Documents

Oxygen XML Editor Eclipse plugin supports editing remote files, using the WebDAV , FTP (Deprecated), SFTP (Deprecated) protocols. You can edit remote files in the same way you edit local files.

You can open one or more remote files in [the Open using FTP/SFTP dialog box \(on page 261\)](#)

A WebDAV resource can be locked when it is opened in Oxygen XML Editor Eclipse plugin by selecting the [Lock WebDAV files on open option \(on page 179\)](#) to prevent other users to modify it concurrently on the server. If a user tries to edit a locked file, Oxygen XML Editor Eclipse plugin displays an error message that contains the lock owner's name. The lock is released automatically when the editor for that resource is closed in Oxygen XML Editor Eclipse plugin.

To avoid conflicts with other users when you edit a resource stored on a SharePoint server, you can **Check Out** the resource.

To improve the transfer speed, the content exchanged between Oxygen XML Editor Eclipse plugin and the HTTP / WebDAV server is compressed using the GZIP algorithm.

The current *WebDAV Connection* (on page 1880) details can be saved by switching to the **Database perspective** (on page 2680) and then you can browse and manage the connection in the **Data Source Explorer** view (on page 1831).

Open URL

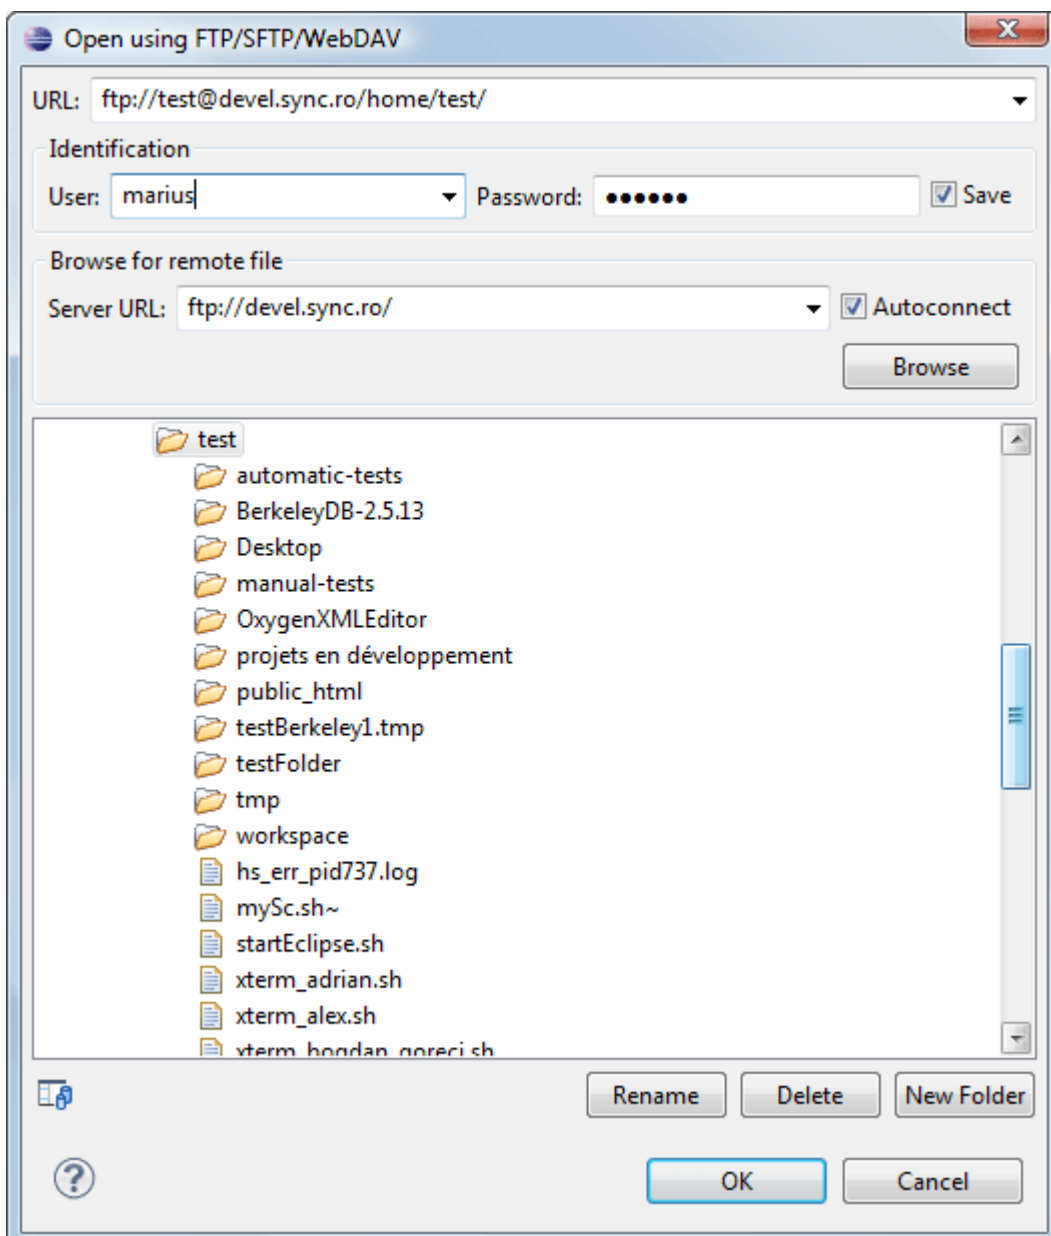

To access the **Open using FTP/SFTP/WebDAV** dialog box, go to **File > Open URL** menu, then choose the  **Browse for remote file** option from the drop-down action list.

Figure 42. Open URL Dialog Box

The displayed dialog box is composed of several parts:

- The editable **URL** combo box where you specify the URL to be opened or saved.

**Tip:**

If the file is accessible through an anonymous FTP, you can type a URL like: `ftp://anonymous@some.site/home/test.xml`.

This combo box also displays the current selection when you change selection by browsing the tree of folders and files on the server.

- The **Identification** section contains the access credentials. If you want to browse for a file on a server, you have to specify the user and password. This information is bound to the selected URL and is also used in opening or saving the file. If the **Save** checkbox is selected, the user and password are saved between editing sessions. The password is encrypted and kept in the options file.

**Note:**

Your password is well protected. If the options file is used on another machine by a user with a different user name the password, it will become unreadable since the encryption is user-name dependent. This is also true if you add URLs to your project that include a user and password.

- The **Browse for remote file** section contains the **Server URL** combo box and **Autoconnect** checkbox. In the **Server URL** combo box, you can specify the protocol, the server host name, or server IP.

**Tip:**

When accessing an FTP server, you only need to specify the protocol and the host (such as `ftp://server.com` or if using a non-standard port `ftp://server.com:7800/`).

By pressing the **Browse** button, the directory listing will be shown in the component. When **Autoconnect** is selected, every time the dialog box is displayed, the browse action will be performed.

- The bottom part of the dialog box displays the tree view of the documents stored on the server. You can browse the directories and make multiple selections. Additionally, you can use the **Rename**, **Delete**, and **New Folder** actions to manage the file repository.

The file names are sorted in a case-insensitive manner.

Changing File Permissions on a Remote FTP Server

Some FTP servers allow the modification of permissions of the files served over the FTP protocol. This protocol feature is accessible directly in the FTP file browser dialog box by right-clicking a tree node and selecting the *Change permissions* menu item.

In this dialog box, the usual Unix file permissions *Read*, *Write*, and *Execute* are granted or denied for the file owner, owner group, and the rest of the users. The aggregate number of permissions is updated in the *Permissions* text field when it is modified with one of the checkboxes.

WebDAV over HTTPS

If you want to access a WebDAV repository across a non-secure network, Oxygen XML Editor Eclipse plugin allows you to load and save the documents over the HTTPS protocol (if the server understands this protocol) so that any data exchange with the WebDAV server is encrypted.

When a WebDAV repository is first accessed over HTTPS, the server hosting the repository will present a security certificate as part of the HTTPS protocol, without any user intervention. Oxygen XML Editor Eclipse plugin will use this certificate to decrypt any data stream received from the server. For the authentication to succeed you should make sure the security certificate of the server hosting the repository can be read by Oxygen XML Editor Eclipse plugin. This means that Oxygen XML Editor Eclipse plugin can find the certificate in the key store of the Java Runtime Environment where it runs. You know the server certificate is not in the JRE key store if you get the error *No trusted certificate found* when trying to access the WebDAV repository.

Troubleshooting HTTPS

If Oxygen XML Editor Eclipse plugin cannot connect to an HTTPS-capable server and an error message appears stating that it is "unable to find a valid certification path to the requested target", the HTTPS server is most likely either configured to use a self-signed certificate or to use a certificate issued by an unknown authority that the *Java Runtime Environment (JRE)* used by Oxygen XML Editor Eclipse plugin does not trust.

Note:

For Windows, starting with version 26.0, by default, Oxygen XML Editor Eclipse plugin uses the trusted root certificates from the Windows certificate store instead of the JRE cacerts store. To trust a certificate, the root certificate should be imported in the Windows Trusted Root certificates store.

Tip:

To make Oxygen XML Editor Eclipse plugin accept a certificate even if it is invalid, [open the Preferences dialog box \(on page 70\)](#), go to **Network Connection settings > HTTP(S)/WebDAV**, and select the **Automatically accept a security certificate, even if invalid** option.

Notice:

This **Automatically accept a security certificate, even if invalid** option does not influence the entire Eclipse workspace. It is limited to URLs that are opened directly by Oxygen XML Editor Eclipse plugin.

To trust a certificate, follow this procedure:

1. Export a certificate into a local file using any HTTPS-capable web browser:

Chrome or Edge

- a. Navigate to the page that uses the certificate.
- b. Right-click the page and select **Inspect**.
- c. Select the **Security** tab.
- d. Click **View Certificate**. **Step Result:** A **Certificate** dialog box is displayed.
- e. Select the **Details** tab of the **Certificate** dialog box.
- f. Click the **Export** button.
- g. In the resulting dialog box, for the **Save as type** option, select **DER-encoded binary, single certificate (*.der)**.
- h. Save the certificate to the local file `server.der`.

Safari

- a. Navigate to the page that uses the certificate.
 - b. If there is a "This connection is not private" message, click **Show Details** and in the expanded panel, click **view the certificate**.
 - c. Otherwise, in the address bar, click the *padlock icon* on the left side of the website name and in the displayed pop-up, click **Show Certificate**.
 - d. Another pop-up box is displayed showing information about the **certificate**. Drag the large **certificate** icon to a *Finder* window. A `.cer` file will be created in the indicated folder from *Finder*.
2. Import the local file into the JRE running Oxygen XML Editor Eclipse plugin:
 - a. Open a text-mode console with administrative rights. If Oxygen XML Editor Eclipse plugin has been installed in a user's home directory and includes a bundled JRE, administrative rights are not required. In all other cases, administrative rights will be required.
 - b. Go to the `lib/security` directory of the JRE running Oxygen XML Editor Eclipse plugin. You can find the home directory of the JRE in the `java.home` property that is displayed in the **About** dialog box (**Installation Details > Configuration**).

Note:

On macOS, for the distribution of Oxygen XML Editor Eclipse plugin that bundles the JRE from Oracle, the JRE uses the `.install4j/jre.bundle/Contents/Home/jre/lib/security/cacerts` path within its installation directory.

- c. Run the following command:

```
..\..\bin\keytool -import -trustcacerts -file server.cer -keystore cacerts
```

The `server.cer` file contains the server certificate, created during the previous step. The `keytool` requires a password before adding the certificate to the JRE *keystore* (on page 2680). The default password is `changeit`. If someone changed the default password, then that person is the only one who can perform the import.

**Tip:**

If you need to import multiple certificates, you need to specify a different alias for each additional imported certificate with the `-alias` command-line argument, as in the following example:

```
..\..\bin\keytool -import -alias myalias1 -trustcacerts -file
server1.cer -keystore cacerts

..\..\bin\keytool -import -alias myalias2 -trustcacerts -file
server2.cer -keystore cacerts
```

3. Restart Oxygen XML Editor Eclipse plugin.

Related information

[HTTP\(S\)/WebDAV Preferences \(on page 179\)](#)

HTTP Authentication Schemes

Oxygen XML Editor Eclipse plugin supports the following HTTP authentication schemes:

- **Basic** - The *basic* authentication scheme defined in the [RFC2617 specifications](#).
- **Digest** - The *digest* authentication scheme defined in the [RFC2617 specifications](#).
- **NTLM** - The *NTLM* scheme is a proprietary Microsoft Windows Authentication protocol (considered to be the most secure among currently supported authentication schemes).

**Note:**

For NTLM authentication, the user name must be preceded by the name of the domain it belongs to, as in the following example:

```
domain\username
```

- **Kerberos (on page 265)** - An authentication protocol that works on the basis of *tickets* to allow nodes communicating over a non-secure network to prove their identity to one another in a secure manner.

Single Sign-on

Oxygen XML Editor Eclipse plugin implements the *Single sign-on* property (meaning that you can log on once and gain access to multiple services without being prompted to log on for each of them), based on the **Kerberos** protocol and relies on a *ticket-granting ticket (TGT)* that Oxygen XML Editor Eclipse plugin obtains from the operating system.

**Restriction:**

This *Single sign-on* support is not available for SharePoint integrations.

To turn on the **Kerberos**-based authentication, you need to add the following system property in the `eclipse.ini` configuration file (on a separate line after the `-vmargs` parameter):

```
-Djavax.security.auth.useSubjectCredsOnly=false
```

Contextual Menu of the Current Editor Tab

A contextual menu is available when you right-click the current editor tab label.

The actions that are available depend on the context and the number of files that are opened. The menu includes the following actions:

Close (Ctrl + F4 (Command + F4 on macOS))

Closes the currently selected editor.

Close Others

If multiple files are opened, this action is available to close all open editors in the current group/stack of tabs except for the one you are currently viewing.

Close All (Ctrl + Shift + F4 (Command + Shift + F4 on macOS))

If multiple files are opened, this action is available to close all open editors.

Viewing File Properties

The **Editor Properties** view displays information about the currently edited document. The information includes:

- Character encoding.
- Full path on the file system.
- Schema used for content completion and document validation.
- Document type name and path.
- Associated transformation scenario.
- Read-only state of a file.
- Bidirectional text (left to right and right to left) state.
- Total number of characters in the document.
- Line width.
- Indent with tabs state.
- Indent size.

The view can be accessed from **Window > Show View > Other > Editor Properties**.

To copy a value from the **Editor Properties** view in the clipboard (for example, the full file path), use the **Copy** action available on the contextual menu of the view.

Simple Text Editor

Oxygen XML Editor Eclipse plugin specializes in XML-related technologies, you can also use it to create and edit various types of non-XML files. Non-XML files are opened in a simple text editor and many of the helpful features that are commonly used when editing XML files in the Oxygen XML Editor Eclipse plugin **Text** editing mode are available in this simple editor.

Types of Non-XML Files That are Supported in the Simple Text Editor

The types of files that can be created and edited in the simple text editor include:

- Java
- C++
- C
- Dockerfile
- PHP
- Perl
- Properties
- SQL
- PowerShell
- Batch
- Python
- Text

Features Available in the Simple Text Editor

When editing files in the simple text editor, the features that are available include the following:

- **Project Support** - The unique [features that are designed to help you work with projects \(on page 268\)](#) are available for all types of files.
- **Shortcut Actions** - Many of the shortcut actions that are available in **Text** mode are also available in the simple text editor.
- **Drag and Drop** - The normal drag and drop support is available in the simple text editor.
- **Content Selection Features** - The [content selection shortcuts \(on page 317\)](#) that are available in **Text** mode are also available in the simple text editor.
- **Convert Hexadecimal Characters** - You can [convert a sequence of hexadecimal characters to the corresponding Unicode character \(on page 348\)](#).
- **Encoding/Decoding Actions** - Contextual menu actions are available to [encode or decode Base 64, Base 32, and Hex schemes \(on page 349\)](#).
- **Code Templates** - You can define your own [code templates \(on page 323\)](#) for any type of file and use the [Content Completion Assistant \(on page 2677\)](#) to invoke them.

- **Syntax Highlighting** - Non-XML files also support syntax highlighting with dedicated coloring schemes. To customize them, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Syntax Highlight (on page 176)**. Select and expand the appropriate section in the top pane for the type of file you are editing and you can see the effects of your changes in the **Preview** pane.

Using Projects to Group Documents

Oxygen XML Editor Eclipse plugin includes a **Project Explorer view (on page 269)** that helps you organize your projects. Oxygen XML Editor Eclipse plugin offers a variety of helpful features for working with projects and makes it easy to share your projects with other members of your team. This section presents various unique features that will help you to create and work with projects.

Creating a New Project

Oxygen XML Editor Eclipse plugin allows you to organize your XML-related files into projects. This helps you manage and organize your files and also allows you to perform batch operations (such as validation and transformation) over multiple files. Use the **Project Explorer view (on page 269)** to manage projects, and the files and folders contained within.

Creating a New Project

To create a new project, select **New > XML Project** or **New > Sample XML Project** from the contextual menu or **File** menu.

This opens a dialog box that allows you to create and customize a new project and adds it to the structure of the project in the **Project Explorer** view.

You can either create a new XML document from scratch by choosing one of the available types in the wizard. You can also create one from a template by selecting **File > New > New from Templates** and choosing a template from the **Global templates** or **Framework templates** folders. If you are looking for a common document type, such as DITA or DocBook, you can find templates for these document types in the **Framework templates** folder. If your company has created its own templates, you can also find them there.

Adding Items to the Project

To add items to the project, select the desired document type or folder from the **New** menu of the contextual menu, when invoked from the **Project Explorer** view (or from the **File** menu). You can also create a document from a template by selecting **New > New from Templates** from the contextual menu.

Using Linked Folders (Shortcuts)

Another easy way to organize your XML working files is to place them in a directory and then to create a corresponding linked folder in your project. If you add new files to that folder, you can simply use the

 **Refresh (F5)** action from the project contextual menu and the **Project Explorer view (on page 269)** will

display the existing files and subdirectories. If your files are scattered among several folders, but represent the same class of files, you might find it useful to combine them in a logical folder.

You can create linked folders (shortcuts) by dragging and dropping folders from the Windows Explorer (macOS Finder) to the project tree, or by using the contextual menu from the location in the project tree where you want it added and selecting **New > Folder > Advanced**. The linked folders presented in the **Project Explorer view** ([on page 269](#)) are marked with a special icon. To create a file inside a linked folder, use the contextual menu and select **New > File** (you can use the **Advanced** button to link to a file in the local file system).

**Note:**

Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

For more information on managing projects and their content, see [Project Explorer View](#) ([on page 269](#)).

Related information

[Using Projects to Group Documents](#) ([on page 268](#))

Project Explorer View

The **Project Explorer** view is designed to assist you with organizing and managing related files grouped in the same XML project. The actions available in the contextual menu and on the toolbar associated to this panel allows you to create XML projects and provide shortcuts to various operations for the project documents.

**Tip:**

You can also use the **Project Explorer** view for many of the same purposes as the **Project Explorer** view.

Figure 43. Project Explorer View

By default, the view is positioned on the left side of Oxygen XML Editor Eclipse plugin, above the **Outline** view. If the view has been closed, it can be reopened at any time from the **Window > Show View** menu (the **Project Explorer** view is in the **Other** submenu).

Project View Toolbar

The following actions are grouped in the upper right corner:

Collapse All

Collapses all project tree folders. You can also collapse/expand a project tree folder if you select it and press the **Enter** key or **Left Arrow** to collapse and **Right Arrow** to expand.

Link with Editor

When selected, the currently edited file (from the main editor or from the DITA Maps Manager view) is highlighted in the project tree, if the file is found in the project.

Note:

This button is disabled automatically when you move to the **Debugger perspective** (on [page 2680](#)).

View Menu

Drop-down menu that contains various settings contributed by the Eclipse plugin.

File Explorer Area

The rest of the view is basically a file explorer similar to most other commonly used file explorers. The XML project (.xpr file) is a logical container with a collection of resources (folders and files). The types of resources displayed include:

- **Logical folders with Linked folders/files** - This folder type is used as containers for linked resources (shortcuts). The icons for file shortcuts include a shortcut symbol (📁). The linked folders/files are added using **New > Folder > Advanced** or **New > File > Advanced**, or by dragging and dropping files/folders from the view or the system file explorer. ✖ **Delete** can be used to remove them from the project.
- **Physical folders and files** - Marked with the operating system-specific icon for folders (usually a yellow icon on Windows and a blue icon on macOS). These folders and files are mirrors of real folders or files that exist in the local file system. They are created or added to the project by using contextual menu actions (such as **New > File**, **New > Folder**, 📄 **Copy**, and 📄 **Paste**) or by dragging and dropping files/folders from the view or the system file explorer. Also, the contextual menu action ✖ **Delete** can be used to remove them from the project and local file system.

Figure 44. Project Explorer View with Both Types of Resources

Creating New Projects

The following actions are available from the **New** menu when right-clicking any item, or the **File > New** menu:

XML Project

Opens the **New XML Project** dialog box that allows you to create a new project and adds it to the project structure in the **Project Explorer** view.

Sample XML Project

Opens the **New sample XML project** dialog box that allows you to customize sample resources in a new project and adds it to the project structure in the **Project Explorer** view.

Managing Project Contents

There are various contextual menu actions, shortcuts, and ways to organize the folders and files inside the project:

Creating New Folders and Files

Right-click any item > New > File

Opens a [New Document Wizard \(on page 246\)](#) that helps you create a new file and adds it to the project structure.

Right-click any item > New > New from Templates

Opens a wizard where you can [create a new document based on a template \(on page 253\)](#) and adds it to the project structure.

Right-click any item > New > Folder

Opens a **New Folder** dialog box that allows you to specify a name for a new folder and adds it to the structure of the project.

Adding Resources

You can add resources by using drag and drop (or  **Copy** and  **Paste**) actions from within the **Project Explorer** view or dragging them from the system file explorer. Files may have multiple instances within the folder system, but cannot appear twice within the same folder.

Removing Folders and Files

To remove logical folders or the linked resources inside them from the project, use  **Delete** from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

To remove folders or files from both the project and the local file system, use  Delete from the contextual menu (or press **Delete** on your keyboard) and confirm by clicking **OK** in the resulting dialog box.

Moving Folders and Files

You can move the resources by using drag and drop actions from within the **Project Explorer** view.

You can also use the usual  **Copy** and  **Paste** actions (or the **Move** action) from the contextual menu to move resources in the project.

You can also move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) or folders by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the  button.

Renaming Folders and Files

There are several ways to rename a folder or file in the project (this works for both physical and linked resources):

- Select **Rename** from the contextual menu.
- Press **F2** on your keyboard.

You also can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) or folders by using the **Refactoring > Rename resource** action from the contextual menu.

This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope by using the  button.

Opening Files

There are several ways to open a file:

- Double-click the file.
- Select it and press **Enter** on your keyboard.
- Right-click the file and select **Open**.
- Drag the file from the project tree and drop it in the editor area.
- If you want to choose the application or location where to open it, you can right-click the file and select **Open with**.

Saving the Project

The project file is automatically saved every time the content of the **Project Explorer** view is saved or modified by actions such as adding or removing files and drag and drop.

Other Contextual Menu Actions

Numerous other actions are available in the contextual menu, depending on the type of file or folder where it is invoked from (some actions are available for multiple selected files):

Refactoring submenu

Oxygen XML Editor Eclipse plugin includes some refactoring operations that help you manage the structure of your documents. The following actions are available from the contextual menu in the **Refactoring** submenu:

Rename resource (Available for certain types of XML documents or folders)

Opens the **Rename resource** dialog box (*on page 276*) where you can change the name of a resource. It also includes an option to update the references to the renamed resource and you can choose between various scopes for the operation.

Move resource (Available for certain types of XML documents or folders)

Opens the **Move resource** dialog box (*on page 276*) where you can choose a destination and change the name of a resource. It also includes an option to update the references to the moved resource and you can choose between various scopes for the operation.

 **XML Refactoring**

Opens the **XML Refactoring** tool wizard (*on page 608*) that presents refactoring operations to assist you with managing the structure of your XML documents.

Show referenced resources

Opens the **Referenced/Dependent Resources** view (*on page 600*) that allows you to see the referenced resource hierarchy for an XML document.

Show dependent resources

Opens the **Referenced/Dependent Resources** view (*on page 600*) that allows you to see the resource dependencies for an XML document.

Refresh

Refreshes the content and the dependencies between the resources in the **Main Files** directory (*on page 278*).

 **XPath in Files**

Opens the **XPath/XQuery Builder** view (*on page 1817*) that allows you to compose XPath and XQuery expressions and execute them over the currently edited XML document.

 **Check Spelling in Files**

Allows you to check the spelling of multiple files (*on page 294*).

 **Format and Indent Files**

Opens the **Format and Indent Files** dialog box (*on page 344*) that allows you to configure the format and indent (*pretty-print* (*on page 2681*)) action that will be applied on the selected documents.

HTML to XML Well-formed (Available when selecting multiple resources)

Batch converts the selected HTML documents to be XML well-formed. This means that missing end tags will be added to applicable elements, unclosed tags will be properly closed, and quotes will be added to attribute values that were missing the quotes.

Notes:

- All selected HTML files are backed up before being processed (same path/name but with the ".bak" extension added at the end).
- Any detected conversion errors are grouped and listed in a dedicated tab in the **Results** pane at the bottom of the application.
- A brief report is displayed at the end of the operation.

Transform submenu

The currently selected files associated with the Oxygen XML Editor Eclipse plugin in the **Package Explorer** view or **Project Explorer** view can be transformed in one step with one of the following actions available from contextual menu in the **Transform** submenu:

Apply Transformation Scenario(s)

Obtains the output with one of the built-in scenarios.

Configure Transformation Scenario(s)

Opens a dialog box that allows you to configure pre-defined transformation scenarios.

Transform with

Allows you to select a transformation scenario to be applied to the currently selected files.

Validate submenu

The currently selected files associated with the Oxygen XML Editor Eclipse plugin in the **Package Explorer** view or **Project Explorer** view can be checked to be XML well-formed or validated against a schema (DTD, XML Schema, Relax NG, Schematron or NVDL) with one of the following contextual menu actions found in the **Validate** submenu:

Check Well-Formedness

Checks if the selected file or files are well-formed.

Validate

Validates the selected file or files against their associated schema. For EPUB files, this action triggers an **EPUB Validate and Check for Completeness** ([on page 1827](#)) operation.

Validate with Schema

Validates the selected file or files against a specified schema.

 **Configure Validation Scenario(s)**

Allows you to configure and run a validation scenario.

 **Clear Validation Markers**

Clears all the error markers from the main editor and **Problems** view.

Generate XML Schema Documentation

Opens the [XML Schema Documentation Dialog Box](#) (on page 764).

Generate Stylesheet Documentation

Opens the [XSLT Stylesheet Documentation Dialog Box](#) (on page 691).

Generate XQuery Documentation

Opens the [XQuery Documentation Dialog Box](#) (on page 795).

Generate WSDL Documentation

Opens the [WSDL Documentation Dialog Box](#) (on page 818).

 **Properties**

Displays the properties of the current file in a **Properties** dialog box.

Enable Main Files Support (Available from the project container)

Allows you to enable the **Main Files Support** (on page 279) for each project.

 **Detect Main Files (Available from the project container when Main Files Support is enabled)**

Opens the **Detect Main Files** wizard (on page 280) that enables the automatic detection of *main files*.

 **Add to Main Files (Available when Main Files Support is enabled)**

Adds the selected files to the Main Files folder (on page 281).

Moving/Renaming Resources in the Project Explorer View

The **Refactoring** submenu in the contextual menu of the **Project Explorer** view (on page 269) provides actions for moving or renaming resources in the current project while offering the option to update the references to the resources.

Moving Resources

You can move certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Move resource** action from the contextual menu. This action opens the **Move resource** dialog box that includes the following options:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, based upon the selected scope. You can select or configure the scope by using the  button.

Renaming Resources

You can rename certain types of files (such as XML, XML Schema, Relax NG, WSDL, and XSLT) by using the **Refactoring > Rename resource** action from the contextual menu. This action opens the **Rename resource** dialog box that includes the following options:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource** - Select this option to update the references to the resource you are renaming. You can select or configure the scope by using the  button.

Problems Updating References of Moved/Renamed Resources

In some cases, the references of a moved or a renamed resource cannot be updated. For example, when a resource is resolved through an *XML Catalog (on page 2683)* or when the path to the moved or renamed resource contains entities. For these cases, Oxygen XML Editor Eclipse plugin displays a warning dialog box.

Figure 45. Problems Dialog Box

Contextual Project Operations Using 'Main Files' Support

Oxygen XML Editor Eclipse plugin allows you to define *Main Files* (on page 2680) at project level. These *main files* are automatically used by Oxygen XML Editor Eclipse plugin to determine the context for operations such as validation, transformation, content completion, refactoring, or searches for XML, XSD, XSL, WSDL, and RNG modules. Oxygen XML Editor Eclipse plugin maintains the hierarchy of the *main files*, helping you to determine the editing context.

Oxygen XML Editor Eclipse plugin also provides unique support for using the *Main Files* support in DITA projects. In DITA, when you rename or move non-DITA resources, it allows you to update all the references to these resources in the scope of the *Main Files* (in this case the *main DITA map (root map)* (on page 2682)). For more information, see *Main Files Support in DITA* (on page 2628).

Resources

For more information about the *Main Files* support for XML documents, watch our video demonstrations:

Main Files Benefits

Using the *Main Files* support in Oxygen XML Editor Eclipse plugin includes the following benefits:

- When the *main file* is validated, Oxygen XML Editor Eclipse plugin automatically identifies the modules included in the *main file* and validates all of them.
- When the *main file* is transformed, Oxygen XML Editor Eclipse plugin automatically identifies the modules included in the *main file* and transforms them accordingly.
- The *Content Completion Assistant (on page 2677)* presents all the components that are collected from the *main files* for the modules they include.
- The **Outline view (on page 326)** displays all the components that are defined in the *main files* hierarchy.
- The *main files* that are defined for the current module determines the [scope of the search and refactoring actions \(on page 600\)](#). Oxygen XML Editor Eclipse plugin performs the search and refactoring actions in the context that the *main files* determine, thus improving the speed of execution.

Enabling the Main Files Support

Oxygen XML Editor Eclipse plugin stores the *main files* in a folder located in the **Project Explorer view (on page 269)**, as the first child of the project root. The *Main Files Support* is disabled by default and Oxygen XML Editor Eclipse plugin allows you to enable or disable the *Main Files Support* for each project you are working on.

To enable *Main Files* support, select **Enable Main Files Support** from the contextual menu of the project root folder in the **Project Explorer view (on page 269)**.

Related information

[Detecting Main Files \(on page 280\)](#)

[Adding or Removing Files/Folders in the Main Files Directory \(on page 281\)](#)

Detecting Main Files

Oxygen XML Editor Eclipse plugin allows you to detect the *main files* using the  **Detect Main Files** option. This action applies to the folders you select in the project.

To detect *main files* over the entire project, do one of the following:

- Right-click the root of the project and select  **Detect Main Files from Project**.
- Use the  **Detect Main Files from Project** option, available in the contextual menu of the **Main Files** folder.

Both of these options display the **Detect Main Files** wizard. In the first panel you can select the type of *main files* you want Oxygen XML Editor Eclipse plugin to detect. In the subsequent panel the detected *main files* are presented in a tree-like fashion. The resources are grouped into three categories:

- **Possible main files** - The files presented on the first level in this category are not imported or included from other files. These files are most likely to be set as *main files*.

**Note:**

For DITA projects, only [DITA Maps \(on page 2678\)](#) are reported as possible *main files*.

- **Cycles** - The files that are presented on the first level have circular dependencies between them. Any file presented on the first level of a cycle is a possible *main file*.
- **Standalone** - Files that do not include or import other files and are also not included or imported themselves. It is not necessary to set them as *main files*.

To set them as *main files*, simply select their checkboxes. Oxygen XML Editor Eclipse plugin marks all the children of a *main file* as modules. Modules are rendered in gray and their tool-tip presents a list of their *main files*. A module can be accessed from multiple *main files*.

The next panel displays a list with the selected *main files*. Click the **Finish** button to add the *main files* in the **Main Files** folder.

You can use the **Select Main Files** option to automatically mark all *main files*. This action sets all the resources from the **Possible Main Files** category and the first resource of each **Cycle** as *main files*. The **Deselect All** button simply removes all of your selections.

**Tip:**

It is recommended that you only add top-level files (files that are at the root of the include/import graph) in the **Main Files** directory.

Related information

[Enabling the Main Files Support \(on page 279\)](#)

[Adding or Removing Files/Folders in the Main Files Directory \(on page 281\)](#)

Adding or Removing Files/Folders in the Main Files Directory

Adding Files/Folders to the Main File Directory

The **Main Files** directory can contain logical folders, linked folders, or linked files.

To add files in the **Main Files** directory, use one of the following methods:

- Right-click a file from your project and select  **Add to Main Files** from the contextual menu.
- Drag and drop files into the **Main Files** directory.
- From the contextual menu of the **Referenced/Dependent Resources** view (*on page 600*), use the  **Add to Main Files** action.

To add folders in the **Main Files** directory, use one of the following methods:

- Right-click **Main Files** directory and select **Add Folder** from the contextual menu.
- Drag and drop folders into the **Main Files** directory.

You can view the *main files* for the currently edited resource in the **Editor Properties** view (*on page 266*).

Removing Files/Folders from the Main Files Directory

The main files that are already defined in the project are automatically marked in the tree. To disable a main file or folder, remove it from the **Main Files** folder (for example, right-click and select  **Delete**). Removing files or folders from the **Main Files** folder does NOT delete the files from disk. It just removes the logical files from that logical folder in the project.

Related information

[Enabling the Main Files Support \(on page 279\)](#)

[Detecting Main Files \(on page 280\)](#)

Search and Find/Replace Features

Oxygen XML Editor Eclipse plugin includes advanced search capabilities to help you locate documents and resources. The search features are powered by [Apache Lucene](#). Apache Lucene is a free open source information retrieval software library. You can perform simple text searches or more complex searches using the [Apache Lucene - Query Parser Syntax](#).

Note:

When Oxygen XML Editor Eclipse plugin performs the indexing of resources, referenced content is not taken into account. For example, when DITA documents are indexed, the content referenced in a [@conref](#) or [@conkeyref](#) attribute is not parsed. The files that make up the index are stored on disk in the folder.

Find All Elements Dialog Box

To open the **Find All Elements** dialog box, go to **Edit > Find All Elements** . It assists you in defining XML element / attribute search operations in the current document.

Figure 46. Find All Elements Dialog Box

The dialog box can perform the following actions:

- Find all the elements with a specified name.
- Find all the elements that contain, or does not contain, a specified string in their text content.
- Find all the elements that have a specified attribute.
- Find all the elements that have an attribute with, or without, a specified value.

You can combine all of these search criteria to filter your results.

The following fields are available in the dialog box:

- **Element name** - The qualified name of the target element to search for. You can use the drop-down menu to find an element or enter it manually. It is populated with valid element names collected from the associated schema. To specify *any* element name, leave the field empty.

Note:

Use the qualified name of the element (`<namespace prefix>:<element name>`) when the document uses this element notation.

- **Element text** - The target element text to search for. The drop-down menu beside this field allows you to specify whether you are looking for an exact or partial match of the element text. For *any* element text, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements with no text will be found. Select **not contains** to find all elements that do not include the specified text.

- **Attribute name** - The name of the attribute that must be present in the element. You can use the drop-down menu to select an attribute or enter it manually. It is populated with valid attribute names collected from the associated schema. For *any* or no attribute name, leave the field empty.

Note:

Use the qualified name of the attribute (`<namespace prefix>:<attribute name>`) when the document uses this attribute notation.

- **Attribute value** - The drop-down menu beside this field allows you to specify that you are looking for an exact or partial match of the attribute value. For *any* or no attribute value, select **contains** from the drop-down menu and leave the field empty. If you leave the field empty but select **equals** from the drop-down menu, only elements that have at least an attribute with an empty value will be found. Select **not contains** to find all elements that have attributes without a specified value.
- **Case sensitive** - When this option is selected, operations are case-sensitive.

When you select **Find All**, Oxygen XML Editor Eclipse plugin tries to find the items that match all the search parameters. The results of the operation are presented as a list in the message panel.

Regular Expressions Syntax

Oxygen XML Editor Eclipse plugin uses the [Java regular expression syntax](#). It is **similar** to that used in Perl 5, with several exceptions. Thus, Oxygen XML Editor Eclipse plugin does not support the following constructs:

- The conditional constructs `(?{X})` and `(?(condition)X|Y)`.
- The embedded code constructs `(?{code})` and `(??{code})`.
- The embedded comment syntax `(?#comment)`.
- The preprocessing operations `\l`, `\u`, `\L`, and `\U`.

When using regular expressions, note that some sets of characters from [XPath/XML Schema/Schematron](#) are slightly different than the ones used by Oxygen XML Editor Eclipse plugin/Java in the text searches. The most common example is with the `\w` and `\W` set of characters. To ensure consistent results between the two, it is recommended that you use the following constructs:

- `/w` - `[#x0000-#x10FFFF]-[\p{P}\p{Z}\p{C}]` instead of `\w`
- `/W` - `[\p{P}\p{Z}\p{C}]` instead of `\W`

There are some other notable differences that may cause unexpected results, including the following:

- In Perl, `\1` through `\9` are always interpreted as back references. A backslash-escaped number greater than 9 is treated as a back reference if at least that many sub-expressions exist. Otherwise, it is interpreted, if possible, as an octal escape. In this class octal escapes must always begin with a zero. In Java, `\1` through `\9` are always interpreted as back references, and a larger number is accepted as a back reference if at least that many sub-expressions exist at that point in the regular expression.

Otherwise, the parser will drop digits until the number is smaller or equal to the existing number of groups or it is one digit.

- Perl uses the `g` flag to request a match that resumes where the last match left off.
- In Perl, embedded flags at the top level of an expression affect the whole expression. In Java, embedded flags always take effect at the point where they appear, whether they are at the top level or within a group. In the latter case, flags are restored at the end of the group just as in Perl.
- Perl is forgiving about malformed matching constructs, as in the expression `*a`, as well as dangling brackets, as in the expression `abc]`, and treats them as literals. This class also accepts dangling brackets but is strict about dangling meta-characters such as `+`, `?` and `*`.

Related information

[Comparison between the Java and Perl 5 regular expression syntax](#)

Spell Checking

Oxygen XML Editor Eclipse plugin includes an [automatic \(as-you-type\) spell checking feature \(on page 293\)](#), as well as a manual spell checking action to open a **Spelling** dialog box that offers a variety of options.

To manually check spelling in the current document, use the  **Check Spelling** action on the toolbar.

Figure 47. Check Spelling Dialog Box

The **Spelling** dialog box contains the following:

Unrecognized word

Displays the word that cannot be found in the selected dictionary. The word is also highlighted in the XML document.

Replace with

The character string that will replace the misspelled word.

Guess

Displays a list of suggested words to replace the unknown word. Double-click a word to automatically insert it in the document and resume the spell checking process.

Default language

Allows you to select the default language dictionary used by the spelling engine.

Paragraph language

In an XML document, you can mix content written in multiple languages. You can set the language code in the `@lang` or `@xml:lang` attribute for any particular section and Oxygen XML Editor Eclipse plugin will automatically instruct the spell checker engine to apply the appropriate language dictionary for that section.

Begin at cursor position

Instructs the spell checker to begin checking the document starting from the current cursor position.

Action Buttons

Replace

Use this button to replace the unrecognized word with the selected word from the **Replace with** field.

Replace All

Use this button to replace all occurrences of the unrecognized word with the selected word from the **Replace with** field, starting from the cursor's position to the end of the document.

**Note:**

This action is case-sensitive.

Ignore

Ignores the first occurrence of the unrecognized word and allows you to continue checking the document. Oxygen XML Editor Eclipse plugin skips the content of the XML elements [marked to be ignored \(on page 293\)](#).

Ignore All

Ignores all instances of the unrecognized word in the current document.

Learn

Adds the unrecognized word to the list of valid words.

Options

Opens the **Spell Check preferences page** (*on page 172*) where you can configure various options regarding the feature.

Related information

[AutoCorrect Misspelled Words](#) (*on page 295*)

Spell Check Dictionaries and Term Lists

Oxygen XML Editor Eclipse plugin uses the **Hunspell** engine for the spell checking feature. The Hunspell spell checking engine is open source and has an LGPL license. It is designed for languages with rich morphology and complex compounding or character encoding. Each language-country variant combination have their own specific dictionaries. Oxygen XML Editor Eclipse plugin includes the following built-in dictionaries for the spell checker:

- English (US) [en_US]
- English (UK) [en_GB]
- French [fr]
- German [de_DE]
- Spanish [es_ES]

Other Hunspell Dictionaries

You can also download Hunspell dictionaries for other languages and add them to the Oxygen XML Editor Eclipse plugin spell checker. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

If you cannot find a Hunspell dictionary that is already built for your language, you can build the dictionary you need. To build a full Hunspell dictionary, follow [these instructions](#) and then add the dictionary to the Oxygen XML Editor Eclipse plugin spell checker by following [this procedure](#) (*on page 287*).

Personalized Term Lists

Authoring in certain areas of expertise (for example, the pharmaceutical or automobile industries) might require the use of specific terms that are not part of the standard spell checker dictionary. To avoid marking these terms as errors, Oxygen XML Editor Eclipse plugin provides a way of [adding personalized term lists](#) (*on page 290*) to the spell check engine. This involves creating a term list file that the spell checker will recognize and it is similar to the file Oxygen XML Editor Eclipse plugin uses for storing [learned words](#) (*on page 292*).

The term list files are specific for each language and can be specific to each domain or area of expertise (for example, *legal, medical, automotive*). They can also be used to control forbidden words.

Related information[Adding Custom Spell Check Dictionaries \(on page 287\)](#)[Adding Custom Spell Check Term Lists \(on page 290\)](#)[Building and Testing Hunspell Dictionaries](#)

Adding Custom Dictionaries and Term Lists

The Oxygen XML Editor Eclipse plugin spell checker allows you to add customized Hunspell dictionaries and personalized term lists. The Hunspell dictionary mechanism requires a dictionary file (with a `.dic` file extension) and an affix file (with the `.aff` file extension). The personalized term lists are custom files (with the `.tdi` file extension) that you can create to include specialized terms or specify forbidden words in the Oxygen XML Editor Eclipse plugin spell checker.

You can [add dictionaries \(on page 287\)](#) and [personalized term lists \(on page 290\)](#) to the default folder where they are stored or specify your own custom locations. You can view the default storage location in the [Spell Check Dictionaries preferences page \(on page 174\)](#) and the **Include dictionaries and term list from option (on page 174)** allows you to choose a custom storage location. All the dictionaries and term lists for a particular language that are found in either location are merged and used by the spell checker in Oxygen XML Editor Eclipse plugin.

Related information[Replacing a Spell Check Dictionary \(on page 291\)](#)[Editing the Spell Checking Dictionaries](#)

Adding Custom Spell Check Dictionaries

There are three possible scenarios for adding Hunspell dictionaries to the Oxygen XML Editor Eclipse plugin spell checker:

- You can download a pre-built Hunspell dictionary and add it to the spell checking mechanism.
- You can create a custom Hunspell dictionary file that defines your own list of words and add it to the spell checking mechanism.
- You can build your own full Hunspell dictionary and add it to the spell checking mechanism.

Download and Add a Pre-Built Hunspell Dictionary

To add a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.

**Important:**

The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the **Preferences** dialog box (on page 70) and go to **Editor > Spell Check > Dictionaries** (on page 174).
3. Choose one of the following two options for adding the downloaded files.
 - a. Copy both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 174).
 - b. Copy both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option (on page 174), and select that directory. If you choose this option, make sure you read [this important note](#) (on page 175).
4. Restart the application for the spell checker to start using the new dictionary.

Create a Custom Hunspell Dictionary that Defines a List of Words

To create a custom Hunspell dictionary that defines your own list of words, follow these steps:

1. Create a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). The affix file (`.aff`) can be left empty, but it is needed for the mechanism to work properly.

**Important:**

The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. In the dictionary file (`.dic` extension), add the words you want to be included in your custom dictionary. Add one word per row and the first line needs to contain the number of words, as in the following example:

```
2
parabola
asimptotic
```

**Tip:**

Words stored in dictionaries are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

**Note:**

If you save the `.dic` file using UTF-8 encoding, then the corresponding `.aff` file should specify the encoding as a property inside it (if you do not specify the encoding, the default platform encoding will be used):

```
SET UTF-8
```

3. Open the **Preferences** dialog box (on page 70) and go to **Editor > Spell Check > Dictionaries** (on page 174).
4. Choose one of the following two options for saving the files.
 - a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 174).
 - b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option (on page 174), and select that directory. If you choose this option, make sure you read this important note (on page 175).
5. Restart the application for the spell checker to start using the new dictionary.

Build and Add a Full Hunspell Dictionary

To build and add a full Hunspell dictionary, follow these steps:

1. Create your Hunspell dictionary. For more information on how to do this, see: [Editing the Spell Checking Dictionaries](#).

Step Result: You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with an `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

**Important:**

The name of the files should begin with a two letter prefix for the language code, followed by an underscore or hyphen, then two letters that indicate the country code, followed by another underscore or hyphen, and then a descriptive name (for example, `en_US_medical.dic` for a medical dictionary in the US version of the English language, or for a less specific English medical dictionary, you could omit the country code like this: `en_medical.dic`). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

2. Open the **Preferences** dialog box (on page 70) and go to **Editor > Spell Check > Dictionaries** (on page 174).

3. Choose one of the following two options for saving the files.
 - a. Save both files (`.dic` and `.aff`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 174).
 - b. Save both files (`.dic` and `.aff`) to any other directory, select the **Include dictionaries and term list from** option (on page 174), and select that directory. If you choose this option, make sure you read [this important note](#) (on page 175).
4. Restart the application for the spell checker to start using the new dictionary.

Related information

[Adding Custom Spell Check Term Lists](#) (on page 290)

[Editing the Spell Checking Dictionaries](#)

Adding Custom Spell Check Term Lists

You can create personalized term lists that are used to store specialized terms or control forbidden words. They can then be added to one of the directories that store the spell check dictionaries, and the spell checker will merge them with all the dictionaries and other term lists for a particular language.

Create and Add Personalized Term Lists

To create and add a personalized term list, follow these steps:

1. Create a *term list* file (with the `.tdi` file extension). The name of the file must begin with a two letter prefix that indicates the language it should be attached to, followed by an underscore or hyphen, and then a descriptive name (for example, `en_US_myterms.tdi` for term list in the US version of the English language or `en_myterms.tdi` for a less specific English term list). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.
2. In the term list file (`.tdi` extension), add the terms you want to be included in your custom dictionary. If you need to specify forbidden terms, those words simply need to be preceded by an asterisk. Add one word per row, as in the following example:

```
parabola
asimptotic
*hyperbola
```

Note:

Words stored in term lists are not handled as case-sensitive. Therefore, you do not need to include both uppercase and lowercase versions of the words.

3. Open the **Preferences** dialog box (on page 70) and go to **Editor > Spell Check > Dictionaries** (on page 174).
4. Choose one of the following two options for saving the file.

- a. Save the file (`.tdi`) to the default directory displayed in the **Dictionaries and term lists default folder** option (on page 174).
 - b. Save the file (`.tdi`) to any other directory, select the **Include dictionaries and term list from** option (on page 174), and select that directory. If you choose this option, make sure you read this important note (on page 175).
5. Restart the application for the spell checker to start using the new term list.

[Adding Custom Spell Check Dictionaries \(on page 287\)](#)

Replacing a Spell Check Dictionary

There are several possible scenarios for replacing an existing Hunspell dictionary for the Oxygen XML Editor Eclipse plugin spell checker:

- You can download a pre-built Hunspell dictionary and replace an existing dictionary with it.
- You can build your own full Hunspell dictionary and replace an existing dictionary with it.

Download a Pre-Built Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a downloaded pre-built dictionary, follow these steps:

1. Download the files needed for your dictionary. You will need a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). If the dictionary does not include an affix file (`.aff`), you can create one and leave it empty, but it is needed for the mechanism to work properly. An example of a website that includes numerous dictionary files is: <http://extensions.services.openoffice.org/dictionary>.
2. Open the **Preferences** dialog box (on page 70) and go to **Editor > Spell Check > Dictionaries** (on page 174).
3. Choose one of the following two options to replace existing files.
 - a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option (on page 174). Leave the **Include dictionaries and term list from** option deselected.
 - b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the **Include dictionaries and term list from** option (on page 174). If you choose this option, make sure you read this important note (on page 175).

Important:

Do not alter the naming convention. The name of the files must begin with a two letter prefix that indicates the language it should be attached to (for example, `en_US.dic` for a US English dictionary or `en.dic` for a less specific English dictionary). For a list of language codes, see https://en.wikipedia.org/wiki/List_of_ISO_639-1_codes.

4. Restart the application for the spell checker to start using the new dictionary.

Build a Full Hunspell Dictionary and Replace an Existing One

To replace an existing dictionary with a full Hunspell dictionary that you build, follow these steps:

1. Follow these instructions: [Building and Testing Hunspell Dictionaries](#).

Step Result: You should end up with a *dictionary* file (with a `.dic` file extension) and an *affix* file (with the `.aff` file extension). The affix file (`.aff`) can be empty, but it is needed for the mechanism to work properly.

2. Open the **Preferences** dialog box ([on page 70](#)) and go to **Editor > Spell Check > Dictionaries** ([on page 174](#)).
3. Choose one of the following two options to replace existing files.
 - a. Replace the existing files (`.dic` and `.aff`) for the particular language in the default directory displayed in the **Dictionaries and term lists default folder** option ([on page 174](#)). Leave the **Include dictionaries and term list from** option deselected.
 - b. Replace existing files (`.dic` and `.aff`) for the particular language in a directory specified in the **Include dictionaries and term list from** option ([on page 174](#)). If you choose this option, make sure you read [this important note](#) ([on page 175](#)).
4. Restart the application for the spell checker to start using the new dictionary.

Related information

[Adding Custom Dictionaries and Term Lists](#) ([on page 287](#))

Learned Words

Spell checker engines rely on dictionaries to decide if a word is spelled correctly. To instruct the spell checker engine that an unknown word is actually correctly spelled, you need to add that word to a list of learned words. There are two ways to do this:

- Invoke the contextual menu on an unknown word, then select **Learn word**.
- Click the **Learn** button from the **Spelling dialog box** ([on page 284](#)) that is invoked by using the  **Check Spelling** action on the toolbar.

Note:

To delete items from the list of learned words, use the **Delete learned words** option in the **Editor > Spell Check > Dictionaries** preferences page ([on page 174](#)).

Related information

[Adding Custom Spell Check Term Lists](#) ([on page 290](#))

Ignored Words (Elements)

You may want the content of certain XML elements to always be skipped during the spell check process (for example, `<programlisting>`, `<codeblock>`, `<codeph>`, `<filepath>`, or `<screen>`). This can be done in one of several ways:

- You can skip through them manually, word by word, using the **Ignore** button in the **Spelling** dialog box (on page 284) that is invoked by using the  **Check Spelling** action on the toolbar.
- You can automatically skip the content of certain elements by maintaining a set of known element names that should never be checked. You can manage this set of element names by using the **Ignore elements** section (on page 174) in the **Spell Check** preferences page.

Automatic Spell Check

Oxygen XML Editor Eclipse plugin includes an option to automatically check the spelling as you type. Not only does it check spelling when you are typing in the main editor, but also when you are typing in a **comment** (on page 427). This feature is disabled by default, but it can be enabled and configured in the **Spell Check** preferences page (on page 172). When the **Automatic Spell Check** option (on page 172) is selected, unknown words are underlined and some actions are available in the contextual menu to help you correct the word or prevent the word from being reported in the future.

Tip:

You can configure the color and how spelling errors are shown from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on macOSX) > Preferences > General > Editors > Text Editors > Annotations**).

Figure 48. Automatic Spell Checking in Author Mode

Figure 49. Automatic Spell Checking in Text Mode

The contextual menu includes the following actions:

Delete Repeated Word

Allows you to delete words that were repeated in consecutive order.

List of Suggestions

A list of words suggested by the spell checking engine as possible replacements for the unknown word.

Learn Word

Allows you to add the current unknown word to the persistent dictionary of [learned words](#) (on [page 292](#)).

Spell check options (Available in Author mode only)

Opens the [Spell Check preferences page](#) (on [page 172](#)).

Other actions

This submenu give you access to all the usual contextual menu actions.

Related information

[Learned Words](#) (on [page 292](#))

Spell Check Multiple Files

The  **Check Spelling in Files** action allows you to check the spelling on multiple local or remote documents.

This action is available in the following locations:

-
- The contextual menu of the [Project Explorer view](#) (on [page 269](#)).
- The contextual menu of the [DITA Maps Manager view](#) (on [page 2337](#)), when editing DITA documents.

This action opens the **Check Spelling in Files** dialog box that allows you to define the scope and several other options. After you configure the settings for the operation, click the **Check All** button to check the spelling

in all specified files. The spelling corrections are displayed in the **Results view** ([on page 335](#)) view at the bottom of the editor and you can group the reported errors as a tree with two levels.

Tip:

If you want to instruct the spell checking engine to not report a particular word as being a spelling error in the future, use the **Learn Word(s)** action from the contextual menu in the **Results** view.

The following scopes are possible, depending on where the action was invoked:

- **All opened files** - The spell check is performed in all open files.
- **Current file directory** - All the files in the folder of the currently edited file.
- **Current DITA map hierarchy** - Option available when the dialog is invoked from the **DITA Maps Manager** view. Checks the spelling in all references contained in the DITA map.
- **Project** - All files from the current project.
- **Selected project resources** - The selected files from the current project.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

The **Options** section includes the following options:

- **File filter** - Allows you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the spell check is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the spell check is also performed in the hidden files.
- **Spell Check Options** - The spell check processor uses the options available in the **Spell Check preferences page** ([on page 172](#)).

When working with DITA documents, if you invoke the **Check Spelling in Files** action in the **DITA Maps Manager view** ([on page 2337](#)), a slightly different version of the dialog box is displayed:

The following scopes are available when you check the spelling in files from the **DITA Maps Manager** ([on page 2337](#)):

- **Current DITA Map hierarchy** - All the files referenced in the currently selected *DITA map* ([on page 2678](#)) from in the **DITA Maps Manager** view.
- **Selected references** - Checks the spelling in the selected references.
- **Specified path** - Checks the spelling in the files located at a path that you specify.

AutoCorrect Misspelled Words

Oxygen XML Editor Eclipse plugin includes an *AutoCorrect* feature to automatically correct misspelled words, as well as to insert certain symbols or other text, as you type in **Author** mode. Oxygen XML Editor Eclipse plugin includes a default list of commonly misspelled words and symbols, but you can modify the list to suit your needs. You can also choose to have the *AutoCorrect* feature use suggestions from the main spell

checker. The suggestions will only be used if the misspelled words are not found in the [Replacements Table \(on page 141\)](#).

When enabled, the *AutoCorrect* feature can be used to do the following:

- Automatically correct misspelled words while you edit in **Author** mode. The actual operation of replacing a word is triggered by a space, dash, or certain punctuation characters (, . ; : ? ! ' ")] }).
- Easily insert symbols. For example, if you want to insert a ® character, you would type (R).
- Quickly insert text fragments.
- Quickly insert XML fragments. For example, if you enter a hyphen (-) in an empty paragraph followed by a space, it will automatically be converted to a list with a list item.

AutoCorrect is enabled by default. To configure this feature, open the **Preferences** dialog box (on page 70) and go to **Editor > Edit Modes > Author > AutoCorrect**.

AutoCorrect Drop-down Actions

After the automatic operation of replacing a misspelled word (triggered by a space, dash, or certain punctuation characters), the affected string is highlighted. The highlight is removed upon the next editing action (text insertion or deletion). If you hover over the highlight, a small widget appears below the word. If you hover over the widget, it expands and you can click it to present a drop-down list that includes the following actions:

- **Change back to "[original word]"** - Reverts the correction back to its original form.
- **Stop Automatically Correcting "[original word]"** - This option is presented if the correction is performed based on the [AutoCorrect Replacements Table \(on page 141\)](#) and selecting it will delete the corresponding entry from the Replacements Table.
- **Learn Word "[original word]"** - This option is presented if the **Use additional suggestions from the spell checker** option (on page 140) is selected in the **AutoCorrect preferences page (on page 140)** and the correction is performed based on the *Spell Checker*. Selecting this option will add the item to the list of [learned words \(on page 292\)](#).
- **AutoCorrect options** - Opens the **AutoCorrect preferences page (on page 140)** that allows you to configure the feature.

Figure 50. AutoCorrect Drop-down Actions

AutoCorrect Case-Sensitivity

The *AutoCorrect* feature results in the following types of substitutions regarding case-sensitivity:

- Words with all lower-case characters will be replaced with lower-case substitutions (for example, "abotu" is replaced with "about").
- Words with irregular-case characters will be replaced with lower-case substitutions ("ABotU" is replaced with "about").
- Words with all upper-case characters will be replaced with upper-case substitutions ("ABOTU" is replaced with "ABOUT").
- Words starting with an upper-case character will be replaced with substitutions having the same pattern ("Abotu" is replaced with "About").

**Note:**

The *AutoCorrect* feature also uses the list of [ignored elements from the Spell Check preferences page \(on page 174\)](#). All elements (along with their descendant elements) included in this list will be ignored by the *AutoCorrect* engine.

Related information

[Spell Checking \(on page 284\)](#)

Add Dictionaries for the AutoCorrect Feature

To add new dictionaries for the *AutoCorrect* mechanism (on page 295), or to replace an existing one, follow these steps:

1. Download an *AutoCorrect* dictionary file for the desired language. The file needs to have a `.dat` file extension. An example of a website that includes some *AutoCorrect* dictionary files is: [OpenOffice Extensions Search Page](#).
2. Open the **Preferences** dialog box (on page 70) and go to **Editor > Edit Modes > Author > AutoCorrect > Dictionaries** (on page 142).
3. Choose one of the following two options for adding the downloaded files:
 - a. Copy the downloaded `.dat` file to the default directory displayed in the **Dictionaries default folder** option. (on page 142). Note that if you are replacing an existing dictionary file, this is the best option.
 - b. Copy the downloaded `.dat` file to any other directory, select the **Include dictionaries from** option (on page 142), and select that directory. If you choose this option, make sure you read [this important note \(on page 142\)](#).
4. Restart the application for the *AutoCorrect* mechanism to start using the new dictionary.

Working with Special Characters and Encoding

While regular characters make up the English and European alphabets and the corresponding basic set of figures and symbols, there are many other *special characters* that belong to various other language representations, such as Arabic, Indian, Japanese, Chinese, or Korean. Oxygen XML Editor Eclipse plugin provides support for special characters in various ways:

Opening and Saving Documents

The [Unicode standard](#) provides support for all the character symbols in all known languages and Oxygen XML Editor Eclipse plugin [provides support for all Unicode characters \(on page 299\)](#). There are various encoding options and features to help determine how to handle [documents with unsupported characters \(on page 299\)](#).

Fonts

Oxygen XML Editor Eclipse plugin provides the ability to [choose the fonts to be used in the various editing modes \(on page 177\)](#). In some cases, changing the font may be a solution when special characters are not rendered as expected.

For special characters that are not included in any of the default fonts, Oxygen XML Editor Eclipse plugin tries to find that symbol in a [fallback font \(on page 299\)](#). For the **Author** editing mode, you can specify a set of fallback fonts in the `font-family` CSS property (in the particular CSS file used for rendering your documents). For more information, see the [CSS Support in Author Mode \(on page 2117\)](#) section.

Tip:

For documents written in languages that use special characters (such as Japanese or Chinese), change the font to one that supports the specific characters (a Unicode font). For the Windows platform, *Arial Unicode MS* or *MS Gothic* is recommended. To change the font in Oxygen XML Editor Eclipse plugin, [open the Preferences dialog box \(on page 70\)](#), go to **Fonts**. You can select a font for each editing mode in this preferences page.

Navigation and Layout

Oxygen XML Editor Eclipse plugin supports bidirectional text, such as Arabic, Hebrew, and certain Asian languages, or other special characters that are combined into a single glyph.

Editing

Oxygen XML Editor Eclipse plugin includes a contextual menu action that [converts a sequence of hexadecimal characters to the corresponding Unicode character \(on page 348\)](#).

If you do not have a special way of inserting special characters using your keyboard, you can [insert special characters using the Character Map feature \(on page 301\)](#).

For more information about working with special characters in specific editing modes, see the following sections:

- [Special Character Support in Author Mode \(on page 523\)](#)
- [Special Character Support in Grid Mode \(on page 365\)](#)

Unicode Support

Unicode is a standard for providing consistent encoding, representation, and handling of text. There is a unique Unicode number for every character, independent of the platform and language. Unicode is internationally recognized and is required by modern standards (such as XML, Java, JavaScript, LDAP, CORBA 3.0, WML, etc.).

Oxygen XML Editor Eclipse plugin provides support for the Unicode standard, enabling your XML application to be targeted across multiple platforms, languages, and countries without re-engineering. Internally, the Oxygen XML Editor Eclipse plugin uses 16-bit characters covering the Unicode Character set.

Note:

Oxygen XML Editor Eclipse plugin may not be able to display characters that are not supported by the operating system (either not installed or unavailable).

Tip:

On windows, you can enable the support for **CJK** (Chinese, Japanese, Korean) languages from **Control Panel / Regional and Language Options / Languages / Install files for East Asian languages**.

Related information

[Unicode Fallback Font Support \(on page 299\)](#)

[Inserting Special Characters with the Character Map \(on page 301\)](#)

Opening and Saving Documents with Unsupported Characters

When loading documents, Oxygen XML Editor Eclipse plugin receives the encoding of the document from the Eclipse platform. This encoding is then used to instruct the Java Encoder to load support for and to save the document using the specified code chart.

Saving Documents with Unsupported Characters

When saving a document with UTF-16 encoding, the saved document has a Byte Order Mark (BOM) that specifies the byte order of the document content. The default byte order is platform-dependent. That means that a UTF-16 document created on a Windows platform (where the default byte order mark is *UnicodeLittle*) has a different BOM than one created on a macOS platform (where the byte order mark is *UnicodeBig*). The byte order and the BOM of an existing document are preserved when the document is edited and saved.

Unicode Fallback Font Support

Oxygen XML Editor Eclipse plugin provides fonts for most common Unicode ranges. However, if you [use special symbols or characters \(on page 301\)](#) that are not included in the default fonts, they will be rendered as small rectangles. A *fallback* font is a reserve typeface that contains symbols for as many [Unicode characters \(on page 299\)](#) as possible. When a display system encounters a character that is not part of the

range of any of the available fonts, Oxygen XML Editor Eclipse plugin will try to find that symbol in a *fallback* font.

Example of a Scenario Where a Fallback Font is Needed

Suppose that you need to insert the wheelchair symbol (♿ - U+267F) into your content in a Windows operating system. By default, Oxygen XML Editor Eclipse plugin does not render this symbol correctly since it is not included in any of the default fonts. It is included in **Segoe UI Symbol**, but this font is not part of the default fonts that come with Oxygen XML Editor Eclipse plugin. To allow Oxygen XML Editor Eclipse plugin to recognize and render the symbol correctly, you can add **Segoe UI Symbol** as a *fallback* font.

Adding a Fallback Font in Windows (7 or Later)

To add a fallback font to the Oxygen XML Editor Eclipse plugin installation, use the following procedure:

1. Start Windows Explorer and browse to the `[OXYGEN_INSTALL_DIR]/jre/lib/fonts` directory.
2. Create a directory called `fallback` (if it is not already there).
3. Copy a font file (True Type Font - TTF) that includes the special characters into this directory.

Tip:

You could, for example, copy the *Segoe UI Symbol Regular* font from `C:\Windows\Fonts`.

4. Restart Oxygen XML Editor Eclipse plugin for the changes to take full effect.

Result: Whenever Oxygen XML Editor Eclipse plugin finds a character that cannot be rendered using its standard fonts, it will look for the glyph in the fonts stored in the `fallback` folder.

Adding a Fallback Font in Other Platforms

For macOS or other platforms, you could use the following approach:

1. Use a font editor (such as [FontForge](#)) to combine multiple true type fonts into a single custom font.
2. Install the font file into the dedicated font folder of your operating system.
3. In Oxygen XML Editor Eclipse plugin, [open the Preferences dialog box \(on page 70\)](#), go to **Fonts**.
4. Click the **Change** button for the particular editing mode and select your custom font from the drop-down list in the subsequent dialog box.
5. Restart Oxygen XML Editor Eclipse plugin for the font changes to take full effect.

Related information

[Unicode Support \(on page 299\)](#)

[Inserting Special Characters with the Character Map \(on page 301\)](#)

Inserting Special Characters with the Character Map

Oxygen XML Editor Eclipse plugin includes a **Character Map** for inserting special characters. It can also be used to find the decimal, hexadecimal, or *character entity* equivalent for a particular character or symbol.

Inserting Special Characters

To insert a special character at the current location within a document, follow these steps:

1. Open the **Character Map** dialog box (*on page 302*) by **Edit > Ω Insert from Character Map**.
2. Find the symbol you want to insert and double-click it (or select it and click **Insert**).

**Tip:**

The most recently used characters and some of the most common characters are listed when you click the **Ω Symbols** drop-down button so you can easily insert any of those characters by simply selecting it from the drop-down.

Finding the Decimal, Hexadecimal, or Character Entity Equivalent

You can see the hexadecimal value for any character that is already inserted in your document by placing the cursor right after the character and you can see its value in the status bar at the bottom of the application.

For other characters, or to find the decimal equivalent, or even the *character entity* equivalent, following these steps:

1. Open the **Character Map** dialog box (*on page 302*) by **Edit > Ω Insert from Character Map**.
2. Find the symbol and select it. You can use the filters and the **Search** field at the top of the dialog box to narrow the search.
3. Click the **Details** tab on top of the preview window to see the decimal, hexadecimal, and description of the character. The *character entity* equivalent (both its decimal and hexadecimal values) are displayed at the bottom of the dialog box.

Character Map Dialog Box

Figure 51. Character Map Dialog Box

The **Character Map** dialog box allows you to visualize all characters that are available in a particular font, pick the character you need, and insert it in the document you are editing. It includes the following fields and sections:

Font

Use this drop-down list to choose the font that will have characters displayed.

Unicode Block

Use this drop-down list to only see a certain range of characters. This will filter the number of characters displayed, showing only a contiguous range of characters corresponding to the selected block. Unassigned characters are displayed as empty squares.

Search

Use this filter to search for a character by one of the following attributes:

- hexadecimal
- decimal

- **description**

**Note:**

Selecting **description** opens the **Details** tab ([on page 303](#)). If you enter a character description in the **Search** field, the **description** is selected automatically.

Character Table Section

The characters that are available to be inserted are listed in two tabs:

- **Compact** - Matrix-like table that displays a visual representation of the characters.
- **Details** - Displays the available characters in a tabular format, presenting their decimal and hexadecimal value along with their description.

Recently Used Characters Section

Displays the symbols that you have used recently and you can also select one from there to insert it in the current document.

Character Mode Section

The next section of the dialog box allows you to select how you want the character to appear in the **Text** editing mode. You can choose between the following:

- **Character**
- **Character entity - decimal**
- **Character entity - hexadecimal**

You can see the character or code that will be inserted in **Text** mode next to the selections in this section and a box on the right side of the dialog box allows you to see the character that will be inserted in **Author** mode. You can also see the name and range name of a character either at the bottom of the dialog box, or in a tooltip when hovering the cursor over the character.

Click the **Insert** button to insert the selected character in the current editor at the cursor position. You will see the character in the editor if [the editor font \(on page 177\)](#) is able to render it. The **Copy** button copies it to the clipboard without inserting it in the editor.

**Note:**

The **Character Map** dialog box is not available in the **Grid** editor ([on page 242](#)).

Related information

[Working with Special Characters and Encoding \(on page 297\)](#)

Handling Read-Only Files

The default workbench behavior applies when editing read-only files in the **Text** mode. For all other modes no modification is allowed provided that the file remains read-only.

You can check out the read-only state of the file by looking in the **Properties view** ([on page 266](#)). If you modify the file properties from the operating system and the file becomes writable, you can modify it on the spot without having to reopen it.

Viewing Status Information

Status information generated by operations such as *schema detection*, *manual validation*, *automatic validation*, and *transformations* are fed into the **Console** view, allowing you to monitor how the operation is being executed (the **Enable Oxygen consoles** option ([on page 180](#)) must be selected in the **View** preferences page ([on page 180](#))).

Figure 52. Console View Messages

Messages contain a timestamp, the name of the thread that generated it, and the actual status information. The number of displayed messages can be controlled with the **Limit console output** option in the **View** ([on page 180](#)) preference page.

To make the view visible, select **Window > Show View > Console**.

Editor Highlights

An *editor highlight* is a text fragment emphasized by a colored background.

Highlights are generated in both **Text** and **Author** mode when the following actions generate results:

- **Find All Elements** ([on page 282](#))
- **XPath in Files** ([on page 274](#))
- **Search References** ([on page 355](#))
- **Search Declarations** ([on page 355](#))

By default, Oxygen XML Editor Eclipse plugin uses a different color for each type of highlight (*XPath in Files*, *Find/Replace*, *Search References*, *Search Declarations*, etc.) You can customize these colors and the

maximum number of highlights displayed in a document on the [Editor preferences page \(on page 117\)](#). The default maximum number of highlights is 10000.

You can navigate the highlights in the current document by using the following methods:

- Clicking the markers from the range ruler, located at the right side of the editor pane.
- Clicking the **Next** and **Previous** buttons () from the bottom of the range ruler, located at the right side of the editor pane.

**Note:**

When there are multiple types of highlights in the document, the **Next** and **Previous** buttons () navigate through highlights of the same type.

- Clicking the messages displayed in the [Results view \(on page 335\)](#) view at the bottom of the editor.

To remove the highlights, you can do the following:

- Click the  **Remove all** button from bottom of the range ruler, located at the right side of the editor pane.
- Close the results tab at the bottom of the editor that contains the output of the action that generated the highlights.
- Click the  **Remove all** button on the right side of the [Results view \(on page 335\)](#) view at the bottom of the editor.

8.

Editing Supported Document Types

Oxygen XML Editor Eclipse plugin includes [built-in frameworks for the most popular XML document types \(DITA, DocBook, TEI, XHTML, JATS\) \(on page 1030\)](#) with a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). In addition, Oxygen XML Editor Eclipse plugin provides support for editing numerous other types of documents (all XML document types and even some non-XML formats).

Each type of document has unique features and options and this chapter includes a large amount of information about editing numerous types of documents and various editing features that are provided in Oxygen XML Editor Eclipse plugin, including general information about [editing XML documents in Text mode \(on page 307\)](#), the visual **Author** mode [\(on page 367\)](#), and **Grid** mode [\(on page 357\)](#).

For extensive details about the DITA editing features included in Oxygen XML Editor Eclipse plugin, see the [DITA Authoring chapter \(on page 2327\)](#).

Related information

[Built-in Frameworks \(Document Types\) \(on page 1030\)](#)

Editing XML Documents

The structure of an XML document and the required restrictions on its elements and their attributes are defined with an XML schema. This makes it easier to edit XML documents in the visual **Author** editing mode. For more information about schema association, see [Associating a Schema to XML Documents \(on page 584\)](#).

Oxygen XML Editor Eclipse plugin includes fully supported built-in [frameworks \(on page 2679\)](#) for the most popular [XML document types \(DITA, DocBook, TEI, XHTML, JATS\) \(on page 1030\)](#) with a full set of features. These built-in [frameworks](#) are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. For extensive details about the DITA editing features included in Oxygen XML Editor Eclipse plugin, see the [DITA Authoring chapter \(on page 2327\)](#).

This section includes information about the user interface components and actions that are available in the various editing modes and numerous features to help you edit XML documents in any mode.

Related information

[Text Editing Mode \(on page 241\)](#)

[Built-in Frameworks \(Document Types\) \(on page 1030\)](#)

Editing XML Documents in Text Mode

This section includes topics that describe how to work with XML documents in **Text** mode, including various features, actions that are available, and much more.

The Oxygen XML Editor Eclipse plugin **Text** editing mode is designed to be a simple, yet powerful, XML source editor. You can use this mode to edit XML code, markup, and text and it provides support to help you transform, and debug XML-based documents. It is similar to other common text editors, but Oxygen XML Editor Eclipse plugin also includes numerous specialized editing actions, a powerful *Content Completion Assistant* (on page 319), a helpful **Outline view** (on page 326), and many other unique features.

To switch to this mode, select **Text** at the bottom of the editing area.

Navigating the Document Content in Text Mode

Oxygen XML Editor Eclipse plugin includes some useful features to help you navigate XML documents in **Text** mode.

Navigation Keyboard Shortcuts

Ctrl + CloseBracket (Command + CloseBracket on macOS)

Navigate to the next XML node.

Ctrl + OpenBracket (Command + OpenBracket on macOS)

Navigate to the previous XML node.

Ctrl + RightArrow (Command + RightArrow on macOS)

Navigate one word forward.

Ctrl + LeftArrow (Command + LeftArrow on macOS)

Navigate one word backward.

Ctrl + Home (Command + Home on macOS)

Position the cursor at the beginning of the document.

Ctrl + End (Command + End on macOS)

Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Editor Eclipse plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the **Navigation** menu:

Last Edit Location (Ctrl+Q)

Navigates to the last modification in any open tab.

Back (Alt+LeftArrow (Command+OpenBracket on macOS))

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links.

Forward (Alt+RightArrow (Command+CloseBracket on macOS))

Available after you use the **Back** button at least once, and it navigates in the opposite direction as the **Back** button.

Navigating with the Outline View

Oxygen XML Editor Eclipse plugin includes an **Outline view** (on page 326) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 53. Outline View Navigation in Text Mode

Using the Breadcrumb to Navigate

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 54. Breadcrumb in Text Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Navigating with the Go To Dialog Box

In **Text** mode, you can navigate precisely to a location in the document you are editing by pressing (**Ctrl+L** (**Command+L on macOS**)) or selecting **Go To Line** from the **Navigation** menu.

Navigating with Bookmarks

By using *bookmarks*, you can mark positions in an edited document so that you can return to it later. This is especially helpful for navigating through large documents or while editing multiple documents.

To insert a *bookmark* in **Text** mode, right-click the desired location in the vertical stripe on the left side of the editor and select **Add Bookmark** (you can remove it by selecting **Remove Bookmark** from the same contextual menu).

To navigate to any of the *bookmarks*, click their corresponding markers in the vertical stripe on the right side of the editor.

Tip:

You can configure the color and how the *bookmarks* are shown from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on macOSX) > Preferences > General > Editors > Text Editors > Annotations**).

Smart Editing in Text Mode

Oxygen XML Editor Eclipse plugin includes *smart editing* features to help you edit XML documents in **Text** mode. The following smart editing features are included:

- **Closing tag auto-expansion** - This feature helps save some keystrokes by automatically inserting a closing tag when you insert a complete start tag and the cursor is automatically placed in between the start and end tags. For instance, after entering a start `<tag>`, the corresponding closing `</tag>` is automatically inserted and the cursor is placed between the two (`<tag>|</tag>`).
- **Auto-rename matching tag** - When you edit the name of a start tag, Oxygen XML Editor Eclipse plugin will mirror-edit the name of the matching end tag. This feature can be controlled from the **Content Completion** option page (*on page 119*).
- **Auto-breaking the edited line** - The **Hard line wrap option** (*on page 164*) automatically breaks the edited line when its length exceeds the maximum line length *defined for the format and indent operation* (*on page 164*).
- **Indent on Enter** - The **Indent on Enter option** (*on page 164*) indents the new line inserted when you press **Enter**.
- **Smart Enter** - The **Smart Enter option** (*on page 164*) inserts an empty line between the start and end tags. If you press **Enter** between a start and end tag, the action places the cursor in an indented position on the empty line between the lines that contain the start and end tag.
- **Double-click** - A double-click selects certain text, depending on the position of the click in the document:
 - If the click position is on a start tag or end tag, then the element name is selected.
 - If the click position is after a start tag or before an end tag, then the entire content of the element without the start and end tags is selected.
 - If the click position is before a start tag or after an end tag, then the entire tag is selected, including the start and end tags, and the content in between.
 - If the click position is immediately before an attribute, then the entire attribute and its value are selected.
 - If the click position is immediately after the opening quote or immediately before the closing quote of an attribute value, then the entire attribute value is selected.
 - Otherwise, a double-click selects contiguous text.
- **Triple-click** - A triple-click selects the entire current line of text.

Shortcut Actions in Text Mode

Oxygen XML Editor Eclipse plugin includes numerous shortcut actions to help you edit content in the **Text** editing mode.

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on macOS))

Reverses a maximum of 200 editing actions to return to the preceding state.

Note:

Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on macOS))

Selects the entire content of the current document.

Moving XML Nodes

You can use the following shortcuts to move XML elements or XSLT variables up or down in **Text** mode:

Ctrl + Alt + UpArrow (Command + Option + UpArrow on macOS)

Moves the node up one line.

Ctrl + Alt + DownArrow (Command + Option + DownArrow on macOS)

Moves the node down one line.

**Note:**

The requirements for these node moving actions to work are as follows:

- The mechanism is designed to work without a selection. If you use these actions on a selection of content, it moves the entire selection. To make this mechanism work as intended, simply position the cursor somewhere on the line that you want to move.
- A start tag must be the first text occurrence on the line where the cursor is positioned.
- On the line where the element ends, only whitespaces are allowed after the end tag.

Miscellaneous Shortcut Actions in Text Mode

Oxygen XML Editor Eclipse plugin also includes the following other miscellaneous shortcut actions in **Text** mode:

Ctrl + Delete (Command + Delete on macOS)

Deletes the next word.

Ctrl + Backspace (Command + Backspace on macOS)

Deletes the previous word.

Ctrl + W (Command + W on macOS)

Cuts the previous word.

Ctrl + K (Command + K on macOS)

Cuts to end of line.

Ctrl + Single-Click (Command + Single-Click on macOS) or F3

Use this shortcut to open any of the following:

- Any absolute URL (URLs that have a protocol), regardless of their location in the document.
- URI attributes such as: `@schemaLocation`, `@noNamespaceSchemaLocation`, `@href` and others.
- Open the target for DITA references (such as a `@conref`, `@conkeyref`, `@keyref`, and more).
[Only **F3** works for these types of references]
- Processing instructions used for associating resources, xml-models, xml-stylesheets.

Ctrl + Shift + Y (Command + Shift + Y on macOS) (Document > Edit > Toggle Line Wrap)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Editing XML Markup in Text Mode

Oxygen XML Editor Eclipse plugin includes some useful actions that allow you to easily edit XML markup in **Text** mode. These actions are available in the **Refactoring** submenu of the contextual menu, and many of the actions can also be done with simple keyboard shortcuts.

Using the Breadcrumb

A *breadcrumb* on the top stripe indicates the path from the document root element to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 55. Breadcrumb in Text Mode

article sect1 note para processing-instruction

The last element listed in the *breadcrumb* is the element at the current cursor position. Clicking an element in the *breadcrumb* selects the entire element in the editor area. Also, each element provides a contextual menu with access to the following actions:

Append Child

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it as a child of the current element.

Insert Before

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately before the current element, as a sibling.

Insert After

Allows you to select an element (from a drop-down list) that is allowed by the associated schema and inserts it immediately after the current element, as a sibling.

Edit Attributes

Opens an editing window that allows you to edit the attributes of the currently selected element.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Cut

Removes the selected element and copies it to the clipboard.

Copy

Copies the selected element to the clipboard.

Delete

Deletes the currently selected element.

Move Nodes

You can easily move XML nodes in the current document by using the following shortcut keys:

Alt + UpArrow (Option + UpArrow on macOS)

Moves the current node or selected nodes in front of the previous node.

Alt + DownArrow (Option + DownArrow on macOS)

Moves the current node or selected nodes after the subsequent node.

Rename Elements

You can rename elements by using the following actions in the **Refactoring** submenu of the contextual menu:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor Eclipse plugin will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu:

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 120*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 120*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Surround with <![CDATA]]> (Alt + Shift + C (Command + Option + C on macOS))

Surround the selected content with a `<CDATA>` tag so that the parser will interpret it as textual data rather than markup.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu:

Delete element tags (Alt + Shift + Comma)

Deletes the start and end tag of the current element.

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu:

Join elements (Alt + Shift + F (Command + Option + F on macOS))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Split element

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Folding XML Elements in Text Mode

When working with a large document, the *folding* (on page 2679) support in Oxygen XML Editor Eclipse plugin can be used to collapse some element content leaving only those that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 56. Folding of XML Elements in Text Mode

```

+ <person id="Big.Boss">
- <person id="one.worker">
  <name>
    <family>Worker</family>
    <given>One</given>
  </name>
  <email>one@oxygenxml.com</email>
  <link manager="Big.Boss"/>
</person>
+ <person id="two.worker">
- <person id="three.worker">
  <name>
    <family>Worker</family>
    <given>Three</given>
  </name>
  <email>three@oxygenxml.com</email>
  <link manager="Big.Boss"/>
</person>
- <person id="four.worker">

```

Folding Actions in Text Mode

Element folds are marked with a small icon ( / ) in the left stripe. To toggle the fold, simply click the icon. Also, if you right-click the icon, the following actions are available in the **Folding** sub-menu:

 **Toggle Fold**

Toggles the state of the current fold.

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the child elements that are indented one level inside the current element.

 **Expand Child Folds**

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

Resources

For more information about the *folding* support in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Drag and Drop in Text Mode

To move a whole region of text to other location in the same edited document, just select the text, drag the selection by holding down the left mouse button and drop it to the target location.

You can also copy content from other applications and paste it into the document.

Selecting Content in Text Mode

Oxygen XML Editor Eclipse plugin includes a variety of keyboard shortcuts that allow you to select content in **Text** mode. These include numerous standard continuous selection possibilities that are common to many text editors.

Standard Continuous Selection Shortcuts

Ctrl + A (Meta + A on macOS)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on macOS)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on macOS, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on macOS, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects certain text, depending on the position of the click in the document. See [Smart Editing: Double-Click \(on page 309\)](#) for the specifics.

Triple-Click

Selects entire regions of text, depending on the position of the click in the document. See the [Smart Editing: Triple-Click \(on page 309\)](#) for the specifics.

Right-Click > Select > Element

Selects the entire element at the current cursor position.

Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Attributes

Selects all the attributes of the element at the current cursor position.

Right-Click > Select > Parent

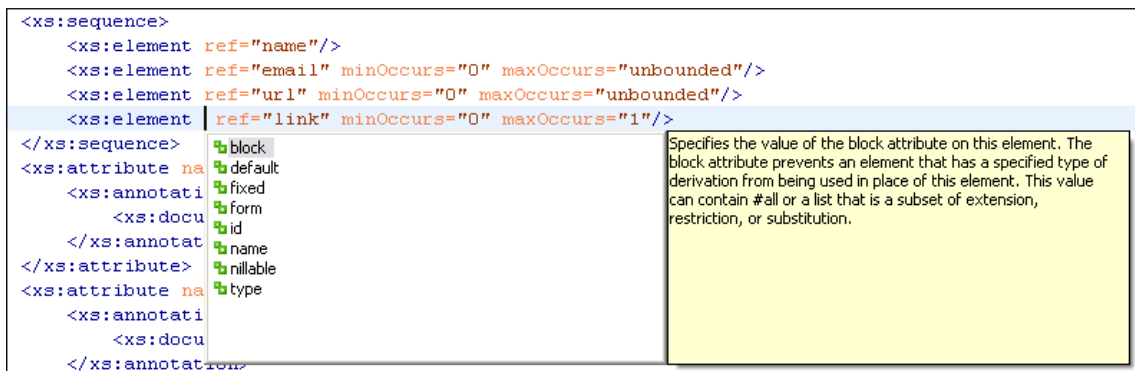

Selects the entire parent element at the current cursor position.

Content Completion Assistant in Text Mode

Oxygen XML Editor Eclipse plugin includes an intelligent *Content Completion Assistant* (on page 2677) that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (on page 70), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 119).

Figure 57. Content Completion Assistant

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the *Content Completion Assistant* (on page 2677) depend on the associated schemas (DTD, XML Schema, Relax NG, or NVDL schema). For information about the various ways to associate a schema and the order of their precedence, see the *Associating a Schema to XML Documents* (on page 584) section.

Using the Content Completion Assistant in Text Mode

The feature is activated in **Text** mode in the following situations:

- After you enter the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the **Activation delay of the proposals window (ms)** option (on page 121) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In some cases, the *Content Completion Assistant* displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

**Note:**

When the DTD, XML Schema or RELAX NG schema specifies required child elements for the newly added element, they are inserted automatically only if the **Add Element Content** option ([on page 120](#)) (in the **Content Completion** preferences page) is selected. The *Content Completion Assistant* can also add optional content and first choice particle, as specified in the DTD, XML Schema, or RELAX NG schema. To activate these features, select the **Add optional content** ([on page 120](#)) and **Add first Choice particle** ([on page 120](#)) options in the **Content Completion** preferences page.

After inserting an element, the cursor is positioned:

- Before the > character of the start tag, if the element allows attributes, to allow rapid insertion of any of the attributes supported by the element. Pressing the space bar displays the Content Completion list once again. This time it contains the list of allowed attribute names. If the attribute supports a fixed set of parameters, the assistant list displays the list of valid parameters. If the parameter setting is user-defined and therefore variable, the assistant is closed to allow manual insertion. The values of the attributes can be learned from the same elements in the current document.
- After the > character of the start tag, if the element has no attributes.

Where the Content Completion Assistant is Displayed

The *Content Completion Assistant* is displayed:

- Anywhere within a tag name or at the beginning of a tag name in an XML document, XML Schema, DTD, or Relax NG (full or compact syntax) schema.
- Anywhere within an attribute name or at the beginning of an attribute name in any XML document with an associated schema.
- Within attribute values or at the beginning of attribute values in XML documents where lists of possible values have been defined for that element in the schema associated with the document.

Types of Proposals Listed in the Content Completion Assistant

The following things are considered for determining the proposals that are listed in the content completion window:

Element Structure Specified in DTD or Schema

The proposals that populate the *Content Completion Assistant* depend on the element structure specified in the DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema associated with the edited document.

**Note:**

The *Content Completion Assistant* is able to offer elements defined both by XML Schemas version 1.0 and 1.1.

Current Cursor Position

The number and type of elements displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the structured document. The child elements displayed within a given element are defined by the structure of the specified DTD, XML Schema, Relax NG (full or compact syntax) schema, or NVDL schema.

Unique ID Attribute Values

A schema may declare certain attributes as *ID* or *IDREF/IDREFS*. When the document is validated, Oxygen XML Editor Eclipse plugin checks the uniqueness and correctness of the `@id` attributes. It also collects the attribute values declared in the document to prepare the list of proposals. This is available for documents that use DTD, XML Schema, and Relax NG schema.

Values for *xml:id* Attributes

Values of all the `@xml:id` attributes are handled as `@id` attributes. They are collected and displayed by the *Content Completion Assistant* as possible values for *anyURI* attributes defined in the schema of the edited document. This works only for XML Schema and Relax NG schemas.

Links/References in DITA

When entering values for the various types of links and references in DITA (for example, values for `@href` or `@conref` elements), the *Content Completion Assistant* will propose potential targets when you use the forward slash key (`/`).

ID Values for DITA Key References

In DITA, when inserting key references (`@keyref`) or content key references (`@conkeyref`), the ID values that are defined in the key reference are presented as possible targets. The *Content Completion Assistant* will only propose targets that are valid in the current context.

Element and Attribute Values

For documents that use an XML Schema or Relax NG schema, the *Content Completion Assistant* offers proposals for attribute and element values as long as the allowed values are defined in the schema. Also, if a default value or fixed value is defined in the schema, then that value is offered in the *Content Completion Assistant*.

Related information

[Customizing the Content Completion Assistant Using a Configuration File \(on page 2002\)](#)

Schema Annotations in Text Mode

A schema annotation is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in:

- The *Content Completion Assistant* (on page 2677).
- A small tooltip window shown when the mouse hovers over an element or attribute.

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** (on page 121) option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `
`, `<table>`, ``, or ``).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** (on page 122) option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `
`, ``, ``), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `
` breaks the current line, `` encloses a list of items, and `` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
  </xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor Eclipse plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
```

```

    Information about a person. </a:documentation>

    <ref name="name" />

    <zeroOrMore>

    <ref name="email" />

    </zeroOrMore>

  </element>
</define>

```

However, any element outside the Relax NG namespace (<http://relaxng.org/ns/structure/1.0>) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** (on page 122) option in the **Annotations** preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```

## Information about a person.
element person { name, email*}

```

Collecting Annotation from DTDs

For DTD, Oxygen XML Editor Eclipse plugin defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** (on page 121) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```

<!--doc:Description of the element. -->

```

Content Completion Helper Views (Text Mode)

Information about the current element being edited is also available in various *dockable* (on page 2677) views, such as the **Model view** (on page 331), **Attributes view** (on page 329), **Elements view** (on page 333), and **Entities view** (on page 334). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline view** (on page 326), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor Eclipse plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a  symbol in the content completion list (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). Also, in **Text** mode you can press **Ctrl + Shift + Space** to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content

completion list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

To create a code template, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Editor > Content Completion > Code Templates**.
2. Click **New** to open a code template configuration dialog box.

Tip:

You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

Figure 58. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:
 - **Name** - The name of the code template.
 - **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the **Content Completion Assistant** ([on page 2677](#)). HTML markup can be used for better rendering.
 - **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
 - **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:

- **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
- **M2** represents the **Shift** key.
- **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
- **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted.

An [editor variable \(on page 218\)](#) can be inserted in the text box using the  **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

Result: Your code template can now be selected using the [Content Completion Assistant \(on page 2677\)](#) (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). The code templates are displayed with a  symbol.

How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the [Preferences dialog box \(on page 70\)](#) and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the [Preferences dialog box \(on page 70\)](#) and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (`.xpr`).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their [Project Explorer view \(on page 269\)](#), the code templates will be available in their content completion list.

Tip:

It is also possible to [configure certain actions that function similar to code templates and add them to the content completion list \(on page 2002\)](#) for a particular framework. You could then [share the whole framework \(on page 2099\)](#) with other members of your team.

Text Mode Views

There is a variety of *dockable* (on page 2677) helper views that are displayed by default in **Text** mode. There are also a large selection of additional views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Text** mode.

Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

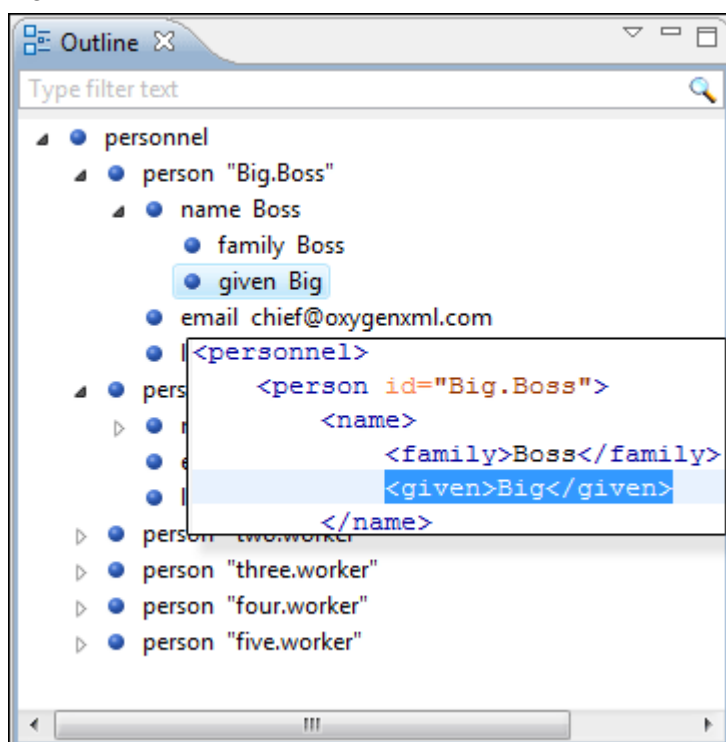

It also includes a **View menu** in the top-right corner that presents a variety of options to help you filter the view even further.

Drag and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Figure 59. Outline View

Outline View Filters

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

The following actions are available in the **View menu** of the **Outline** view:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting

one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the [Outline preferences panel](#) (*on page 214*).

Configure displayed attributes

Displays the [XML Structured Outline preferences page](#) (*on page 214*).

Outline View Contextual Menu Actions

The contextual menu of the **Outline** view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the [profiling attributes](#) (*on page 442*) defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, **Copy**, **Paste**, **Delete common editing actions**

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand All

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip:

You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Text Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use the **Attributes** view to insert attributes, edit their values, or add values to existing attributes.

The attributes are rendered differently depending on their state:

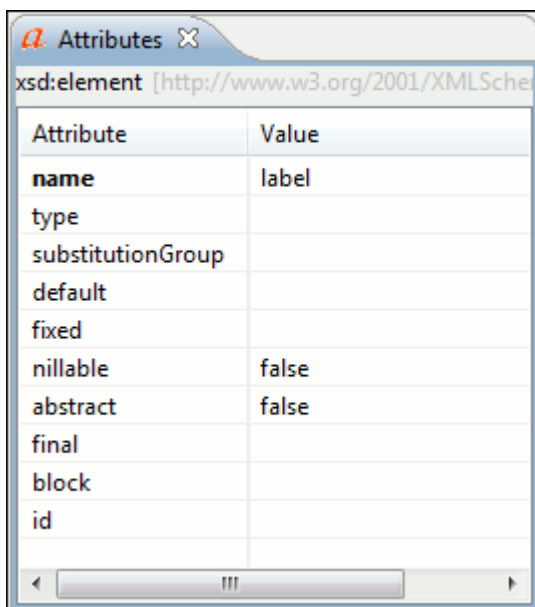

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 60. Attributes View

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Text** mode:

Add

Allows you to insert a new attribute. Adding an attribute that is not in the list of all defined attributes is not possible when the [Allow only insertion of valid elements and attributes \(on page 154\)](#) schema-aware option is selected.

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

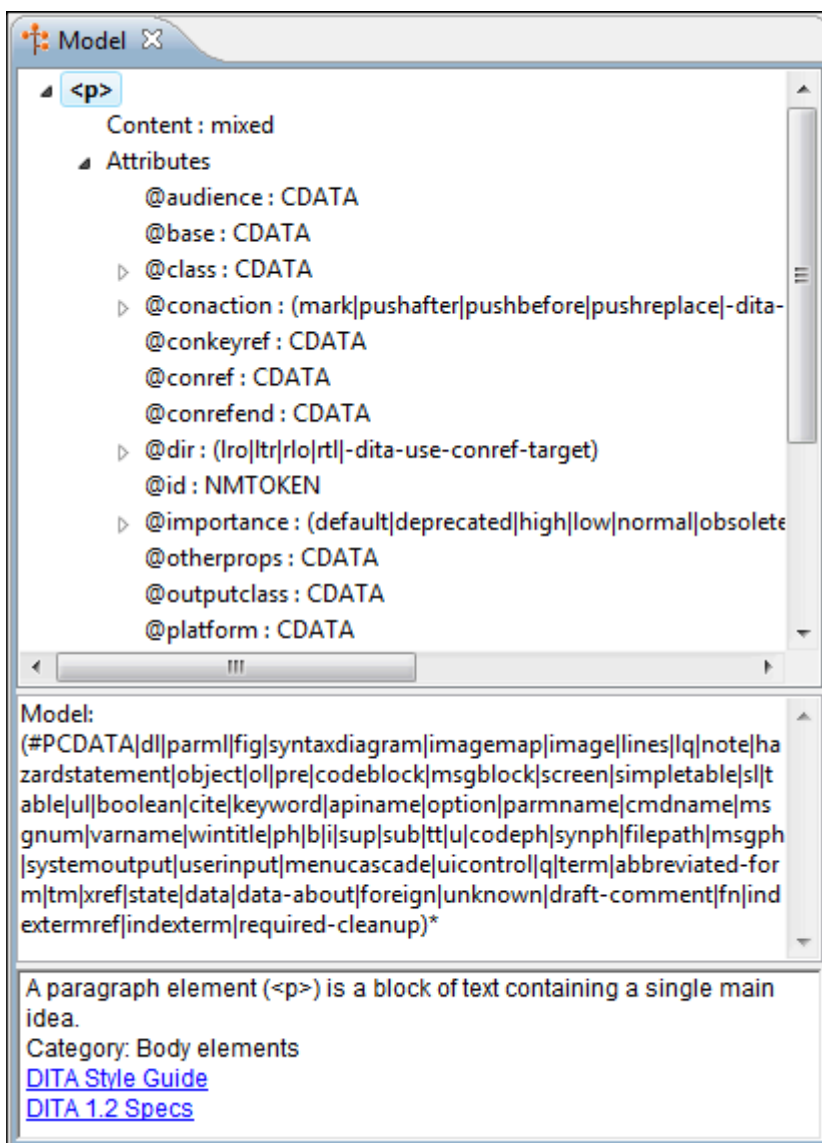

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

Model View

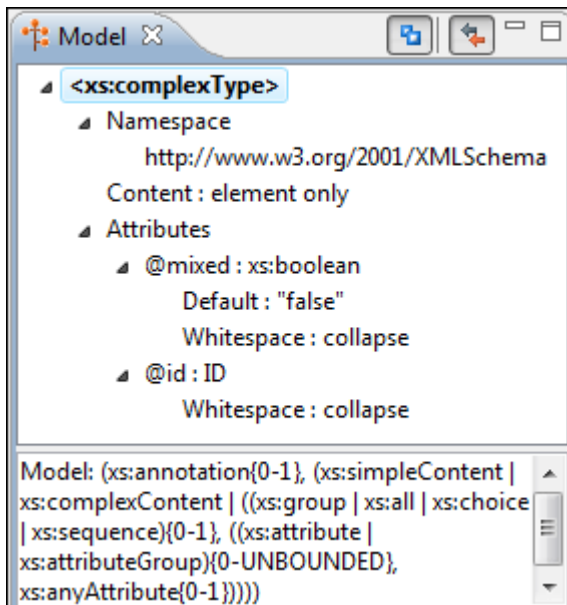

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 61. Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

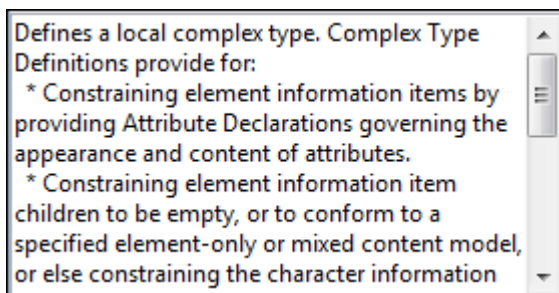

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

Figure 62. Element Structure Panel

Annotation Panel

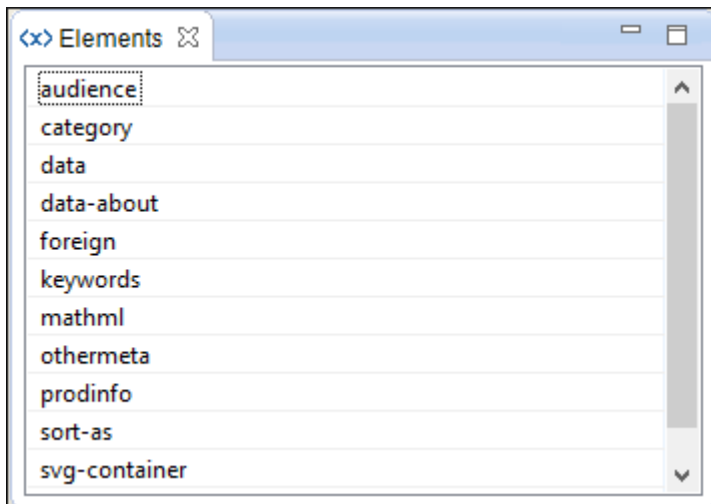

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 63. Annotation panel

Elements View in Text Mode

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking any of the listed elements inserts that element into the edited document, at the current cursor position. Pressing **F2** with an element selected will display information about that particular element.

Figure 64. Elements View in Text Mode

Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`<`, `>`, `&`, `'`, `"`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

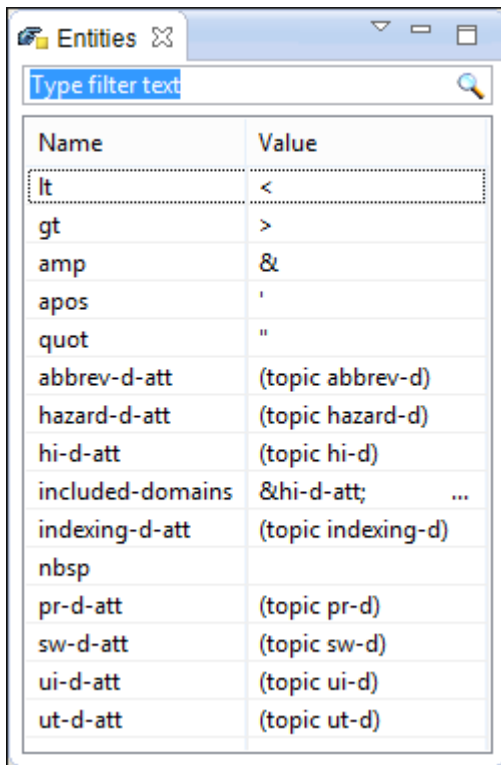

Note:

If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 65. Entities View

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&hi-d-att; ...
indexing-d-att	(topic indexing-d)
nbsp	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:**

When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

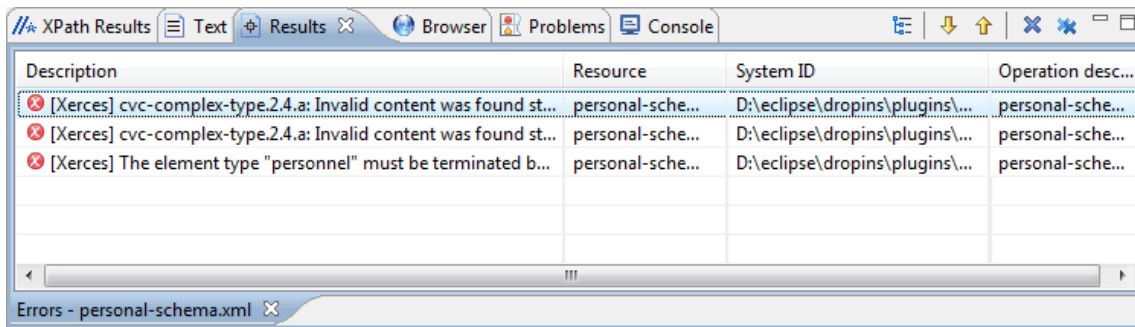

Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is *dockable* (on page 2677), so it can be moved to another UI location alongside other side views.

The actions that contribute messages to this view include:

- **Validation** actions (on page 547)
- **Transformation** actions (on page 1171)
- **Check Spelling in Files** action (on page 294)
-
-

- **Search References** action (on page 678)
- **SQL results** (on page 1884)

Figure 66. Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

Grouping Mode toggle options

You can choose to group the result messages in a **Hierarchical** or **Flat** arrangement.

Next

Navigates to the message below the current selection.

Previous

Navigates to the message above the current selection.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Learn Word(s) (Available when spelling errors are reported in the Results view)

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

Remove

Removes selected messages from the view.

Remove all

Removes all messages from the view.

Copy

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

Copy Description

Copies the description values for all selected items.

Show message

Opens a dialog box that displays the details of the message.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy action** ([on page 337](#)).

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy action** ([on page 337](#)).

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy action** ([on page 337](#)).

Expand All

Available when **Hierarchical** mode is selected. Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Collapse All

Available when **Hierarchical** mode is selected. Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

Syntax Highlighting in XML Documents

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML files, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)).
2. Go to **Editor > Syntax Highlight** ([on page 176](#)).
3. Select and expand the **XML** section in the top pane.

4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the [Editor > Syntax Highlight > Elements/Attributes by Prefix](#) preferences page (on page 176).

Related Information:

[Customize Syntax Highlight colors](#) (on page 176)

Syntax Highlight Depending on Namespace Prefix

The [syntax highlight scheme of an XML file type](#) (on page 176) allows the configuration of a color per each type of token that can appear in an XML file. Distinguishing between the XML tag tokens based on the namespace prefix brings additional visual help in editing some XML file types. For example, in XSLT stylesheets, elements from various namespaces (such as XSLT, XHTML, XSL:FO, or XForms) are inserted in the same document and the editor panel can become cluttered. [Marking tags with different colors based on the namespace prefix](#) (on page 176) allows easier identification of the tags.

Figure 67. Example of Coloring XML Tags by Prefix

```

<xsl:template match="name">
  <fo:list-item>
    <fo:list-item-label end-indent="label-end()">
      <fo:block text-align="end" font-weight="bold">Full Name:</fo:block>
    </fo:list-item-label>
    <fo:list-item-body start-indent="body-start()">
      <fo:block text-align="start" color="red">
        <xsl:apply-templates select="*" />
      </fo:block>
    </fo:list-item-body>
  </fo:list-item>
</xsl:template>

```

Related Information:

[Changing the colors displayed in the Text Mode Editor](#) (on page 176)

Formatting and Indenting XML Documents

In [Text mode](#) (on page 241), you can decide how the XML file is formatted and indented. In the other modes, and when you switch between modes, Oxygen XML Editor Eclipse plugin automatically formats and indents the XML.

You can trigger a format and indent operation for your XML document (in **Text** mode) using one of the following actions:

-  **Format and Indent** toolbar button - Formats and indents the current document.
- **Document > Source >  Format and Indent** - Formats and indents the whole document.
- **Document > Source >  Indent Selection** - Indents the current selection (but does not add line breaks). This action is also available in the **Source** submenu of the contextual menu.
- **Document > Source >  Format and Indent Element** - Formats and indents the current element (the inmost nested element that currently contains the cursor) and its child-elements. This action is also available in the **Source** submenu of the contextual menu.

Various settings affect how Oxygen XML Editor Eclipse plugin formats and indents XML. Many of these settings have to do with how whitespace is handled.

Significant and Insignificant Whitespace in XML

XML documents are text files that describe complex documents. Some of the white space (spaces, tabs, line feeds, etc.) in the XML document belongs to the document it describes (such as the space between words in a paragraph) and some of it belongs to the XML document (such as a line break between two XML elements). Whitespace belonging to the XML file is called *insignificant whitespace*. The meaning of the XML would be the same if the insignificant whitespace were removed. Whitespace belonging to the document being described is called *significant whitespace*.

Knowing when whitespace is significant or insignificant is not always easy. For instance, a paragraph in an XML document might be laid out like this:

```
<p>NO Free man shall be taken or imprisoned, or be stripped of his Freedom,
or Liberties, or free Customs, or be outlawed, or exiled, or any otherwise
destroyed; nor will we not pass upon him, nor condemn him, but by lawful
judgment of his Peers, or by the <xref
href="http://en.wikipedia.org/wiki/Law_of_the_land" format="html"
scope="external">Law of the land</xref>.
We will sell to no man, we will not deny to any man either Justice or Right.</p>
```

By default, XML considers a single whitespace between words to be significant, and all other whitespace to be insignificant. The paragraph above could have been written on one line because the XML parser would see it as exactly the same paragraph since all multiple consecutive whitespaces will be replaced with a single whitespace. Removing the insignificant space in markup like this is called *normalizing space*.

In some cases, all the spaces inside an element should be treated as significant. For example, in a code sample:

```
<codeblock>
class HelloWorld
{
    public static void main(String args[])
    {
        System.out.println("Hello World");
    }
}
```

```
}  
}  
</codeblock>
```

Here every whitespace character between the `<codeblock>` tags should be treated as significant.

How Oxygen XML Editor Eclipse plugin Determines When Whitespace is Significant

When Oxygen XML Editor Eclipse plugin formats and indents an XML document, it introduces or removes insignificant whitespace to produce a layout with reasonable line lengths and elements indented to show their place in the hierarchy of the document. To correctly format and indent the XML source, Oxygen XML Editor Eclipse plugin needs to know when to treat whitespace as significant and when to treat it as insignificant. However it is not always possible to tell this from the XML source file alone. To determine what whitespace is significant, Oxygen XML Editor Eclipse plugin assigns each element in the document to one of four categories:

Ignore space

In the ignore space category, all whitespace is considered insignificant. This generally applies to content that consists only of elements nested inside other elements, with no text content.

Normalize space

In the normalize space category, a single whitespace character between character strings is considered significant and all other spaces are considered insignificant. Therefore, all consecutive whitespaces will be replaced with a single space. This generally applies to elements that contain text content only.

Mixed content

In the mixed content category, a single whitespace between text characters is considered significant and all other spaces are considered insignificant.

Notes:

- Whitespace between two child elements embedded in the text is normalized to a single space (rather than to zero spaces as would normally be the case for a text node with only whitespace characters, or the space between elements generally).
- The lack of whitespace between a child element embedded in the text and either adjacent text or another child element is considered significant. That is, no whitespace can be introduced here when formatting and indenting the file.

For example:

```
<p>The file is located in <i>HOME</i>/<i>USER</i>/hello.  
This is a <strong>big</strong>
```

```
<emphasis>deal</emphasis> .
</p>
```

In this example, whitespace should not be introduced around the `i` tags as it would introduce extra significant whitespace into the document. The space between the end `` tag and the beginning `<emphasis>` tag should be normalized to a single space, not zero spaces.

Preserve space

In the preserve space category, all whitespace in the element is regarded as significant. No changes are made to the spaces in elements in this category. However, child elements may be in another category, and may be treated differently.

Attribute values are always in the preserve space category. The spaces between attributes in an element tag are always in the default space category.

Oxygen XML Editor Eclipse plugin evaluates several pieces of information to assign an element to one of these categories. An element is always assigned to the most restrictive category (from Ignore to Preserve) that it is assigned to by any of the sources Oxygen XML Editor Eclipse plugin consults. For instance, if the element is named on the **Default elements** list (as described below) but it has an `@xml:space="preserve"` attribute in the source file, it will be assigned to the preserve space category. If an element has the `@xml:space="default"` attribute in the source, but is listed on the **Mixed content** elements list, it will be assigned to the mixed content category.

To assign elements to these categories, Oxygen XML Editor Eclipse plugin consults information from the following sources:

xml:space

If the XML element contains the `@xml:space` attribute, the element is promoted to the appropriate category based on the value of the attribute.

CSS whitespace property

If the CSS stylesheet controlling the **Author** mode editor applies the `whitespace: pre` setting to an element, it is promoted to the preserve space category.

CSS display property

If a text node contains only white-spaces:

- If the node has a parent element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If the left or right sibling is an element with the CSS `display` property set to `inline` then the node is promoted to the mixed content category.
- If one of its ancestors is an element with the CSS `display` property set to `table` then the node is assigned to the ignore space category.

Schema-aware formatting

If a schema is available for the XML document, Oxygen XML Editor Eclipse plugin can use information from the schema to promote the element to the appropriate category. For example:

- If the schema declares an element to be of type `xs:string`, the element will be promoted to the preserve space category because the string built-in type has the whitespace facet with the value preserve.
- If the schema declares an element to be mixed content, it will be promoted to the mixed content category.

Schema-aware formatting can be turned on and off.

- To turn it on or off for **Author** mode, open the **Preferences** dialog box (on page 70), go to **Editor > Edit modes > Author > Schema-Aware**, and select/deselect the **Schema-aware normalization, format and indent** option (on page 154).
- To turn it on or off for the **Text** editing mode, open the **Preferences** dialog box (on page 70), go to **Editor > Format > XML**, and select/deselect the **Schema-aware format and indent** option (on page 169).

Preserve space elements list

If an element is listed in the **Preserve space** tab of the **Element Spacing** list (on page 168) in the **XML formatting preferences** (on page 166), it is promoted to the preserve space category.

Default space elements list

If an element is listed in the **Default space** tab of the **Element Spacing** list (on page 168) in the **XML formatting preferences** (on page 166), it is promoted to the default space category.

Mixed content elements list

If an element is listed in the **Mixed content** tab of the **Element Spacing** list (on page 168) in the **XML formatting preferences** (on page 166), it is promoted to the mixed content category.

Element content

If an element contains mixed content, that is, a mix of text and other elements, it is promoted to the mixed content category. (Note that, in accordance with these rules, this happens even if the schema declares the element to have element only content.)

If an element contains text content, it is promoted to the default space category.

Text node content

If a text node contains any non-whitespace characters then the text node is promoted to the normalize space category.

Exception to the Rule

In general, an element can only be promoted to a more restrictive category (one that treats more whitespace as significant). However, there is one exception. In **Author** mode, if an element is marked as mixed content in

the schema, but the actual element contains no text content, it can be demoted to the space ignore category if all of its child elements are displayed as *blocks* by the associated CSS (that is, they have a CSS property of `display: block`). For example, in some schemas, a section or a table entry can be defined as having mixed content but in many cases they contain only *block elements* (on page 2676). In these cases, any whitespace they contain cannot be significant and they can be treated as space ignore elements. This exception can be turned on or off using the **Schema-Aware Editing** option (on page 154) in the **Schema-Aware** preferences page.

How Oxygen XML Editor Eclipse plugin formats and indents XML

You can control how Oxygen XML Editor Eclipse plugin formats and indents XML documents. This can be particularly important if you store your XML document in a version control system, as it allows you to limit the number of trivial changes in spacing between versions of an XML document. The following preference pages include options that control how XML documents are formatted:

- **Format** preferences page (on page 162)
- **XML Formatting** preferences page (on page 166)
- **Whitespaces** preferences page (on page 169)

When Oxygen XML Editor Eclipse plugin formats and indents XML

Oxygen XML Editor Eclipse plugin formats and indents a document, or part of it, on the following occasions:

- In **Text** mode when you select one of the format and indent actions (**Document > Source > Format and Indent**, **Document > Source > Indent Selection**, or **Document > Source > Format and Indent Element**).
- When saving documents in **Author** mode.
- When switching from **Author** mode to another mode.
- When saving documents in **Design** mode.
- When switching from **Design** mode to another mode.
- When saving or switching to **Text** mode from **Grid** mode, if the **Format and indent when passing from grid to text or on save** option (on page 158) is selected in the **Grid** preferences page.

Setting an Indent Size to Zero

Oxygen XML Editor Eclipse plugin will automatically **format and indent** (on page 338) documents at certain times. This includes indenting the content from the margin to reflect its structure. In some cases, you may not want your content indented. To avoid your content being indented, you can set an indent size of zero.

Note:

Changing the indent size does not override the rules that Oxygen XML Editor Eclipse plugin uses for handling whitespace when formatting and indenting XML documents. Therefore, changing the indent size will have no effect on elements that require whitespaces to be maintained.

There are two cases to consider.

Maintaining zero indent in documents with zero indent

If you have existing documents with zero indent and you want Oxygen XML Editor Eclipse plugin to maintain a zero indent when editing or formatting those documents:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Editor > Format** (*on page 162*).
2. Select **Detect indent on open**.
3. Select **Use zero-indent if detected**.

Oxygen XML Editor Eclipse plugin will examine the indent of each document as it is opened and if the indent is zero for all lines, or for nearly all lines, a zero indent will be used when formatting and indenting the document. Otherwise, Oxygen XML Editor Eclipse plugin will use the indent closest to what it detects in the document.

Enforcing zero indent for all documents

If you want all documents to be formatted with zero indent, regardless of their current indenting:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Editor > Format** (*on page 162*).
2. Deselect **Detect indent on open**.
3. Set **Indent size** to `0`.

All documents will be formatted and indented with an indent of zero.

Warning:

Setting the indent size to zero can change the meaning of some file types, such as Python source files.

Format and Indent (Pretty-Print) Multiple Files

Oxygen XML Editor Eclipse plugin provides support for formatting and indenting (*pretty-print* (*on page 2681*)) multiple files at once. This action is available for any document in XML format, as well as for XQuery, CSS, JavaScript, and JSON documents.

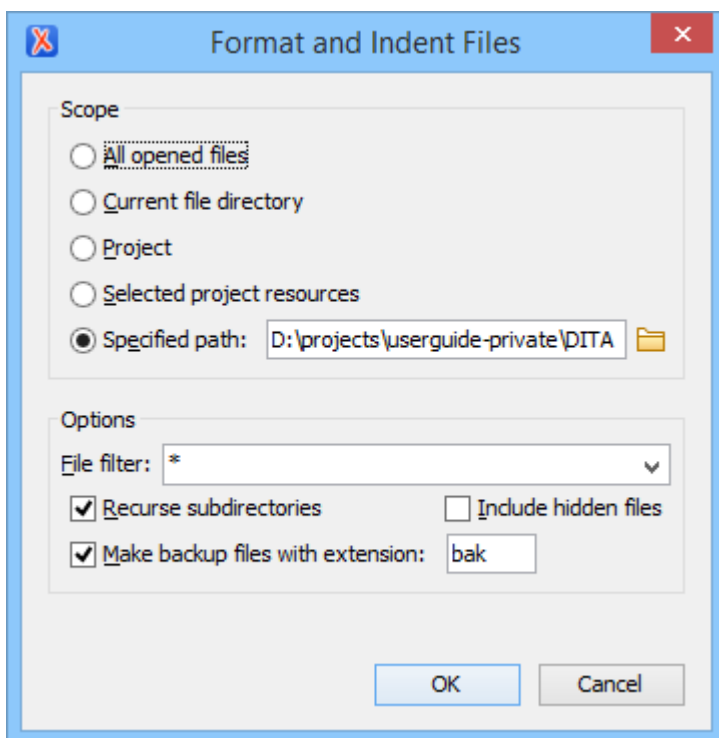

To format and indent multiple files, use the  **Format and Indent Files** action that is available in the contextual menu of the **Project Explorer** view (*on page 269*). This opens the **Format and Indent Files** dialog box that allows you to configure options for the action.

Figure 68. Format and Indent Files Dialog Box

The **Scope** section allows you to choose from the following scopes:

- **All opened files** - The *pretty-print (on page 2681)* is performed in all opened files.
- **Directory of the current file** - All the files in the folder of the currently edited file.
- **Project files** - All files from the current project.
- **Selected project files** - The selected files from the current project.
- **Specified path** - the *pretty-print (on page 2681)* is performed in the files located at a specified path.

The **Options** section includes the following options:

- **File filter** - Allow you to filter the files from the selected scope.
- **Recurse subdirectories** - When selected, the *pretty-print (on page 2681)* is performed recursively for the specified scope. The one exception is that this option is ignored if the scope is set to **All opened files**.
- **Include hidden files** - When selected, the *pretty-print (on page 2681)* is also performed in the hidden files.
- **Make backup files with extension** - When selected, Oxygen XML Editor Eclipse plugin makes backup files of the modified files. The default extension is `.bak`, but you can change the extension as you prefer.

Quick Assist Support for IDs and IDREFS

The *Quick Assist support (on page 2681)* is activated automatically when you place the cursor inside an ID or IDREF in **Text** mode. To access it, click the yellow bulb help marker placed on the current line, in the

line number stripe of the editor. You can also invoke the *Quick Assist* menu from the contextual menu or by pressing **Ctrl+1 (Command+1 on macOS)** on your keyboard.

The following actions are available:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Change scope

Opens the **Select the scope for the Search and Refactor operations** (*on page 600*) dialog box.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Search Occurrences

Searches for the declaration and references of the ID located at the cursor position in the current document.

Related Information:

Highlight ID Occurrences in Text Mode

To see the occurrences of an ID in an XML document in the **Text** mode, place the cursor inside the ID declaration or reference. The occurrences are marked in the vertical side bar at the right of the editor. Click a marker on the side bar to jump to the occurrence that it corresponds to. The occurrences are also highlighted in the editing area.

Note:

Highlighted ID declarations are rendered with a different color than highlighted ID references. To customize these colors or disable this feature, open the **Preferences** dialog box (*on page 70*) and go to **Editor > Mark Occurrences** (*on page 171*).

Related Information:

Contextual Menu Actions in Text Mode

When editing XML documents in **Text** mode, Oxygen XML Editor Eclipse plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu):

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

Copy XPath

Copies the XPath expression of the current element or attribute (or property for JSON documents) to the clipboard.

Toggle Line Wrap (**Ctrl + Shift + Y** (**Command + Shift + Y** on macOS))

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Toggle Comment (**Ctrl + Shift + Comma** (**Command + Shift + Comma** on macOS))

Comments the current selection of the current editor. If the selection already contains a comment the action removes the comment from around the selection. If there is no selection in the current editor and the cursor is not positioned inside a comment, the current line is commented. If the cursor is positioned inside a comment, then the commented text is uncommented.

Go to submenu

This submenu includes the following actions:

 **Go to Matching Tag** (**Ctrl + Shift + G** (**Command + Shift + G** on macOS))

Moves the cursor to the end tag that matches the start tag, or vice versa.

Go after Next Tag (**Ctrl + CloseBracket** (**Command + CloseBracket** on macOS))

Moves the cursor to the end of the next tag.

Go after Previous Tag (**Ctrl + OpenBracket** (**Command + OpenBracket** on macOS))

Moves the cursor to the end of the previous tag.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Attributes

Selects all the attributes of the element at the current cursor position.

Parent

Selects the parent element at the current cursor position.

Source submenu

This submenu includes the following actions:

Shift Right

Shifts the currently selected block to the right.

Shift Left

Shifts the currently selected block to the left.

Indent selection (Ctrl + I (Command + I on macOS))

Corrects the indentation of the selected block of lines if it does not follow the current [indenting preferences \(on page 162\)](#).

Escape Selection

Escapes a range of characters by replacing them with the corresponding character entities.

Unescape Selection

Replaces the character entities with the corresponding characters.

Format and Indent Element (Ctrl + Shift + I (Command + Shift + I on macOS))

Pretty-prints (on page 2681) the element that surrounds the current cursor position.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ě`
- `0X0125` to `ĥ`

- 265 to 
- 2190 to 

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Base64 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base 64** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection.

Decode Selection

Replaces a selection of text with the result of decoding that selection.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Base32 Encode/Decode submenu

This submenu include the following actions for encoding or decoding **base32** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection.

Decode Selection

Replaces a selection of text with the result of decoding that selection.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Hex Encode/Decode submenu

This submenu include the following actions for encoding or decoding **hex** schemes:

Import File to Encode and Insert

Encodes a file and then inserts the encoded content into the current document at the cursor position.

Decode Selection and Export to File

Decodes a selection of text from the current document and then exports (saves) the result to another file.

Encode Selection

Replaces a selection of text with the result of encoding that selection.

Decode Selection

Replaces a selection of text with the result of decoding that selection.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you to select whether you want to modify only matches with the same letter case or all matches.

Join and Normalize Lines

For the current selection, this action joins the lines by replacing the *line separator* with a single space character. It also normalizes the whitespaces by replacing a sequence of such characters with a single space.

Insert XInclude

Displays a dialog box that allows you to browse and select the content to be included and automatically generates the corresponding XInclude instruction.

Note:

In the **Author** mode, this dialog box presents a preview of the inserted document as an author page in the **Preview** tab and as a text page in the **Source** tab. In the **Text** mode, the **Source** tab is presented.

Import entities list

Displays a dialog box that allows you to select a list of files as sources for external DTD entities. The internal subset of the DOCTYPE declaration of your document will be updated with the chosen entities. For instance, choosing the files `chapter1.xml` and `chapter2.xml` inserts the following section in the DOCTYPE:

```
<!ENTITY chapter1 SYSTEM "chapter1.xml">
<!ENTITY chapter2 SYSTEM "chapter2.xml">
```

Canonicalize

Opens the **Canonicalize** dialog box that allows you to select a *canonicalization (on page 2677)* algorithm to standardize the format of the document.

Sign

Opens the **Sign** dialog box that allows you to configure a digital signature for the document.

Verify Signature

Allows you to specify the location of a file to verify its digital signature.

Manage Highlighted Content submenu

This submenu is available from the contextual menu when it is invoked from a highlight after you perform a search operation or apply an XPath expression that highlights more than one result.

The following options are available in this submenu:

Modify All

Allows you to modify (in-place) all the occurrences of the selected content. A thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Surround All

Surround the highlighted content with a specific tag. This option opens the **Tag** dialog box. The **Specify the tag** drop-down menu presents all the available elements that you can choose from.

Remove All

Removes all the highlighted content.

Modify All Matches

Use this option to modify (in-place) all the occurrences of the selected content (or the contiguous fragment where the cursor is located). When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Go to Definition (Ctrl + Shift + Enter)

Navigates to the definition of the current element or attribute in the schema (DTD, XML Schema, Relax NG schema) associated with the edited XML document. If the current attribute is a *“type”* belonging to the *“<http://www.w3.org/2001/XMLSchema-instance>”* namespace, the cursor is moved in the XML schema to the definition of the type referenced in the value of the attribute. For JSON documents, it navigates to the definition of the current JSON property in the associated JSON Schema.

Refactoring submenu

This submenu includes the following actions:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Rename Prefix (Alt + Shift + P (Command + Shift + P on macOS))

The prefix of the element from the cursor position, and any elements with the same prefix, can be renamed according with the options from the **Rename** dialog box.

- If you select the **Rename current element prefix** option, the application will recursively traverse the current element and all its children. *For example*, to change the `xmlns:p1="ns1"` association in the current element to `xmlns:p5="ns1"`, if the `xmlns:p1="ns1"` association is applied on the parent element, then Oxygen XML Editor Eclipse plugin will introduce `xmlns:p5="ns1"` as a new declaration in the current element and will change the prefix from `p1` to `p5`. If `p5` is already associated with another namespace in the current element, then the conflict will be displayed in a dialog box. By pressing **OK**, the prefix is modified from `p1` to `p5` without inserting a new declaration.
- If you select the **Rename current prefix in all document** option, the application will apply the change on the entire document.
- To also apply the action inside attribute values, select the **Rename also attribute values that start with the same prefix** checkbox.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag that encloses a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option (on page 120)** is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option (on page 120)** is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Surround with <![CDATA]> (Alt + Shift + C (Command + Option + C on macOS))

Surround the selected content with a `<CDATA>` tag so that the parser will interpret it as textual data rather than markup.

Delete element tags (Alt + Shift + Comma)

Deletes the start and end tag of the current element.

Split element

Split the element from the cursor position into two identical elements. The cursor must be inside the element.

Join elements (Alt + Shift + F (Command + Option + F on macOS))

Joins the left and right elements relative to the current cursor position. The elements must have the same name, attributes, and attributes values.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema (not available for DITA). It includes the following actions:

 **Rename in**

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

 **Search References**

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** (*on page 600*).

 **Search Declarations**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** dialog box, this scope will be used instead.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 600).

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

Quick Assist (**Ctrl + 1** (**Command + 1** on macOS))

Available when the cursor is inside an ID or IDREF, this action opens the *Quick Assist* (on page 2681) window that allows you to select some search and refactoring actions for the selected ID or IDREF.

Apply all default quick fix proposals

Available when one or more quick fix proposals have been detected for the reported validation errors. If multiple quick fixes are available for the same validation error, only the first one presented is executed. All selected quick fix proposals will be automatically executed in bulk, one after the other.

Important Notes to Consider:

- To maintain the accuracy of the initially calculated error validation ranges, the quick fix proposals are applied in the reverse order of their selection.
- If two or more quick fixes act on the same "area" within the document, only one is applied (no changes can be made to changes already made).
- Quick fixes that involve "user-entered values" that normally present a dialog box to facilitate data entry will not be executed (the automatic process of applying all selected quick fixes cannot be interrupted by the presence of the respective dialog boxes).

Once the analysis of the impact of applying the quick fixes on the content is complete, a preview dialog box is presented that provides an overview of the content changes that will be made, according to the quick fixes that will be applied. If you agree with the changes presented, the actual procedure of applying the quick fixes and updating the content is triggered.

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document**

wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Show referenced resources

Opens the [Referenced/Dependent Resources view \(on page 600\)](#) that allows you to see the referenced resource hierarchy for an XML document.

Show dependent resources

Opens the [Referenced/Dependent Resources view \(on page 600\)](#) that allows you to see the resource dependencies for an XML document.

Editing XML Documents in Grid Mode

This section includes topics that describe how to work with XML documents in **Grid** mode, including various features, actions that are available, and much more.

The **Grid** mode in Oxygen XML Editor Eclipse plugin displays the XML document as a structured grid of nested tables where the text content can be modified without directly interacting with the XML markup. This is helpful for non-technical users who want to edit text content without modifying the XML markup.

To switch to this mode, select **Grid** at the bottom of the editing area.

You can easily expand or collapse elements within the table and the document structure can be changed with simple contextual menu actions, drag/drop, or copy/paste operations. The text content can be modified simply by editing the value of cells that contain the text and a useful [Content Completion Assistant \(on page 2677\)](#) is also available to help you edit or insert XML elements.

Resources

For more information about some of the features available in the **Grid** editor, watch our video demonstration:

<https://www.youtube.com/embed/PoYm2VqjsWk>

Layouts: Grid and Tree

The **Grid** editor offers two layout modes. The default one is the grid layout. This smart layout detects the recurring elements in the XML document and creates tables having the children (including the attributes) of these elements as columns. This way, it is possible to have tables nested in other tables, reflecting the structure of your document.

Figure 69. Grid Layout

<?xml	version="1.0" encoding="UTF-8"	test	table	tr	@id	first	last
				(3 rows)	1	10001	Jhon Doe
					2	10002	Mark Ewing
					3	10003	Dave Flint

The other layout mode is tree-like. It does not create any tables and it only presents the structure of the document.

Figure 70. Tree Layout

<?xml		version="1.0" encoding="UTF-8"	
test	table	tr	@id 10001
			first Jhon
			last Doe
		tr	@id 10002
			first Mark
			last Ewing
		tr	@id 10003
			first Dave
			last Flint

To switch between the two modes, select **Grid mode/Tree mode** from the contextual menu.

Grid Mode Navigation

When you first open a document in **Grid** mode, the content is collapsed. Only the root element and its attributes are displayed. An arrow sign (➤) displayed at the left of the node name indicates that this node has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (⏪). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

Expand/Collapse Submenu

The following actions are available on the **Expand/Collapse** submenu:

Expand All

Expands the selection and all its children.

Collapse All

Collapses the selection and all its children.

Expand Children

Expands all the children of the selection but not the selection.

Collapse Children

Collapses all the children of the selection but not the selection.

Collapse Others

Collapses all the siblings of the current selection but not the selection.

Keyboard Shortcuts

A variety of other keyboard shortcuts are also available in **Grid** mode:

Table 3. Shortcuts in the Grid Mode

Key	Action
<u>Tab</u>	Moves the cursor to the next editable value in a table row.
<u>Shift + Tab</u>	Moves the cursor to the previous editable value in a table row.
<u>Enter</u>	Begins editing and lets you insert a new value. Also commits the changes after you finish editing.
<u>UpArrow/PageUp</u>	Navigates toward the beginning of the document.
<u>DownArrow/PageDown</u>	Navigates toward the end of the document.
<u>Shift</u>	Used in conjunction with the navigation keys to create a continuous selection area.
<u>Ctrl (Command on macOS) key</u>	Used in conjunction with the mouse cursor to create discontinuous selection areas.

The following key combinations can be used to scroll the grid:

- **Ctrl + UpArrow (Command + UpArrow on macOS)** - scrolls the grid upwards.
- **Ctrl + DownArrow (Command + DownArrow on macOS)** - scrolls the grid downwards.
- **Ctrl + LeftArrow (Command + LeftArrow on macOS)** scrolls the grid to the left.
- **Ctrl + RightArrow (Command + RightArrow on macOS)** scrolls the grid to the right.

Related Information:

[Editing Actions in Grid Mode \(on page 359\)](#)

Editing Actions in Grid Mode

Since **Grid** mode presents XML content in a structured grid of nested tables, editing content in this mode can be done with a combination of the [Content Completion Assistant \(on page 364\)](#) and actions that allow you to work with the structure or content of the nested tables much like you would with any table. Oxygen XML Editor Eclipse plugin provides ways to edit content in the cells of the nested tables or to edit the structure of the tables.

Tip:

There are two different types of layouts available in **Grid** mode. Most people prefer to leave it on the default **Grid mode** layout, but there is also a **Tree mode** layout that presents the structure of the document in more of a vertical tree-like manner. You can switch between the two layouts to see which one works best for you particular situation from the **Document > Grid Layout** menu.

Expanding/Collapsing Nodes

An arrow sign () displayed at the left of a node indicates that it has child nodes. To display the children, click this arrow sign. To collapse a node, click the reverse arrow sign (). The expand/collapse actions can also be invoked with the **NumPad+** and **NumPad-** keys, or from the **Expand/Collapse** submenu of the contextual menu.

To expand all child nodes, right-click the cell that contains the parent node and select  **Expand All** from the **Expand/Collapse** submenu. To collapse all node, right-click any cell and select  **Collapse All** from the **Expand/Collapse** submenu.

Editing Elements or Attributes

To edit elements or attributes in **Grid** mode, simply double-click the cell that contains the element or attribute (or select the cell and press **Enter**) to invoke the *Content Completion Assistant (on page 364)*. This opens a pop-up window that offers a list of proposals that are valid for that particular node.

Editing Text Content in Cells

To edit the text value of a cell, simply select the grid cell and press **Enter** (or double-click the cell), and start editing.

To stop editing a cell value, press **Enter** again.

To cancel the editing without saving the current changes in the document, press the **Esc** key.

Editing the Structure of the Nested Tables

To edit the structure of the nested tables in **Grid** mode, Oxygen XML Editor Eclipse plugin provides the following actions in the contextual menu (many of them also appear in the submenus of the **Document** menu, or the toolbar):

 **Cut**,  **Copy**,  **Paste**,  **Delete** common editing actions

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste as Child

Pastes the copied content as the last child of the current selection.

Duplicate

Creates a new node by duplicating the currently selected one.

Insert Before

Offers a list of valid nodes, depending on the context, and inserts your selection before the currently selected node, as a sibling.

Insert After

Offers a list of valid nodes, depending on the context, and inserts your selection after the currently selected node, as a sibling.

Append Child

Offers a list of valid nodes, depending on the context, and appends your selection as a child of the currently selected node.

Sort Ascending, Sort Descending

The sorting result depends on the data type of the column content. It could be a numerical sorting for numbers or an alphabetical sorting for text information. The editor automatically analyzes the content and decides what type of sorting to apply. When a mixed set of values is present in the sorted column, a dialog box is displayed that allows you to choose the desired type of sorting between *numerical* and *alphabetical*.

Insert Row

Inserts a new row below the current selection. To insert a new row, you could also select the row header (the zone to the left of the row that holds the row number) and press **Enter**.

Insert Column

Inserts a column after the current selection.

Clear Content

Removes all content from the current cell.

Expand/Collapse > Expand All

Expands the selection and all its children.

Expand/Collapse > Collapse All

Collapses the selection and all its children.

Expand/Collapse > Expand Children

Expands all the children of the selection but not the selection.

Expand/Collapse > Collapse Children

Collapses all the children of the selection but not the selection.

Expand/Collapse > Collapse Others

Collapses all the siblings of the current selection but not the selection.

Refresh Selected

Forces the layout to be recomputed.

Related Information:

[Grid Mode Navigation \(on page 358\)](#)

[Copy and Paste in the Grid Editing Mode \(on page 362\)](#)

[Drag and Drop in the Grid Editing Mode \(on page 362\)](#)

[Content Completion Assistant in Grid Mode \(on page 364\)](#)

Drag and Drop in the Grid Editing Mode

You can easily arrange sections in your XML document in the **Grid** mode by using drag and drop actions.

You can do the following with drag and drop:

- Copy or move a set of nodes.
- Change the order of columns in the tables.
- Move the rows from the tables.

These operations are available for both single and multiple selections. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

While dragging, the editor paints guide-lines showing the locations where you can drop the nodes. You can also drag nodes outside the **Grid** editor and text from other applications into the **Grid**.

Tip:

When using drag and drop to reorganize the document, the resulting layout can be different from what you expected. For instance, the layout can contain a set of sibling tables that can be joined together.

To force the layout to be recomputed, you can use the  **Refresh Selected** action that is available in the contextual menu and in the **Document > Grid Edit** menu.

Copy and Paste in the Grid Editing Mode

Selecting content in the **Grid** mode is similar to working with any table with a little more complexity.

Specifically, depending on the type of node, when you select a cell, the selection may automatically include additional cells that are implied by the currently selected node. For example, if you click a node that contains any child nodes, all cells that contain the parent and child nodes will be selected. In this case, the currently selected cell is painted with a color that is different from the rest of the selection.

You can also select discontinuous regions of nodes and place them in the clipboard with the copy action. To deselect one of the selected fragments, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.

Pasting Content Within Grid Mode

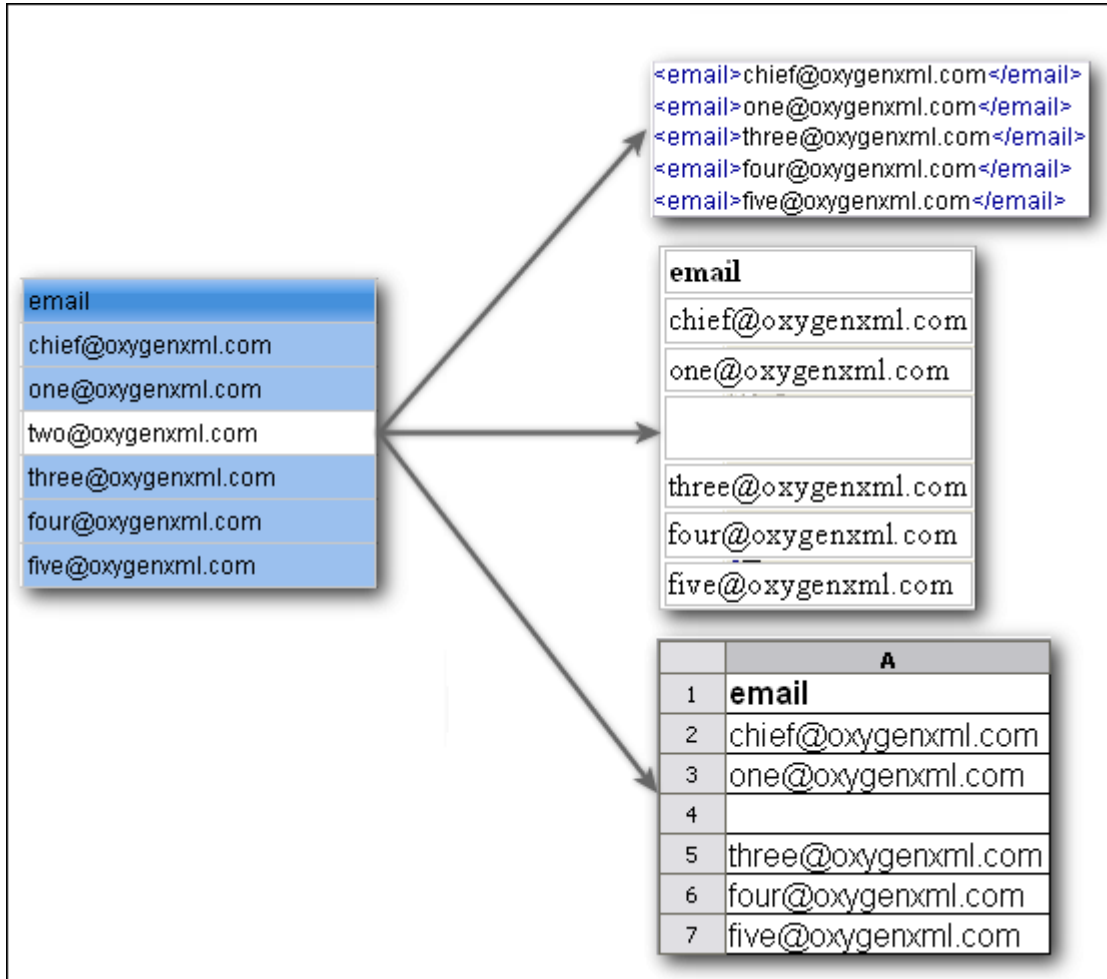

You can paste copied nodes relative to the currently selected cell using one of the following actions (available in the contextual menu):

-  **Paste (Ctrl + V (Command + V on macOS))** - Pastes copied content, as a sibling, just below (after) the current selection.
- **Paste as Child** - Pastes copied content as the last child of the current selection.

Pasting Content from Grid Mode to Other Editors

Nodes that are copied from the **Grid** editor can also be pasted into **Text** mode or other external applications. When pasting copied content from **Grid** mode, the inserted string represents the nodes serialization. The nodes from tables can be copied using HTML or RTF in table format. The resulting cells contain only the concatenated values of the text nodes.

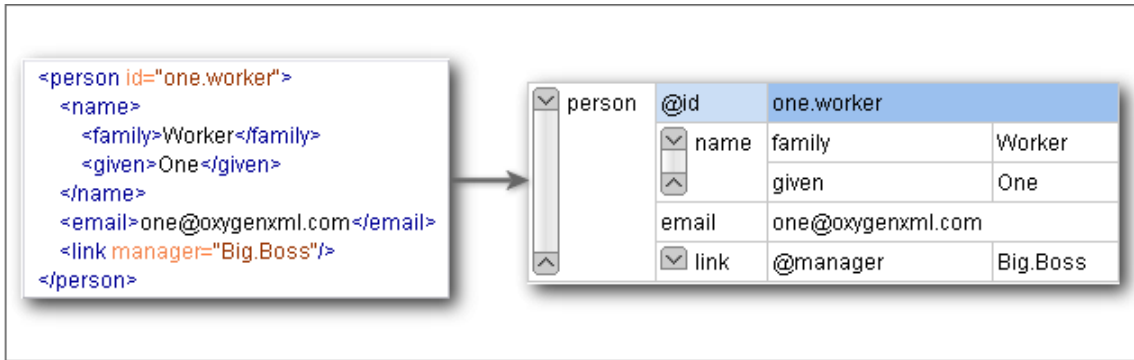

Figure 71. Copying from Grid to Other Editors

Pasting Content from Other Editors into Grid Mode

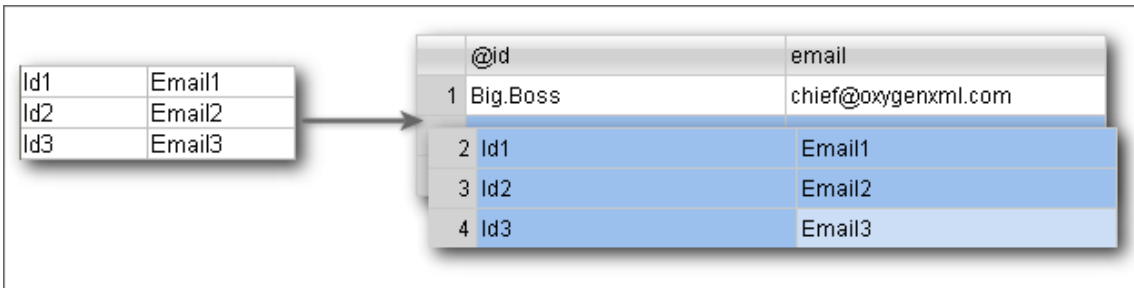

You can also paste well-formed XML content or tab-separated values from other editors into the **Grid** editor. If you paste XML content, the result will be the insertion of the nodes obtained by parsing this content.

Figure 72. Pasting XML Data into Grid

If the pasted text contains multiple lines of tab-separated values, it can be considered as a matrix of values. By pasting this matrix of values into the **Grid** editor, the result will be a matrix of cells. If the operation is performed inside existing cells, the existing values will be overwritten and new cells will be created when needed.

Figure 73. Pasting Tab-Separated Values into Grid

If you need to add copied content to your existing content (rather than overwriting existing cells), you need to first insert new cells by using the **Insert row** or **Insert column** actions from the contextual menu. This is useful, for example, when trying to transfer data from spreadsheet-like editors to the **Grid** editor.

Content Completion Assistant in Grid Mode

If the edited document is associated with a schema (DTD, XML Schema, Relax NG, etc.), the **Grid** editing mode offers a *Content Completion Assistant* (on page 2677) for the names and values of elements and attributes. If you choose to insert an element that has required content, the sub-tree of needed elements and attributes are also automatically included.

To display the content completion pop-up menu, simply double-click a cell that contains an element or attribute (or press **Enter** on your keyboard).

Figure 74. Content Completion in Grid Editing Mode

Special Character Support in Grid Mode

If you are editing documents with a bidirectional text orientation or other special characters (such as combining characters), you can change the way the text is rendered and edited in the grid cells by using the **Change Text Orientation (Ctrl + Shift + O (Command + Shift + O on macOS))** action that is available from the **Edit** menu in the **Grid** editing mode. Use this action to switch from the default left to right text orientation to the right to left orientation, and vice versa.

Note:

This change applies only to the text from the cells, and not to the layout of the grid editor.

Figure 75. Default left to right text orientation

<?xml	version="1.0" encoding="UTF-8"
sample	#text
(9 rows)	
1	عندما يريد العالم أن يتكلم، فهو يتحدث بلغة يونيكود.
2	Quan el món vol conversar, parla Unicode
3	כאשר העולם רוצה לדבר, הוא מדבר ב-Unicode
4	Ha a világ beszélni akar, azt Unicode-ul mondja
5	Quando il mondo vuole comunicare, parla Unicode
6	世界的に話すなら、Unicodeです。
7	세계를 향한 대화, 유니코드로 하십시오
8	Når verden vil snakke, snakker den Unicode
9	Når verda ønskjer å snakke, talar ho Unicode

Figure 76. Right to left text orientation

<?xml		"version="1.0" encoding="UTF-8"
sample		#text
(9 rows)	1	عندما يريد العالم أن يتكلم، فهو يتحدث بلغة يونيكود.
	2	Quan el món vol conversar, parla Unicode
	3	כאשר העולם חוצה לדבר, הוא מדבר ב-Unicode
	4	Ha a világ beszélni akar, azt Unicode-ul mondja
	5	Quando il mondo vuole comunicare, parla Unicode
	6	◦ 世界的に話すなら、Unicode です
	7	세계를 향한 대화, 유니코드로 하십시오
	8	Når verden vil snakke, snakker den Unicode
	9	Når verda ønskjer å snakke, talar ho Unicode

Exporting XML Content to Excel

For use-cases where you have XML content that needs to be exported to Excel (or any other spreadsheet application) but the content is not already in some sort of table format, **Grid** mode offers you a way to display the content of an XML document as a structured grid of nested tables and you can work with the cells in those tables much like you would with any spreadsheet application. This makes it possible to export content to Excel by copying cells that contain the specific content and then pasting the copied cells in Excel the same as you would when working with any table or spreadsheet.

To export XML content from **Grid** mode to Excel or other spreadsheet applications, follow this procedure:

1. Open the XML document in Oxygen XML Editor Eclipse plugin and switch to **Grid** mode.
2. [Expand the nodes \(on page 360\)](#) to gain access to the particular nested table that contains the content you want to export.
3. Copy the cells that contain the content you want to export (📄 **Copy** from the contextual menu or **Ctrl +C**).
4. Switch to your spreadsheet application and paste the copied cells.
5. You may need to make some manual adjustments depending on the complexity of the structure in the original XML document.

Note that Oxygen XML Editor Eclipse plugin also supports the reverse scenario (copying cells from a spreadsheet application and pasting them in **Grid** mode). For more information, see [Import from MS Excel Files – Grid Mode Method \(on page 1903\)](#).

Resources

For more information about exchanging data between Oxygen XML Editor Eclipse plugin and spreadsheet applications, watch our video demonstration:

<https://www.youtube.com/embed/8VwsF58zLkU>

[Pasting Content from Other Editors into Grid Mode \(on page 363\)](#)

Editing XML Documents in Author Mode

This section includes topics that describe how to work with XML documents in **Author** mode, including its various features, actions that are available, and much more.

The **Author** editing mode in Oxygen XML Editor Eclipse plugin allows you to visually edit XML documents in a user-friendly interface that is similar to a WYSIWYG word processor. This makes structured authoring easier for people who are not familiar with XML and it also provides easier access to the XML structure for XML experts. Oxygen XML Editor Eclipse plugin provides support for visually editing the most commonly used XML vocabularies in **Author** mode, including DITA, Doc Book, TEI, and XHTML.

Adding text content in **Author** mode is as simple as doing so in a standard text editor but the content is rendered similar to how you see it in the output. Tables, images, and media objects (such as videos) are also rendered comparable to the output. You can even play audio and video objects directly in **Author** mode and it includes an intuitive [Image Map Editor \(on page 496\)](#). You can easily change the rendering by selecting one of the preset [main styles \(on page 2680\)](#) from the **Styles** drop-down menu [\(on page 368\)](#) (available on the toolbar) and combine multiple [alternate styles \(on page 2676\)](#) that behave like layers. You can also use the options in the  **Tags Display Mode** drop-down menu [\(on page 372\)](#) to control how much XML markup is displayed in **Author** mode and there are various features and views that provide information about the XML structure based on your current location within the document.

Author mode provides numerous helpful editing actions, many of which are specific to the type of document you are editing and it includes a variety of other powerful editing features, such as keyboard shortcuts, [drag and drop support \(on page 389\)](#), a [Smart Paste mechanism \(on page 390\)](#), and an [intelligent Content Completion Assistant \(on page 393\)](#). **Author** mode also allows you to visualize and [manage profiled content \(on page 442\)](#), you can collaborate with others with various [review features \(on page 416\)](#) (such as the ability to add comments, track changes, or highlight content), and includes many other unique features.

To switch to this mode, click the **Author** button at the bottom of the editing area.

Resources

For more information about some of the features available in the visual **Author** editing mode, watch our video demonstration:

<https://www.youtube.com/embed/bnQwJZD58wY>

Author Mode User Roles

There are two main types of users for the **Author** mode: *framework developers* and *content authors*.

Framework Developers

A *framework developer* is a technical person with advanced XML knowledge who defines the *framework* ([on page 2679](#)) for authoring XML documents in the visual editor. Once the *framework* is created or edited by the developer, it is distributed as a deliverable component ready to plug into the application for the content authors.

The *framework* (document type) configuration defines a type of XML document by specifying all the details needed for editing the content of XML documents in **Author** mode.

The *framework* details that are created and customized by the developer include:

- The CSS stylesheet that drives the visual rendering of the document.
- The rules for associating an XML schema with the document, which is needed for the content completion assistance and validation of the document.
- Transformation scenarios for the document.
- Configuration of *XML Catalogs* ([on page 2683](#)).
- Custom actions available as buttons on the toolbar or in menus.

Oxygen XML Editor Eclipse plugin includes some ready-to-use built-in document types for XML *frameworks*, such as DocBook, DITA, TEI, JATS, and XHTML.

Content Authors

A *content author* does not need to have advanced knowledge about XML markup, operations such as validation of XML documents, or applying XPath expressions to an XML document. The content author just uses the *framework* set up by the developer in the application and starts editing the content of XML documents without editing the XML tags directly.

Changing the Look of Documents in Author Mode Using the Styles Menu

The **Author** mode renders the content of the XML documents visually, based on CSS stylesheets associated with the document.

Oxygen XML Editor Eclipse plugin provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style* ([on page 2680](#)) and multiple *alternate CSS styles* ([on page 2676](#)). This makes it easy to change the look of the document as it appears in **Author** mode.

The list of CSS styles that are available in the **Styles** menu depend on the *framework* ([on page 2679](#)) (document type).

Figure 77. Styles Drop-down Menu in a DITA Document

You can use the **Styles** drop-down menu to select a *main css style* (on page 2680) that applies to the whole document and then select one or more *alternate css styles* (on page 2676) that behave like layers and are merged sequentially with the *main style*. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in **Author** mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor Eclipse plugin remembers them when subsequent documents are opened.

Main CSS Styles

The *main styles* are listed in the top section and each of their corresponding CSS files contain all the styles associated with the XML elements for the particular type of document. You can only select one main style at a time.

Alternate CSS Styles

The *alternate styles* are listed in the bottom section and their corresponding CSS files contain additional styling for certain XML elements and are merged with the selected *main styles*. You can select as many alternate styles as you wish (they are applied sequentially as layers). If you are unsure about how each of the styles will change the look of your documents based solely upon their name, there is no harm in selecting them to see the difference. You can simply deselect them to revert to the previous look.

**Note:**

If you deselect the **Enable multiple selection of alternate CSSs** option (*on page 96*) in the **CSS** subtab of the **Document Type** configuration dialog box (*on page 90*), the *alternate styles* are treated like *main CSS styles* and you can only select one at a time.

**Tip:**

For information about configuring the **Styles** drop-down menu, see [Configuring and Managing Multiple CSS Styles for a Framework](#) (*on page 1955*).

Related information

[Associating a Schema to XML Documents](#) (*on page 584*)

[Configuring and Managing Multiple CSS Styles for a Framework](#) (*on page 1955*)

Navigating the Document Content in Author Mode

Oxygen XML Editor Eclipse plugin includes some useful features to help you navigate XML documents.

Navigation Keyboard Shortcuts

Tab

Navigate to the next XML node.

**Tip:**

If you encounter a *space-preserved element* (*on page 2682*) when you navigate through a document and you do not press another key, pressing the **Tab** key will continue the navigation. However, if the cursor is positioned in a *space-preserved element* and you press another key or you position the cursor inside such an element using the mouse, the **Tab** key can be used to arrange the text.

Shift + Tab

Navigate to the previous XML node.

Ctrl + RightArrow (Command + RightArrow on macOS)

Navigate one word forward.

Ctrl + LeftArrow (Command + LeftArrow on macOS)

Navigate one word backward.

Ctrl + Home (Command + Home on macOS)

Position the cursor at the beginning of the document.

Ctrl + End (Command + End on macOS)

Position the cursor at the end of the document.

Navigating to a Modification

Oxygen XML Editor Eclipse plugin includes some actions to help you quickly navigate to a particular modification. They can be invoked using keyboards shortcuts or from the **Navigation** menu:

Last Edit Location (**Ctrl+Q**)

Navigates to the last modification in any open tab.

Back (**Alt+LeftArrow (Command+OpenBracket on macOS)**)

Navigates to the last selected editor tab or to the last selected element/content in the current tab. You can also go back after clicking on links.

Forward (**Alt+RightArrow (Command+CloseBracket on macOS)**)

Available after you use the **Back** button at least once, and it navigates in the opposite direction as the **Back** button.

Navigating with the Outline View

Oxygen XML Editor Eclipse plugin includes an **Outline view** ([on page 326](#)) that displays a hierarchical tag overview of the currently edited XML Document.

You can use this view to quickly navigate through the current document by selecting nodes in the outline tree. It is synchronized with the editor area, so when you make a selection in the **Outline** view, the corresponding nodes are highlighted in the editor area.

Figure 78. Outline View Navigation in Author Mode

Using the Breadcrumb to Navigate

A *breadcrumb* in the toolbar area at the top of the document indicates the path from document root to the current element. It can also be used as a helpful tool to navigate to specific elements throughout the structure of the document.

Figure 79. Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. Clicking an element from the *breadcrumb* selects the entire element and navigates to it in the editor area.

Using the Linking Support

When working on multiple documents that reference each other (references, external entities, XInclude, DITA conref, etc.), the **linking support** is useful for navigating between the documents. In the built-in frameworks that are bundled with Oxygen XML Editor Eclipse plugin, links are marked with the  icon (or the  icon for key-based references). When hovering over the icon, the mouse pointer changes its shape to indicate that the link can be accessed and a tooltip presents the destination location. Click the link to open the referenced resource in the editor or system browser. The same effect can be obtained by pressing the **F3** key when the cursor is inside a link element.

Note:

Depending on the referenced file type, the target link will either be opened in the Oxygen XML Editor Eclipse plugin or in the default system application. If the target file does not exist, Oxygen XML Editor Eclipse plugin prompts you to create it.

Displaying the Markup

You can control the amount of markup that is displayed in the **Author** mode with various levels of tag modes for both *block* and *in-line* elements.

Tags Display Mode

The following dedicated tag modes are available from the  **Tags Display Mode** drop-down menu (available on the toolbar):

Full Tags with Attributes

Displays full tag names with attributes for both *block* ([on page 2676](#)) and *inline elements* ([on page 2679](#)). Oxygen XML Editor Eclipse plugin

Full Tags

Displays full tag names without attributes for both *block elements* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Block Tags without Element Names

Displays tags for *block elements* but without element names for a more compact version of **Block Tags** mode. You can still see the element names by hovering over the tags.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Note:

The associated CSS information is used to determine whether a tag should be considered *inline* or *block*. If the current document does not have an associated CSS stylesheet, then the **Full Tags** mode will be used.

Displaying Referenced Content

The references to external entities, XInclude, DITA conrefs, and constructs in other vocabularies [with displayable referenced content \(on page 2052\)](#) are expanded by default in **Author** mode and the referenced content is displayed. The referenced resources are loaded and displayed inside the element or entity that references them, but the displayed content cannot be modified directly in the document. You can control this behavior from the [Author preferences page \(on page 136\)](#). If the [Display referenced content option \(on page 139\)](#) is not selected, the referenced resources are not automatically loaded and displayed, but each reference can be expanded on demand by using the small expansion button located next to each element that contains references.

If the referenced resource cannot be resolved, an error will be presented inside the element that refers them instead of the content.

If you want to make modifications to the referenced content, you must open the source where the referenced resource resides. The referenced resource can be opened quickly by clicking the link (marked with the  icon, or the  icon for key-based references) that is displayed before the referenced content or by using the **Edit Reference** action from the contextual menu (in this case, the cursor is placed at the precise location where the action was invoked). The referenced resource is resolved through the [XML Catalog \(on page 2683\)](#) set in the [XML Catalog preferences page \(on page 189\)](#).

The referenced content is refreshed as follows:

- Automatically, when it is modified and saved from Oxygen XML Editor Eclipse plugin.
- On demand, by using the  **Refresh references** action [\(on page 526\)](#). This is useful when the referenced content is modified outside the Oxygen XML Editor Eclipse plugin scope.

Related Information:

[Configuring a Reference Resolver \(on page 2052\)](#)

Visual Hints for the Cursor Position

When the cursor is positioned inside a new context, a tooltip will be shown for a couple of seconds displaying the position of the cursor relative to the context of the current element.

Here are some of the common situations that can be encountered:

- **Before first *block*** - The cursor is positioned before the first *block (on page 2676)* child of the current node.

- **Between two *block elements*** - The cursor is positioned between two *block elements (on page 2676)*.

- **After last *block*** - The cursor is positioned after the last *block element (on page 2676)* child of the current node.

- **Inside a *node*** - The cursor is positioned inside a node.

- **Before an *inline element*** - The cursor is positioned inside an element, before a child *inline element (on page 2679)*.

- **Between two *inline elements*** - The cursor is positioned between two *inline elements (on page 2679)*.

- **After an inline element** - The cursor is positioned inside an element, after a child *inline element* (on page 2679).

The nodes in these cases are displayed in the tooltip window using the element names.

To deactivate this feature, open the **Preferences** dialog box (on page 70), go to **Author > Cursor Navigation**, and deselect the **Show cursor position tooltip** option (on page 143). Even if this option is deselected, you can still display the position tooltip by pressing **Shift+F2**.

Note:

The position information tooltip is not displayed if **Full Tags with Attributes** or **Full Tags** is selected in the  **Tags display mode** drop-down menu (on page 372).

Location Tooltip

When editing XML documents in a visual environment, you might find it difficult to position the cursor between certain tags that do not have a visual representation. To counterbalance this, Oxygen XML Editor Eclipse plugin displays a transparent preview of the position information, called the **Location Tooltip**:

Figure 80. Location Tooltip

Oxygen XML Editor Eclipse plugin displays a **Location Tooltip** when the following conditions are met:

- You are editing the document in one of the following *tags display modes* (on page 372): **Inline Tags**, **Partial Tags**, **No Tags**.
- The mouse pointer is moved between *block elements* (on page 2676).

To activate or deactivate this feature, use the **Show location tooltip on mouse move** option (on page 143) in the **Cursor Navigation** preferences page (on page 143).

Whitespace Handling in Author Mode

When you edit a document in **Author** mode, Oxygen XML Editor Eclipse plugin must serialize the resulting document as XML. Oxygen XML Editor Eclipse plugin serializes the document when you save it or switch to another editing mode. When the document is serialized, Oxygen XML Editor Eclipse plugin **formats and indents the XML document** (on page 338) according to the current **format and indent settings** (on page 162).

Minimizing Whitespace Differences Between Versions

When serializing a document to XML, **Author** mode will only format and indent those elements of the document that have been edited. Any element that has not been edited will be serialized exactly as it was loaded from disk. This is useful when your content is managed in a version control systems, as it avoids introducing insignificant whitespace differences between version, which in turn makes diff output easier to read.

Entering Whitespace in Author Mode

Oxygen XML Editor Eclipse plugin controls the entry of whitespace characters in **Author** mode according the [XML whitespace rules \(on page 338\)](#), which means it will not let you insert insignificant whitespace. This means that it will not let you insert extra line-breaks or spaces inside a typical paragraph element, for instance. (Any such whitespace would be normalized away when the document was serialized to XML, so Oxygen XML Editor Eclipse plugin is saving you from any surprises when this happens.)

Of course, you will legitimately want to enter additional spaces and returns in some cases, such as code samples. Oxygen XML Editor Eclipse plugin will allow this in elements that are configured as preserve space elements according to the XML whitespace rules. For all of its [built-in document types \(on page 1030\)](#), Oxygen XML Editor Eclipse plugin is [correctly configured to recognize preserve space elements \(on page 166\)](#) and to allow you to enter additional spaces in them.

If you are using a built-in document type and you are unable to enter additional whitespace, make sure that you are using an element from that document type that is intended to be a preserve-space element.

If you are using a custom document type, make sure that it is [configured correctly \(on page 1941\)](#) so that Oxygen XML Editor Eclipse plugin recognizes that the current element is a preserve-space element.

Serialization Options for Author Mode

The **Options > Preferences > Editor > Edit modes > Author > Serialization** page contains some options that control how the formatting and indenting is applied when a document is saved in **Author** mode or when switching from **Author** to **Text** mode. It also includes a [Compatibility with other tools option \(on page 158\)](#) that controls how line breaks are handled when a document is serialized to help obtain better compatibility with other applications.

Editing Content in Author Mode

The **Author** mode includes a large variety of user-friendly authoring features to help you work with XML content, including numerous toolbar, menu, and shortcut actions and some specialized content editing features.

Undo/Redo Actions

The typical undo and redo actions are available with shortcuts or in the **Edit** menu:

Undo (Ctrl + Z (Command + Z on macOS))

Reverses a maximum of 200 editing actions to return to the preceding state.

Note:

Complex operations such as **Replace All** or **Indent selection** count as single undo events.

Redo (Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix))

Recreates a maximum of 100 editing actions that were undone by the **Undo** function.

Copy and Paste Actions

The typical copying and pasting actions are available with shortcuts or in the contextual menu (or the **Edit** menu):

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Select All (Ctrl + A (Command + A on macOS))

Selects the entire content of the current document.

Entering Text in Elements

By default, you can only enter text in elements that accept text content. If the element is declared as *empty* or *element only* in the associated schema, you are not allowed to insert text in it. Instead, a warning message is displayed.

Figure 81. Editing in empty element warning

To allow text to be inserted in these instances, go to the **Schema-Aware** preferences page and deselect the **Reject action when its result is invalid** option in the **Typing** actions section (*on page 155*).

Editing Text Content Without Modifying the XML Markup

You can use the options in the  **Tags Display Mode** drop-down menu (*on page 372*) (available on the toolbar) to control how tags are displayed in **Author** mode. This can help you to clearly see where the current cursor position is within the tag structure so that you can avoid making unintended modifications to the

XML markup. You can also switch to the **Grid editing mode** ([on page 357](#)) to modify text content without affecting the XML tags.

Related Information:

[Editing XML Markup in Author Mode](#) ([on page 378](#))

[Drag and Drop in Author Mode](#) ([on page 389](#))

[Smart Paste in Author Mode](#) ([on page 390](#))

[Content Completion Assistant in Author Mode](#) ([on page 393](#))

[Contextual Menu Actions in Author Mode](#) ([on page 531](#))

Editing XML Markup in Author Mode

Oxygen XML Editor Eclipse plugin includes some useful actions that allow you to easily edit XML markup in **Author** mode. Most of these actions are available in the contextual menu and some of them have simple keyboard shortcuts.

Selecting XML Markup in Author Mode

Selecting XML tags in Oxygen XML Editor Eclipse plugin is very simple with several methods for selecting entire elements:

- **Breadcrumb** - Click the element (XML tag) on the [breadcrumb](#) ([on page 378](#)) displayed at the top of the editing window.
- **Outline View** - Click the element name in the **Outline view** ([on page 326](#)).
- **Full Tags Mode** - While editing in **Full Tags mode** ([on page 372](#)), click the start or end tag of the element in the editor.
- **Mouse Selection** - While editing in **Full Tags mode** ([on page 372](#)), click before the start tag of the element, drag the selection, and release the mouse button after the end tag.
- **Shift + Arrow Keys** - While editing in **Full Tags mode** ([on page 372](#)), place the cursor before the start tag of the element, press and hold **Shift**, and use the arrow keys to make the selection (including the end tag).

**Note:**

If the selection does not include the entire element (for example you do not include the end tag of the element), Oxygen XML Editor Eclipse plugin will automatically close the appropriate tags when pasting the copied selection. This ensures that the pasted content will always result in [well-formed XML](#) ([on page 545](#)).

Using the Breadcrumb in Author Mode

A *breadcrumb* on the top stripe indicates the path from document root to the current element. It can also be used as a helpful tool to insert and edit specific elements in the document structure.

Figure 82. Breadcrumb in Author Mode

The last element listed in the *breadcrumb* is the element at the current cursor position. The last element is also highlighted by a thin light blue bar for easier identification. Clicking an element from the *breadcrumb* selects the entire element in the editor area and each element provides a contextual menu with access to the following actions:

Edit Attributes

Opens the [in-place attributes editor \(on page 407\)](#) that allows you to easily edit the attributes of an element.

Edit Profiling Attributes

Allows you to select the [profiling attributes \(on page 442\)](#) that apply to a certain element.

Append child

Opens a content completion list that allows you to select an element to be inserted as a child of the selected element.

Insert before

Opens a content completion list that allows you to select an element to be inserted (as a sibling) before the selected element.

Insert after

Opens a content completion list that allows you to select an element to be inserted (as a sibling) after the selected element.

Cut

Removes the selected element and copies it to the clipboard, while preserving the styles of the content.

Copy

Copies the selected element to the clipboard, while preserving the styles of the copied content.

Paste

Pastes a well-formed element from the clipboard at currently selected position in the breadcrumb.

Paste before

Insert a well-formed element (from the clipboard) before the currently selected element.

Paste after

Insert a well-formed element (from the clipboard) after the currently selected element.

Paste as XML

Inserts clipboard content that is considered to be well-formed XML content, preserving its XML structure.

Delete

Deletes the currently selected element.

Toggle Comment

Encloses the currently selected element in a comment if the element is not commented, or removes the comment if it is commented.

Rename Element

Opens the **Rename** dialog box that allows you to rename the currently selected element and other elements with the same name.

Tip:

The tag names displayed in the *breadcrumb* can be customized with an **Author** mode extension class that implements the *AuthorBreadcrumbCustomizer* API. See the [Oxygen SDK](#) for more details.

Move Nodes

You can move XML nodes in the current document by using the following actions in the **Refactoring** submenu of the contextual menu:

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Tip:

The easiest way to move nodes is to use the Alt + UpArrow (Option + UpArrow on macOS) and Alt + DownArrow (Option + DownArrow on macOS) shortcut keys.

Promote/Demote Nodes

You can easily promote or demote selected nodes (for example, within ordered lists or unordered lists) by using the following keyboard shortcuts:

Promote (Shift + Tab)

Promotes an entirely selected node to be a sibling of its parent node (the list item is moved to the left). It also works for selections of multiple nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Demote (Tab)

Demotes an entirely selected node (the list item is moved to the right). It also works for selections of multiple nodes as long as all the selected nodes are siblings (on the same hierarchical level).

Join or Split Elements

You can join or split elements in the current document by using the following actions in the **Refactoring** submenu of the contextual menu:

Join Elements

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Tip:

Specifically, the **Delete** or **Backspace** keys can be used to join *block elements* in the following situations:

- The cursor is located before the end position of the first element and **Delete** key is pressed.
- The cursor is located after the end position of the first element and **Backspace** key is pressed.
- The cursor is located before the start position of the second element and **Delete** key is pressed.
- The cursor is located after the start position of the second element and **Backspace** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Rename Elements

You can rename elements by using the following action in the **Refactoring** submenu of the contextual menu:

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Surround Content with Tags (Wrap)

You can surround a selection of content with tags (*wrap* the content) by using the following action in the **Refactoring** submenu of the contextual menu:

Surround with Tags (**Alt + Shift + E**)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option** (*on page 120*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option** (*on page 120*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (**Alt + Shift + ForwardSlash**)

Surround the selected content with the last tag used.

Unwrap the Content of Elements

You can unwrap the content of an element by using the following action in the **Refactoring** submenu of the contextual menu:

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Tip:

Specifically, the **Delete** or **Backspace** keys can be used to unwrap the content of an element in the following situations:

- The cursor is located before the start position of the element and **Delete** key is pressed.
- The cursor is located after the start position of the element and **Backspace** key is pressed.
- The cursor is located before the end position of the element and **Delete** key is pressed.
- The cursor is located after the end position of the element and **Backspace** key is pressed.

If the element has no sibling or the sibling element has a different name, an **Unwrap** operation will be performed.

Remove Markup from Blocks of Content

You can remove the markup from the current element by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu:

 **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

**Tip:**

You can use the **Delete** or **Backspace** keys to remove markup, in which case the elements in the selected block will be unwrapped or joined with their sibling, or if the current element is empty, the element tags will be deleted.

Remove Text from Selected Markup

You can remove the text from elements by highlighting the appropriate block of content and using the following action in the **Refactoring** submenu of the contextual menu:

 **Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Other Refactoring Actions

You can also manage the structure of the markup by using the other specific XML refactoring actions that are available in the **Refactoring** submenu of the contextual menu:

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Copying XML Content in Author Mode to the Clipboard

It is possible to copy the XML structure of a document to the system clipboard. Simply select the XML content in **Author** mode (for example, by selecting an element in the breadcrumb), and select **Document > Edit > Copy as XML**. The system clipboard will now contain the corresponding XML structure.

[Contextual Menu Actions in Author Mode \(on page 531\)](#)

Editing Attributes in Author Mode

You can easily edit attributes in **Author** mode by using the **Attributes View** ([on page 405](#)) and Oxygen XML Editor Eclipse plugin also allows you to edit attribute and element values in-place, directly in the **Author** mode, using an in-place attribute editor.

In-place Attributes Editor

Oxygen XML Editor Eclipse plugin includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes:
 -  **Full Tags with Attributes**,
 -  **Full Tags**,
 -  **Block Tags**, or
 -  **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 83. In-place Attributes Editor**Name Combo Box**

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

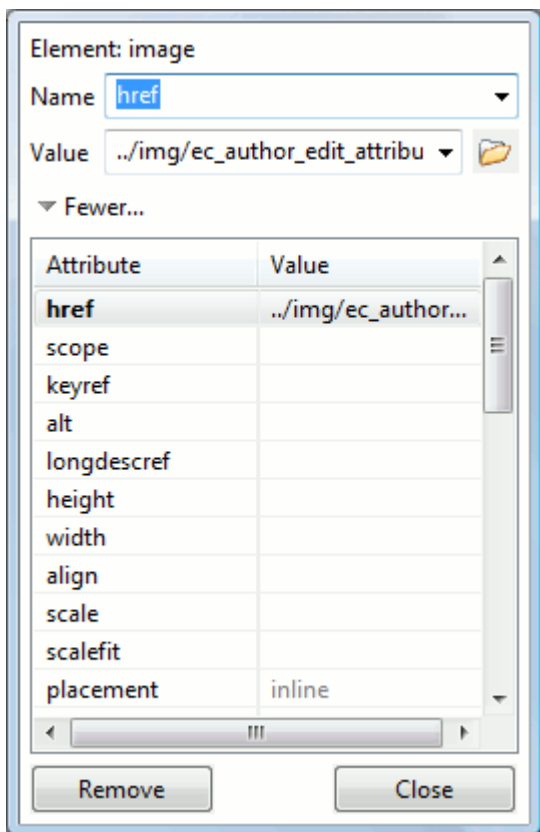

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

**Note:**

For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the  **Browse** button is replaced by a  **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

Figure 84. In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

**Note:**

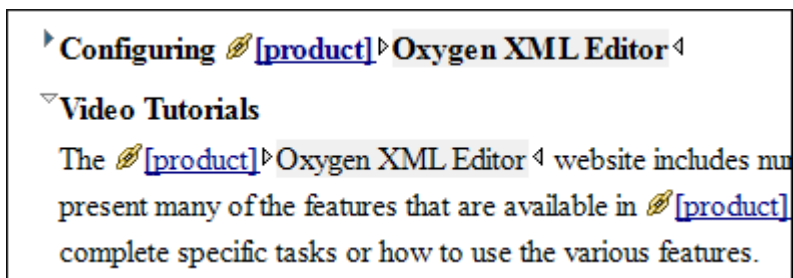

If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

[Attributes View in Author Mode \(on page 405\)](#)

Folding XML Elements in Author Mode

When working with a large document, the *folding* (on page 2679) support in Oxygen XML Editor Eclipse plugin can be used to collapse some element content leaving only the parts that you need to edit in focus. Expanding and collapsing works on individual elements. Expanding an element leaves the child elements unchanged.

Figure 85. Folding of XML Elements in Author Mode

Folding Actions in Author Mode

Foldable elements (on page 2679) are marked with a small triangle ( / ) on the left side of the editor panel. If you hover over that arrow, the entire content of the element is highlighted by a dotted border for quick identification of the *foldable* area. To toggle the fold, simply click the icon. Also, the following actions are available in the **Folding** sub-menu of the contextual menu:

Toggle Fold (or you can simply click on the / arrow)

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the child elements that are indented one level inside the current element.

Expand Child Folds

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

Resources

For more information about the *folding* support in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

https://www.youtube.com/embed/eR9HfN_peAE

Related Information:

[Folding Elements: -oxy-foldable / -oxy-folded / -oxy-not-foldable-child \(on page 2159\)](#)

Drag and Drop in Author Mode

The Oxygen XML Editor Eclipse plugin **Author** mode includes support for dragging and dropping content in XML documents.

When editing content in **Author** mode, entire sections or chunks of data can be moved or copied by using the drag and drop feature. The following situations can be encountered:

- When both of the drag and drop sources are from the **Author** mode editor, a well-formed XML fragment is transferred. The section is balanced before dropping it by adding matching tags when needed.
- When the drag source is from the **Author** mode editor but the drop target is a text-based editor, only the text inside the selection is transferred as it is.
- The text dropped from another text editor or another application into the **Author** mode editor is inserted without changes.

Related Information:

[Smart Paste in Author Mode \(on page 390\)](#)

Smart Paste in Author Mode

The **Author** editing mode includes a *Smart Paste* feature that preserves certain style and structure information when copying content and pasting it into document types that support the feature. You can copy content from various sources, including web pages, external applications (such as Office-type applications), Markdown documents, or other types of documents and then paste it into DITA, TEI, DocBook, JATS, and XHTML documents. Oxygen XML Editor Eclipse plugin preserves the original text styling (such as bold, italics, underline) and formatting (such as lists, tables, paragraphs) and considers various pasting solutions to keep the resulting document valid.

The styles and general layout of the pasted content are converted to the equivalent XML markup for the target document type while preserving certain style and structure information. For example, if you copy content that includes multiple paragraphs and then paste it in **Author** mode, the multiple paragraph structure is preserved. If you paste the content in a location where the resulting XML would not be valid, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

Notes:

- When pasting text fragments formatted with the *Courier New* font, the *Smart Paste* mechanism will wrap it in an inline code element (for example, in DITA it would be wrapped in a `<codeph>` element).
- Review comments that exist in the copied Word content are intentionally ignored when pasting the content in **Author** mode.

Smart Paste Options

By default, the *Smart Paste* feature is enabled in Oxygen XML Editor Eclipse plugin. There are several options in the [Schema Aware preferences page \(on page 154\)](#) that control the *Smart Paste* mechanism:

- **Smart paste and drag and drop** (*on page 155*) - This option determines whether or not Oxygen XML Editor Eclipse plugin will try to find an appropriate insert position when the current location is not valid for the pasted content. This option is selected by default.
- **Reject action when its result is invalid** (*on page 155*) - If you select this option, Oxygen XML Editor Eclipse plugin will not let you paste content into a position where it would be invalid. This option is deselected by default.
- **Convert external content on paste** (*on page 156*) - This option determines whether or not Oxygen XML Editor Eclipse plugin will convert the styling and formatting of copied content from external sources when pasting it into a document type that supports the feature. This option is selected by default.
- **Convert even when pasting inside space-preserve elements** (*on page 157*) - If you select this option, the *Smart Paste* feature will also work when pasting external content into a *space-preserve* element (such as a `<codeblock>`). This option is deselected by default.

Smart Paste Supported Document Types

The *Smart Paste* feature is supported for the following document types (*frameworks (on page 2679)*):

- DITA
- DocBook 4
- DocBook 5
- TEI
- XHTML
- JATS

Resources

For more information about the *Smart Paste* support, watch our video demonstration:

Selecting Content in Author Mode

Oxygen XML Editor Eclipse plugin includes a variety of features and keyboard shortcuts to help you select content in **Author** mode.

Selection Shortcuts in Author Mode

Ctrl + A (Meta + A on macOS)

Selects all content in the document.

Shift + Left/Right Arrow Keys

Begins a continuous selection at the cursor position and extends it one character at a time in the direction that you press the arrow keys.

Shift + Up/Down Arrow Keys

Begins a continuous selection at the cursor position and extends it one line at a time in the direction that you press the arrow keys.

Ctrl + Shift + Left/Right Arrow Keys (Meta + Shift + Left/Right Arrow Keys on macOS)

Begins a continuous selection at the cursor position and extends it one word at a time in the direction that you press the arrow keys.

Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the current line (on macOS, it extends to the beginning of the document).

Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the current line (on macOS, it extends to the end of the document).

Ctrl + Shift + Home

Begins a continuous selection at the cursor position and extends it to the beginning of the document.

Ctrl + Shift + End

Begins a continuous selection at the cursor position and extends it to the end of the document.

Shift + PageUp

Begins a continuous selection at the cursor position and extends it up one screen page.

Shift + PageDown

Begins a continuous selection at the cursor position and extends it down one screen page.

Double-Click

Selects the word at the cursor position.

Triple-Click

Selects the node at the cursor position.

Right-Click > Select > Element

Selects the entire element at the current cursor position.

Right-Click > Select > Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Right-Click > Select > Parent

Selects the entire parent element at the current cursor position.

Intelligent Selection in Author Mode

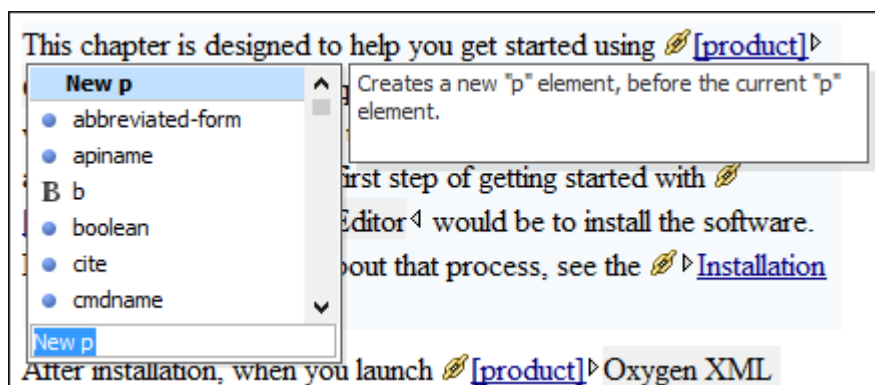

Oxygen XML Editor Eclipse plugin supports all usual content selection methods using the mouse or keyboard shortcuts (for example **Shift + Arrow Keys**). When selecting content in **Author** mode, there may be instances where you want to select an element (along with its content) rather than just inline text content. There are several ways to select an element, including:

- You can select an element by clicking the element name in the *breadcrumb* (on page 371).
- You can select an element using the **Outline** view (on page 326).
- If you have the  **Tags Display Mode** (on page 372) set to any of the modes other than  **Partial Tags** or  **No Tags**, you can select an element directly in the main editing pane by clicking on the element's tag.
- If you have the  **Tags Display Mode** (on page 372) set to  **Partial Tags** (and the **Compact tag layout** option is enabled in the **Author** preferences page (on page 139)), you can still select certain block elements directly in the main editing pane by spanning the selection to the right of the end of the content that is inside a block element so that the selection includes the element's *invisible* end tag. In this mode, the end tag is normally not visible, but when your selection includes the invisible end tag, a tooltip displays the selected element name and the selection includes the whole element (along with its content).

Content Completion Assistant in Author Mode

One of the most useful features in **Author** mode is the *Content Completion Assistant* (on page 2677). It offers a list of elements, attributes, attribute values, and other options that are valid in the current editing context.

Figure 86. Content Completion Assistant in Author Mode

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (on page 70), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 119).

Using the Content Completion Assistant in Author Mode

To activate the feature in **Author** mode, use any of the following shortcut keys:

- **Enter**
- **Ctrl + Space**
- **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In some cases, the *Content Completion Assistant* displays a documentation window with information about the particular proposal and some of them have links to additional information (for example, DITA elements might have a link to the DITA Style Guide). You can use **Tab** and **Shift + Tab** to navigate to those links and **Space** to trigger them. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Author** mode, simply press **Enter**.

Types of Proposals Listed in the Content Completion Assistant

The *Content Completion Assistant* offers the following types of proposed actions depending on the current context:

- Insert allowed elements for the current context schema and the list of proposals contains elements depending on the elements inserted both before and after the cursor position.
- Insert element values if such values are specified in the schema for the current context.
- Insert new undeclared elements by entering their name in the text field.
- Insert CDATA sections, comments, processing instructions.
- Insert [code templates \(on page 323\)](#).
- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in  **Full Tags mode (on page 372)**), it will allow you to rename the element.
- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.
- If invoked on an empty list item that is the last element of the list, it will allow you to convert the list item to a paragraph.
- If the **Show all possible elements in the content completion list** option from the **Schema-Aware preferences page (on page 156)** is selected, the content completion pop-up window will present all the elements defined by the schema. When choosing an element from this section, the insertion will be performed using the schema-aware smart editing features.

Note:

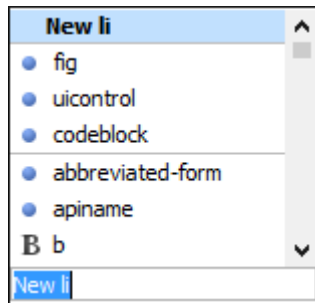

By default, you are not allowed to insert element names that are not defined by the schema. This can be changed by deselecting the **Allow only insertion of valid elements and attributes** check box from the **Schema-Aware preferences page (on page 156)**.

Examples of How the Content Completion Assistant Works

To illustrate how the feature works, consider the following examples of invoking the *Content Completion Assistant* in certain contexts:

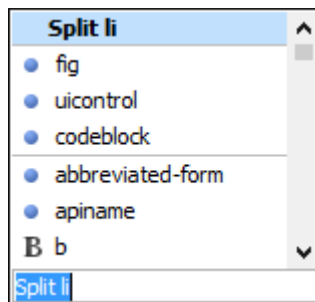

- If the cursor is positioned at the beginning or at the end of the element, the first item offered in the *Content Completion Assistant* is a **New <Element>** item. Selecting this item will insert an empty element.

Figure 87. Example (New [Element Name])

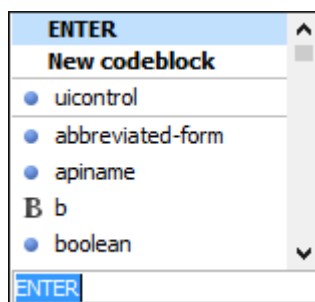

- If the cursor is positioned somewhere inside the element, the first entry in the *Content Completion Assistant* is a **Split <Element>** item. In most cases, you can only split the closest *block element* (on page 2676) to the cursor position, but if it is inside a list item, the list item will also be proposed for split. Selecting **Split <Element>** splits the content of the specified element around the cursor position.

Figure 88. Example (Split [Element Name])

- If the cursor is positioned inside a *space-preserved element* (on page 2682) (for example, a *codeblock*), the first choice in the *Content Completion Assistant* is **Enter**, which will insert a new line in the content of the element, followed by **New <Element>**.

Figure 89. Example ('ENTER' New Line)

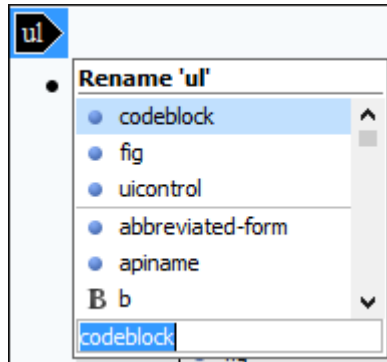

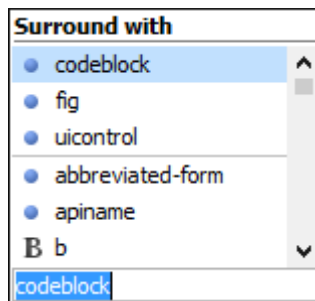

- If invoked on a selection that only contains an element start or end tag (remember that you can see all element tags while working in  **Full Tags mode** (*on page 372*)), it will allow you to rename the element.

Figure 90. Example (Rename)

- If invoked on a selection of multiple elements or other content, it will allow you to surround the content with certain tags.

Figure 91. Example (Surround)

Related Information:

[Customizing the Content Completion Assistant Using a Configuration File](#) (*on page 2002*)

Set the Schema to be Used for Content Completion

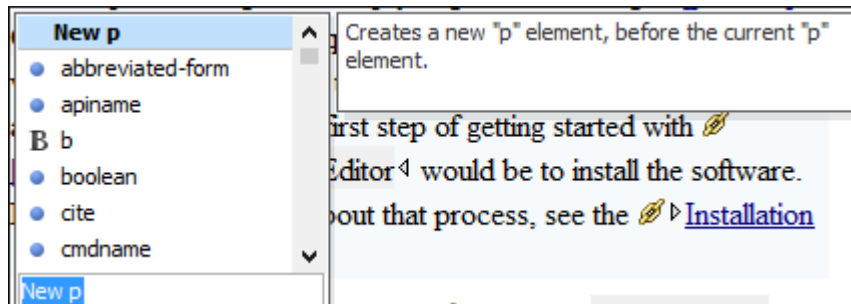

The proposals that are presented in the *Content Completion Assistant* (*on page 2677*) depend on the associated schemas. The DTD, XML Schema, Relax NG, or NVDL schema used to populate the *Content Completion Assistant* is specified in the following methods, in the order of their precedence:

- The [schema specified explicitly in the document](#) (*on page 591*). In this case, Oxygen XML Editor Eclipse plugin reads the beginning of the document and resolves the location of the DTD, XML Schema, Relax NG schema, or NVDL schema.
- The [default schema declared](#) (*on page 593*) in the **Schema** tab of the **Document Type** configuration dialog box (*on page 94*) for the particular document type.

Schema Annotations in Author Mode

A *schema annotation* is a documentation snippet associated with the definition of an element or attribute in a schema. If such a schema is associated with an XML document, the annotations are displayed in the *Content Completion Assistant* (on page 2677).

Figure 92. Schema Annotation in the Content Completion Assistant

The schema annotations support is available if the schema type is one of the following:

- XML Schema
- Relax NG
- NVDL schema
- DTD

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant** (on page 121) option in the **Annotations** preferences page.

Styling Annotations with HTML

You can use HTML format in the annotations you add in an XML Schema or Relax NG schema. This improves the visual appearance and readability of the documentation window displayed when editing XML documents validated against such a schema. An annotation is recognized and displayed as HTML if it contains at least one HTML element (such as `<div>`, `<body>`, `<p>`, `
`, `<table>`, ``, or ``).

The HTML rendering is controlled by the **Show annotations using HTML format, if possible** (on page 122) option in the **Annotations** preferences page. When this option is deselected, the annotations are converted and displayed as plain text and if the annotation contains one or more HTML tags (`<p>`, `
`, ``, ``), they are rendered as an HTML document loaded in a web browser. For example, `<p>` begins a new paragraph, `
` breaks the current line, `` encloses a list of items, and `` encloses an item of the list.

Collecting Annotations from XML Schemas

In an XML Schema, the annotations are specified in an `<xs:annotation>` element like this:

```
<xs:annotation>
  <xs:documentation>
    Description of the element.
```

```
</xs:documentation>
</xs:annotation>
```

If an element or attribute does not have a specific annotation, then Oxygen XML Editor Eclipse plugin looks for an annotation in the type definition of that element or attribute.

Collecting Annotations from Relax NG Schemas

For Relax NG schema, element and attribute annotations are made using the `<documentation>` element from the `http://relaxng.org/ns/compatibility/annotations/1.0` namespace like this:

```
<define name="person" >
  <element name="person">
    <a:documentation xmlns:a="http://relaxng.org/ns/compatibility/annotations/1.0">
      Information about a person. </a:documentation>
    <ref name="name" />
    <zeroOrMore>
    <ref name="email" />
    </zeroOrMore>
  </element>
</define>
```

However, any element outside the Relax NG namespace (`http://relaxng.org/ns/structure/1.0`) is handled as annotation and the text content is displayed in the annotation window. To activate this behavior, select the **Use all Relax NG annotations as documentation** (*on page 122*) option in the **Annotations** preferences page.

Collecting Annotations from Relax NG Compact Syntax Schemas

For Relax NG Compact Syntax schema, annotations are made using comments like this:

```
## Information about a person.
element person { name, email*}
```

Collecting Annotation from DTDs

For DTD, Oxygen XML Editor Eclipse plugin defines a custom mechanism for annotations using comments enabled by the **Prefer DTD comments that start with "doc:" as annotations** (*on page 121*) option in the **Annotations** preferences page. The following is an example of a DTD annotation:

```
<!--doc:Description of the element. -->
```

Related Information:

[Customizing the Rendering of Elements](#) (*on page 2018*)

[Customizing Annotations in the Content Completion Assistant](#) (*on page 2023*)

Content Completion Helper Views (Author Mode)

Information about the current element being edited is also available in various *dockable* (on page 2677) views, such as the **Model** view (on page 331), **Attributes** view (on page 405), **Elements** view (on page 410), and **Entities** view (on page 334). By default, they are located on the right-hand side of the main editor window. These views, along with the powerful **Outline** view (on page 326), provide spatial and insight information about the edited document and the current element. If any particular view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Code Templates

Code templates are code fragments that can be inserted quickly at the current editing position. Oxygen XML Editor Eclipse plugin includes a set of built-in code templates for CSS, Schematron, XSL, XQuery, JSON, HTML, and XML Schema document types. You can also define your own code templates for any type of file and share them with others.

Code templates are displayed with a  symbol in the content completion list (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). Also, in **Text** mode you can press **Ctrl + Shift + Space** to see a complete list of the available code templates. To enter the code template at the cursor position, select it from the content completion list or type its code and press **Enter**. If a shortcut key has been assigned to the code template, you can also use the shortcut key to enter it.

How to Create Code Templates

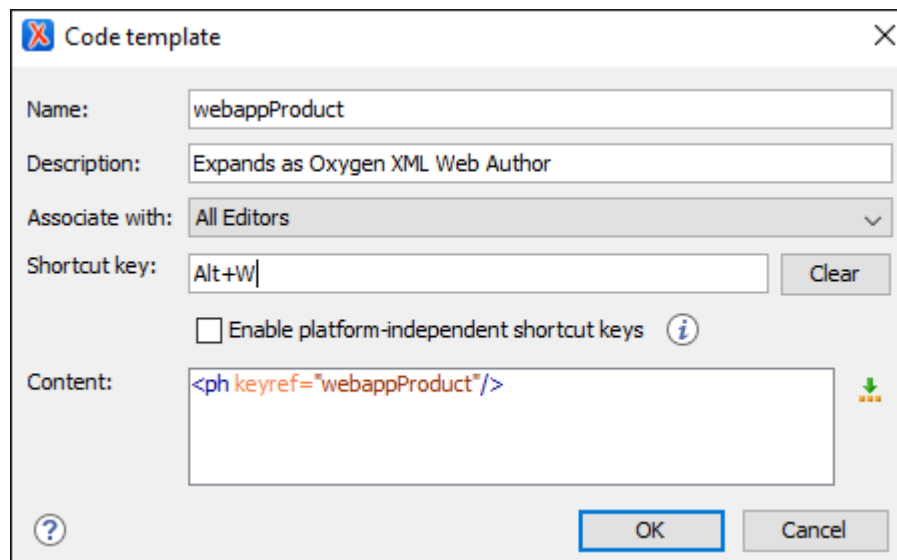

To create a code template, follow these steps:

1. Open the **Preferences** dialog box (on page 70) and go to **Editor > Content Completion > Code Templates**.
2. Click **New** to open a code template configuration dialog box.

Tip:

You can use one of the existing code templates as a starting point by selecting that template and clicking **Duplicate**.

Figure 93. Code Template Configuration Dialog Box

3. Configure your template using the fields in the code template configuration dialog box:

- **Name** - The name of the code template.
- **Description** - [Optional] The description of the code template that will appear in the **Code Templates** preferences page and in the tooltip message when selecting it from the *Content Completion Assistant (on page 2677)*. HTML markup can be used for better rendering.
- **Associate with** - You can choose to set the code template to be associated with a specific type of editor or for all editor types.
- **Shortcut key** - [Optional] If you want to assign a shortcut key that can be used to insert the code template, place the cursor in the **Shortcut key** field and press the desired key combination on your keyboard. Use the **Clear** button if you make a mistake. If the **Enable platform-independent shortcut keys** checkbox is selected, the shortcut is platform-independent and the following modifiers are used:
 - **M1** represents the **Command** key on macOS, and the **Ctrl** key on other platforms.
 - **M2** represents the **Shift** key.
 - **M3** represents the **Option** key on macOS, and the **Alt** key on other platforms.
 - **M4** represents the **Ctrl** key on macOS, and is undefined on other platforms.
- **Content** - Text box where you define the content that is used when the code template is inserted. An *editor variable (on page 218)* can be inserted in the text box using the  **Insert Editor Variables** button.

4. Click **OK** to save your new code template.

Result: Your code template can now be selected using the *Content Completion Assistant (on page 2677)* (**Enter** in **Author** mode or **Ctrl + Space** in **Text** mode). The code templates are displayed with a  symbol.

How to Share Code Templates

There are two ways to easily share all of your code templates with other members of your team:

Method 1: Export/Import

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Editor > Templates > Code Templates**.
2. Click the **Export** button to export all of your code templates into an XML file.
3. Save the XML file.
4. Share the XML file with other members of your team.
5. Instruct them to [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Templates > Code Templates**, click the **Import** button, and select the file you sent them.

Result: The code templates will be now available in their content completion list.

Method 2: Share Project

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Editor > Templates > Code Templates**.
2. Select **Project Options** at the bottom of the dialog box. This stores the preferences in the project file (`.xpr`).
3. Share the project file with the other members of your team. For example, you can commit it to your version control system and have them update their working copy.

Result: When they open the updated project file in their **Project Explorer view** ([on page 269](#)), the code templates will be available in their content completion list.

Tip:

It is also possible to [configure certain actions that function similar to code templates and add them to the content completion list \(on page 2002\)](#) for a particular framework. You could then [share the whole framework \(on page 2099\)](#) with other members of your team.

Author Mode Views

The content author is supported by a variety of [dockable \(on page 2677\)](#) helper views that are displayed by default when editing in **Author** mode. These views are automatically synchronized with the current editing context of the editor panel. They present additional information about this context thus helping the author to see quickly the current location in the overall document structure and the available editing options.

There is also a large selection of additional useful views available in the **Window > Show View** menu. This section presents some of the most helpful views for editing in **Author** mode.

Outline View for XML Documents

The **Outline** view displays a general tag overview of the currently edited XML document. When you edit a document, the **Outline** view dynamically follows the changes that you make, displaying the node that you modify. This functionality gives you great insight on the location of your modifications in the current document. It also shows the correct hierarchical dependencies between elements. This makes it easy for you to be aware of the document structure and the way element tags are nested.

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Insert or delete nodes using contextual menu actions.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- View document errors, as they are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

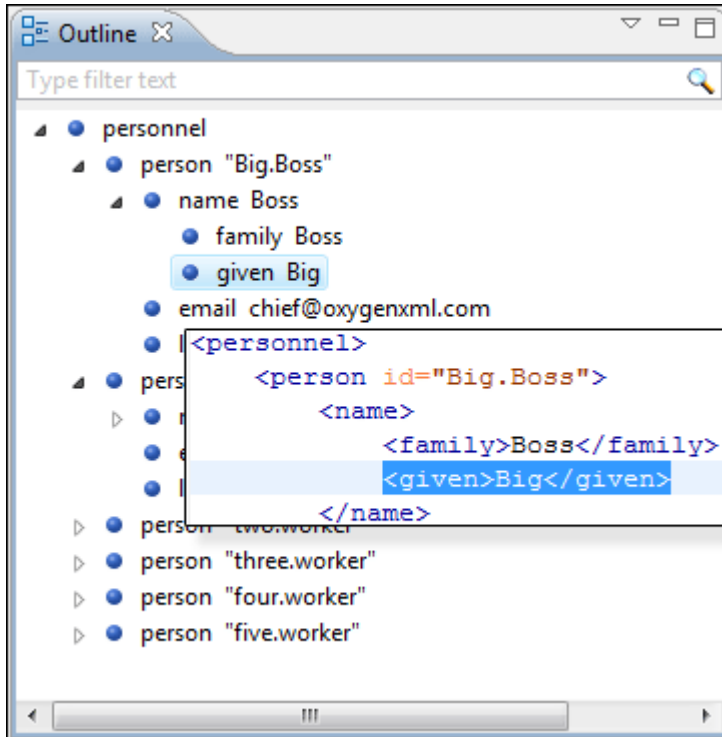

It also includes a **View menu** in the top-right corner that presents a variety of options to help you filter the view even further.

Drag and Drop Actions in the Outline View

Entire XML elements can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag an XML element in the **Outline** view and drop it on another node, then the dragged element will be moved after the drop target element.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target element will be expanded first and the dragged element will be moved inside the drop target element after its opening tag.
- You can also drop an element before or after another element if you hold the mouse pointer towards the upper or lower part of the targeted element. A marker will indicate whether the drop will be performed before or after the target element.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Figure 94. Outline View

Outline View Filters

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

The following actions are available in the **View menu** of the **Outline** view:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move (Available in Text mode)

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel \(on page 214\)](#).

Configure displayed attributes

Displays the **XML Structured Outline** preferences page [\(on page 214\)](#).

Outline View Contextual Menu Actions

The contextual menu of the **Outline** view contains the following actions:

Edit Attributes

Displays an in-place attributes editor that allows you to edit the attributes of a selected node.

Edit Profiling Attributes (Available in Author mode)

Allows you to change the [profiling attributes \(on page 442\)](#) defined on all selected elements.

Append Child

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection as a child of the current element.

Insert Before

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately before the current element, as a sibling.

Insert After

Invokes a content completion list with the names of all the elements that are allowed by the associated schema and inserts your selection immediately after the current element, as a sibling.

Cut, **Copy**, **Paste**, **Delete common editing actions**

Executes the typical editing actions on the currently selected elements. The **Cut** and **Copy** operations preserve the styles of the copied content.

Paste before (Available in Author mode)

Inserts a well-formed copied element before the currently selected element.

Paste after (Available in Author mode)

Inserts a well-formed copied element after the currently selected element.

Paste as XML (Available in Author mode)

Pastes copied content that is considered to be valid XML, preserving its XML structure.

Toggle Comment

Encloses the currently selected element in a comment, if the element is not already commented. If it is already commented, this action will remove the comment.

Rename Element (Available in Author mode)

Invokes a **Rename** dialog box that allows you to rename the currently selected element, siblings with the same name, or all elements with the same name.

Expand All

Expands the structure tree of the currently selected element.

Collapse All

Collapses all of the structure tree of the currently selected node.

Tip:

You can copy, cut or delete multiple nodes in the **Outline** by using the contextual menu after selecting multiple nodes in the tree.

Attributes View in Author Mode

The **Attributes** view presents all the attributes of the current element determined by the schema of the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened from the **Window > Show View** menu.

You can use this view to edit or add attribute values. The attributes of an element are editable if any one of the following is true:

- The CSS stylesheet associated with the document does not specify a **false** value for the `-oxy-editable` (on page 2157) property associated with the element.
- The element is entirely included in a deleted *Track Changes* (on page 416) marker.
- The element is part of a content fragment that is referenced in **Author** mode from another document.

The attributes are rendered differently depending on their state:

- The names of the attributes are rendered with a bold font, and their values with a plain font.
- Default values are rendered with a plain font, painted gray.
- Empty values display the text "[empty]", painted gray.
- Invalid attributes and values are painted red.

To edit the value of the corresponding attribute, double-click a cell in the **Value** column. If the possible values of the attribute are specified as `list` in the schema of the edited document, the **Value** column acts as a combo box that allows you to either select the value from a list or manually enter it.

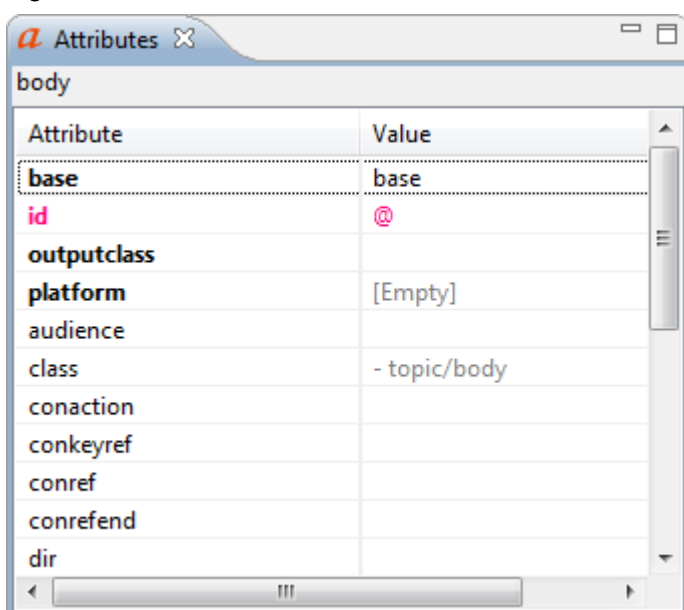

**Note:**

If the cursor is located inside read-only content, the attribute names and values are faded and you cannot add, edit, or remove values.

You can sort the attributes table by clicking the **Attribute** column header. The table contents can be sorted as follows:

- By attribute name in ascending order.
- By attribute name in descending order.
- Custom order, where the used attributes are displayed at the beginning of the table sorted in ascending order, followed by the rest of the allowed elements sorted in ascending order.

Figure 95. Attributes View

A drop-down list located in the upper part of the view allows you to select the current element or its ancestors.

Contextual Menu Actions in the Attributes View

The following actions are available in the contextual menu of the **Attributes** view when editing in **Author** mode:

Set empty value

Specifies the current attribute value as empty.

Remove

Removes the attribute (action available only if the attribute is specified). You can invoke this action by pressing the **Delete** or **Backspace** keys.

Copy

Copies the `attrName="attrValue"` pair to the clipboard. The `attrValue` can be:

- The value of the attribute.
- The value of the default attribute, if the attribute does not appear in the edited document.
- Empty, if the attribute does not appear in the edited document and has no default value set.

Paste

Depending on the content of the clipboard, the following cases are possible:

- If the clipboard contains an attribute and its value, both of them are introduced in the **Attributes** view. The attribute is selected and its value is changed if they exist in the **Attributes** view.
- If the clipboard contains an attribute name with an empty value, the attribute is introduced in the **Attributes** view and you can start editing it. The attribute is selected and you can start editing it if it exists in the **Attributes** view.
- If the clipboard only contains text, the value of the selected attribute is modified.

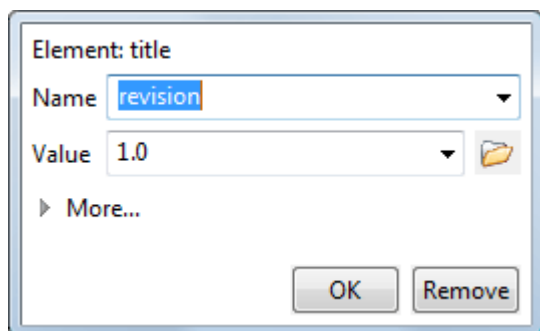

In-place Attributes Editor

Oxygen XML Editor Eclipse plugin includes an in-place attributes editor in **Author** mode. To edit the attributes of an XML element in-place, do one of the following:

- Select an element or place the cursor inside it and then press the **Alt + Enter** keyboard shortcut.
- Double-click any named start tag when the document is edited in one of the following display modes:
 - ▢ **Full Tags with Attributes**, ▢ **Full Tags**, ▢ **Block Tags**, or ▢ **Inline Tags**.

This opens an in-place attributes editor that contains the same content as the **Attributes** view. By default, this editor presents the **Name** and **Value** fields, with the list of all the possible attributes collapsed.

Figure 96. In-place Attributes Editor

Name Combo Box

Use this combo box to select an attribute. The drop-down list displays the list of possible attributes allowed by the schema of the document, as in the **Attributes** view.

Value Combo Box

Use this combo box to add, edit, or select the value of an attribute. If the selected attribute has predefined values in the schema, the drop-down list displays those possible values. You can use the  **Browse** button to select a URL for the value of an attribute. You can also press **Ctrl + Space** to open a content completion window that offers a list of possible choices and allows you to select multiple values.

Note:

For built-in frameworks, if the selected attribute in the **Name** field is an `@id` attribute, the  **Browse** button is replaced by a  **Generate Unique ID Value** button. Clicking this button will automatically generate a unique ID for the selected element.

If you click **More** while in the collapsed version, it is expanded to the full version of the in-place attribute editor.

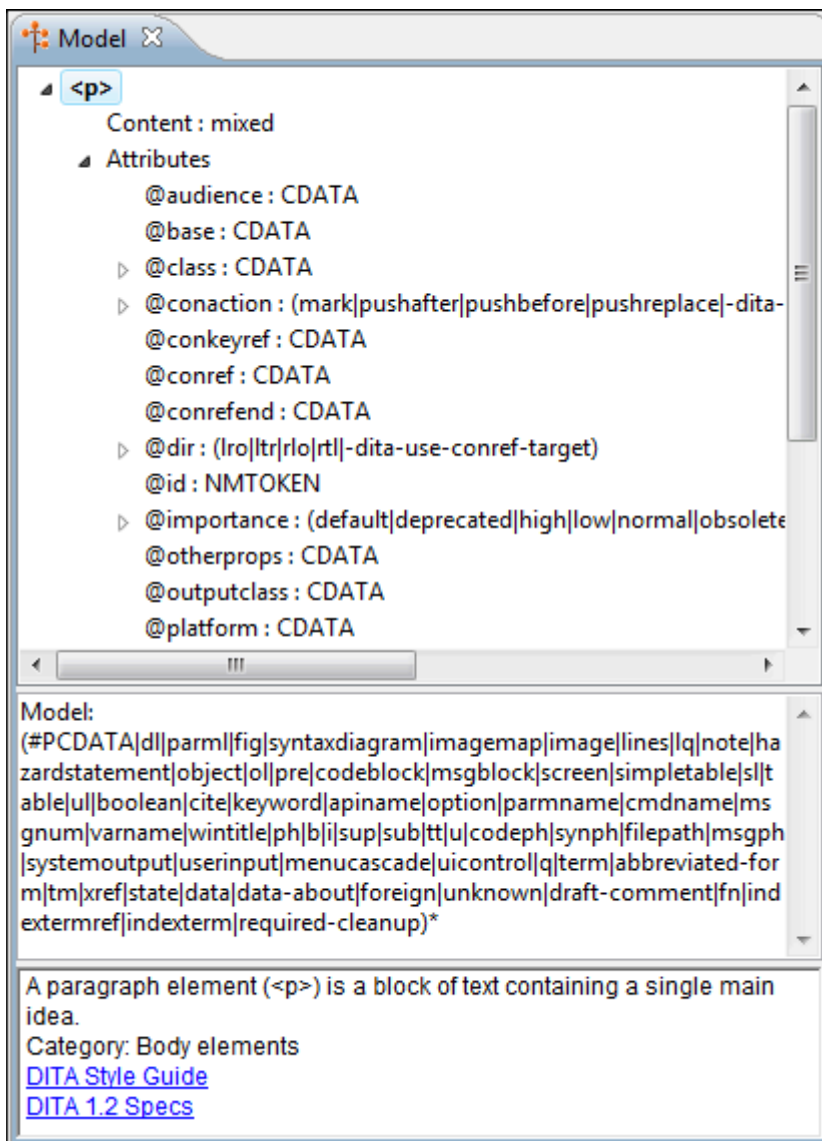

Figure 97. In-place Attributes Editor (Full Version)

The full version includes a table grid, similar to the **Attributes** view, that presents all the attributes for the selected element.

Model View

The **Model** view presents the structure of the currently selected tag, and its documentation, defined as annotation in the schema of the current document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

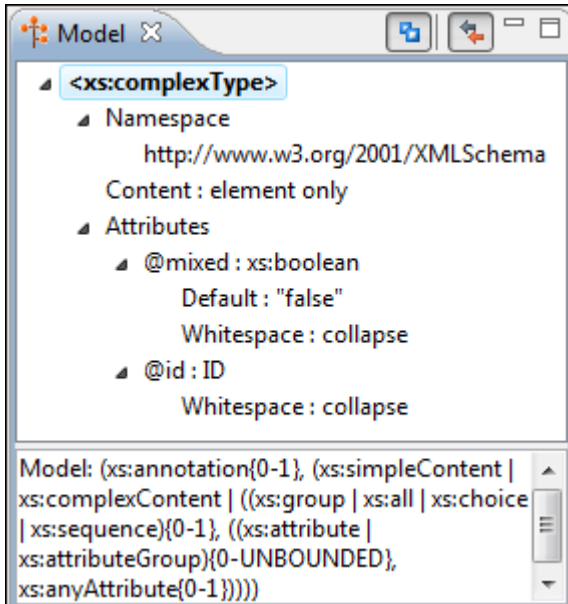

Figure 98. Model View

The **Model** view is comprised of two sections, an element structure panel and an annotations panel.

Element Structure Panel

The element structure panel displays the structure of the currently edited or selected tag in a tree-like format. The information includes the name, model, and attributes of the current tag. The allowed attributes are shown along with imposed restrictions, if any.

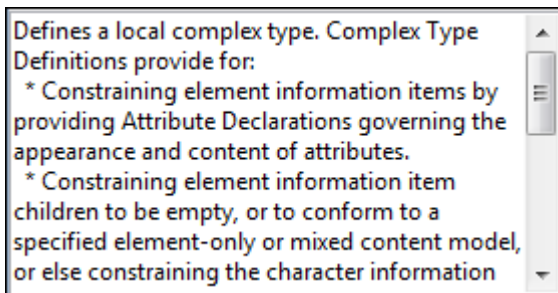

Figure 99. Element Structure Panel

Annotation Panel

The **Annotation** panel displays the annotation information for the currently selected element. This information is collected from the XML schema.

Figure 100. Annotation panel

Elements View in Author Mode

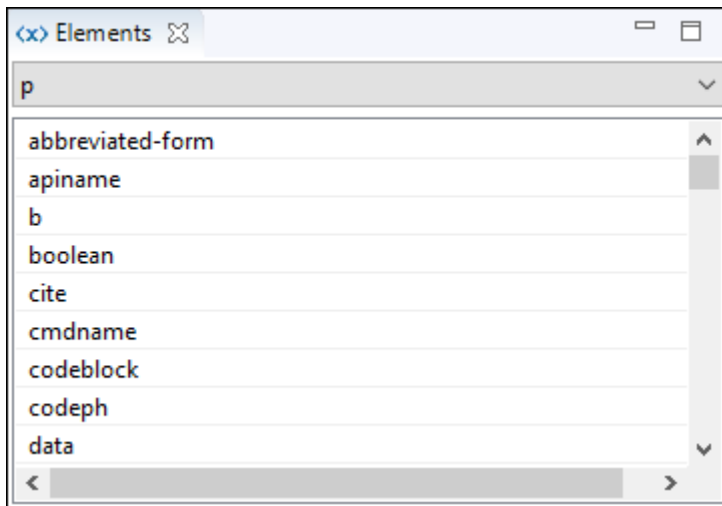

The **Elements** view presents a list of all defined elements that are valid at the current cursor position according to the schema associated to the document. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view features a combo box that contains the ordered ancestors of the current element. Selecting a new element in this combo box updates the list of the allowed elements. By default, only the elements that are allowed at the current cursor position are listed. However, if the **Show only allowed items** option (*on page 180*) is not selected in the **View preferences page** (*on page 180*), all elements allowed by the schema will be listed.

Double-clicking any of the listed elements inserts that element into the edited document at the current cursor position.

Pressing **F2** with an element selected will display information about that particular element.

Figure 101. Elements View in Author Mode

Entities View

Entities provide abbreviated entries that can be used in XML files when there is a need of repeatedly inserting certain characters or large blocks of information. An *entity* is defined using the `ENTITY` statement either in the DOCTYPE declaration or in a DTD file associated with the current XML file.

There are three types of entities:

- **Predefined** - Entities that are part of the predefined XML markup (`<`, `>`, `&`, `'`, `"`).
- **Internal** - Defined in the DOCTYPE declaration header of the current XML.
- **External** - Defined in an external DTD module included in the DTD referenced in the XML DOCTYPE declaration.

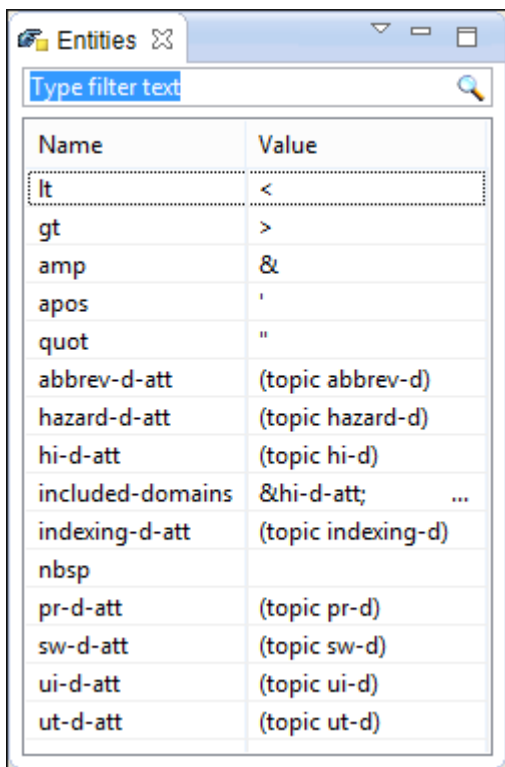

Note:

If you want to add internal entities, you would need to switch to the Text editing mode and manually modify the DOCTYPE declaration. If you want to add external entities, you need to open the DTD module file and modify it directly.

The **Entities** view displays a list with all entities declared in the current document, as well as built-in ones. By default, it is located on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Double-clicking one of the entities will insert it at the current cursor position in the XML document. You can also sort entities by name and value by clicking the column headers.

Figure 102. Entities View

Name	Value
lt	<
gt	>
amp	&
apos	'
quot	"
abbrev-d-att	(topic abbrev-d)
hazard-d-att	(topic hazard-d)
hi-d-att	(topic hi-d)
included-domains	&hi-d-att; ...
indexing-d-att	(topic indexing-d)
nbsp	
pr-d-att	(topic pr-d)
sw-d-att	(topic sw-d)
ui-d-att	(topic ui-d)
ut-d-att	(topic ut-d)

The view features a filtering capability that allows you to search an entity by name, value, or both. Also, you can choose to display the internal or external entities.

**Note:**

When entering filters, you can use the ? and * wildcards. Also, you can enter multiple filters by separating them with a comma.

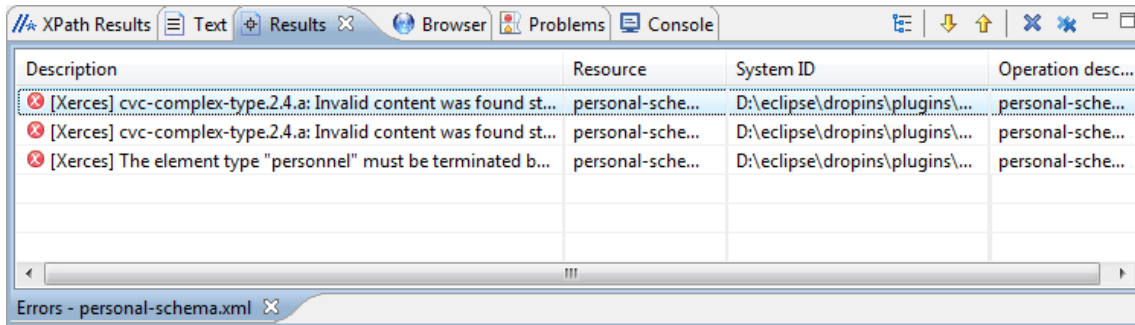

Results View

The **Results** view displays the messages generated as a result of user actions such as validations, transformations, search operations, and others. Each message is a link to the location related to the event that triggered the message. Double-clicking a message opens the file containing the location and positions the cursor at the location offset. The **Results** view is automatically opened when certain actions generate result messages. By default, the view normally opens at the bottom of the editor, but it is *dockable* (on page 2677), so it can be moved to another UI location alongside other side views.

The actions that contribute messages to this view include:

- **Validation** actions (on page 547)
- **Transformation** actions (on page 1171)
- **Check Spelling in Files** action (on page 294)
-
-

- **Search References** action (on page 678)
- **SQL results** (on page 1884)

Figure 103. Results View

Results View Toolbar Actions

The view includes a toolbar with the following actions:

Grouping Mode toggle options

You can choose to group the result messages in a **Hierarchical** or **Flat** arrangement.

Next

Navigates to the message below the current selection.

Previous

Navigates to the message above the current selection.

Remove selected

Removes the current selection from the view. This can be helpful if you want to reduce the number of messages, or remove those that have already been addressed or not relevant to your task.

Remove all

Removes all messages from the view.

Results View Contextual Menu Actions

The following actions are available when the contextual menu is invoked in this view:

Learn Word(s) (Available when spelling errors are reported in the Results view)

Adds the word(s) to a list of learned words to instruct the spell checker engine to not report the word(s) as spelling errors in the future.

Remove

Removes selected messages from the view.

Remove all

Removes all messages from the view.

Copy

Copies information associated with the selected messages. For example:

- The file path of the document that triggered the output message.
- Error severity (error, warning, info message, etc.)
- Name of validating processor.
- The line and column in the file that triggered the message.

Copy Description

Copies the description values for all selected items.

Show message

Opens a dialog box that displays the details of the message.

Save Results

Saves the complete list of messages in a file in text format. For each message, the included details are the same as the ones for the **Copy action** (*on page 414*).

Save Results as XML

Saves the complete list of messages in a file in XML format. For each message, the included details are the same as the ones for the **Copy action** (*on page 414*).

Save Results as HTML

Saves the complete list of messages in a file in HTML format. For each message, the included details are the same as the ones for the **Copy action** (*on page 414*).

Expand All

Available when **Hierarchical** mode is selected. Expands all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

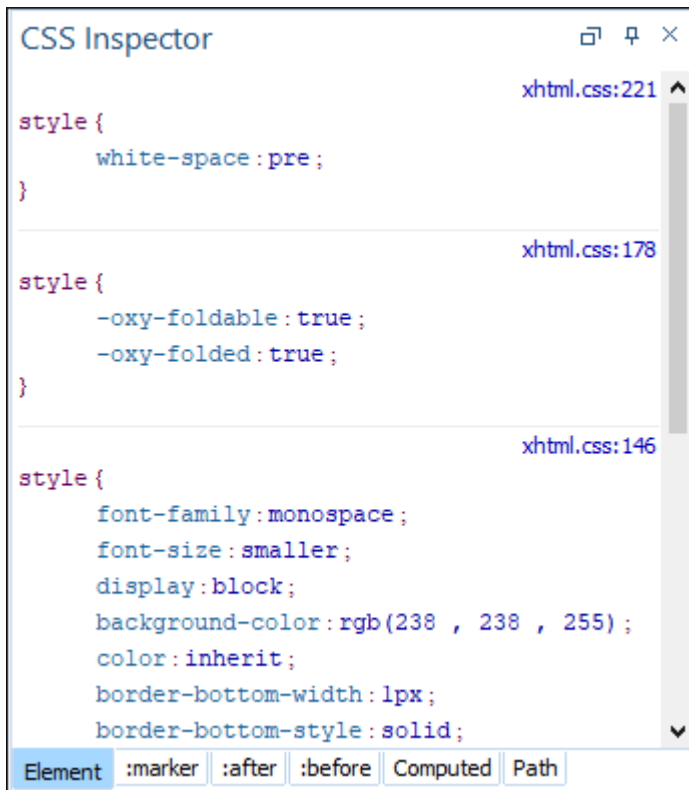

Collapse All

Available when **Hierarchical** mode is selected. Collapses all the nodes of the tree, which is useful when the messages are presented in a hierarchical mode.

CSS Inspector View

The purpose of the **CSS Inspector** view is to display information about the styles applied to the currently selected element. You can use this view to examine the structure and layout of the CSS rules that match the element. The matching rules displayed in this view include a link to the line in the CSS file that defines the styles. With this tool you can see how the CSS rules were applied and the properties defined, and use the link to open the associated CSS for editing purposes.

Figure 104. CSS Inspector View

Displaying the CSS Inspector View

You can open this view by selecting the **Inspect Styles** action from the contextual menu in **Author** mode, or selecting the **CSS Inspector** view in the **Window > Show View** menu. This action makes the view visible and also initializes it for the currently selected element.

Displaying Rules

All rules that apply to the current element are displayed in sections, which are listed in order of importance (from most specific to least specific). Rules that are overridden by other rules are crossed out. If you click the link in the top-right corner of a rule Oxygen XML Editor Eclipse plugin opens the associated CSS file at the line number where the properties of the rule are defined.

Figure 105. CSS Inspector View - Displaying Rules

The **CSS Inspector** view has six possible tabs (depending on the current context):

- **Element** - Displays the CSS rules matching the currently selected element in the **Author** page (ordered from most-specific to least-specific).
- **:marker** - Displays the rules matching the `:marker` pseudo-element.
- **:before** - Displays the rules matching the `:before` pseudo-element.
- **:after** - Displays the rules matching the `:after` pseudo-element.
- **Computed** - Displays all the styling properties that apply to the current element, as a result of all the CSS rules matching the element.
- **Path** - Displays the path for the current element, and its attributes, allowing you to quickly see the attributes on all parent elements, and allows you to copy fragments from this view and paste it into the associated CSS to easily create new rules.

The information displayed in each of the five tabs is updated when you click other elements in the **Author** editing view. The first three tabs include the link to the associated CSS source, while the other two tabs simply display the style properties that match the current element.

Each of the tabbed panes include a contextual menu with the following actions:

- **Copy** - copies the current selection
- **Select all** - selects all information listed in the pane

Also, a **Show empty rules** action is available from a drop-down menu in the toolbar of the view. This action forces the view to show all the matching rules, even if they do not declare any CSS properties. By default, the empty rules are not displayed.

Reviewing Documents

Oxygen XML Editor Eclipse plugin includes a variety of helpful review tools that improve your ability to collaborate with other members of your team, track changes, mark content for various reasons, add comments in your content, and to manage the review features.

Tracking Document Changes

The *Track Changes feature (on page 2683)* is a way to keep track of the changes you make in a document. The *Track Changes* feature highlights changes that you make to the content in a document, as well as changes to attributes. Changes can be tracked for insertions and deletions. When the *Track Changes feature is activated (on page 418)*, insertions are rendered in **Author** mode with an underline while deletions are rendered with a strike through.

The *tracked changes* are also displayed in the **Review view (on page 438)** and you can also choose to present the changes in *callouts (on page 432)* by selecting the **Track Changes Deletions (on page 153)** and **Track Changes Insertions (on page 153)** options in the **Callouts preferences page (on page 153)**.

Adding Comments in Documents

You can associate a comment to a selected area of content. Comments can highlight virtually any content from your document, with the exception of *read-only* text. The difference between using comments and *change tracking* is that a comment can be associated to an area of text without modifying or deleting the text.

Comments are presented in *callouts* (on page 432) with persistent highlights and a colored background. The background color is assigned automatically by the application, but it can also be customized from the **Review preferences page** (on page 150).

Highlighting Content

Oxygen XML Editor Eclipse plugin includes a highlighting feature that allows you to create digital markers to emphasize important fragments of your documents. This is especially useful when you want to mark content that needs additional work or the attention of others.

Using the Review View

Oxygen XML Editor Eclipse plugin includes a **Review view** (on page 438) that provides a simplified way of monitoring all the insertions, deletions, comments, and highlights in an XML document. This handy tool is especially useful for large teams that need to gather and manage all the edits from all team members who are working on the same project.

The **Review** view is also useful for managing *tracked changes* and comments in a single panel. In this view, the changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes and comments in the main editing area.

You can use this view to quickly navigate through changes, accept or reject them, or to view and manage comments or highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Printing Review Information

When you print a document from **Author** mode, whatever review information is shown in the main editing area will be included in the printed output. For example, *tracked changes* will be included and as long as the **Comments option** (on page 153) is selected in the **Callouts preferences page** (on page 153), comment callouts will also be included (same with *tracked change* callouts if their corresponding options are selected in the **Callouts preferences page** (on page 153)).

Managing Tracked Changes

Oxygen XML Editor Eclipse plugin includes a *Track Changes feature* (on page 2683) that allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review view** (on page 438).

The *Track Changes* feature is also able to keep track of changes you make to attributes in a document and the changes are presented in the **Review view** (on page 438) and **Attributes view** (on page 405).

Types of Tracked Changes

The types of *tracked changes* include:

- Inserting, deleting content (text or elements)
- Drag and drop content (text or elements)
- Cutting or pasting content (text or elements)
- Inserting, deleting, and changing the structure of tables
- Inserting and editing lists and their content
- Inserting and deleting entities
- Inserting and deleting element tags
- Editing attributes
- Performing a **Split** operation
- Performing a **Surround with** operation
- Changes in referenced content (for example, XInclude fragments or DITA conrefs)

Important:

If you copy content in **Author** mode that contains *tracked changes*, the changes will automatically be accepted prior to the content being copied to the clipboard. This filtering is performed only if the selection is not entirely inside a tracked change.

Activating the Change Tracking Feature

To activate the *Track Changes* feature for the current document, use any of the following methods:

- Click the  **Track Changes** button on the toolbar.
- Select  **Track Changes** from the **Review** submenu of the contextual menu in the main editing area in **Author** mode.
- Select  **Track Changes** from the **Edit > Review** menu.

To activate the *Track Changes* feature globally for all documents that you open in Oxygen XML Editor Eclipse plugin, change the **Initial State** option to **Always On** (on page 150) in the **Review preferences page** (on page 150).

Rendering Tracked Changes in Author Mode

When *Track Changes* (on page 2683) is enabled, your modifications are highlighted using a distinctive color. The colors can be customized from the **Review preferences page** (on page 150), along with the name of the author and the initial state of the feature when you open a document. Insertions are rendered with an underline while deletions are rendered with a strike through.

Figure 106. Change Tracking in Author Mode

Docbook 4 supports \mathbb{X} HTML tables:

Sample \mathbb{X} HTML Table with fixed width and proportional column widths

```
col[span:1, width:2.08*]
col[span:1, width:0.46*]
```

Person Name	Age
Jane	26
Bart	24
Alexander	22
John	25

They belongare all students of the computer science department

Inserted by John Doe
Wed Apr 08 16:10:32 EEST 2009

This is a list of useful \mathbb{X} ML links:

When hovering over a change a tooltip displays information about the author and modification time.

Change Tracking Contextual Menu Actions

You can right-click any change in **Author** mode to access the following contextual menu actions:

✓ Accept Change(s)

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

✗ Reject Change(s)

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

🗨 Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Change Tracking Toolbar Actions

By default, the toolbar includes the following actions and options for reviewing or *tracking changes* (on page 2683) (similar actions are also available in the **Edit > Review** menu and the **Review** submenu of the contextual menu):

Track Changes

Enables or disables the *Track Changes* (on page 2683) support for the current document.

Accept Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

-  **Accept Change(s) and Move to Next** - Accepts the *Tracked Change* (on page 2683) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.
-  **Accept Change(s)** - Accepts the *Tracked Change* (on page 2683) located at the cursor position or all of the changes in a selection.
-  **Accept All Changes** - Accepts all *Tracked Changes* (on page 2683) in the current document.

Reject Change(s) combo box

This combo box is both a button and a drop-down menu that includes the following actions (when you select an action from the drop-down menu, that action becomes the default action for the combo box button):

-  **Reject Change(s) and Move to Next** - Rejects the *Tracked Change* (on page 2683) located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.
-  **Reject Change(s)** - Rejects the *Tracked Change* (on page 2683) located at the cursor position or all of the changes in a selection.
-  **Reject All Changes** - Rejects all *Tracked Changes* (on page 2683) in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change* (on page 2683). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

▾ **Track Changes Visualization Modes Drop-Down Menu**

This drop-down menu includes specialized actions that allow you to switch between the following visualization modes:

-  **View All Changes/Comments** - This mode is active by default. When you use this mode, all tracked changes are represented in the **Author** mode.
-  **View only Changes/Comments by** - Only the tracked changes made by the author you select are presented.
-  **View Final** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were accepted.
-  **View Original** - This mode offers a preview of the document as if all tracked changes (both inserted and deleted) were rejected. If you attempt to edit the document in this mode, the view mode will switch to **View All Changes/Comments**.
-  **Review Settings** - Opens the [Review Preferences \(on page 150\)](#) page where the **Initial display mode** setting can be configured.

Note:

If you use  **View Final** mode and  **View Original** mode, [callouts \(on page 2677\)](#) are not displayed for comments or changes. To display callouts, use the  **View All Changes/Comments** mode.

Highlight

Enables or disables the **Highlight tool (on page 430)**. Use the  ▾ **Highlight** drop-down menu to select a new color.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Tracked Change Callouts

You can also choose to display insertion and deletion changes in *callouts* (on page 2677) in **Author** mode. By default, tracked changes are not displayed in callouts, but you can change this behavior by selecting the **Track Changes Deletions** (on page 153) and **Track Changes Insertions** (on page 153) options in the **Callouts preferences page** (on page 153). You can also choose to display the actual content of the deletion or insertion.

By displaying the changes in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. For more information, see *Author Callouts* (on page 432).

Tracked Changes in the Review View

The **Review view** (on page 438) is also useful for managing tracked changes and comments. In this view, the edits are presented in a compact form, in the order they appear in the document and each edit is marked with a type-specific icon. You can use this view to quickly navigate through changes, accept or reject them, or to add and manage comments for the changes. You can also search for specific changes and it includes some filtering options (for example, you can filter it to only show certain types of changes or to only show changes for a particular author).

For more information, see *Review View* (on page 438).

Tracked Changes XML Source Code

The changes are stored in the document source code as processing instructions and they do not interfere with validation or transformations. For each change, the author name and the modification time are preserved.

Example - Insertion Change: The following processing instruction is an example of how an *insertion* change is stored in a document:

```
<?oxy_insert_start author="John Doe" timestamp="20090408T164459+0300"?>all<?oxy_insert_end?>
```

Example - Deletion Change: The following processing instruction is an example of how a *deletion* change is stored in a document:

```
<?oxy_delete author="John Doe" timestamp="20090508T164459+0300" content="belong"?>
```

Tracked Changes Behavior

The behavior of the *Track Changes* feature (on page 2683) depends on the context, the type of change, and whether or not it is activated.

Inserting Content

If the *Track Changes* feature is disabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in an **Insert** change results in the change being split in two and the content is inserted without being marked as change.
- Making an insertion in regular content results in a regular insertion.

If the *Track Changes* feature is enabled and you insert content, the following behavior is possible:

- Making an insertion in a **Delete** change results in the change being split in two and the current inserted content appears marked as an INSERT.
- Making an insertion in an **Insert** change results in the following:
 - If the original insertion was made by another user, the change is split in two and the current inserted content appears marked as an INSERT by the current author.
 - If the original **Insert** change was made by the same user, the change is just expanded to contain the inserted content. The creation time-stamp of the previous insert is preserved.
- If inserted in regular content, the current inserted content appears marked as an **Insert** change.

Surrounding Content

If the *Track Changes* feature is enabled and you surround content in a new XML element, the following behavior is possible:

- Making a surround in a **Delete** change results in nothing happening.
- Making a surround in an **Insert** change results in the following:
 - If the original insertion was made by another user, the change is split in two and the surround operation appears marked as being performed by the current author.
 - If the original **Insert** change was made by the same user, the existing change is just expanded to contain the surrounded content.
- Making a surround in regular content results in the operation being marked as a surround change.

Deleting Characters

If the *Track Changes* feature is disabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in nothing happening.
- Deleting content in an existing **Insert** change results in the content being deleted without being marked as a deletion and the INSERT change shrinks accordingly.
- Deleting in regular content results in a regular deletion.

If the *Track Changes* feature is enabled and you delete content character by character, the following behavior is possible:

- Deleting content in an existing **Delete** change results in the following:
 - If the same author created the **Delete** change, the previous change is marked as deleted by the current author.
 - If another author created the **Delete** change, nothing happens.
- Deleting content in an existing **Insert** change results in the following:
 - If the same author created the **Insert** change, the content is deleted and the **Insert** change shrinks accordingly.
 - If another author created the **Insert** change, the **Insert** change is split in two and the deleted content appears marked as a **Delete** change by the current author.
- Deleting in regular content results in the content being marked as a **Delete** change by the current author.

Deleting Selections of Content

If the *Track Changes* feature is disabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change disappears and the content is deleted.
- If the selection intersects with a **Delete** change (starts or ends in one), it results in nothing happening.
- If the selection contains an entire **Insert** change, the change disappears and the content is deleted.
- If the selection intersects with an **Insert** change (starts or ends in one), the **Insert** change is shrunk and the content is deleted.

If the *Track Changes* feature is enabled and you delete a selection of content, the following behavior is possible:

- If the selection contains an entire **Delete** change, the change is considered as rejected and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects a **Delete** change (starts or ends in one), the change is considered as rejected and marked as deleted by the current author, along with the other selected content.
- If the selection contains an entire **Insert** change, the following is possible:
 - If the **Insert** is made by the same author, the change disappears and the content is deleted.
 - If the **Insert** is made by another author, the change is considered as accepted and then marked as deleted by the current author, along with the other selected content.
- If the selection intersects an **Insert** change (starts or ends in one), the **Insert** change shrinks and the part of the **Insert** change that intersects with the selection is deleted.

Deleting Tags

Assuming you are using any of the [Tag Display Modes \(on page 372\)](#) other than  **No Tags** and the *Track Changes* feature is disabled, if you delete a start or end tag, both the start and end tag will be removed, while any content that was inside the element is preserved.

Assuming you are using any of the [Tag Display Modes \(on page 372\)](#) other than  **No Tags** and the *Track Changes* feature is enabled, if you delete a start tag of an [inline element \(on page 2679\)](#), both the start and end tag are marked as a **Delete** change by the current author, while any content that was inside the element is preserved.

Copying Content

If the *Track Changes* feature is disabled and you copy content, if the copied area contains **Insert** or **Delete** changes (or attribute edits), these are also copied to the clipboard.

If the *Track Changes* feature is enabled and you copy content, if the copied area contains **Insert** or **Delete** changes (or attribute edits), these are all accepted in the content of the clipboard (the changes will no longer be in the clipboard).

Pasting Content

If the *Track Changes* feature is disabled and you paste content, if the clipboard content contains **Insert** or **Delete** changes (or attribute edits), they will be preserved on paste.

If the *Track Changes* feature is enabled and you paste content, if the clipboard content contains **Insert** or **Delete** changes (or attribute edits), all the changes are accepted and then the paste operation proceeds according to the insertion rules.

Track Changes Limitations

There are some inherent limitations to the [Change Tracking \(on page 2683\)](#) feature. These limitations include the following:

- **Limitations to rejected changes** - Recording changes has limitations and there is no guarantee that rejecting all changes will return the document exactly to its original state.
- **Limitations to hierarchical changes** - Recorded changes are not hierarchical, a change cannot contain other changes inside. For example, if you delete an insertion made by another user, then reject the deletion, the information about the author who made the previous insertion is not preserved.
- **Limitations to using certain actions** - Some actions cannot be implemented with the [Track Changes feature \(on page 2683\)](#) enabled. For example, some table-related actions ( **Delete Row(s)**,  **Delete Column(s)**,  **Join Cells**,  **Split Cell**) ignore the *Track Changes* feature.
- **Possible Serialization Limitation** - If you have equivalent adjacent tracked changes, for example, you see two back-to-back changes in the **Review** pane that have identical properties (the same user, timestamp, content, etc.), when you save the document, it is sometimes possible for the document to only contain a single processing instruction.

DITA-Specific Track Changes Limitations

- When presenting cross references or related links in the **Author** visual editing mode, if the link target element has a title that contains change tracking, the presented link reference content is shown as if all tracked changes in the target element's title have been accepted.
- When presenting phrases with key references in the **Author** visual editing mode, if the defined key has a keyword that contains change tracking, the presented referenced keyword reference content is shown as if all track changes inside it have been accepted.

Publishing-Specific Track Changes Limitations

- **Deletion Change Tracking Limitation** - When displaying tracked changes in published outputs (for example, when enabling the `show.changes.and.comments` DITA parameter in WebHelp and PDF publications), the deleted content will be presented as plain XML with the tag names serialized as plain text. Key references and content key references are also not resolved in the presented deleted content.

Tracked Changes XML Markup

Depending on the type of edits, the following markup appears in the document source code when you activate the *Track Changes* feature (on page 2683):

Edit Type	Processing Instruction Start Marker	Processing Instruction End Marker	Attributes
Insertion	<code><?oxy_insert_start?></code>	<code><?oxy_insert_end?></code>	Common Attributes (on page 427)
Split	<code><?oxy_insert_start?></code>	<code><?oxy_insert_end?></code>	Common Attributes (on page 427), type="split"
Surround	<code><?oxy_insert_start?></code>	<code><?oxy_insert_end?></code>	Common Attributes (on page 427), type="surround"
Deletion	<code><?oxy_delete?></code>	-	Common Attributes (on page 427), content
Comment	<code><?oxy_comment_start?></code>	<code><?oxy_comment_end?></code>	Common Attributes (on page 427), mid, parentID
Attribute Change	<code><?oxy_attributes?></code>	-	Attributes of the <i>Processing Instruction</i> have the name as the attribute that was changed on the <i>XML element</i> . The value is an attribute change descriptor (on page 427).

If a comment intersects another, the `@mid` attribute is used to correctly identify start and end processing instruction markers.

Common Attributes

The following attributes can be added on both change tracking and comment processing instructions:

- `@id` - Used to link a reply to its parent comment or change.
- `@comment` - The comment message associated with a comment or change.
- `@timestamp` - The time when the change or comment was created.
- `@author` - The name of the author that created the change or comment.
- `@flag` - The value `done` means that the item is **Marked as Done**.

Attribute Change Descriptor

The value of the attributes for a *Processing Instruction* is an (escaped) XML element as in:

```
<change type="modified" oldValue="word" author="John" timestamp="20210520T091038+0000" />
```

Managing Comments

You can add comments to any selected area of content within XML documents, with the exception of *read-only* content. The difference between using comments and *tracked changes (on page 2683)* is that a comment is associated to a selection without modifying or deleting the content.

By default, when you annotate your XML documents, the comments are displayed in the **Author** mode as *callouts (on page 2677)* (balloons) and they are rendered with a unique name and background for each user. If comments are not currently displayed in callouts, select the **Comments** option *(on page 153)* in the **Callouts preferences page (on page 153)**. Comments are also displayed in the **Review view (on page 438)**.

Figure 107. Comments in Author Mode

Managing Comments in the Main Editor

You can insert and manage comments directly in the main editing area in **Author** mode.

Add Comment

To insert a comment at the cursor position or on a specific selection of content, select the

 **Add Comment** action from the toolbar (or in the **Review** submenu of the contextual menu).

**Tip:**

When adding or editing a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor Eclipse plugin will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Show/Edit Comments

To edit an existing comment that you have added in the main editing area in **Author** mode, select the  **Show/Edit Comments** action from the toolbar (or in the **Review** submenu of the contextual menu). The action opens a dialog box that allows you to see and edit your comment at the cursor position. Note that you cannot edit a comment that was added by another user, so in that case, the dialog box just displays the comment without the possibility of editing it.

Remove Comments

To remove a comment at the cursor position or multiple comments in a selection, select  **Remove Comment(s)** from the toolbar (or in the **Review** submenu of the contextual menu).

Copy/Paste

If you copy content that includes comments, they will be preserved when you paste it.

Managing Comments in Callouts

As long as the **Comments** option ([on page 153](#)) is selected in the **Callouts** preferences page ([on page 153](#)), comments are also displayed in [callouts](#) ([on page 432](#)). By displaying the comments in callouts, you then have access to even more actions, such as the ability to reply or mark them as being done. When you right-click a specific comment in its callout, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes](#) ([on page 2683](#)). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view](#) ([on page 438](#)).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes](#) ([on page 2683](#)) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

**Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the [Callouts preference page \(on page 153\)](#) where you can configure various callout options.

Tip:

When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor Eclipse plugin will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

Managing Comments in the Review View

The [Review view \(on page 438\)](#) is also useful for managing comments. In this view, comments are presented in a compact form, in the order they appear in the document, along with tracked changes. You can also use this view to search for specific comments and it includes some filtering options (for example, you can filter it to only show comments for a particular author). When you right-click a specific comment in the **Review** view, the contextual menu includes the following actions.

Reply

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes \(on page 2683\)](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view \(on page 438\)](#).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes \(on page 2683\)](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Show only reviews by '<author name>'

Filters the comments to only show comments for the particular author.

Remove all Comments

Removes all comments from the document.

Comments XML Source Code

The comments are stored in the document source code as processing instructions that contain information about the author name and the comment time:

```
<?oxy_comment_start author="John Doe" timestamp="20090508T164459+0300"
  comment="Do not change this content"?>
  Important content
<?oxy_comment_end?>
```

Replies to comments are stored in the document source code as a comment (with information about the author name and time), but with a `@parentID` attribute and its value is the same as the `@id` value of the parent comment.

```
<?oxy_comment_start author="Tom" timestamp="20160217T102630+0200"
  comment="We should not forget about recycling the oil and oil filter!"
  parentID="vws_x41_lv" mid="4"?>
```

[Author Callouts \(on page 432\)](#)

[Review View \(on page 438\)](#)

Managing Highlights

Use the  **Highlight** tool to mark fragments in your document using various colors. This is especially useful when you want to mark sections that need additional editing or to draw the attention of others to particular content.

Using the Highlight Tool

You can find the  **Highlight** action on the main toolbar, in the **Edit > Review** menu, or in the **Review** submenu of the contextual menu of a document. You can also choose the color to use for the highlight or choose to **Stop highlighting** from the same menus.

To highlight content, follow these steps:

1. Click the  **Highlight** icon on the toolbar.

Step Result: The highlighting mode is on and the cursor changes to a dedicated symbol.

2. Click the small arrow next to the  **Highlight** icon and select the color that you want to use for the highlighting.
3. Select the content you want to highlight. To mark multiple parts of a document, press and hold **Ctrl** (**Meta on macOS**) and select the parts you want to highlight.
4. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

To remove highlighting from a document, follow these steps:

1. Either select the text you want to remove highlighting from using your cursor, or press **Ctrl + A** (**Command + A on macOS**) if you want to select all of the text.
2. Click the small arrow next to the  **Highlight** icon and select **No color (erase)**, or right-click the highlighted content and select **Remove highlight(s)**.
3. To exit the highlighting mode, press **Esc**, click the  **Highlight** icon, or start editing the document.

Note:

Oxygen XML Editor Eclipse plugin preserves the highlighting of a document between working sessions. Also, if you copy content that includes highlights, the highlighting will be preserved when you paste it.

Review View

The **Review view** ([on page 438](#)) is also useful for managing highlights. In this view, the highlights are presented in a compact form, in the order they appear in the document, along with [tracked changes](#) ([on page 2683](#)) and comments. The following actions are available in the contextual menu of each highlight in the **Review** view:

Change Color

Allows you to change the color of an existing highlight by selecting the new color from this menu.

Remove Highlight

Removes the selected highlight.

Remove Highlights with the Same Color

Removes the selected highlight and all others that have the same color.

Remove All Highlights

Removes all highlights from the document.

Highlights XML Source Code

The highlights are stored in the document source code as processing instructions that contain information about the color:

```
<?oxy_custom_start type="oxy_content_highlight" color="0,128,255"?>
The highlights are stored<?oxy_custom_end?>
```

[Review View \(on page 438\)](#)

Author Callouts

Oxygen XML Editor Eclipse plugin uses [callouts \(on page 2677\)](#) to present comments and [tracked change \(on page 2683\)](#) modifications that you or other members of your team have added to the document.

Displaying Callouts in Author Mode

The callouts are displayed in the right side of the editing area in **Author** mode. They are decorated with a colored border and also have a colored background. The background color is assigned automatically by the application depending on the user who is editing the document and the type of change, but it can also be customized from the [Review preferences page \(on page 150\)](#). This preferences page allows you to configure the colors for tracked change insertions or deletions, and for comments.

You can also choose to use the same color for all changes of that particular type of change, regardless of who makes the change. To do this, select the **Fixed** option for the particular type of change and choose a color from the color box. If the **Automatic** option is selected, Oxygen XML Editor Eclipse plugin automatically assigns a color based upon the [Colors for automatic assignment list \(on page 152\)](#).

The horizontal line that connects the callouts to their corresponding text fragments has the same color as the border. If this horizontal line is not visible, select the [Show all connecting lines option \(on page 153\)](#) in the **Callouts** preferences page. If you hover over a callout, it is highlighted and a tooltip is displayed that contains additional information.

Figure 108. Multiple Author Callouts

Winter Flowers

Winter is the season of cold weather. The season occurs during December - February in Northern hemisphere. In the Southern hemisphere winter occurs during June - August.

Some of the flowers blooming in winter are: Acashia, Alstromeria, Amaryllis, Carnation, Chrysanthemums, Cyclamen, Evergreens, Gerbera Daisy, Ginger, Helleborus, Holly berry, Lily, Asiatic Lily, Casa Blanca Lily, Narcissus, Orchid, Pansy, Pepperberry, Phlox, Protea, Queen Ann's Lace, Roses, Star of Bethlehem, Statice.

Deleted [Mary]: Delete any extra spacing before and after punctuation marks.

Deleted [Mary]: Also use a single space between words.

Commented [John]: We should include one more topic with information about Narcissus.

Commented [Bob]: It's a good idea to add more plants (consider including also Roses).

**Note:**

Oxygen XML Editor Eclipse plugin displays callouts only if **View All Changes/Comments** or **View Only Changes/Comments** by is selected in the **Track Changes Visualization Modes** drop-down menu. Oxygen XML Editor Eclipse plugin does not display callouts in **View Final** and **View Original** modes.

In some cases, the text you are editing can span into the callouts area. For example, this situation can appear for callouts associated with wide images or *space-preserved elements* (on page 2682) that contain long fragments (such as a DITA `<codeblock>` element or `<programlisting>` in DocBook). To help you view the text under the covered area, Oxygen XML Editor Eclipse plugin applies transparency to these callouts. When the cursor is located under a callout, the transparency is enhanced, allowing you to both edit the covered content and access the contextual menu of the editing area.

Figure 109. Transparent Callout

```

/**
 * Operation used to select the element
 */
public class SelectElementAtCaretOperation

```

Commented [marian_tudor]: Another good example would be GetElementAtCaretPosition

Adjusting Callout Width

To display more of the content in all the callouts in the current document, you can adjust the width by dragging the left side of any of the callouts. This will adjust the width for all comments in the current document. When you end the current editing session, the width of all callouts will revert back to the default value, which is the value of the **Initial Width** option (on page 153) in the **Callouts** preferences page.

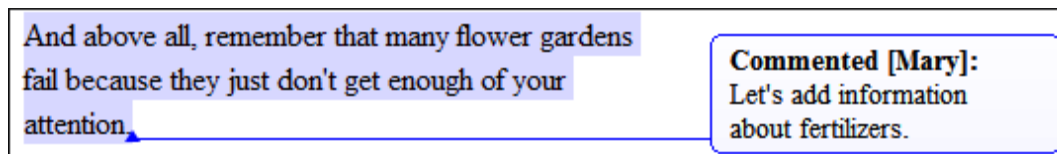

You can also adjust the maximum number of lines to be shown in the callouts using the **Text Lines Count Limit** option (on page 154). Note that this does not limit the number of lines in the actual comment. It only limits the number of lines shown without opening or editing it.

Type of Callouts in Oxygen XML Editor Eclipse plugin

Oxygen XML Editor Eclipse plugin uses callouts to display comments and *Tracked Changes* (on page 2683) that you associate with fragments of the document you are editing. You can choose which types of edits will be shown in callouts by configuring the options in the **Callouts** preferences page (on page 153). You can choose to enable the following types of review callouts:

- **Comment Callouts** - As long as the **Comments** option (on page 153) is selected in the **Callouts** preferences page (on page 153), comments are displayed in callouts. A comment callout contains the name of the author who inserts the callout and the comment itself. You can also select the **Show review time** option (on page 153) to include timestamp information in the comment callouts.

Figure 110. Comment Callouts

There are several types of comments that can be added in **Author** mode:

- *Author Review Comments* - Comments that you associate with specific content. To insert this type of comment, select the content and use the  **Add Comment** action that is available on the toolbar (or in the **Review** submenu of the contextual menu).
- *Comments Added to Tracked Changes* - Comments that you add to an already existing *tracked change* insertion or deletion. To insert this type of comment, right-click the change in the main editor or its callout and select  **Comment Change**.
- *Replies to Comments* - You can use this type of comment to create discussion threads. To insert this type of comment, right-click the change in its callout and select **Reply**. A single callout is presented for a root comment or change and its replies. The replies are displayed with an indentation in the callouts and those that are on the same level are sorted depending on the timestamp.

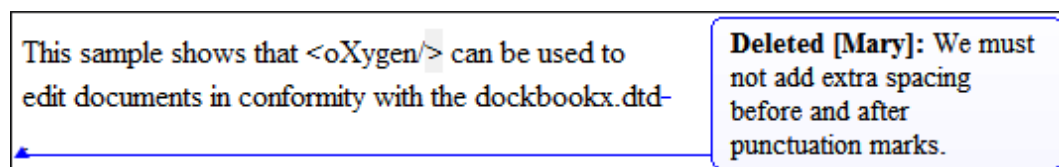

Figure 111. Callout for a Comment with Replies

**Tip:**

When adding, editing, or replying to a comment, you can use **Enter** to insert line breaks and Oxygen XML Editor Eclipse plugin will take the line breaks into account when presenting the callout. You can also use **Ctrl + Enter** to accept your changes and close the dialog box.

- **Tracked Change Deletion Callouts** - As long as the **Track Changes Deletions** option (*on page 153*) is selected in the **Callouts preferences page** (*on page 153*), deletions that are made while the *Track Changes* feature is enabled are displayed in callouts. A deletion callout contains the type of callout (**Deleted**) and the name of the author that made the deletion. You can also select the **Show deleted content in callout** option (*on page 153*) to display the actual deleted content in the callout. Additionally, you can select the **Show review time** option (*on page 153*) to include timestamp information in the deletion callouts.

Figure 112. Deletion Callouts

- **Tracked Change Insertion Callouts** - As long as the **Track Changes Insertions** option (*on page 153*) is selected in the **Callouts preferences page** (*on page 153*), insertions that are done while the *Track Changes* feature is enabled are displayed in callouts. An insertion callout contains the type of callout (**Inserted**) and the name of the author that inserted the content. You can also select the **Show inserted content in callout** option (*on page 153*) to display the actual deleted content in the callout. Additionally,

you can select the **Show review time** option (*on page 153*) to include timestamp information in the deletion callouts.

Figure 113. Insertion Callouts

Callout Contextual Menu Actions

Some useful actions are available when the contextual menu is invoked on a callout. The actions depend on the type of callout.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu of an insertion or deletion callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes* (*on page 2683*). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view** (*on page 438*).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes* (*on page 2683*) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendants. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✓ Accept Change

Accepts the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

✗ Reject Change

Rejects the tracked change, removes the callout, and moves to the next change. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change* (on page 2683). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the **Callouts preference page** (on page 153) where you can configure various callout options.

Comment Callout Actions

The following options are available in the contextual menu of a comment callout:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes* (on page 2683). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view** (on page 438).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes* (on page 2683) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the [Callouts preference page \(on page 153\)](#) where you can configure various callout options.

Printing Callouts

When you print a document from **Author** mode, all callouts that you or other authors have added to the document are printed. For a preview of the document and its callouts, go to **File > Print Preview**.

Review View

The **Review view (on page 438)** is also useful for managing the information in callouts. In this view, changes and comments are presented in a compact form, in the order they appear in the document, and they are synchronized with the changes in the callouts. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

For more information, see [Review View \(on page 438\)](#).

Resources

For more information about the Callouts support in Oxygen XML Editor Eclipse plugin, see our video demonstration:

Related information

[Managing Tracked Changes \(on page 417\)](#)

[Managing Comments \(on page 427\)](#)

[Review View \(on page 438\)](#)

Review View

The **Review** view is an independent panel, available both for built-in and custom XML document *frameworks (on page 2679)*. It is designed to offer an enhanced way of monitoring all the changes that you make to a document. This means you can view and manage highlights, comments, and *tracked changes (on page 2683)* using a single view.

The **Review** view is useful when you are working with documents that contain large number of edits. The edits are presented in a compact form, in the order they appear in the document. Each type of edit is marked with a specific icon. This view and the editing area are synchronized. When you select an edit listed in the **Review** view, its corresponding fragment of text is highlighted in the editing area and the reverse is also true.

For example, when you place the cursor inside an area of text marked as inserted, its corresponding edit is selected in the list.

You can use this view to quickly navigate through changes and it includes some useful hover actions and contextual menu actions to help you manage changes, comments, and highlights. You can also search for specific changes or comments and it includes some filtering options (for example, you can filter it to only show certain types of edits or to only show edits for a particular author).

Figure 114. Review View

Activating the Review View

To activate the **Review** view, do one of the following:

- Click the  **Manage reviews** button on the toolbar.
- Right-click anywhere in a document and select **Review > Manage reviews**.
- Open it from the **Window > Show View** menu.

Review View Toolbar Actions and Settings

The upper part of the view contains a filtering area that allows you to search for specific edits. The filter field also includes a search history drop-down list. The toolbar also includes a  **Settings** menu button.

Settings

The  **Settings** menu includes the following options:

Show highlights

Controls whether or not the **Review** view displays the highlighting in your document.

Show comments

Controls whether or not the **Review** view displays the comments in the document you are editing.

Show track changes

Controls whether or not the **Review** view displays the inserted and deleted content in your document.

Show reviews in read-only content

Controls whether or not the **Review** view displays review items from content referenced with a `@conref` or `@conkeyref` attribute.

Show review time

Displays the time when the edits from the **Review** view were made.

Sort by date

Expands to offer the following sorting options: **Oldest to newest**, **Newest to oldest**, and **No sorting**.

Configure review options

Opens the [Review preferences page \(on page 150\)](#) where you can configure various options for review information.

Hover Actions in the Review View

You can use this view to easily manage changes, highlights, and comments that have been added by you or other users. The following actions are available when you hover over the changes in the **Review** view:

Remove

Available for highlights and comments presented in the **Review** view and it removes the particular highlight or comment from your document and moves to the next change.

Accept

Available for inserted and deleted content presented in the **Review** view and it accepts the particular change in your document and moves to the next change.

Reject

Available for inserted and deleted content presented in the **Review** view and it rejects the particular change in your document and moves to the next change.

Contextual Menu Actions in the Review View

Depending on the type of an edit, the following additional actions are available in the contextual menu of the **Review** view:

Reply

Opens the **Reply** dialog box where you can add a reply to comment or change. The replies are displayed with an indentation in this view.

Mark as Done

Toggles the comment or change as being done and grays it out. You can mark a whole discussion thread as being done by selecting the action on the first (parent) comment in the thread.

Show Comment

Available for comments added by other users and you can use this option to view it in a **Show comment** dialog box.

Edit Comment

Available for comments you have added and you can use this action to edit a comment.

Remove Comment

Use this action to remove the selected comment.

Show only Reviews by '<author name>'

Use this action to filter the edits to only show them for a certain author.

Remove All Comments

Use this action to remove all the comments that appear in the edited document.

Change Color

Available for highlights and it opens a palette where you can choose a new color for the highlighted content.

Remove Highlight

Available for highlights and you can use this action to remove the selected highlight.

Remove Highlights with the Same Color

Available for highlights and you can use this action to remove all the highlights with the same color from the entire document.

Remove All Highlights

Available for highlights and you can use this action to remove all the highlights in your document.

Accept Change

Accepts the selected change and moves to the next change.

Reject change

Rejects the selected change and moves to the next change.

Comment change

Available for insertions or deletions and you can use this option to add a comment for the particular change.

Accept all changes

Accepts all the changes in the current document.

Reject all changes

Rejects all the changes in the current document.

Publishing Tracked Changes, Comments, and Color Highlights

By default, tracked changes do not influence the published output. However, certain parameters can be enabled to display tracked changes and comments in **WebHelp Responsive** and **PDF** output:

- **WebHelp Responsive** - Enable the `webhelp.show.changes.and.comments` publishing parameter. For more details, see: [WebHelp Responsive Transformation Parameters \(on page 1486\)](#).
- **PDF (CSS based)** - Enable the `show.changes.and.comments` publishing parameter. For more details, see: [DITA Map PDF - based on HTML5 & CSS Transformation \(on page 1188\)](#).
- **PDF (XSL-FO based)** - Enable the `show.changes.and.comments` publishing parameter.

Profiling and Conditional Text

Profiling text is a way to mark blocks of text meant to appear in some renditions of the document but not in others. Conditional text differs from one variant of the document to another, while unconditional text appears in all document versions. For example, you can mark a section of a document that is to be included in a manual to be designated for *expert* users and another section for *novice* users, while unmarked sections are included in all renditions.

Profiling Attributes and Condition Sets

Oxygen XML Editor Eclipse plugin allows you to define values for the profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing. You can also conditionally profile parts of a document so that certain parts are displayed when certain profiling conditions are set. You can even customize the colors and styling of how the profiling is displayed in **Author** mode.

You can use profiling and conditional text to help you create documentation for multiple output scenarios, including:

- Multiple outputs for a series of similar products.
- Multiple outputs for various releases of a product.
- Multiple outputs for various audiences.

This feature helps to reduce the effort for updating and translating your content and provides an easy way to customize the output for various audiences.

Figure 115. Example: Profiling Content

Oxygen XML Editor Eclipse plugin includes a preconfigured set of profiling attribute values for some of the most popular document types. These attributes can be redefined to match your specific needs in the [Attributes and Condition Sets preferences page \(on page 146\)](#). You can also define your own profiling attributes and condition sets for each document type ([framework \(on page 2679\)](#)).

For information about creating and editing profiling attributes, see [Creating and Editing Profiling Attributes \(on page 443\)](#).

For information about creating and editing condition sets, see [Creating and Editing Profiling Condition Sets \(on page 448\)](#).

Related Information:

[Customizing Elements that Wrap Profiled Content \(on page 2074\)](#)

Creating and Editing Profiling Attributes

Oxygen XML Editor Eclipse plugin includes support for defining your own profiling attributes, or modifying existing ones, for each particular document type ([framework \(on page 2679\)](#)). You can then apply the profiling attributes to content in **Author** mode to see how the profiling will affect the output.

Create or Editing Profiling Attributes

To create or edit profiling attributes for a specific document type, follow these steps:

1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.
2. Open the [Preferences dialog box \(on page 70\)](#) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

**Information:**

The **Profiling Attributes** section ([on page 147](#)) is used to define the attributes and their values for each document type.

3. To add new attributes and values, click the **+** **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **🔗** **Edit** button.

Step Result: In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

Figure 116. Profiling Attribute Dialog Box

Note: Define only profiling attributes that actually exist in your schema. This feature does not add profiling support to XML vocabularies that do not have it already.

Document type: DITA* ⓘ

Attribute name: OperatingSystem

Display name: OS

Value	Label	Description
win	Windows	MS Windows Operating Syst...
mac	Mac OS X	Macintosh Operating Systems
linux	Unix/Linux	Unix/Linux Operating Systems

Single value
 Multiple values separated by: <space>

? OK Cancel

The following options are available in this dialog box:

Document type

Select the document type ([framework \(on page 2679\)](#)).

**Tip:**

You can use the `*` or `?` wildcards in this combo box. For example, `DITA*` would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

Attribute name

The name of the profiling attribute.

Display name

This optional field is used for descriptive rendering in profiling dialog boxes.

Attribute Values Table

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (**+ New**, **Edit**, **Delete**).

The columns are as follows:

- **Value** - The attribute value.
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode (**Edit Profiling Attributes** dialog box (on page 446), **Condition Set** dialog box (on page 448), and other UI components where the profiling is shown (on page 452)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

Single value

Select this option if you want the attribute to only accept a single value.

Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
5. Click **Apply** to save the changes.

Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the **In-Place Attributes Editor** (on page 386) in **Author** mode, the **Attributes view** (on page 405), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the **Attributes and Condition Sets preferences page** (on page 146) where you can edit the profiling configuration.

**Note:**

If the **Allow contributing extra profiling attribute values** option (on page 147) is not selected in the **Attributes and Condition Sets** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this automatically adding value not be possible.

Figure 117. Profiling Values Conflict Dialog Box

**Related Information:**

[Applying Profiling Attributes \(on page 446\)](#)

[Creating and Editing Profiling Condition Sets \(on page 448\)](#)

[Applying Profiling Condition Sets \(on page 450\)](#)

[Showing and Filtering Profiled Content in Author Mode \(on page 452\)](#)

Applying Profiling Attributes

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

To apply a profiling attribute to content in **Author** mode, follow these steps:

1. To apply a profiling attribute to content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu. To profile an entire element, position the cursor inside the element, right-click, and select **Edit Profiling Attributes** (you can also right-click the element in the *breadcrumb* (on page 378) or *Outline* (on page 326) view).

Step Result: The **Edit Profiling Attributes** dialog box is displayed and shows all the profiling attributes and their values, as defined for the particular document type (*framework*). If you have a large list of

profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the  **Expand All** /  **Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If you have [defined profiling attribute values \(on page 443\)](#) for the DITA document type in the [Attributes and Condition Sets preferences page \(on page 146\)](#), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

Figure 118. Edit Profiling Attributes Dialog Box

2. In the **Edit Profiling Attributes** dialog box, select the checkboxes that correspond to the attribute values you want to apply on the *document fragment (on page 2677)*.
3. Click **OK** to finish the profiling configuration.

Result: The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the [Show Profiling Attributes option \(on page 452\)](#) (available in the  **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the

attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 119. Profiling Attribute Value Form Control Pop Up

Related Information:

[Creating and Editing Profiling Attributes \(on page 443\)](#)

[Creating and Editing Profiling Condition Sets \(on page 448\)](#)

[Applying Profiling Condition Sets \(on page 450\)](#)

[Showing and Filtering Profiled Content in Author Mode \(on page 452\)](#)

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

Creating and Editing Profiling Condition Sets

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. A *Profiling Condition Set* is a very powerful and convenient tool that can be used to preview the content that goes into the published output. For example, an installation manual available in both Windows and Linux variants can be profiled to highlight only the Linux procedures for more advanced users.

Create Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

Information:

The **Profiling Condition Sets** section ([on page 148](#)) is used to define condition sets.

2. To add new condition set, click the **+ New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

Step Result: In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

Figure 120. Condition Set Configuration Dialog Box

The following options are available in this dialog box:

Name

The name of the new condition set.

Document type

Select the document type (*framework (on page 2679)*) that has profiling attributes defined.

Use DITAVAL file

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a *DITAVAL file (on page 2602)*. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.

Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
4. Click **Apply** to save the condition set.

Related Information:

[Applying Profiling Condition Sets \(on page 450\)](#)

[Creating and Editing Profiling Attributes \(on page 443\)](#)

[Applying Profiling Attributes \(on page 446\)](#)

[Showing and Filtering Profiled Content in Author Mode \(on page 452\)](#)

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

Applying Profiling Condition Sets

All defined [Profiling Condition Sets \(on page 448\)](#) are available as shortcuts in the  **Profiling / Conditional Text** toolbar menu [\(on page 452\)](#). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode and **Outline view (on page 326)**. An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:

▼ **Spray painting**

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

▼ The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.

Condition Set

Name:

Document type:

Use DITAVAL file:  

Include the content matching the following conditions:

Type filter text

Audience:

- expert
- novice

Product:

- product1
- product2

Other:

- prop1
- prop2

This is how the document looks in **Author** mode after you apply the condition set:

▼ **Spray painting**

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

▼ The garage is a good place to spray paint.

Step 1

Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2

Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3

Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4

Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5

Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

[Creating and Editing Profiling Condition Sets \(on page 448\)](#)

[Creating and Editing Profiling Attributes \(on page 443\)](#)

[Applying Profiling Attributes \(on page 446\)](#)

[Showing and Filtering Profiled Content in Author Mode \(on page 452\)](#)

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 454\)](#)

Showing and Filtering Profiled Content in Author Mode

You can visualize the effects of profiled content in **Author** mode by using the options in the  **Profiling/Conditional Text** drop-down menu that is located on toolbar. This drop-down menu includes the following filtering options:

Show Profiling Colors and Styles

Select this option to show colors and styles for profiled content in **Author** mode. You can configure the colors and styles or specify whether or not this option is selected by default in the [Profiling/Conditional Text > Colors and Styles preferences page \(on page 148\)](#).

Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode. You can specify whether or not this option is selected by default in the [Profiling/Conditional Text preferences page \(on page 146\)](#).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in **Author** mode and the **Outline** (*on page 326*) view. When this option is selected and a **condition set** is selected in this drop-down menu (*on page 453*), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (*on page 453*), the filtered content is hidden. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text** preferences page (*on page 146*).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

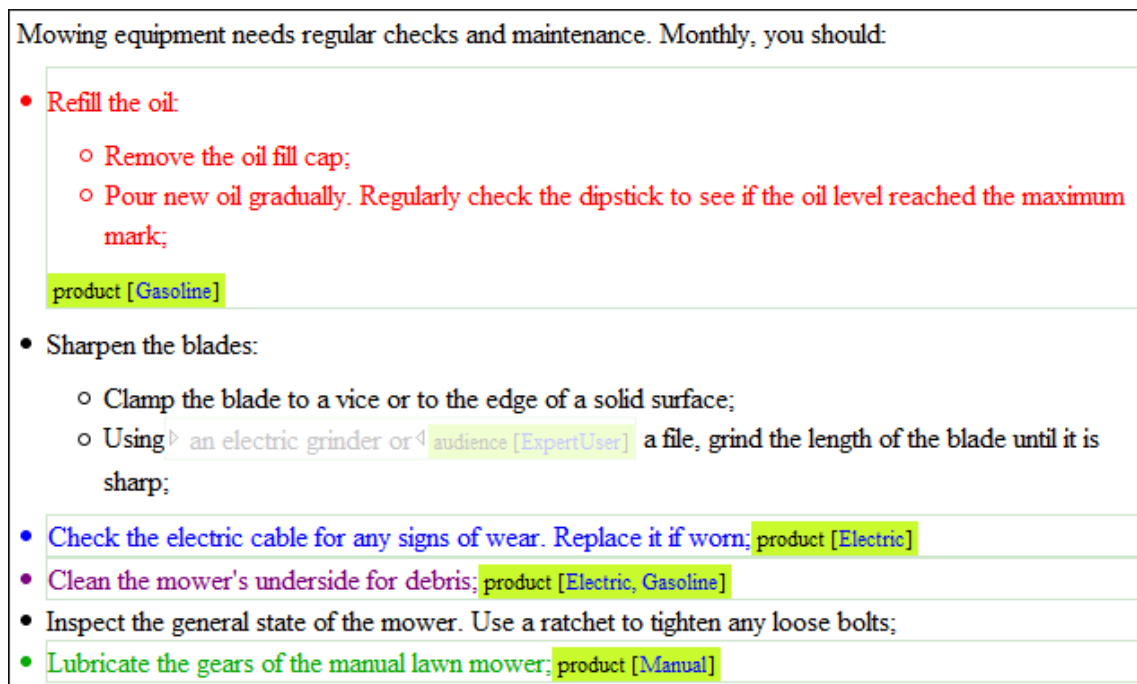

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in **Author** mode to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the **More** submenu or by using the **Choose Condition Set** option (*on page 453*) to access a dialog box that presents all of them.

Profiling Settings

Opens the **Attributes and Condition Sets** preferences page (*on page 146*) where you can add and edit profiling attributes and condition sets.

Figure 121. Example: Profiling Controls in Author Mode

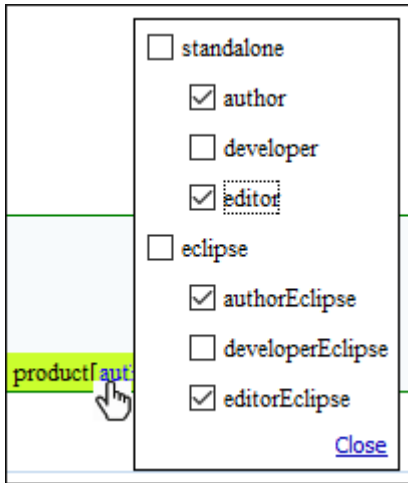

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
 - Remove the oil fill cap;
 - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;
 product [Gasoline]
- Sharpen the blades:
 - Clamp the blade to a vice or to the edge of a solid surface;
 - Using an electric grinder or audience [ExpertUser] a file, grind the length of the blade until it is sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 122. Profiling Attribute Value Form Control Pop Up

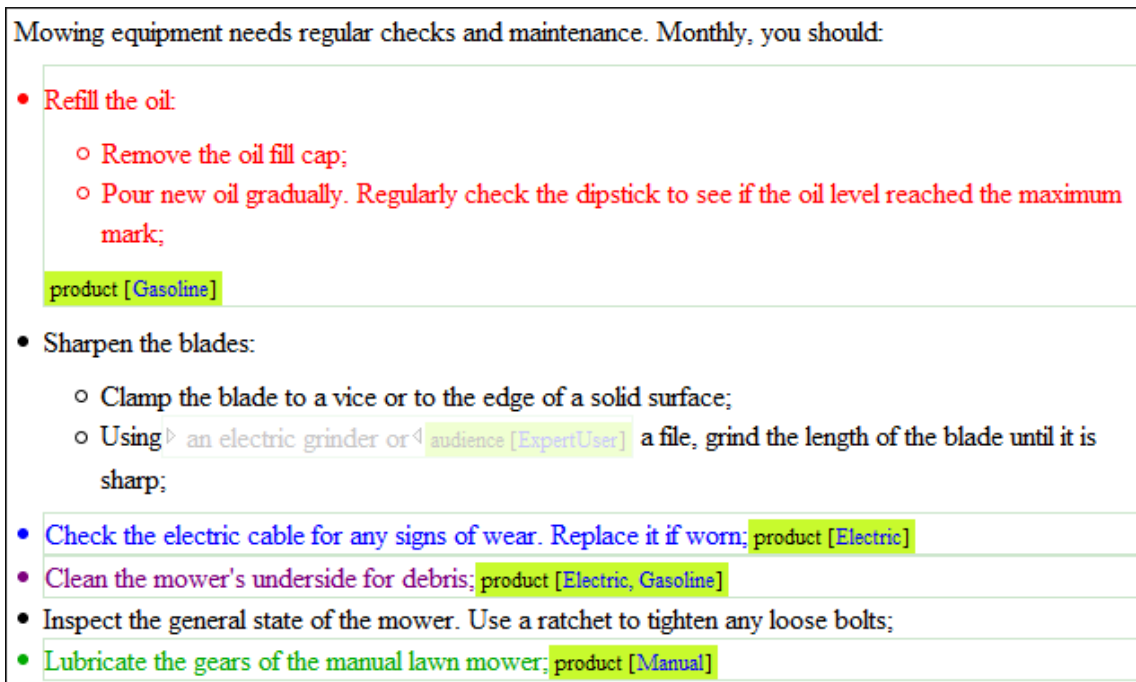

Related Information:

- [Creating and Editing Profiling Attributes \(on page 443\)](#)
- [Applying Profiling Attributes \(on page 446\)](#)
- [Creating and Editing Profiling Condition Sets \(on page 448\)](#)
- [Applying Profiling Condition Sets \(on page 450\)](#)
- [Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 454\)](#)

Customizing Colors and Styles for Rendering Profiling in Author Mode

In **Author** mode, profiling colors and styles can be applied to mark profiled content. This enables the user to distinguish between multiple variants of the output and preview the content that will be published. The excluded text is grayed-out or hidden, making it easy to identify the differences.

Figure 123. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option (*on page 452*) from the  **Profiling / Conditional Text** toolbar drop-down menu.
2. Select  **Profiling Settings** (*on page 453*) from the  **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Attributes and Condition Sets preferences page** (*on page 146*).
3. Go to the **Colors and Styles preferences page** (*on page 148*) to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes preferences page** (*on page 150*) to configure how you want the profiling attributes to appear in Oxygen XML Editor Eclipse plugin.

Result: The styling is now applied in the **Author** editing mode and the **Outline view** (*on page 326*). Also, to help you more easily identify the profiling you want to apply in the current context, the styling is applied in the **Edit Profiling Attributes dialog box** (*on page 443*) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Adding Tables in Author Mode

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in various *frameworks* (on page 2679) (DITA, DocBook, TEI, and XHTML). This opens the **Insert Table** dialog box. Each *framework* has a different set of options that are available in this dialog box for configuring the properties of the tables. In all cases, Oxygen XML Editor Eclipse plugin includes some general editing actions for configuring tables in **Author** mode.

This section explains those general actions and the various configuration options and layouts for tables that are inserted in the most commonly used document types.

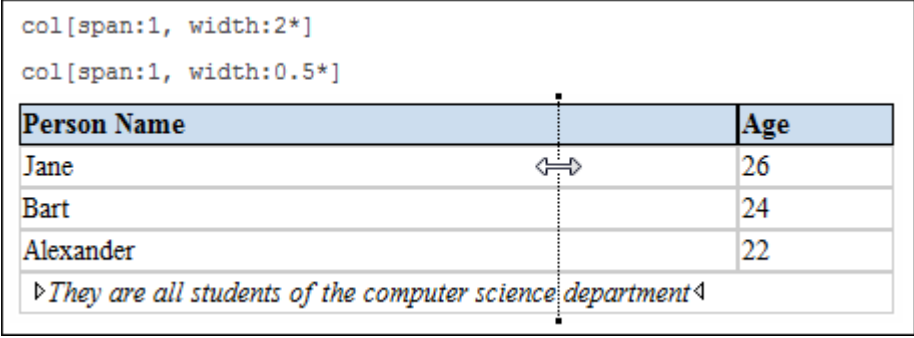

Editing Tables in Author Mode

Oxygen XML Editor Eclipse plugin provides support for editing data in a tabular form. A variety of features and operations are available for editing tables in **Author** mode and they include the following:

Adjusting Column Width

To adjust the width of a column or table, drag the border of the column or table. The changes you make to a table are committed into the source document. You can also manage table width and column width specifications from the source document, and some types of tables include a **colspecs** section that appears above the table in **Author** mode that allows you to easily configure some column specifications (such as column width). These column width specifications are supported in fixed, dynamic, and proportional dimensions. The built-in DITA, DocBook, and XHTML *frameworks* (on page 2679) support this feature. The layout of the tables for these document types takes into account the table width and the column width specifications particular to them.

Figure 125. Resizing a Table Column in Author Mode

```
col[span:1, width:2*]
col[span:1, width:0.5*]
```

Person Name	Age
Jane	26
Bart	24
Alexander	22
▾ They are all students of the computer science department ▾	

Selecting Columns and Rows

To select a row or a column of a table, place the mouse cursor above the column or in front of the row you want to select, then click. When hovering the mouse cursor in front of rows or above column headers, the

cursor changes to  for row selection and to  for column selection and that specific row or column is highlighted.

You can use the **Ctrl** and **Shift** keys to select multiple rows.

Selecting Cells

To select a cell in a table, press and hold the **Ctrl** key and click anywhere inside the cell. You can also use the **Ctrl** and **Shift** keys to select multiple cells or to deselect cells from a selection. Alternatively, you can click the left corner of a cell (right corner if you are editing an [RTL document \(on page 524\)](#)) to select it. The cursor changes to  when you hover over the corner of the cell.

You can also select multiple rectangular blocks of cells by using your mouse to select a cell and drag it to expand the selection.

Drag and Drop

You can use the drag and drop action to edit the content of a table. You can select a column and drag it to another location in the table you are editing. When you drag a column and hover the cursor over a valid drop position, Oxygen XML Editor Eclipse plugin decorates the target location with bold rectangles. The same drag and drop action is also available for entire rows or columns by hovering the mouse cursor in front of rows or above column headers, then selecting the row or column and dragging them to the desired location.

Copy/Cut and Paste

In Oxygen XML Editor Eclipse plugin, you can copy/cut entire rows or columns of the table you are editing and paste the copied columns or rows inside the same table or inside other tables. You can also use the copy or cut actions for tables located in other documents. If you paste a row or column into non-table content, Oxygen XML Editor Eclipse plugin introduces a new table that contains the fragments of the copied row or column content.

For copied columns, the fragments are introduced starting with the header of the column. Also, if the copied column is from a *CALS* table (DITA or DocBook), Oxygen XML Editor Eclipse plugin preserves column width information. This information is then used when you paste the column into another *CALS* table.

For copied cells, when pasting them into another cell without a selection (the cursor is just placed in the new cell), the copied cells are pasted while preserving their initial order and spacing. If pasting them into a selection of cells, first the content of the selected cells is deleted, then the copied cells are pasted with their initial order and spacing preserved and if there are more cells in the selection than in the copied content, the pasting will repeat the copied cells until the end of the selection.

Deleting Content

To delete the content of a cell, select the cell and press the **Delete** or **Backspace** key on your keyboard. If you press **Delete** or **Backspace** again, the selected table structure will also be removed.

To delete an entire row or column, place the cursor inside the row or column (or select it) and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for the current row or column.

To delete a selection of multiple rows or columns, select them and use the  **Delete Row(s)** or  **Delete Column(s)** actions from the toolbar or contextual menu. This will delete both the content and the table structure for all rows or columns that exist in the current selection.

Navigating Cells

Along with the normal mouse navigation, you can also navigate between cells by using the arrow keys on your keyboard. By default, when using the arrow keys to navigate between table cells, the cursor jumps from one cell to another. However, if the **Quick navigation in tables** option (*on page 144*) is not selected in the **Cursor Navigation** preferences page, using the arrow keys to navigate between table cells will cause the cursor to navigate between XML nodes, rather than jumping from cell to cell.

Related information

[Adding Tables in DocBook \(*on page 458*\)](#)

[Adding Tables in DITA Topics \(*on page 2429*\)](#)

[Adding Tables in XHTML Documents \(*on page 482*\)](#)

[Sample Plugin: Add CALS Support for any XML Document](#)

Adding Tables in DocBook

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DocBook document.

DocBook supports two types of tables:

- **CALS** table model - This is used for more advanced functionality.
- **HTML** table model - This is used for inserting a formal (captioned) HTML table.

Inserting a CALS Table Model in DocBook

To insert a *CALS* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure a few more properties than the *HTML* model.

Figure 126. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@colwidth` attribute are automatically changed accordingly. By

default, when you insert, drag and drop, or copy/paste a column, the value of the `@colwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width (`@colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

Row separator

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Column separator

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Note:

The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `<colspecs>` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as

part of the **Author mode** (on page 242), the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 127. CALS Table in DocBook

Sample DocBook CALS Table

colspecs...

column name c1 number 1 width 221.25pt align [v] colsep rowsep

column name c2 number 2 width 232.5pt align [v] colsep rowsep

Inserting an HTML Table Model

To insert an *HTML* table model in DocBook documents, select the  **Insert Table** action on the toolbar or from the contextual menu. The **Insert Table** dialog box appears. Select **HTML** for the table **Model**.

Figure 128. Insert Table Dialog Box - Simple Model

Insert Table

Model

CALS HTML

Title

Table Size

Rows 3 Columns 2

Generate table header Generate table footer

Column widths: proportional

Frame: void

Row separator: <unspecified>

Column separator: <unspecified>

Alignment: <unspecified>

The dialog box allows you to configure the following options when you select the **HTML** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`@width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@width` attribute (in a `<col>` element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@width` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form "0*" (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.

- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

**Note:**

The options in the **Insert Table** dialog box for DocBook documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your document at the current cursor position.

When you insert an HTML table, you see a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. Although this section appears as part of the **Author mode** (on page 242), it will not appear in your output. It is just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (on page 405) (**Window > Show View > Attributes**).

You can also use the  **Table Properties (Ctrl + T (Command + T on macOS))** (on page 2439) action from the toolbar or contextual menu to modify many of the properties of the table (on page 465).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 241).

DocBook Table Layouts

The DocBook *framework* (on page 2679) supports the following two table model layouts:

- *CALS* table model (on page 463)
- *HTML* table model (on page 464)

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@colwidth` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author mode** (on page 242), the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 129. CALS Table in DocBook

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ colspecs...

column name	c1	number	1	width	0.32*	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	c2	number	2	width	1.49*	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	c3	number	3	width	1.15*	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	c4	number	4	width	0.4*	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	c5	number	5	width	1.67*	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep

Horizontal Span		a3	a4	a5
<i>f1</i>	<i>f2</i>	<i>f3</i>	<i>f4</i>	<i>f5</i>
b1	b2	b3	b4	▶ Vertical Span
c1	Spans ▶ Both directions		c4	
d1			d4	d5

Tip:

A sample plugin is available that can be used as inspiration to add support for CALS tables in any XML document: [Sample Plugin: Add CALS Support for any XML Document](#).

HTML Table Model Layout

Choosing an **HTML** table model from the **Insert Table** dialog box in a DocBook document inserts a formal (captioned) HTML table. The layout of an *HTML* table includes a section above the table that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@width` attribute) or the text alignment (`@align` attribute). Although these properties appear as part of the **Author mode** (on page 242), they will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 130. HTML Table in DocBook

Sample HTML Table

column title	span	width	50%	align	▼
column title	span	width	50%	align	▼

Column 1	Column 2
Data A	Data B
Data C	Data C

Pasting Tables in DocBook

Tables that are pasted into a DocBook file are automatically converted to the *CALS* model. If you want to overwrite this behavior and instruct Oxygen XML Editor Eclipse plugin to convert them to *HTML* tables, set the `docbook.html.table` parameter to `1`. You can find this parameter in the following stylesheet:

- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml12db5Driver.xsl` for DocBook 5
- `[OXYGEN_INSTALL_DIR]/frameworks/docbook/resources/xhtml12db4Driver.xsl` for DocBook 4

Table Validation in DocBook

Oxygen XML Editor Eclipse plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for DocBook table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `@colspan`, `@rowspan`, or `@span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Editing Table Properties in DocBook

You can edit the structure of an existing table using the table buttons on the toolbar (or from the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view \(on page 405\)](#) (**Window > Show View > Attributes**).

You can use the  **Table Properties (Ctrl + T (Command + T on macOS))** action to modify many of the properties of the table. You can also adjust some of the properties in the specification section above the table.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:

Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 131. Table Properties Dialog Box with Cell Tab Selected (DocBook CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook CALS table specifications](#).

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `@thead`, `@tbody`, or `@tfoot` attribute).

Edit Table Properties for an HTML Table Model

For an **HTML** table model, the **Table properties** dialog box includes four tabs of options (**Table**, **Row**, **Column**, and **Cell**) and the options include a **Preview** pane that shows a representation of the modification.

The options in the four tabs include the following:

Frame (Available only in the Table tab)

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in the [DocBook HTML table specifications](#).

Row type (Available in the Row tab only)

Allows you change the row to a header, body, or footer type of row (within a `@thead`, `@tbody`, or `@tfoot` attribute).

Horizontal alignment (Available in the Row, Column, and Cell tabs)

Specifies the horizontal alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Vertical alignment (Available in the Row, Column, and Cell tabs)

Specifies the vertical alignment for the text in the current row/column/cell or selection of multiple rows/columns/cells (`@valign` attribute). The allowed values are:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **baseline** - Sets the row so that all the table data share the same baseline. This often has the same effect as the `bottom` value. However, if the fonts are different sizes, the `baseline` value often makes the table look better.

Related Information:

[Editing Tables in Author Mode \(on page 456\)](#)

Adding Tables in DITA Topics

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- [DITA Simple table model \(on page 2429\)](#) - This is the most commonly used model for basic tables.
- [CALs table model \(OASIS Exchange Table Model\) \(on page 2431\)](#) - This is used for more advanced functionality.
- [DITA Choice table model \(on page 2434\)](#) - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- [DITA Properties table model \(on page 2435\)](#) - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor Eclipse plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

To insert a **Simple** DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 132. Insert Table Dialog Box - Simple Model

The dialog box allows you to configure the following options when you select the **Simple** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and

rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.

- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Note:

The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (**CALS**), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

Figure 133. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`@colwidth` attribute). Entering content into a cell changes the rendered width dynamically.

If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Row separator

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Column separator

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note:

The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:**

The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the *colspecs* (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode** (on page 242), the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 134. CALS Table in DITA

▼ **Sample CALS Table with Fixed Width**

▼ *colspecs...*

name	c1	number	1	width	198pt	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
name	c2	number	2	width	219pt	align	▼	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep

Inserting a Choice Table Model

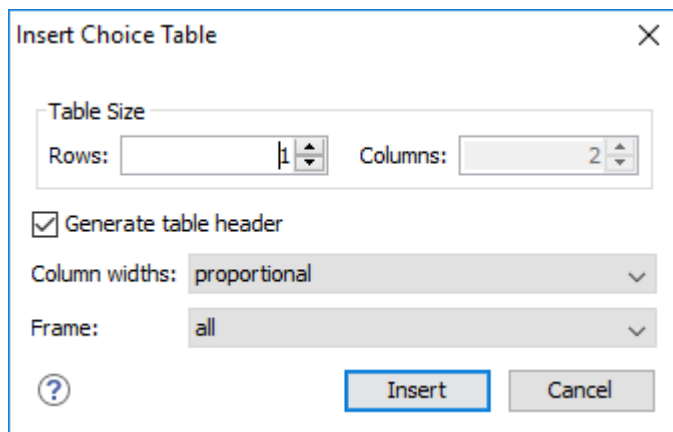

To insert a **Choice** table within a `<step>` element in a DITA Task document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the *Content Completion Assistant* (on page 2677). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 135. Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.

- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `<step>` element).

Inserting a Properties Table Model

To insert a **Properties** table within a `<refbody>` element in a DITA Reference document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the *Content Completion Assistant (on page 2677)*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

Figure 136. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (on page 405) (**Window > Show View > Attributes**). See the [DITA documentation](#) for a full explanation of these attributes.

You can also use the  **Table Properties (Ctrl + T (Command + T on macOS))** (on page 2439) action from the toolbar or contextual menu (or **DITA** menu) to [modify many of the properties of the table](#) (on page 2439).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 241).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor Eclipse plugin includes a [Smart Paste feature](#) (on page 390) that preserves certain style and structure information when pasting content.

Tip:

When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:

[Editing Tables in Author Mode](#) (on page 456)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- *CALS* table model (on page 477)
- *Simple* table model (on page 477)
- *Choice* table model (on page 478)
- *Properties* table model (on page 478)

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@colwidth` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author mode** (on page 242), the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 137. CALS Table in DITA

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ colspecs...

column name	<input type="text" value="c1"/>	number	<input type="text" value="1"/>	width	<input type="text" value="0.32*"/>	align	<input type="text"/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	<input type="text" value="c2"/>	number	<input type="text" value="2"/>	width	<input type="text" value="1.49*"/>	align	<input type="text"/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	<input type="text" value="c3"/>	number	<input type="text" value="3"/>	width	<input type="text" value="1.15*"/>	align	<input type="text"/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep

c1	Spans ▷ Both ◁ directions		c4	
d1			d4	d5

Tip:

A sample plugin is available that can be used as inspiration to add support for CALS tables in any XML document: [Sample Plugin: Add CALS Support for any XML Document](#).

Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and

choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 138. DITA Simple Table

Header 1	Header 2
Column 1	Column 2

Choice Table Model Layout

A **Choice** table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetable>` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting **choicetable** from the *Content Completion Assistant (on page 2677)* (within a `<step>` element) or by using the  **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Figure 139. DITA Choice Table

Option	Description
Opt A	
Opt B	
Opt C	

Properties Table Model Layout

A **Properties** table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting **properties(wizard)** from the *Content Completion Assistant (on page 2677)* (within a `<refbody>` element) or by using the  **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 140. DITA Properties Table

Property Type	Property Value	Property Description
A	B	C

Table Validation in DITA

Oxygen XML Editor Eclipse plugin reports table layout problems that are detected in manual or automatic validations. When you validate a *DITA map (on page 2678)* with the  **Validate and Check for Completeness** action, if the **Report table layout problems** option (on page 2387) is selected in the **DITA Map Completeness**

Check dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties (Ctrl + T (Command + T on macOS))** action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:

Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.

- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 141. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note:

The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Frame (Available only in the Table tab)

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Row tab (not available for *Properties* tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:

[Adding Tables in DITA Topics \(on page 2429\)](#)

[Editing Tables in Author Mode \(on page 456\)](#)

Adding Tables in XHTML Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in an XHTML document. This action opens the **Insert Table** dialog box.

Figure 142. Insert Table Dialog Box in XHTML

The dialog box allows you to configure the following options:

Caption

If this checkbox is selected, you can specify a title (caption) for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Generate table footer

If selected, an extra row will be inserted at the bottom of the table to be used as the table footer.

Column widths

Allows you to specify the type of properties for column widths (`@width` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@width` attribute (in a `<col>` element) with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `width="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@width` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@width` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the

width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the section above the table or in **Text** mode. In addition to the standard pixel, percentage, and relative values, this attribute also allows the special form “0*” (zero asterisk), which means that the width of each column in the group should be the minimum width necessary to hold the contents.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. There are a variety of allowed values, as specified in HTML specifications.

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width. Note that this value cannot be rendered in **Author** mode, so you will only see it in the output.
- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.

Note:

The options in the **Insert Table** dialog box for XHTML documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, an HTML style of table is inserted into your XHTML document at the current cursor position.

When you insert an HTML table, you see a link for setting the `<colspecs>` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode** (on page 242), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (on page 405) (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 241).

XHTML Table Layout

When you insert a table in an XHTML document, an HTML type of table is added. The layout of an *XHTML* table includes a **colspecs** section that allows you to easily configure some properties. For example, you can change the value of column widths (`@width` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author mode** (on page 242), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 143. Table Layout in XHTML Documents

x	y	Spans ▾ Horizontally ▾	
Spans ▾ Vertically ▾	b		
Spans ▾ Both ▾	d	f	
g	h	i	k

Table Validation in XHTML

Oxygen XML Editor Eclipse plugin reports table layout problems that are detected in manual or automatic validations. The types of errors that may be reported for XHTML table layout problems include:

HTML Tables

- A row has fewer cells than the number of table columns.
- The value of the `@colspan`, `@rowspan`, or `@span` attributes are not numeric.
- A cell has a vertical span greater than the available rows count.

Adding Tables in TEI Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a TEI document. This action opens the **Insert Table** dialog box.

Figure 144. Insert Table Dialog Box in TEI

The dialog box allows you to configure the following options:

Head

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Note:

The options in the **Insert Table** dialog box for TEI documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your TEI document at the current cursor position.

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view \(on page 405\)](#) (**Window > Show View > Attributes**). Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to [Text mode \(on page 241\)](#).

Adding Tables in JATS Documents

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a JATS document. This action inserts a simple HTML-type table into your document at the current cursor position. Once inserted, you can edit the structure of the table using the table buttons on the toolbar (or in the contextual menu). For example you can add or remove cells, rows, and columns, or split or join cells. Additional attributes can be used to fine-tune the formatting of your tables by using the [Attributes view \(on page 405\)](#) (**Window > Show View > Attributes**).

Also, remember that underneath the visual representation, the table is really just XML. If necessary, you can edit the XML directly by switching to [Text mode \(on page 241\)](#).

Sorting Content in Tables and List Items

Oxygen XML Editor Eclipse plugin offers support for sorting the content of tables and list items of ordered and unordered lists.

Sorting a Table

To sort rows in a table, select the entire table (or specific rows) and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

Figure 145. Sort Dialog Box

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

**Note:**

When you invoke the sorting operation over an entire table, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
 - **Text** - Alphanumeric characters.
 - **Numeric** - Regular integer or floating point numbers are accepted.
 - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

**Note:**

The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.

Sorting a Selection of Rows

To sort a selection of rows in a table, select the rows that you want to sort and either right-click the selection and choose  **Sort**, or click  **Sort** on the main toolbar. This opens the **Sort** dialog box.

Figure 146. Sort Selected Rows

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire table or only a selection of its rows.

The **Sort** dialog box also allows you to apply the sorting operation to the entire table, using the **All rows** option.

The **Criteria** section specifies the sorting criteria (a maximum of three sorting criteria are available), defined by the following:

- A name, which is collected from the column heading.
- The type of the information that is sorted. You can choose between the following:
 - **Text** - Alphanumeric characters.
 - **Numeric** - Regular integer or floating point numbers are accepted.
 - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

The sort criteria is automatically set to the column where the cursor is located at the time when the sorting operation is invoked.

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

**Note:**

The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.

Sort Using Multiple Criteria

You can also sort an entire table or a selection of its rows based on multiple sorting criteria. To do so, select the rest of boxes in the **Criteria** section of the **Sort** dialog box, configure the applicable items, and click **OK** to complete the sorting operation.

Figure 147. Sorting Based on Multiple Criteria

Sorting a Table that Contains Merged Cells

If a table contains cells that span over multiple rows, you can not perform the sorting operation over the entire table. Still, the sorting mechanism works over a selection of rows that do not contain *rowspans*.

**Note:**

For this type of table, the **Sort** dialog box keeps the **All rows** option disabled even if you perform the sorting operation over a selection of rows.

Sorting List Items

A sorting operation can be performed on various types of lists and list items. The types of lists that can be sorted in Oxygen XML Editor Eclipse plugin depend on the framework (document type), but examples of the types that can be sorted include:

- Ordered list (DITA, DocBook, XHTML, TEI)
- Unordered list (DITA, DocBook, XHTML, TEI)
- Definition list (DITA)
- Variable list (DocBook)

- Parameter list (DITA)
- Simple list (DITA)
- Required conditions (DITA Machinery Task)
- Supplies list (DITA Machinery Task)
- Spare parts list (DITA Machinery Task)
- Safety conditions (DITA Machinery Task)

The sorting mechanism works on an entire list or on a selection of list items. To sort items in a list, select the items or list and use the  **Sort** action from the main toolbar or the contextual menu. This opens the **Sort** dialog box.

Figure 148. Sorting List Items

This dialog box sets the range that is sorted and the sorting criteria. The range is automatically selected depending on whether you sort an entire list or only a selection of its items.

Note:

When you invoke the sorting operation over an entire list, the **Selected rows** option is disabled.

The **Criteria** section specifies the sorting criteria, defined by the following:

- The name of the type of item being sorted.
- The type of the information that is sorted. You can choose between the following:
 - **Text** - Alphanumeric characters.
 - **Numeric** - Regular integer or floating point numbers are accepted.
 - **Date** - Default date and time formats from the local OS are accepted (such as *short*, *medium*, *long*, *full*, *xs:date*, and *xs:dateTime*).
- The sorting direction (either *ascending* or *descending*).

After you finish configuring the options in the **Sort** dialog box, click **OK** to complete the sorting operation. If you want to revert to the initial order of your content, press **Ctrl + Z (Command + Z on macOS)** on your keyboard.

**Note:**

The sorting support takes the value of the `@xml:lang` attribute into account and sorts the content in a natural order.

Inserting Images

To insert an image in a document while editing in **Author** mode, use one of the following methods:

- Click the  **Insert Image** action from the toolbar. This opens a dialog box that allows you to choose the image file you want to insert and configure some properties. Oxygen XML Editor Eclipse plugin tries to reference the image with a path that is relative to that of the document you are currently editing. For example, if you want to add the `file:/C:/project/xml/dir/img1.jpg` image into the `file:/C:/project/xml/doc1.xml` document, Oxygen XML Editor Eclipse plugin inserts a reference to `dir/img1.jpg`. This is useful when multiple users work on a common project and they have it stored in multiple locations.

**Note:**

The  **Insert Image** action is available for the following document types: DITA, DocBook, TEI, XHTML, JATS.

- Drag an image from other application and drop it in the **Author** editing mode. If it is an image file, it is inserted as a reference to the image file. For example, in a DITA topic the path of the image file is inserted as the value of the `@href` attribute in an `<image>` element:

```
<image href="../../../images/image_file.png"/>
```

**Tip:**

To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor Eclipse plugin will automatically update the reference to the new image.

- Copy an image file from another document or another application (such as a system file browser or web browser) and paste it into your document. Oxygen XML Editor Eclipse plugin will insert it as a reference to the image file the same as the drag/drop method.
- Select an image (or part of an image) from another application (such as an image editor), copy it, and paste it into your document. Oxygen XML Editor Eclipse plugin will prompt you to save it. After saving the image, a reference to that file path is inserted at the paste position.

Related Information:

[Image Map Editor \(on page 496\)](#)

[Image Rendering in Author Mode \(on page 492\)](#)

[Adding Video, Audio, and Embedded HTML Resources in DITA Topics \(on page 2419\)](#)

Image Rendering in Author Mode

The **Author** mode and the output transformation process might render the images referenced in an XML document differently, since they use different rendering engines.

Table 4. Supported Image Formats

Image Type	Support	Additional Information
GIF	built-in	Animations not yet supported.
JPG, JPEG	built-in	JPEG images with CMYK color profiles (on page 2321) are properly rendered only if color profile is inside the image.
PNG	built-in	
SVG, SVGZ	built-in	Rendered using the open-source Apache Batik library that supports SVG 1.1.
BMP	built-in	
TIFF	built-in	Rendered using a part of the Java JAI Image library.
EPS	built-in	Renders the preview TIFF image inside the EPS.
AI	built-in	Renders the preview image inside the Adobe Illustrator file.
PDF	built-in	Rendered by using the bundled Apache PDF Box library.
JPEG 2000, WBMP	plugin	Renders by installing the Java Advanced Imaging (JAI) Image I/O Tools plug-in (on page 494) .

When an image cannot be rendered, Oxygen XML Editor Eclipse plugin **Author** mode displays a warning message that contains the reason why this is happening. Possible causes include the following:

- The image is too large. Select the [Show very large images option \(on page 137\)](#).
- The image format is not supported by default. It is recommended to [install the Java Advanced Imaging\(JAI\) Image I/O Tools plug-in \(on page 494\)](#).

Tip:

If you are using a custom XML format and you want images to be displayed in **Author** mode, you could use a custom CSS to define the rendering.

For example, if your XML has something like this:

```
<image href="blue.png" />
```

You can add a selector in your custom CSS like this:

```
image[href]{
    content: attr(href, url);
}
```

Scaling Images

Image dimension and scaling attributes are taken into account when an image is rendered. The following rules apply:

- If you specify only the width attribute of an image, the height of the image is proportionally applied.
- If you specify only the height attribute of an image, the width of the image is proportionally applied.
- If you specify width and height attributes of an image, both of them control the rendered image.
- If you want to scale both the width and height of an image proportionally, use the `@scale` attribute.

Note:

As a Java application, Oxygen XML Editor Eclipse plugin uses the *Java Advanced Imaging* API that provides a pluggable support for new image types. If you have an *ImageIO* library that supports additional image formats, just copy this library to the `[OXYGEN_INSTALL_DIR]/lib` directory.

Rendering CGM Images

Oxygen XML Editor Eclipse plugin offers a few add-ons that provide support for CGM 1.0 images. To allow the rendering of CGM images in **Author** mode, go to <https://github.com/oxygenxml/oxygenxml.cgm.support.eclipse> and follow the instructions.

Rendering PDF Images

Oxygen XML Editor Eclipse plugin provides built-in support for rendering PDF images in **Author** mode and PDF output.

Rendering PSD Images

Oxygen XML Editor Eclipse plugin provides support for rendering PSD (Adobe Photoshop) images.

To allow the rendering of PSD images in **Author** mode, follow this procedure:

1. Download the following *JAR* (on page 2679) files:
 - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-lang/3.1.0/common-lang-3.1.0.jar>
 - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-io/3.1.0/common-io-3.1.0.jar>
 - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/common/common-image/3.1.0/common-image-3.1.0.jar>

- <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-core/3.1.0/imageio-core-3.1.0.jar>
 - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-metadata/3.1.0/imageio-metadata-3.1.0.jar>
 - <http://search.maven.org/remotecontent?filepath=com/twelvemonkeys/imageio/imageio-psd/3.1.0/imageio-psd-3.1.0.jar>
2. Copy the downloaded *JAR* libraries to the `[OXYGEN_INSTALL_DIR]\lib` directory.
 3. Open `OXYGEN_PLUGIN_DIR/META-INF/MANIFEST.MF` and add a reference to the *JAR* libraries in the `Bundle-ClassPath` entry.
 4. Restart Eclipse in clean mode (edit the shortcut you use to start Eclipse and add `-clean` as the first argument.)

Rendering EPS and AI Images

Most EPS and AI image files include a preview picture of the content. Oxygen XML Editor Eclipse plugin tries to render this preview picture. The following scenarios are possible:

- The EPS or AI image does not include the preview picture. Oxygen XML Editor Eclipse plugin cannot render the image.
- The EPS image includes a TIFF preview picture.

Note:

Some newer versions of the TIFF picture preview are rendered in gray-scale.

- The AI image contains a JPEG preview picture. Oxygen XML Editor Eclipse plugin renders the image correctly.

Rendering Special Images with Java Advanced Imaging (JAI) Plugin

Certain special image types can be rendered in Oxygen XML Editor Eclipse plugin by using a Java Advanced Imaging (JAI) Image I/O Tools plugin.

How to Install JAI Image I/O Tools Plugin

To install this plugin, follow this procedure:

1. Start Oxygen XML Editor Eclipse plugin and open the **Help > About** dialog box. Click the **Installation Details** button, go to the **Configuration** tab, and look for the `java.runtime.name` and `java.home` properties. Keep their values for later use.
2. Download the JAI Image I/O kit corresponding to your operating system and Java distribution (found in the `java.runtime.name` property). A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.

**Note:**

The JAI API is not the same thing as JAI Image I/O. Make sure you have installed the latter.

3. Run the installer. When the installation wizard displays the **Choose Destination Location** page, fill-in the **Destination Folder** field with the value of the `java.home` property. Continue with the installation procedure and follow the on-screen instructions.

macOS Workaround

There is no native implementation of the JAI Image I/O Tools plugin for macOS 10.5 and later. However, it has a Java implementation fallback that also works on macOS. Some of the image formats are not fully supported in this fallback mode, but at least the TIFF image format is known to be supported.

Use the following procedure for this macOS workaround:

1. Download a Linux (`tar.gz`) distribution of the JAI Image I/O Tools plugin. A list of archived JAI distributions can be found at: <http://www.oracle.com/technetwork/java/javasebusiness/downloads/java-archive-downloads-java-client-419417.html>.
2. In the `[OXYGEN_INSTALL_DIR]/lib` directory, create a directory named `endorsed` (`[OXYGEN_INSTALL_DIR]/lib/endorsed`).
3. Unpack the `tar.gz`. Copy the `clibwrapper_jiio.jar` and `jai_imageio.jar` files from its `lib` directory and paste them in the `[OXYGEN_INSTALL_DIR]/lib/endorsed` directory.
4. Restart the application and the JAI Image I/O support will be up and running.

Retina/HiDPI Images in Author Mode

Oxygen XML Editor Eclipse plugin provides support for Retina and HiDPI images through simple naming conventions. The higher resolution images are stored in the same images folder as the normal resolution images and they are identified by a scaling factor that is included in the name of the image files. For instance, images with a Retina scaling factor of 2 will include `@2x` in the name (for example, `myImage@2x.png`). Oxygen XML Editor Eclipse plugin displays the larger set of icons starting with 150% (1.5x) scaling.

You can reference an image to style an element in a CSS by using the `url` function in the `content` property, as in the following example:

```
listItem:before{
  content: url('../img/myImage.png');
}
```

This would place the image that is loaded from the `myImage.png` file just before the `<listItem>` element. However, if you are using a Retina display (on a Mac), the icon looks a bit blurry as it automatically gets scaled, or if you are using an HiDPI display (on a Windows-based PC), the icon remains at the original size, thus it will look very small. To solve this rendering problem, you need to be able to reference both a *normal* DPI image and

a *high* DPI image. However, referencing both of them from the CSS is not practical, as there is no standard way of doing this.

Starting with version 17, Oxygen XML Editor Eclipse plugin interprets the argument of the `url` function as key rather than a fixed URL. Therefore, when running on a system with a Retina or HiDPI display, Oxygen XML Editor Eclipse plugin will first try to find the image file that corresponds to the retina scaling factor. For instance, using the previous example, Oxygen XML Editor Eclipse plugin would first try to find `myImage@2x.png`. If this file is not found, it defaults back to the *normal* resolution image file (`myImage.png`).

Oxygen XML Editor Eclipse plugin also supports dark color themes. This means that the background of the editor area can be of a dark color and the foreground a lighter color. On a dark background, you may find it useful to invert the colors of images. Again, this can be done with simple naming conventions. If an image designed for a dark background is not found, the *normal* image is used.

Retina/HiDPI Naming Convention

Refer to the following table for examples of the Retina/HiDPI image naming convention that is used in Oxygen XML Editor Eclipse plugin:

Color Theme	Referred Image File	Double Density Image File	Triple Density Image File
normal	../img/myImage.png	../img/myImage@2x.png	../img/myImage@3x.png
dark	../img/myImage_dark.png	../img/myImage_dark@2x.png	../img/myImage_dark@3x.png

[Using Retina/HiDPI Icons for the Actions from a Framework \(on page 1992\)](#)

Image Map Editor

Oxygen XML Editor Eclipse plugin includes an **Image Map Editor** that allows you to create hyperlinks in specific areas of an image that will link to various destinations. For example, an image that is a map of the seven continents may have a specific hyperlink for each continent that links to a resource that has information about the particular continent. The main purpose of an **image map** is to provide an easy way of linking various parts of an image without having to divide the image into separate image files.

The support for image maps in Oxygen XML Editor Eclipse plugin is available for images in DITA, DocBook, TEI, and XHTML document types ([frameworks \(on page 2679\)](#)). To create an image map on an existing image and open the **Image Map Editor**, right-click the image and select **Image Map Editor**.

Figure 149. Image Map Rendered in Author Mode

Working with Image Maps in DITA

Oxygen XML Editor Eclipse plugin includes support for **image maps** in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 150. Image Map Editor in DITA

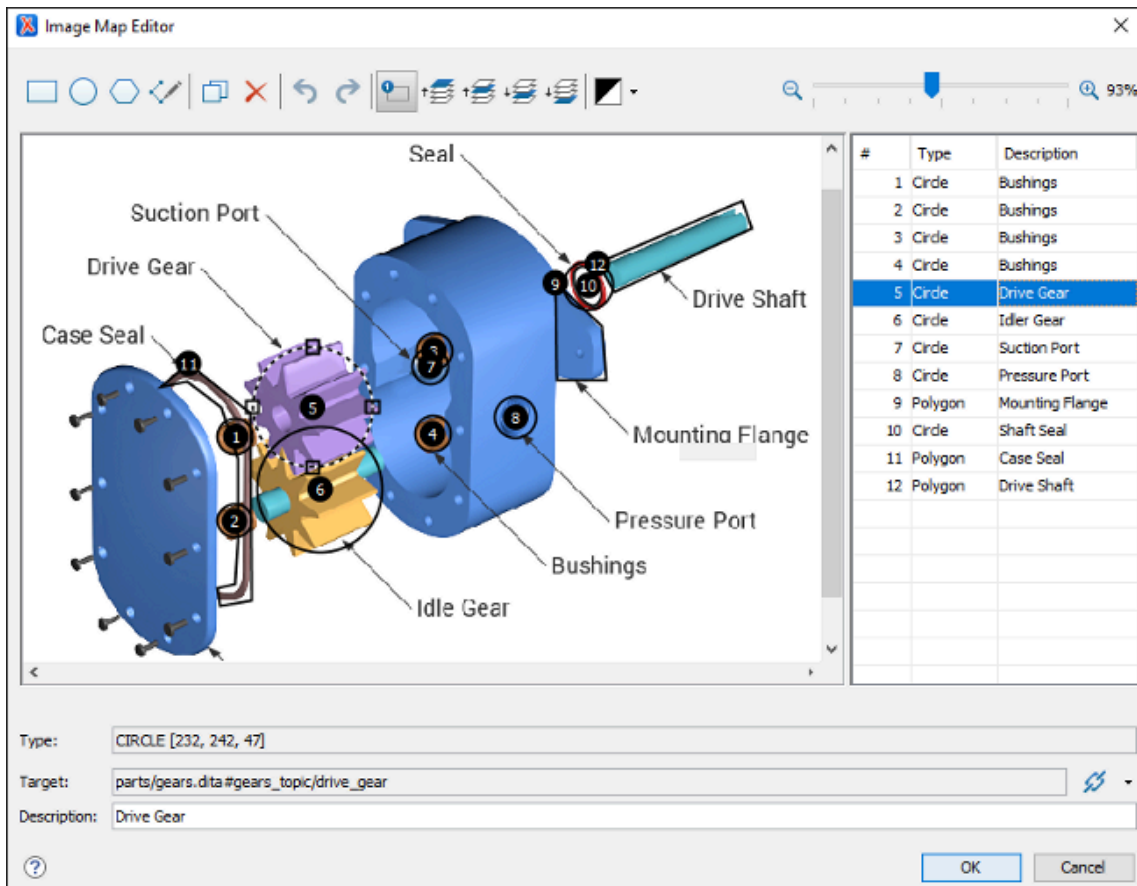

Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape.

Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to *Polygon* or *Free Form* shapes.

Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of [inserting links in DITA \(on page 2515\)](#) by using the identical  **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `<xref>` element will be inserted with either an `@href` attribute or a `@keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see [Inserting a Link in Oxygen XML Editor Eclipse plugin \(on page 2515\)](#).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details** section [\(on page 502\)](#) in **Author** mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons (**New Rectangle**, **New Circle**, or **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar \(on page 498\)](#) to adjust its layer and color, or to perform other editing actions.

Tip:

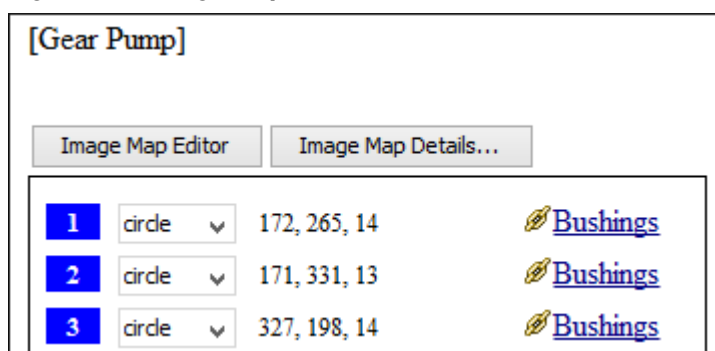

You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful [contextual menu actions \(on page 500\)](#). For example, the easiest way to remove a point is to right-click the point and select **Remove Point**.

4. With the shape selected, use one of the [linking options \(on page 501\)](#) in the  **Link** drop-down menu to select a target resource (or enter its path in the **Target (on page 501)** text field).
5. (Optional) Enter a **Description (on page 501)** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Figure 151. Image Map Details

How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor** toolbar (on page 498). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 498) (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

[Working with Images in DITA Topics \(on page 2416\)](#)

Image Maps in DocBook

Oxygen XML Editor Eclipse plugin includes support for **image maps** in DocBook documents through the use of the `<areaspac>` element. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 152. Image Map Editor in DocBook

Image Map Editor Interface in DocBook

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

 **New Rectangle**

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Duplicate**

Create a duplicate of the currently selected shape.

 **Delete**

Delete the currently selected shape.

 **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **Undo**

Use this action to undo the last action.

 **Redo**

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

ID

The identifier for the selected area. This will become the value of the `@xml:id` attribute for the particular `<area>` element.

Target

Allows you to choose the target resource that you want the selected area to be linked to. You can enter the path to the target in the text field but the easiest way to select a target is to use the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference** or **Web Link**. Both types open a dialog box that allows you to select the target resource and it is inserted as the value of an `@xlink:href` attribute.

Description

You can enter an optional description for the selected area that will be displayed in the **Image Map Details** section (*on page 507*) in **Author** mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DocBook

To create an image map on an existing image in a DocBook document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting the  **New Rectangle** button.
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar \(on page 504\)](#) to adjust its layer and color, or to perform other editing actions.

Tip:

You can right-click any of the shapes or anywhere in the Image Pane to access various helpful [contextual menu actions \(on page 505\)](#).

4. With the shape selected, enter an **ID** ([on page 506](#)) and use one of the [linking options \(on page 506\)](#) in the  **Link** drop-down menu to select a target resource (or enter its path in the **Target** ([on page 506](#)) text field).
5. (Optional) Enter a **Description** ([on page 506](#)) for the selected area (shape).
6. If you want to add more hyperlinks to the image, select  **New Rectangle** button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed above the image. The following two buttons will also now be available at the top of the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in DocBook

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button above the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Note:

If you want to link a set of related `<area>` elements, you can use `<areaset>` elements. To add `<areaset>` elements, and `<area>` elements to the *areaset*s, switch to **Text** mode and insert them manually.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor** toolbar (on page 504)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 504) (.

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

[DocBook 'areaspec' Element Specifications](#)

Image Maps in TEI

Oxygen XML Editor Eclipse plugin includes support for **image maps** in TEI documents through the use of the `<facsimile>` element. In TEI documents, this feature provides an easy way to create areas (using `<zone>` elements) in an image where the end-user can hover or click to retrieve more information about that particular area of the image. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create the areas in the image.

Figure 153. Image Map Editor in TEI

Image Map Editor Interface in TEI

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or

simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

 **Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

 **Duplicate**

Create a duplicate of the currently selected shape.

 **Delete**

Delete the currently selected shape.

 **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

 **Undo**

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and ID. If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

ID

The identifier for the selected area. This will become the value of the `@xml:id` attribute for the particular `<zone>` element. When you insert a new zone, a unique ID is automatically generated and displayed in this field. However, you can change this value if you want to.

How to Create an Image Map in TEI

To create an image map on an existing image in a TEI document, follow these steps:

1. The image (`<graphic>`) must be inside a `<facsimile>` element to support the **Image Map Editor** feature.
2. Right-click the image and select **Image Map Editor**.

Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

3. Add areas (zones) in the image by selecting one of the shape buttons ( **New Rectangle** or  **New Polygon**).
4. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar \(on page 509\)](#) to adjust its layer and color, or to perform other editing actions.

Tip:

You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful [contextual menu actions \(on page 511\)](#). For example, the easiest way to remove a point is to right-click the point and select  **Remove Point**.

5. With the shape selected, enter an **ID** ([on page 512](#)).

6. If you want to add more areas (zones) to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and the following two buttons will now be available at the bottom of the image:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map.

How to Edit an Existing Image Map in TEI

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the coordinates and IDs of the hyperlinked areas.

Restriction:

Currently, if `<zone>` elements contain additional content (such as text or comments) and you edit the image map, the **Image Map Editor** does not preserve the additional content. Therefore, if you do need to insert additional content inside the `<zone>` elements, you should do so after the image map has been created and finalized. Subsequent changes to the image map should then be done in **Text** mode.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor** toolbar (on page 509)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 509) (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

**Warning:**

PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

Image Maps in XHTML

Oxygen XML Editor Eclipse plugin includes support for **image maps** in XHTML documents. This feature provides an easy way to create hyperlinks in various parts of an image without having to divide the image into separate image files. In HTML, an image (in the form of an `` element) may be associated with an image map (in the form of a `<map>` element) by specifying a `@usemap` attribute on the `` element. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 154. Image Map Editor in XHTML

Image Map Editor Interface in XHTML

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **New Circle**

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

 **New Polygon**

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

 **New Free Form Shape**

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

 **Add Point**

Adds a point to *Polygon* or *Free Form* shapes.

 **Remove Point**

Removes the current point from *Polygon* or *Free Form* shapes.

 **Duplicate**

Create a duplicate of the currently selected shape.

 **Delete**

Delete the currently selected shape.

 **New Rectangle**

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

 **New Circle**

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

 **New Polygon**

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

 **Undo**

Use this action to undo the last action.

 **Redo**

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (value of the **Alternative** property). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

Href

Specifies the hyperlink target for the selected area. This will become the value of the `@href` attribute for the particular `<area>` element. The possible values are:

- **An Absolute URL** - A URL of another website (for example, `http://www.example.com/index.htm`).
- **A Relative URL** - A link to a file within your website (for example, `index.htm`).
- **An Element** - A link to the ID of an element within the page (for example, `#top`).

- **Other Protocols** - A specified path using other protocols (such as `https://`, `ftp://`, `mailto:`, `file:`).
- **A Script** - A link to a script (for example, `javascript:alert('Hello');`)

Alternate

The description for the selected area. The value is inserted in an `@alt` attribute in the particular `<area>` element. This is a required attribute to present a text alternative for browsers that do not display images.

Target

Specifies where to open the linked resource. The allowed values are:

- **_blank** - Opens the linked resource in a new window or tab.
- **_self** - Opens the linked resource in the same frame as it was clicked.
- **_parent** - Opens the linked resource in the full body of the window.
- **frameName** - Opens the linked resource in the named frame.

How to Create an Image Map in XHTML

To create an image map on an existing image in an XHTML document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar \(on page 514\)](#) to adjust its layer and color, or to perform other editing actions.

Tip:

You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful [contextual menu actions \(on page 516\)](#). For example, the easiest way to remove a point is to right-click the point and select  **Remove Point**.

4. With the shape selected, specify the hyperlink target in the **Href field (on page 517)** and enter a description for the selected area in the **Alternate field (on page 518)**.
5. (Optional) Specify where the hyperlink resource will be opened in the **Target field (on page 518)**.
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image and its properties are displayed in a section below the image.

How to Edit an Existing Image Map in XHTML

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

In **Author** mode, the details of the image map are also displayed below the image and you can edit the description, href, shape, and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the  **Show/Hide Numbers** button on the **Image Map Editor** toolbar (on page 514)). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (on page 514) (, , , ).

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

Warning:

PDF output is limited to rectangular shaped image map objects. Therefore, if your image contains circles or polygons, those objects will be redrawn as rectangles in the PDF output. Keep in mind that this might affect overlaps in the output.

[HTML Image Map Specifications](#)

Adding Video, Audio, and Embedded HTML Resources

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA, DocBook, or XHTML topics. The media resources can be played directly in **Author** mode and in all

HTML5-based outputs. There is a toolbar button () that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the **Project Explorer** view ([on page 269](#)) and drop them into your documents (or copy and paste them).

Table 5. Supported Media Types

Media	Description	Type	Supported Size Properties
<i>mp3</i>	Moving Picture Experts Group Layer-3 Audio	audio	Width
<i>wav</i>	Windows Wave	audio	Width
<i>pcm</i>	Pulse Code Modulation	audio	Width
<i>m4a</i>	Moving Picture Experts Group Layer-4 Audio	audio	Width
<i>aif</i>	Audio Interchange Format	audio	Width
<i>mp4</i>	Moving Picture Experts Group Layer-4 Video	video	Width & Height
<i>m4v</i>	iTunes Video File	video	Width & Height
<i>avi</i>	Audio Video Interleaved	video	Width & Height
embedded video (such as <i>YouTube</i> , <i>Vimeo</i> , or <i>Vidyard</i>)	Embedded Iframe Code	iframe	Width & Height

Adding a Media Resource

To insert a media resource in a document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. A **Chose Media** dialog box appears.

Note:

You can also drag media files from your system explorer or the **Project Explorer** view ([on page 269](#)) and drop them into your documents (or copy and paste them).

3. Select the URL for the media resource and click **Ok**.

Result in Author Mode: A reference to the specified media object is inserted and rendered in **Author** mode so that it can be played directly from there.

**Attention:**

- On Ubuntu 17.10, if you receive an error when trying to play videos in **Author** mode, you need to install the `libavformat57` library.

Result in Output: In the publishing stage, the media object is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

Embedding HTML Content in DITA Topics

The DITA Open Toolkit that comes bundled with Oxygen XML Editor Eclipse plugin includes a pre-installed [plugin \(on page 2681\)](#) that allows you to embed well-formed HTML content directly in a DITA topic.

For example, suppose you wanted to embed a YouTube video directly in a DITA topic.

The DITA topic would look like this:

```
....
<foreign outputclass="html-embed"><![CDATA[
    <iframe width="420" height="315"
        src="https://www.youtube.com/embed/qepRkQxhTX"
        frameborder="0" allowfullscreen="true">
    </iframe>
]]></foreign>
....
```

The converted HTML output would look like this:

```
.....
<iframe width="420" height="315" src="https://www.youtube.com/embed/qepRkQxhTX"
frameborder="0" allowfullscreen="true">
</iframe>
.....
```

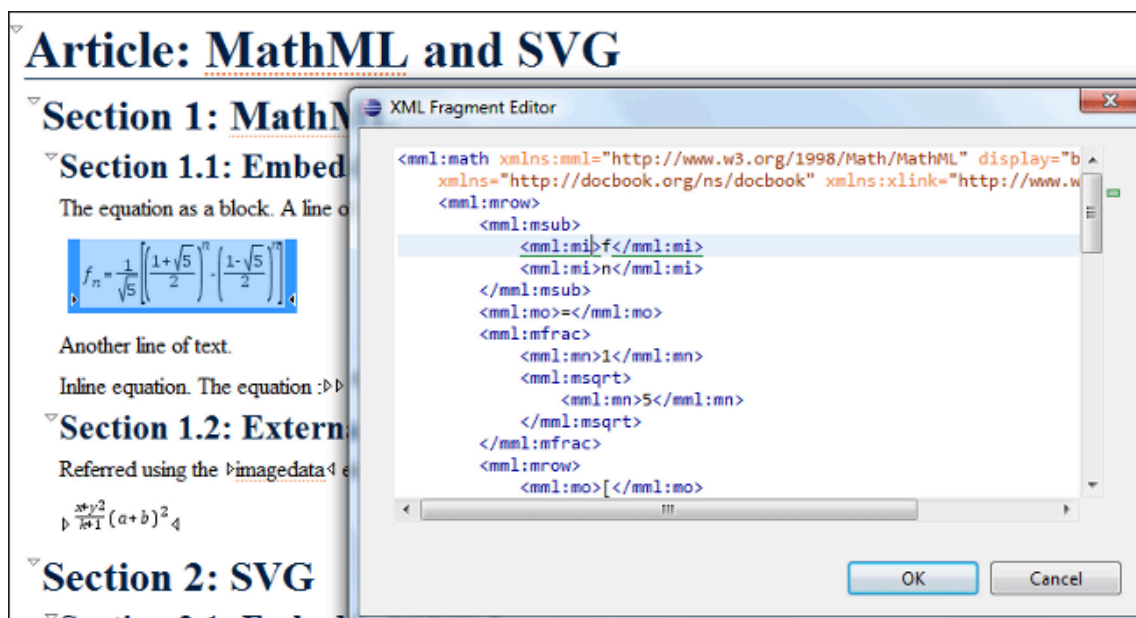

The *plugin* is also available on the [oxygenxml GitHub projects page](#).

Related Information:

[How to Add Video and Audio Objects in DITA WebHelp Output \(on page 1425\)](#)

Editing MathML Notations

Oxygen XML Editor Eclipse plugin includes a built-in editor for *MathML* notations. To start the *MathML* editor, double-click a *MathML* notation (for embedded notations, you can also select the **Edit Equation** action from its contextual menu).

Figure 155. Default *MathML* Editor**Tip:**

For editing *MathML* equations, you can also try free choices, such as [Apache OpenOffice Math](#) (on page 522) or [LibreOffice Math](#) (on page 522).

Configuring the MathType Editor

The Wiris *MathType* integration can replace the default *MathML* editor with a specialized *MathML* editor.

Details about downloading *MathType* can be found here: <https://www.wiris.com/en/mathtype/mathtype-for-oxygen/>.

Installation steps and details about purchasing the product can be found here: <https://docs.wiris.com/mathtype/en/mathtype-for-oxygen-xml-author/mathtype-for-oxygen-xml-author.html>.

Configuring an External MathML Editor

You can configure Oxygen XML Editor Eclipse plugin to use a third-party *MathML* editor (e.g. the free [Libre Office](#) equation editor) by following these steps:

1. Install the third-party application (for example, [Libre Office](#)).
2. Open the [MathML preferences page](#) (on page 144) and in the **External application > Command line** field, set the command line used to open the external application.

For example, the following commands could be used to edit *MathML* equations with a LibreOffice application (depending on the O.S.):

- **Windows** - "C:\Program Files\LibreOffice\program\smath.exe" --nologo "\${cf}"
- **macOS** - /Applications/LibreOffice.app/Contents/MacOS/soffice --math --nologo "\${cf}"
- **Linux** - /usr/lib/libreoffice/program/smath --nologo "\${cf}"

You can use the `$_{cf}` editor variable in the command line to refer to a temporary file automatically created by Oxygen XML Editor Eclipse plugin that will contain the edited MathML content.

3. Insert a new equation or double-click an existing equation. The external application starts and it should display the equation inside it. Once you save the equation and close the external application, the equation rendered in the **Author** visual editing mode will refresh its contents based on your changes. When editing and saving the equation in the started external application, do not alter the path to the saved file in any way as the file is specifically saved in a location from where the Oxygen XML Editor Eclipse plugin application will load it automatically.

Configuring the MathFlow Editor (Deprecated)

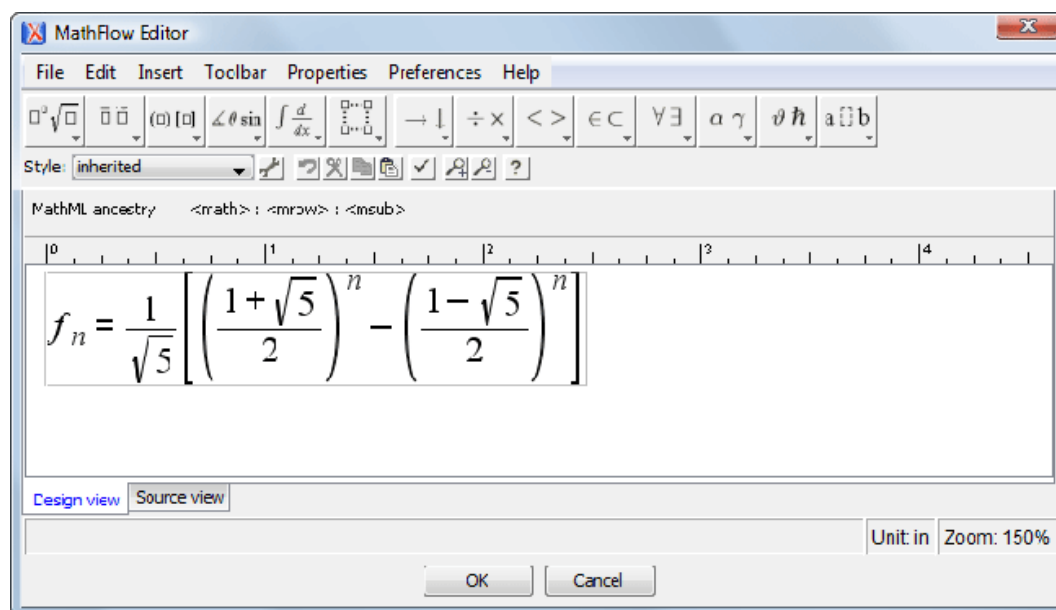

Note:

The *MathFlow* editor integration has been marked as deprecated and was replaced with a new *MathType* integration developed by *Wiris* (on page 522).

The *MathFlow* Components product can replace the default *MathML* editor with a specialized *MathML* editor. You have to [purchase a MathFlow Component from Wiris](#) and configure it in Oxygen XML Editor Eclipse plugin with the following procedure:

1. Install *MathFlow* by using the *Universal* installer (for versions prior to 2.1, use the *MathFlow SDK*).
2. Set the path to the *MathFlow* install folder in the **MathML** preferences page (on page 144).
3. Set the path to the *MathFlow* license file in the **MathML** preferences page (on page 144).

Figure 156. Default MathFlow Editor

Special Character Support in Author Mode

Oxygen XML Editor Eclipse plugin offers support for bidirectional text, such as Arabic or Hebrew languages that require right-to-left scripts, certain Asian languages (such as *Devanagari*, *Bengali*, *Gurmukhi*, *Gujarati*, *Oriya*, *Tamil*, *Telugu*, *Kannada*, *Malayalam*, *Sinhala*, *Thai*, *Khmer*), or other special characters (such as

combining characters). To achieve this, Oxygen XML Editor Eclipse plugin uses the [Unicode Bidirectional Algorithm](#), as specified by the Unicode Consortium. The text arrangement is similar to what you get in a modern HTML browser. The final text layout is rendered according to the directional CSS properties matching the XML elements and the Unicode directional formatting codes.

By default, when navigating bidirectional text with the arrow keys in **Author** mode, pressing the right arrow key moves the cursor in the writing direction and the left arrow moves it in the opposite direction. However, if the **Arrow keys move the cursor in the writing direction** option (*on page 144*) in the **Cursor Navigation** preferences page is not selected, pressing the right arrow will simply move the cursor to the right (and the left arrow moves it to the left), regardless of the text direction.

Tip:

If you experience performance issues when editing documents that contain bidirectional text, you could try the following solution:

- You could try changing the font. For example, you could try using the *David* font in Hebrew content. If it is not already installed in your operating system, this font is available at: <https://www.microsoft.com/typography/fonts/family.aspx?FID=234>. To change the font in Oxygen XML Editor Eclipse plugin, open the **Preferences** dialog box (*on page 70*), go to **Fonts**, and change the font using the **Author** option in the **Fonts** preferences page (*on page 177*).

Resources

For more information about the bidirectional text support in the **Author** mode, watch our video demonstration:

<https://www.youtube.com/embed/IC0ahH1IS7s>

[Special Character Support in Grid Mode \(on page 365\)](#)

[Inserting Special Characters with the Character Map \(on page 301\)](#)

Controlling the Text Direction Using XML Markup

Oxygen XML Editor Eclipse plugin Supports the following CSS properties that control the direction of text:

Table 6. CSS Properties Controlling Text Direction

direction	Specifies the writing direction of the text. The possible values are ltr (the text direction is left to right), rtl (the text direction is right to left, and inherit (the direction property is inherited from the parent element).
unicodeBidi	Used along with the direction property to create levels of embedded text with different text directions in the same document. The possible values of this property are bidi-override (creates an additional level of embedding and forces all strong characters to the direction speci-

Table 6. CSS Properties Controlling Text Direction (continued)

fied in the **direction**), **embed** (creates an additional level of embedding), **normal** (does not use an additional level of embedding), and **inherit** (the value of the **unicodeBidi** property is inherited from parent element).

For instance, to declare an element as being Right to Left, you could use a stylesheet like this:

XML File:

```
<article>
  <myRTLpara>RIGHT TO LEFT TEXT</myRTLpara>
</article>
```

Associated CSS File:

```
myRTLpara{
  direction: rtl;
  unicode-bidi: embed;
}
```

Oxygen XML Editor Eclipse plugin recognizes the **dir** attribute on any XML document. The supported values are:

Values	Description
ltr	The text from the current element is Left to Right, embedded.
rtl	The text from the current element is Right to Left, embedded.
lro	The text from the current element is Left to Right, embedded.
rlo	The text from the current element is Right to Left, embedded.

The following XML document types make use of the **dir** attribute with the above values:

- DITA
- DocBook
- TEI
- XHTML

Note:

When the [inline element \(on page 2679\)](#) tags are visible, the text in the line is arranged according to the BIDI algorithm after replacing the tags symbols with Object Replacement Characters. This makes it possible to get a different text arrangement when viewing a document in the **No Tags** mode versus viewing it in the **Full Tags** mode.

Controlling the Text Direction Using the Unicode Direction Formatting Codes

These Unicode Direction Formatting Codes can be embedded in the edited text, specifying a text direction and embedding. However, it is not recommended to use them in XML as they are zero width characters, making it hard to debug the text arrangement.

Table 7. Directional Formatting Codes

U+202A (LRE)	LEFT-TO-RIGHT EMBEDDING	Treats the following text as embedded left-to-right.
U+202B (RLE)	RIGHT-TO-LEFT EMBEDDING	Treats the following text as embedded right to left.
U+202D (LRO)	LEFT-TO-RIGHT OVERRIDE	Forces the following characters to be treated as strong left-to-right characters.
U+202E (RLO)	RIGHT-TO-LEFT OVERRIDE	Forces the following characters to be treated as strong right-to-left characters.
U+202C (PDF)	POP DIRECTIONAL FORMATTING CODE	Restores the bidirectional state to what it was before the last LRE, RLE, RLO, or LRO.
U+200E (LRM)	LEFT-TO-RIGHT MARK	Left-to-right strong zero-width character.
U+200F (RLM)	RIGHT-TO-LEFT MARK	Right-to-left strong zero-width character.

To insert Unicode Direction Formatting Codes, use the **Symbols** toolbar action. To easily find such a code, you can either enter directly the hexadecimal value, or use the **Details** tab to enter the codes name.

Oxygen XML Editor Eclipse plugin offers the support for bi-directional text in all the side views ([Outline view \(on page 326\)](#), [Attributes view \(on page 405\)](#) and so on) and text fields.

Refreshing the Content

On occasion you may need to reload the content of the document from the disk or reapply the CSS. This can be performed by using the  **Reload (F5)** action available on the toolbar.

To refresh the content of the referenced resources you can use the  **Refresh references** action that is available in the menu for the current *framework* (for example, the **DITA** or **DocBook5** menu). However, this action will not refresh the expanded external entities. For that, you will need to use the  **Reload** action.

Generating IDs for Elements in Author Mode

Oxygen XML Editor Eclipse plugin allows you to manually assign or edit values of `id` attributes in **Author** mode by using the [Attributes View \(on page 405\)](#) or an [in-place attribute editor \(on page 386\)](#). Oxygen XML Editor Eclipse plugin also includes mechanisms to generate ID values for elements, either on-request or automatically, in DITA, DocBook, or TEI documents.

Generate IDs On-Request

You can generate ID values for specific elements on-request. To do so, select the element that will have an ID generated (or place the cursor inside the element) and select the **Generate IDs** action from the contextual menu. This action generates a unique ID for the current element. If you invoke the action on a block of selected content, the action will generate IDs for all top-level elements and elements that are listed in the **ID Options dialog box** ([on page 527](#)). To open this dialog box, open an XML document that belongs to that specific document type and then select **ID Options** from the **DITA**, **DocBook**, or **TEI** main menu (depending on your document type).

**Note:**

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Automatically Generate IDs

Oxygen XML Editor Eclipse plugin includes an option to automatically add unique ID values to certain elements when they are created in **Author** mode. The **Auto generate IDs for elements** option can be found in the **ID Options dialog box** ([on page 527](#)) that is displayed when you select the **ID Options** action from the *framework* ([on page 2679](#))-specific menu (**DITA**, **DocBook**, or **TEI**). If this **Auto generate IDs for elements** option is selected, Oxygen XML Editor Eclipse plugin automatically generates unique ID values for elements that are listed in this dialog box. You can use this dialog box to customize the format of the ID values and choose which elements will have their ID values automatically generated (for example, you can customize the list of elements to include those that you most often need to identify).

ID Options Dialog Box

To configure options for generating IDs, select **ID Options** from the **DITA**, **DocBook**, or **TEI** menu (depending on your document type).

Figure 157. ID Options Dialog Box

The **ID Options** dialog box allows you to configure the following options with regard to generating ID values:

ID Pattern

The pattern for the ID values that will be generated. This text field can be customized using constant strings or any of the Oxygen XML Editor Eclipse plugin [Editor Variables](#) (on page 218).

Element name or class value to generate ID for

The elements that will have ID values generated, specified using class attribute values. To customize the list, use the **Add**, **Edit**, or **Remove** buttons.

Auto generate IDs for elements

If selected, Oxygen XML Editor Eclipse plugin will automatically generate unique IDs for the elements listed in this dialog box when they are created in **Author** mode.

Remove IDs when copying content in the same document (DITA or TEI)

When copying and pasting content in the same DITA or TEI document, this option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs. To retain the element IDs, deselect this option.

Note:

This option does not have an effect on content that is *cut* and *pasted*.

Remove IDs when copying content (DocBook)

This option allows you to control whether or not pasted elements that are listed in this dialog box should retain their existing IDs in DocBook documents. If this option is not selected, IDs are always retained when you copy or cut content and paste it in the same document or other documents. If this option is selected, IDs are never retained for copied content, but if you cut the content, they are preserved for the first paste action (and not retained for any subsequent paste actions).

Duplicating Elements with Existing IDs

If you duplicate elements with existing IDs (for example, through copy/paste or drag/drop actions), all IDs are removed at the resolution of the operation. However, you can use the options in the **ID Options** dialog box to change this behavior. The options in this dialog box affect duplicated elements with existing IDs in the following ways:

- Only the elements listed in this dialog box are affected by these options. Therefore, if you want to use these options to preserve IDs or generate new ones, you must first add the elements to be duplicated to the list in this dialog box.
- If the **Auto generate IDs for elements** option (on page 528) is selected and you duplicate elements with existing IDs, Oxygen XML Editor Eclipse plugin assigns new, unique ID values to the duplicates.
- If the **Auto generate IDs for elements** option (on page 528) is not selected and you duplicate elements with existing IDs, the ID values are removed from the duplicates.
- For DITA and TEI, if the **Remove IDs when copying content in the same document** option (on page 528) is selected, the ID values are removed from elements that are duplicated in the same document. If it is not selected, the ID values are preserved when elements are duplicated in the same document. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected and this option has no effect on elements that are duplicated in other documents.
- For DocBook, if the **Remove IDs when copying content** option (on page 528) is selected, the ID values are removed from any element that is duplicated. If it is not selected, the ID values are preserved when elements are duplicated. Selecting this option has no effect if the **Auto generate IDs for elements** option is selected.

Controlling the Default ID Generation Options

It is possible to configure the default ID generation options for DITA, DocBook, and TEI document types. In the `frameworks` folder for each of those document types, there is an XML configuration file called `idGenerationDefaultOptions.xml` that contains the default settings for generating IDs in each particular type of document. To configure the default settings, you can edit this file and save it back to the same directory.

The configuration file can be found in the `resources` folder within the particular *framework* (on page 2679). For example, the configuration file for the DITA *framework* is located in:

```
[OXYGEN_INSTALL_DIR]/frameworks/dita/resources/idGenerationDefaultOptions.xml.
```

If you want to share your configured default ID generation settings with other members of your team, follow these steps:

1. Configure the `idGenerationDefaultOptions.xml` file for your *framework* according to your needs.
2. Bundle a modified version of the entire *framework* folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita/`). To do this:
 - a. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association**.
 - b. Select your document type and click the **Extend** button.
 - c. In the **Document type configuration** dialog box (on page 90) that is now displayed, select **External** for the **Storage** option. By default, this will save the extension in a new folder in the `frameworks` folder (for example, `[OXYGEN_INSTALL_DIR]/frameworks/dita-extension(1)`), but you can also use the  **Browse** button to specify a specific name and folder.
 - d. In this new extension folder, create a new folder called `resources` and add your modified `idGenerationDefaultOptions.xml` file to this new `resources` folder.
 - e. Go back to the **Document Type Association** preferences page, select the extended *framework*, and click **Edit**.
 - f. Go to the **Classpath** tab (on page 95), add a reference to your new `resources` folder, and move this reference up (using the  **Move Up** button) so that it is the first one that appears in the list.
 - g. Click **OK** and exit out of the preferences page.
3. Distribute your newly extended folder to other team members by using one of the methods described in [Sharing a Framework \(on page 2099\)](#).

Using Form Controls in Author Mode

Form controls make it easier to capture, organize, and edit content. They are especially helpful for less technical users because form controls provide a way to interact with the content of a document in a graphical manner without intimidating the user with the XML structure.

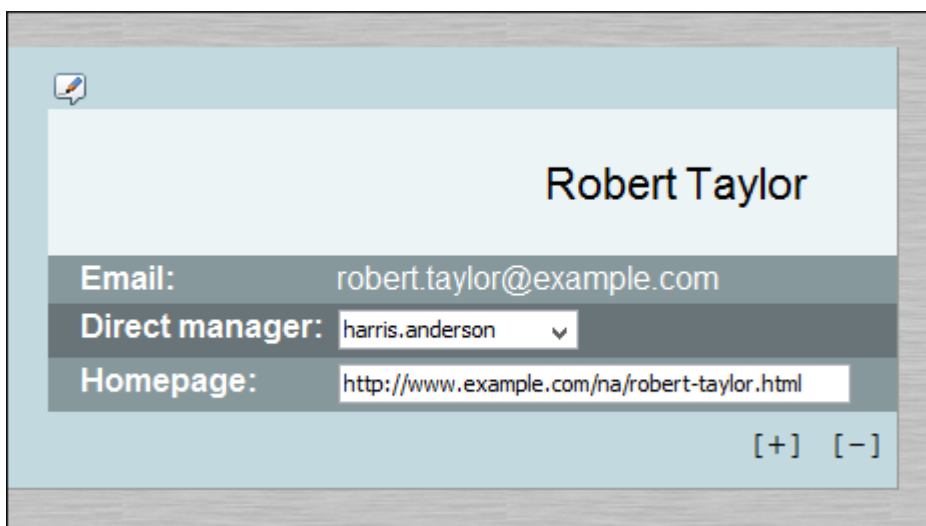

Oxygen XML Editor Eclipse plugin includes a variety of [built-in form controls \(on page 2184\)](#) that can be defined in CSS stylesheets that are used to render **Author** mode (on page 2184). You can also [implement custom form controls \(on page 2215\)](#) for more specific needs. The types of built-in form controls that are available include:

- [Audio \(on page 2184\)](#) - A media object that plays audio clips.
- [Browser \(on page 2185\)](#) - A media object that renders HTML frames or interact with SVG documents
- [Button \(on page 2189\)](#) - A graphical user interface object that performs a specific action.
- [Button Group \(on page 2192\)](#) - A graphical user interface group of buttons (such as radio buttons) that perform specific actions.
- [Checkbox \(on page 2196\)](#) - A graphical user interface box that you can click to select or deselect a value.
- [Combo Box \(on page 2198\)](#) - A graphical user interface object that can be a drop-down menu or a combination of a drop-down menu and a single-line text field.
- [Date Picker \(on page 2200\)](#) - A form control object that allows you to select a date in a specified format.
- [HTML Content \(on page 2202\)](#) - A graphical user interface box that is used for rendering HTML content.

- [Pop-up \(on page 2204\)](#) - A contextual menu that provides quick access to various actions.
- [Text Area \(on page 2207\)](#) - A box that allows you to enter multiple lines of text.
- [Text Field \(on page 2210\)](#) - A graphical user interface box that allows you to enter a single line of text.
- [URL Chooser \(on page 2212\)](#) - A dialog box that allows you to select the location of local or remote resources.
- [Video \(on page 2214\)](#) - A media object that plays videos.

The following image is an example of several form controls rendered in **Author** mode. The first (*Direct manager*) is a combo box with both a drop-down menu and an editable text field. This is followed by a simple text field (*Homepage*), and the **[+]** and **[-]** icons also represent button form controls that are assigned specific actions to add or delete records from the document.

Figure 158. Example of Form Controls in Author Mode

You can use your imagination to envision the multitude of ways that you can use form controls to make the editing experience for content authors easier and more efficient. As a working example, a bundled *samples* project (located in the `samples` folder inside the Oxygen XML Editor Eclipse plugin installation directory) contains a file called `personal.xml` that contains form controls. You can use this file, along with its corresponding `personal.css` file to experiment with an example of how form controls can be implemented in **Author** mode.

Related Information:

[Form Controls \(on page 2184\)](#)

Contextual Menu Actions in Author Mode

Oxygen XML Editor Eclipse plugin includes powerful support for editing XML documents through actions included in the contextual menu. When editing XML documents in **Author** mode, the contextual menu includes *general* actions that are available for all of the recognized document types and *framework (on page 2679)*-specific actions that are configured for each document type.

General Contextual Menu Actions in Author Mode

The *general* actions that are available in the contextual menu (some of them are also available in the submenus of the **Document** menu) for all built-in document types include the following:

Quick Fix (**Alt + 1 (Command + Option + 1 on macOS)**)

Available when the contextual menu is invoked on an error where [Oxygen XML Editor Eclipse plugin](#) can provide a *Quick Fix* (on page 581).

Open Image

Available when the contextual menu is invoked on an image. This action allows you to open an image in a default system application associated with the current image type.

Show in Explorer (**Show in Finder on macOS**)

Available when the contextual menu is invoked on an image. This action allows you to open the parent directory of an image in the system file explorer, and it selects the image file.

Save image as

Available when the contextual menu is invoked on a local, external, or embedded image. This action opens a dialog box where you can choose a location in the local file system where the image will be saved. It also includes an option (**Update the reference to the image**) that can be toggled to choose whether or not to update the path in existing references to the image.

Track Changes Actions

Available when the [Track Changes feature](#) (on page 2683) is enabled and the contextual menu is invoked on a change. The following options are available:

✓ Accept Change(s)

Accepts the [Tracked Change](#) (on page 2683) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

✗ Reject Change(s)

Rejects the [Tracked Change](#) (on page 2683) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing [Tracked Change](#) (on page 2683). The comment will appear in a callout and a tooltip when

hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Author Callout Actions

Available when the contextual menu is invoked on a *callout* (on page 2677). If the corresponding options in the **Show review callouts** section (on page 153) are selected in the **Callouts preferences page** (on page 153), the callouts are displayed in **Author** mode for comments, tracked insertions, or tracked deletions.

Insertion or Deletion Callout Actions

The following actions are available in the contextual menu when invoked on an *insertion* or *deletion* callout box:

Reply

Opens a dialog box that allows you to add a reply to a comment or *Tracked Changes* (on page 2683). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and **Review view** (on page 438).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for *Tracked Changes* (on page 2683) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

✓ Accept Change(s)

Accepts the *Tracked Change* (on page 2683) located at the cursor position or all of the changes in a selection. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted. If you select multiple changes, all of them are accepted. For an *insertion* change, it keeps the inserted text and for a *deletion* change, it removes the content from the document.

✗ Reject Change(s)

Rejects the *Tracked Change* (on page 2683) located at the cursor position or all of the changes in a selection. If you select a part of a

deletion or *insertion* change, only the selected content is rejected. If you select multiple changes, all of them are rejected. For an *insertion* change, it removes the inserted text and for a *deletion* change, it preserves the original content.

Comment Change

Opens a dialog box that allows you to add a comment to an existing [Tracked Change \(on page 2683\)](#). The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Edit Reference

If the fragment that contains a callout is a reference, use this option to go to the reference and edit the callout.

Callouts Options

Select this option to open the [Callouts preference page \(on page 153\)](#) where you can configure various callout options.

Comment Callout Actions

The following actions are available in the contextual menu when invoked on a *comment* callout box:

Reply

Opens a dialog box that allows you to add a reply to a comment or [Tracked Changes \(on page 2683\)](#). When replying to a comment, the dialog box shows the entire conversation in the comment thread, starting with the first comment added in the particular thread, followed by all the replies. After replies are added to a comment thread, they are displayed with an indentation in the callouts and [Review view \(on page 438\)](#).

Mark as Done

A toggle action that marks or unmarks a comment or comment thread as being done. It is also available for [Tracked Changes \(on page 2683\)](#) that are displayed in a callout. When a comment or change is marked as done, the callout is grayed out and cannot be edited unless the action is toggled to the unmarked state. The action applies to the particular comment and all of its descendents. This is useful for marking comments or changes that have been addressed, leaving only those that still need some attention.

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Callouts Options

Select this option to open the **Callouts preference page** (*on page 153*) where you can configure various callout options.

Edit Attributes

Displays an **in-place attributes editor** (*on page 407*) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the **profiling attributes** (*on page 442*) defined on all selected elements.

Insert submenu

This submenu includes insert actions that are specific to each *framework* (*on page 2679*), along with the following general action:

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e. g. #65
- &#<decimal value>; - e. g. A
- #x<hexadecimal value> - e. g. #x41
- &#x<hexadecimal value>; - e. g. A

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes special paste actions that are specific to each *framework (on page 2679)*, as well as the following general paste actions:

Paste As XML

Pastes clipboard content that is considered to be XML, preserving its XML structure.

Paste As Text (Ctrl + Shift + V (Command + Shift + V on macOS))

Pastes clipboard content, ignoring any structure or styling markup.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word. 0034

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `Ě`
- `0x0125` to `ĥ`
- `265` to `ı`
- `2190` to `←`

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

→! Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

∞ Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

∞ Join Elements

Joins two adjacent *block elements* (on page 2676) that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (on page 120) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (on page 120) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

JATSKit Refactoring Actions

Available for JATS documents. Contains built-in XML refactoring operations that pertain to JATS documents with some of the information preconfigured based upon the current context.

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Adds an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Adds a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Assigned IDs are normalized and IDs are assigned to some elements that are missing them.

Processing Instructions Refactoring Actions

Contains built-in XML refactoring operations that pertain to processing instructions.

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights.

Delete processing instructions

Deletes the detected processing instructions.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Manage IDs submenu

This submenu is available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations \(on page 600\)](#) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations \(on page 600\)](#).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

 **Toggle Fold**

Toggles the state of the current fold.

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the elements indented with one level inside the current element.

 **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

Inspect Styles

Opens the **CSS Inspector** view ([on page 414](#)) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page \(on page 136\)](#).

Document Type-Specific Contextual Menu Actions in Author Mode

Other *document type-specific* actions are available in the contextual menu of **Author** mode for the following document types (click the links to see the default actions that are available for each specific document type):

- **DocBook4** Author Actions ([on page 1032](#))
- **DocBook5** Author Actions ([on page 1053](#))
- **DITA** Author Actions ([on page 2444](#))
- **DITA Map** Author Actions ([on page 2388](#))
- **XHTML** Author Actions ([on page 1113](#))
- **TEI ODD** Author Actions ([on page 1139](#))
- **TEI P5** Author Actions ([on page 1127](#))
- **JATS** Author Actions ([on page 1152](#))

Validating XML Documents

The W3C XML specification states that a program should not continue to process an XML document if it finds a validation error. The reason is that XML software should be easy to write and all XML documents should be compatible. With HTML, for example, it is possible to create documents with lots of errors (for instance, when you forget an end tag). One of the main reasons that various HTML browsers have performance and compatibility problems is that they have different methods of figuring out how to render a document when an HTML error is encountered. Using XML helps to eliminate such problems.

Even when creating XML documents, errors are easily introduced. When working with large projects or a large number of files, the probability that errors will occur is even greater. Preventing and solving errors in your projects can be time consuming and frustrating. Fortunately, Oxygen XML Editor Eclipse plugin provides validation functions that allow you to easily identify errors and their location.

Related Information:

Checking XML Well-Formedness

A *Well-formed XML* document is a document that conforms to the XML syntax rules. A *Namespace Well-Formed XML* document is a document that is *Well-formed XML* and is also *Namespace-wellformed* and *Namespace-valid*.

Well-Formedness Rules

The XML Syntax rules for *Well-formed XML* include:

- All XML elements must have a closing tag.
- XML tags are case-sensitive.
- All XML elements must be properly nested.
- All XML documents must have a root element.
- Attribute values must always be quoted.
- With XML, whitespace is preserved.

The *Namespace-wellformed* rules include:

- All element and attribute names contain either zero or one colon.
- No entity names, processing instruction targets, or notation names contain any colons.

The *Namespace-valid* rules include:

- The *xml* prefix is by definition bound to the namespace name: <http://www.w3.org/XML/1998/namespace>. It MAY be declared, but MUST NOT be undeclared or bound to any other namespace name. Other prefixes MUST NOT be bound to this namespace name.
- The *xmlns* prefix is used only to declare namespace bindings and is by definition bound to the namespace name: <http://www.w3.org/2000/xmlns/>. It MUST NOT be declared or undeclared. Other prefixes MUST NOT be bound to this namespace name.
- All other prefixes beginning with the three-letter sequence *x*, *m*, *l*, in any case combination, are reserved. This means that users SHOULD NOT use them except as defined by later specifications and processors MUST NOT treat them as fatal errors.
- The namespace prefix (unless it is *xml* or *xmlns*) MUST have been declared in a namespace declaration attribute in either the start tag of the element where the prefix is used or in an ancestor element (for example, an element in whose content the prefixed markup occurs). Furthermore, the attribute value in the innermost such declaration MUST NOT be an empty string.

Check for Well-Formedness

To check if a document is *Namespace Well-Formed XML* and *Namespace-valid*:

- Select the  **Check Well-Formedness (Alt + Shift + V, W (Command + Option + V, W on macOS))** action from the  **Validation** drop-down menu on the toolbar (or the **XML** menu).
- A selection of files can be checked for well-formedness by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project Explorer** view ([on page 269](#)).

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non *Well-formed XML* Document

```
<root><tag></root>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The element type "tag" must be terminated by the matching end-tag "</tag>"
```

To resolve the error, click the record in the resulting list and it will locate and highlight the approximate position of the error. In this case, identify the tag that is missing an end tag and insert `</tag>`.

Example: A non *Namespace-wellformed* Document

```
<prefix:elem></prefix:elem>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The prefix "prefix" for element "prefix:elem" is not bound.
```

Example: A non *Namespace-valid* Document

```
<x:y></x:y>
```

When the **Check Well-Formedness** action is performed, the following error is displayed:

```
The prefix "x" for element "x:y" is not bound.
```

Validating XML Documents Against a Schema

A *Valid XML* document is a *Well-Formed XML* document that also conforms to the rules of a schema that defines the legal elements of an XML document. The schema type can be: XML Schema, Relax NG (full or compact syntax), Schematron, Document Type Definition (DTD), or Namespace-based Validation Dispatching Language (NVDL).

The purpose of the schema is to define the legal building blocks of an XML document. It defines the document structure with a list of legal elements.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor Eclipse plugin, how validation errors are presented, and information about built-in and custom validation scenarios.

For information about how to associate a schema for the purposes of validation (and content completion), see the [Associating a Schema to XML Documents \(on page 584\)](#) section.

Automatic Validation

By default, Oxygen XML Editor Eclipse plugin automatically checks for validation errors as you are editing a document. The **Enable automatic validation option (on page 133)** in the **Document Checking preferences page (on page 133)** controls whether or not all validation errors and warnings will automatically be highlighted in the editor panel.

The automatic validation starts parsing the document and marking the errors after a [configurable delay \(on page 133\)](#) from the last key typed. Errors are highlighted with underline markers in the main editor panel and small rectangles on the right side ruler of the editor panel. Hovering over a validation error presents a tooltip message with more details about the error.

Related Information:

[Manual Validation Actions \(on page 547\)](#)

[Presenting Validation Errors in Text Mode \(on page 549\)](#)

[Presenting Validation Errors in Author Mode \(on page 551\)](#)

Manual Validation Actions

You can choose to validate documents at any time by using the manual validation actions that are available in Oxygen XML Editor Eclipse plugin.

Tip:

Status information generated by certain operations (such as *validation*) are fed into the **Console** view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select **Window > Show View > Console**.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

Available from the **Validation** drop-down menu on the toolbar, the **XML** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project Explorer view (on page 269)**.

An error list is presented in the message panel at the bottom of the editor. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema

rules. This action also re-parses the [XML Catalogs \(on page 2683\)](#) and resets the schema used for content completion.

Validate (cached)

Available from the  **Validation** drop-down menu on the toolbar or the **XML** menu.

This action caches the schema, allowing it to be reused for the next validation. Markup of the current document is checked to conform with the specified DTD, XML Schema, or Relax NG schema rules.

Note:

Automatic validation also caches the associated schema.

Validate with

Available from the  **Validation** drop-down menu on the toolbar, (or **XML** menu).

This action opens a dialog box that allows you to [specify a schema for validating the current document \(on page 587\)](#).

You can use this action to validate the current document using a schema of your choice (XML Schema, DTD, Relax NG, NVDL, Schematron schema), other than the associated one. An error list is presented in the message panel at the bottom of the editor. Markup of current document is checked to conform with the specified schema rules.

Validate with Schema

Available from the **Validate** submenu when invoking contextual menu in the [Project Explorer view \(on page 269\)](#).

This action opens a dialog box that allows you to [specify a schema for validating all selected files \(on page 588\)](#).

Other Validation Options

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **XML** menu).

To clear the error markers added to the **Problems** view in the last validation, select  **Clear Validation Markers** from the **Validate** submenu when invoking the contextual menu in the **Project Explorer** view.

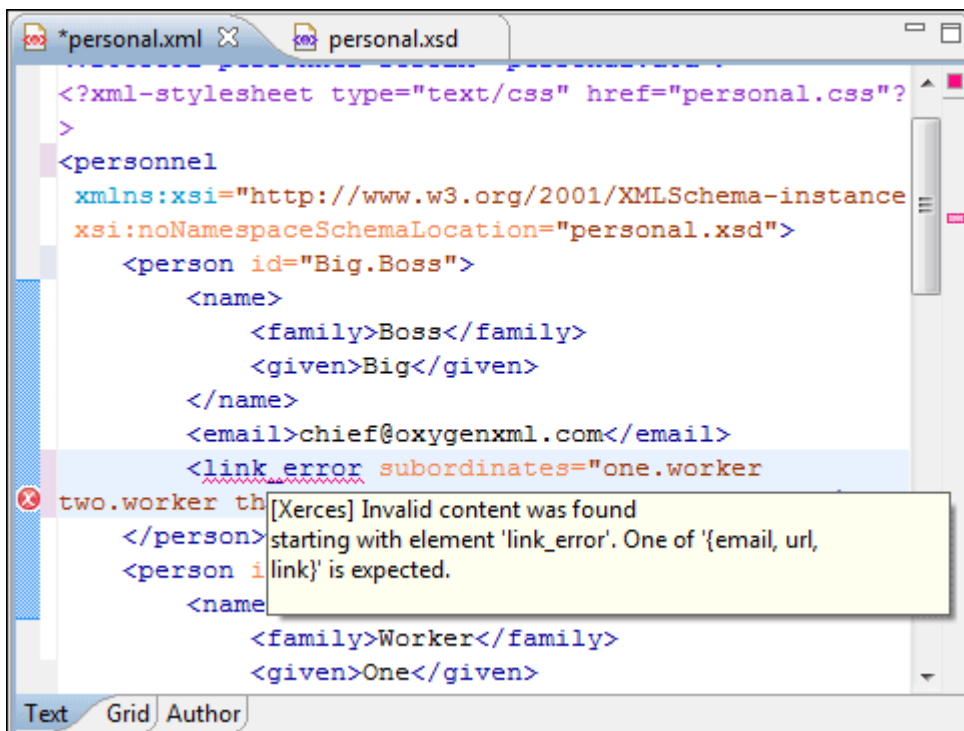

Tip:

If a large number of validation errors are detected and the validation process takes too long, you can [limit the maximum number of reported errors in the Document Checking preferences page \(on page 133\)](#).

Related information[Automatic Validation \(on page 547\)](#)[Presenting Validation Errors in Text Mode \(on page 549\)](#)[Presenting Validation Errors in Author Mode \(on page 551\)](#)

Presenting Validation Errors in Text Mode

By default, Oxygen XML Editor Eclipse plugin [automatically validates documents \(on page 547\)](#) while editing in the **Text** mode, and actions are also available to [manually validate documents \(on page 547\)](#) on-request.

Figure 159. Presenting Validation Errors in Text Mode

Validation Marker Locations

In **Text** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes view (on page 329)**, with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the colors and how the various types of validation problems are rendered from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on macOS) > Preferences > General > Editors > Text Editors > Annotations**).

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights option (on page 133)**.

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the application.

Bottom Part of the Stripe

Two navigation arrows () can be used to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next Error/Highlight (Ctrl + Period (Command + Period on macOS))** and **Document > Automatic validation > Previous Error/Highlight (Ctrl + Comma (Command + Comma on macOS))**.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes \(on page 581\)](#) (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the **Document Checking preferences page (on page 133)** where you can configure some validation options. Some validation messages have an icon () and clicking it opens a dialog box with additional information and a link to specifications.
- Status messages from every validation action are logged in the **Console view (on page 304)** (the **Enable Oxygen consoles** option (on page 180) must be selected in the **View** preferences page).
- If you want to see all the validation messages grouped in the **Results view (on page 335)**, use the  **Validate** action from the toolbar or **XML** menu. This action also collects the validation messages and displays them in the **Problems** view if the validated file is in the current workspace or in a custom **Errors** view if the validated file is outside the workspace.

Presenting Validation Errors in Author Mode

By default, Oxygen XML Editor Eclipse plugin [automatically validates documents \(on page 547\)](#) while editing in the **Author** mode, and actions are also available to [manually validate documents \(on page 547\)](#) on-request.

Figure 160. Presenting Validation Errors in Author Mode

Validation Marker Locations

In **Author** mode, validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- For attributes with detected issues, in the **Attributes view** (*on page 405*), with the attribute and its value colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box](#) (*on page 70*), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option (*on page 133*).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the application.

Bottom Part of the Stripe

Two navigation arrows () can be used to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next Error/Highlight** (**Ctrl + Period** (**Command + Period on macOS**)) and **Document > Automatic validation > Previous Error/Highlight** (**Ctrl + Comma** (**Command + Comma on macOS**)).

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem and [possible quick fixes \(on page 581\)](#) (if available for that issue). Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip where you can use **Tab** and **Shift + Tab** to navigate between quick fixes and **Space** to trigger them.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the [Document Checking preferences page \(on page 133\)](#) where you can configure some validation options. Some validation messages have an icon () and clicking it opens a dialog box with additional information and a link to specifications.
- Status messages from every validation action are logged in the [Console view \(on page 304\)](#) (the **Enable Oxygen consoles** option [\(on page 180\)](#) must be selected in the **View** preferences page).
- If you want to see all the validation messages grouped in the [Results view \(on page 335\)](#), use the  **Validate** action from the toolbar or **XML** menu. This action also collects the validation messages and displays them in the **Problems** view if the validated file is in the current workspace or in a custom **Errors** view if the validated file is outside the workspace.

- [Presenting Schematron Validation Issues \(on page 956\)](#)

Customizing Assert Error Messages

To customize the error messages that the Xerces or Saxon validation engines display for the `<assert>` and `<assertion>` elements, set the `@message` attribute on these elements.

- For Xerces, the `@message` attribute has to belong to the `http://xerces.apache.org` namespace.
- For Saxon, the `@message` attribute has to belong to the `http://saxon.sf.net/` namespace.

The value of the `@message` attribute is the error message displayed if the assertion fails.

Custom Validators

If you need to validate the edited document with a validation engine that is different from the built-in engine, you can configure external validators in the [Custom Validation Engines preferences page \(on page 133\)](#). After a custom validation engine is [properly configured \(on page 133\)](#), it can be applied on the current document by selecting it from the list of custom validation engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

Some validators are configured by default but there are third-party processors that do not support the [output message format \(on page 555\)](#) of Oxygen XML Editor Eclipse plugin for linked messages:

- **Saxon-EE** - Included in Oxygen XML Editor Eclipse plugin. It is associated to XML Editor and XSD Editor. It is able to validate XML Schema schemas and XML documents against XML Schema schemas. The validation is done according to the W3C XML Schema 1.0 or 1.1. This can be [configured in Preferences \(on page 195\)](#).
- **MSXML 4.0 (Legacy)** - Included in Oxygen XML Editor Eclipse plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **MSXML.NET (Legacy)** - Included in Oxygen XML Editor Eclipse plugin (Windows edition only). It is associated to XML Editor, XSD Editor and XSL Editor. It is able to validate the edited document against XML Schema, internal DTD (included in the XML document), external DTD or a custom schema type.
- **LIBXML** - Not included in Oxygen XML Editor Eclipse plugin and, depending on your operating system, the libraries need to be downloaded and installed separately from <http://xmlsoft.org/downloads.html>. Afterward, the `PATH` environment variable needs to be updated to contain the parent folder of the `xmllint` executable. Alternatively, you can go to **Options > Preferences > Editor > Custom Validation Engines**, edit the **LIBXML** validation engine and set a custom path to the `xmllint` executable.

The LIBXML validator is associated with the XML Editor. It is able to validate the edited document against XML Schema, Relax NG schema full syntax, internal DTD (included in the XML document) or a custom schema type. Support for [XML Catalogs \(on page 2683\)](#) (the `--catalogs` parameter) and XInclude processing (`--xinclude`) are enabled by default in the preconfigured LIBXML validator. The `--postvalid` parameter is also set by default and it allows LIBXML to validate correctly the main document even if the XInclude fragments contain IDREFS to ID's located in other fragments.

For validation against an external DTD specified by URI in the XML document, add the `--dtdvalid` `${ds}` parameter manually to the DTD validation command line. `${ds}` represents the detected DTD declaration in the XML document.

CAUTION:

File paths containing spaces are not handled correctly in the LIBXML processor. For example, the built-in [XML Catalog \(on page 2683\)](#) files of the built-in document types (DocBook, TEI, DITA, etc.) are not handled by LIBXML if Oxygen XML Editor Eclipse plugin is installed in the default location on Windows (`C:\Program Files`) because the built-in *XML catalog* files are stored in the `frameworks` subfolder of the installation folder and in this case, the file path contains at least one space character.

Attention:

On macOS, if the full path to the LIBXML executable file is not specified in the **Executable path** text field, some errors may occur during validation against a W3C XML Schema, such as:

```
Unimplemented block at ... xmlschema.c
```

To avoid these errors, specify the full path to the LIBXML executable file.

Linked Output Messages of an External Engine

Validation engines display messages in an output view at the bottom of the Oxygen XML Editor Eclipse plugin window. If such an output message (**warning**, **error**, **fatal error**, etc) spans between three to six lines of text and has the format specified below, then the message is linked to a location in the validated document.

Clicking the message in the output view highlights the location of the message in an editor panel containing the file referenced in the message. This behavior is similar to the linked messages generated by the default built-in validator.

Linked messages have the following format:

- **Type:** [F|E|W] (the string *Type*: followed by a letter for the type of the message: fatal error, error, warning). This property is optional in a linked message.
- **SystemID:** A system ID of a file (the string `SystemID:` followed by the system ID of the file that will be opened for highlighting when the message is clicked in the output message - usually the validated file, the schema file or an included file).
- **Line:** A line number (the string *Line*: followed by the number of the line that will be highlighted).
- **Column:** A column number (the string *Column*: followed by the number of the column where the highlight will start on the highlighted line). This property is optional in a linked message.
- **EndLine:** A line number (the string **EndLine**: followed by the number of the line where the highlight ends). This property is optional in a linked message.
- **EndColumn:** A column number (the string **EndColumn**: followed by the number of the column where the highlight ends on the end line). This property is optional in a linked message.

Note:

The **Line/Column** pair works in conjunction with the **EndLine/EndColumn** pair. Thus, if both pairs are specified, then the highlight starts at **Line/Column** and ends at **EndLine/EndColumn**. If the **EndLine/EndColumn** pair is missing, the highlight starts from the beginning of the line identified by the **Line** parameter and ends at the column identified by the **Column** parameter.

- **AdditionalInfoURL:** The URL string pointing to a remote location where additional information about the error can be found - this line is optional in a linked message.
- **Description:** Message content (the string *Description*: followed by the content of the message that will be displayed in the output view).

Example:

Example of how a custom validation engine can report an error using the format specified above:

```
Type: E
SystemID: file:///c:/path/to/validatedFile.xml
Line: 10
Column: 20
EndLine: 10
EndColumn: 35
```

AdditionalInfoURL: <http://www.host.com/path/to/errors.html#errorID>

Description: custom validator message

Using Saxon Integrated Extension Functions

Saxon, the transformation and validation engine used by Oxygen XML Editor Eclipse plugin, can be customized by adding custom functions (called [Integrated Extension Functions](#)) that can be called from XPath.

To define such a function, follow these steps:

1. Create a file with a Java class that extends `net.sf.saxon.lib.ExtensionFunctionDefinition`. Here is an example:

```
private static class ShiftLeft extends ExtensionFunctionDefinition {
    @Override
    public StructuredQName getFunctionQName() {
        return new StructuredQName("eg", "http://example.com/saxon-extension", "shift-left");
    }

    @Override
    public SequenceType[] getArgumentTypes() {
        return new SequenceType[] {SequenceType.SINGLE_INTEGER, SequenceType.SINGLE_INTEGER};
    }

    @Override
    public SequenceType getResultType(SequenceType[] suppliedArgumentTypes) {
        return SequenceType.SINGLE_INTEGER;
    }

    @Override
    public ExtensionFunctionCall makeCallExpression() {
        return new ExtensionFunctionCall() {
            public SequenceIterator call(SequenceIterator[] arguments, XPathContext context)
                throws XPathException {
                long v0 = ((IntegerValue)arguments[0].next()).longValue();
                long v1 = ((IntegerValue)arguments[1].next()).longValue();
                long result = v0<<v1;
                return Value.asIterator(Int64Value.makeIntegerValue(result));
            }
        };
    }
}
```

2. Compile the class and add it to a JAR file.

3. Add a file called **net.sf.saxon.lib.ExtensionFunctionDefinition** that contains the fully qualified name of the Java class in the `META-INF/services/` folder of the JAR file.

**Note:**

To add more function definitions in the same JAR file, you need to add their fully qualified names on different lines.

To enable Oxygen XML Editor Eclipse plugin to pick up your custom function definition, the JAR file should be added to the classpath of the transformer. Here are some possibilities:

- If you develop a framework, you just need to link the JAR file in the **Classpath** tab (*on page 95*).
- In a **validation scenario** (*on page 558*), you can use the **Extensions** button to open a dialog box where you can add libraries.
- In a transformation scenario, you can use the **Extensions** button in the **XSLT** tab (*on page 1208*) to open a dialog box where you can add libraries.

Validation Scenarios

A complex XML document is split in smaller interrelated modules. These modules do not make much sense individually and cannot be validated in isolation due to interdependencies with other modules. Oxygen XML Editor Eclipse plugin validates the main module of the document when an imported module is checked for errors.

A typical example is the chunking of a DocBook XSL stylesheet that has `chunk.xsl` as the main module and `param.xsl`, `chunk-common.xsl`, and `chunk-code.xsl` as imported modules. `param.xsl` only defines XSLT parameters. The module `chunk-common.xsl` defines an XSLT template with the name `chunk`. `Chunk-code.xsl` calls this template. The parameters defined in `param.xsl` are used in the other modules without being redefined.

Validating `chunk-code.xsl` as an individual XSLT stylesheet generates misleading errors regarding parameters and templates that are used but undefined. These errors are only caused by ignoring the context in which this module is used in real XSLT transformations and validations. To validate such a module, define a validation scenario to set the main module of the stylesheet and the validation engine used to find the errors. Usually this engine applies the transformation during the validation process to detect the errors that the transformation generates.

You can validate a stylesheet with several engines to make sure that you can use it in various environments and have the same results. For example, an XSLT stylesheet may be applied with Saxon 12 or Saxon 6.5 engines in different production systems.

Other examples of documents that can benefit from a validation scenario include:

- A complex XQuery file with a main module that imports modules developed independently but validated in the context of the main module of the query. In an XQuery validation scenario, the default validator of Oxygen XML Editor Eclipse plugin (Saxon 12) or any connection to a database that supports validation (eXist XML Database, MarkLogic version 5 or newer) can be set as a validation engine.
- An XML document where the *main file* (on page 2680) includes smaller fragment files using XML entity references.

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 597\)](#).

**Tip:**

Status information generated by certain operations (such as *validation*) are fed into the **Console** view. This could be helpful for troubleshooting problems encountered during such operations. To open this view, select **Window > Show View > Console**.

Related information

[Presenting Validation Errors in Author Mode \(on page 551\)](#)

[Presenting Validation Errors in Text Mode \(on page 549\)](#)

Creating a New Validation Scenario

To create a validation scenario, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the toolbar, or from the **XML** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project Explorer** view (on page 269)). The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* (on page 2679) are rendered in bold.

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation

units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 597\)](#).

Figure 161. Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the  **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the *scenarios* file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores

it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

 **Note:**
 When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds **imported** to the name of the imported scenario.

 **Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. To add a scenario, click the **New** button.

A validation scenario configuration dialog box is displayed and it lists all the validation units for the scenario.

Figure 162. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.

- Use the  **Insert Editor Variable** button to insert an [editor variable \(on page 218\)](#) or a [custom editor variable \(on page 227\)](#).

Figure 163. Insert an Editor Variable

<code>\${start-dir}</code>	- Start directory of custom validator
<code>\${standard-params}</code>	- List of standard parameters
<code>\${cfn}</code>	- The current file name without extension
<code>\${currentFileURL}</code>	- The path of the currently edited file (URL)
<code>\${cfdu}</code>	- The path of current file directory (URL)
<code>\${frameworks}</code>	- Oxygen frameworks directory (URL)
<code>\${pdu}</code>	- Project directory (URL)
<code>\${oxygenHome}</code>	- Oxygen installation directory (URL)
<code>\${home}</code>	- The path to user home directory (URL)
<code>\${pn}</code>	- Project name
<code>\${env(VAR_NAME)}</code>	- Value of environment variable VAR_NAME
<code>\${system(var.name)}</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page \(on page 206\)](#), [XQuery preferences page \(on page 203\)](#), [XML Schema preferences page \(on page 195\)](#)).
- **DITA Validation engine** - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**, but for a local file rather than an entire *DITA map* (on page 2678)).
- **DITA Map Validation and Completeness Check engine** - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).
- **DITA-OT Project Validation and Completeness Check engine** - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).
- **Table Layout Validation engine** - Looks for table layout problems (for more information, see the [Report table layout problems option \(on page 2387\)](#)).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 547). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#) (on page 133), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

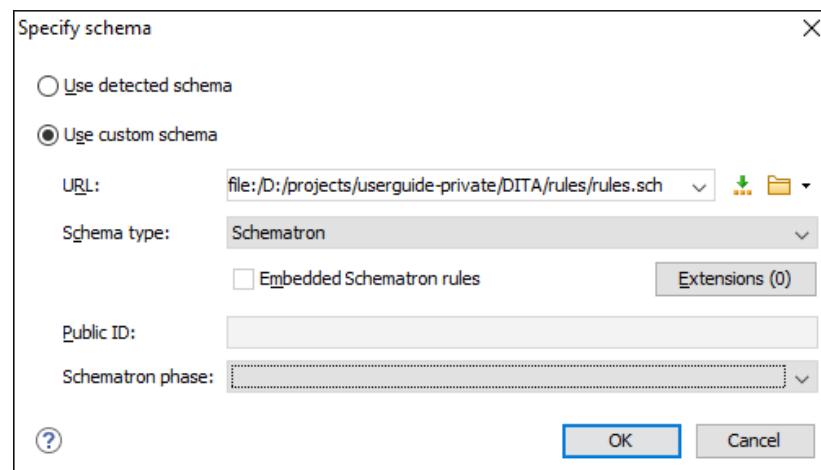

⚙️ Settings

Depending on the selected validation engine, clicking the ⚙️ **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

◦ Specify Schema Dialog Box

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 164. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document](#) (on page 585).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down,

the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* (on page 2679) to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

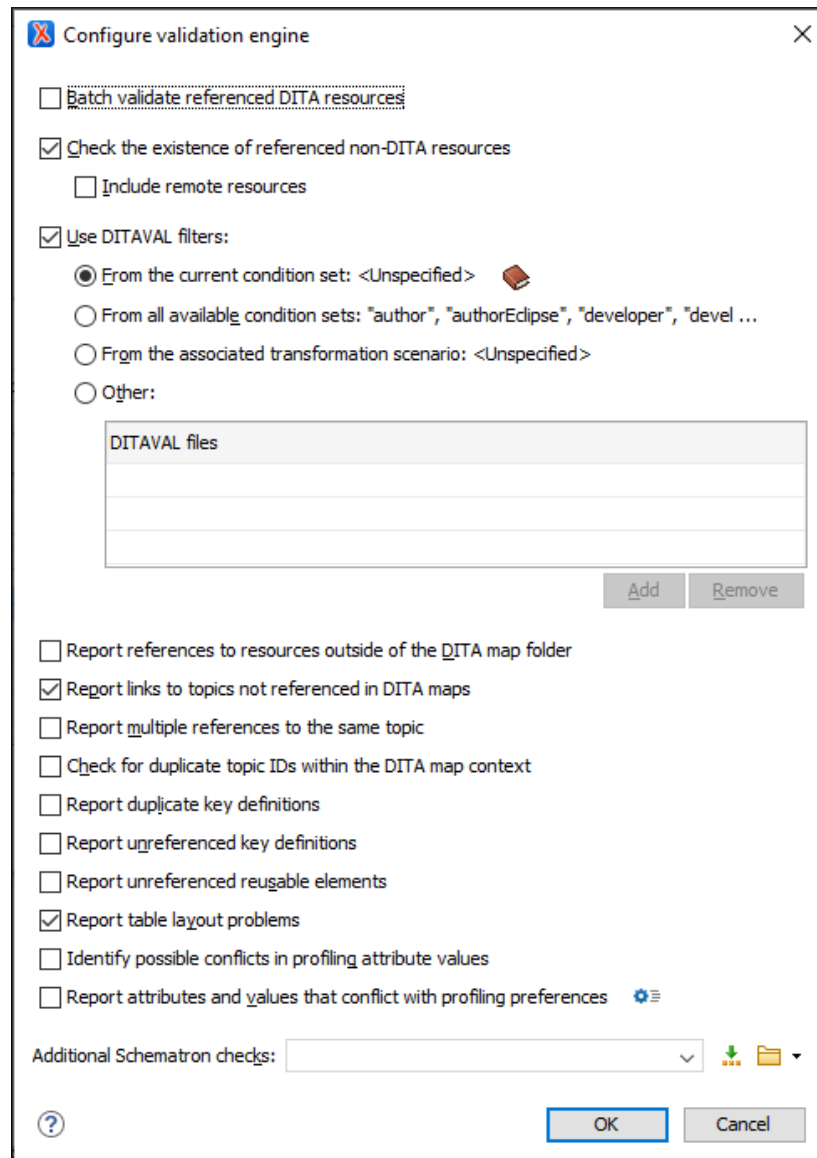

◦ **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).

Note:

The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 165. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated [validation scenario \(on page 557\)](#).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager view** (on page 2337). Clicking the  **Details** icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* (on page 2682) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes *key scopes (on page 2503)* into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2" />
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2" />
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 2503)* on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITaval filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page \(on page 145\)](#) (you can click the  **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.

**Advanced Tip:**

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLExtensionFunctionUtil](#).

↑ Move Up

Moves the selected validation unit up one spot in the list.

↓ Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

- Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.

- Click **OK**.

The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Editing a Validation Scenario

To edit an existing validation scenario, follow these steps:

- Select the  **Configure Validation Scenario(s)** from the toolbar, or from the **XML** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project Explorer** view *(on page 269)*). The **Configure Validation Scenario(s)** dialog box is displayed. It contains built-in and user-defined scenarios. The built-in scenarios are organized in categories depending on the type of file they apply to and you can identify them by a yellow key icon that marks them as *read-only*. The user-defined scenarios are organized under a single category. The default scenarios for the particular *framework* *(on page 269)* are rendered in bold.

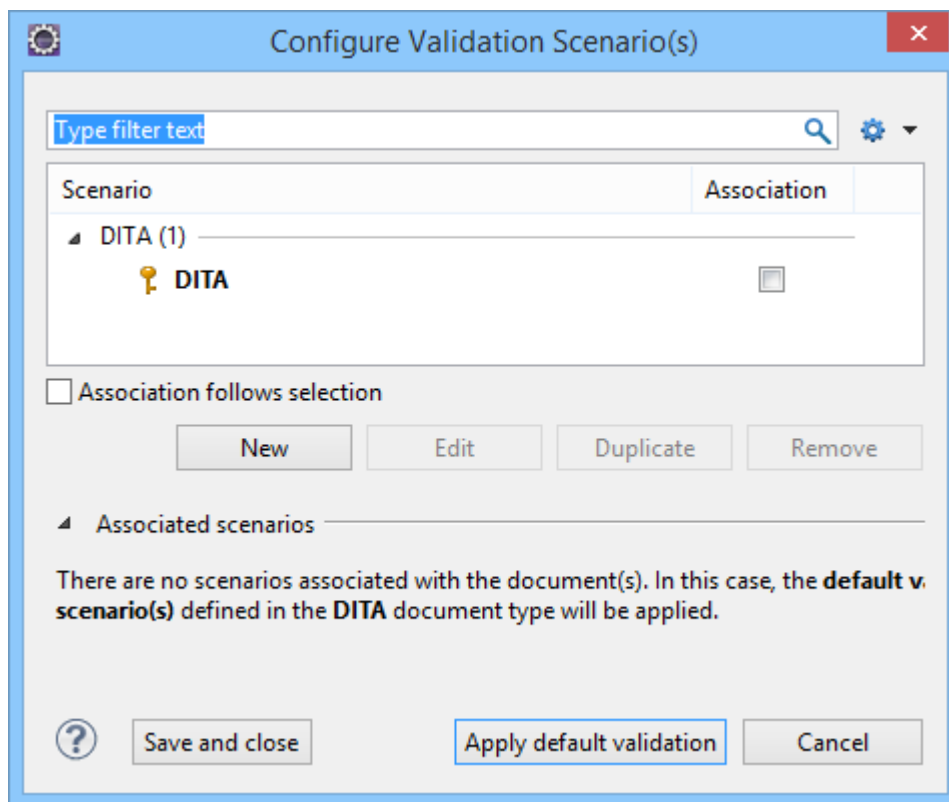

**Note:**

If a *main file* is associated with the current file, the validation scenarios defined in the *main file*, along with any Schematron schema defined in the default scenarios for that particular *framework*, are used for the validation. These take precedence over other types of validation

units defined in the default scenarios for the particular *framework*. For more information on *main files*, see [Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#) or [Modular Contextual XML Editing Using 'Main Files' Support \(on page 597\)](#).

Figure 166. Configure Validation Scenario Dialog Box

The top section of the dialog box contains a filter that allows you to search through the scenarios list and the  **Settings** button allows you to configure the following options:

Show all scenarios

Select this option to display all the available scenarios, regardless of the document they are associated with.

Show only the scenarios available for the editor

Select this option to only display the scenarios that Oxygen XML Editor Eclipse plugin can apply for the current document type.

Show associated scenarios

Select this option to only display the scenarios associated with the document you are editing.

Import scenarios

This option opens the **Import scenarios** dialog box that allows you to select the **scenarios** file that contains the scenarios you want to import. If one of the scenarios you import is identical to an existing scenario, Oxygen XML Editor Eclipse plugin ignores

it. If a conflict appears (an imported scenario has the same name as an existing one), you can choose between two options:

- Keep or replace the existing scenario.
- Keep both scenarios.

 **Note:**
When you keep both scenarios, Oxygen XML Editor Eclipse plugin adds **imported** to the name of the imported scenario.

 **Export selected scenarios**

Use this option to export selected scenarios individually. Oxygen XML Editor Eclipse plugin creates a **scenarios** file that contains the exported scenarios. This is useful if you want to share scenarios with others or export them to another computer.

2. Select the scenario and click the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, you will receive a warning message that Oxygen XML Editor Eclipse plugin needs to create a customizable duplicate (you can also use the **Duplicate** button).

The **Edit scenario** dialog box is displayed and it lists all the validation units for the scenario.

Figure 167. Edit Validation Scenario

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.

- Use the  **Insert Editor Variable** button to insert an [editor variable \(on page 218\)](#) or a [custom editor variable \(on page 227\)](#).

Figure 168. Insert an Editor Variable

<code>\${start-dir}</code>	- Start directory of custom validator
<code>\${standard-params}</code>	- List of standard parameters
<code>\${cfn}</code>	- The current file name without extension
<code>\${currentFileURL}</code>	- The path of the currently edited file (URL)
<code>\${cfdu}</code>	- The path of current file directory (URL)
<code>\${frameworks}</code>	- Oxygen frameworks directory (URL)
<code>\${pdu}</code>	- Project directory (URL)
<code>\${oxygenHome}</code>	- Oxygen installation directory (URL)
<code>\${home}</code>	- The path to user home directory (URL)
<code>\${pn}</code>	- Project name
<code>\${env(VAR_NAME)}</code>	- Value of environment variable VAR_NAME
<code>\${system(var.name)}</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can select one of the engines available in Oxygen XML Editor Eclipse plugin for validation of the particular document type:

- **Default engine** - The default engine is used to run the validation for the current document type, as specified in the preferences page for that type of document (for example, [XSLT preferences page \(on page 206\)](#), [XQuery preferences page \(on page 203\)](#), [XML Schema preferences page \(on page 195\)](#)).
- **DITA Validation engine** - Performs DITA-specific checks in the context of the specifications (it is similar to the process when using the  **Validate and Check for Completeness** action [\(on page 2382\)](#) in the **DITA Maps Manager**, but for a local file rather than an entire *DITA map* [\(on page 2678\)](#)).
- **DITA Map Validation and Completeness Check engine** - Performs a validation process that checks the DITA map document and all referenced topics and maps (it is similar to the process when using the  **Validate and Check for Completeness** action [\(on page 2382\)](#) in the **DITA Maps Manager**).
- **DITA-OT Project Validation and Completeness Check engine** - Performs a validation process that checks each context from the provided DITA-OT project file (it is similar to the process when using the  **Validate and Check for Completeness** action [\(on page 2382\)](#) in the **DITA Maps Manager**).
- **Table Layout Validation engine** - Looks for table layout problems (for more information, see the [Report table layout problems option \(on page 2387\)](#)).

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature (on page 547). If the **Automatic validation** feature is disabled in the [Document Checking preferences page](#) (on page 133), then this option is ignored, as the preference setting has a higher priority.

Schema

This option becomes active when you set the **File type** to **XML Document** and allows you to specify the schema used for the validation unit.

⚙️ Settings

Depending on the selected validation engine, clicking the ⚙️ **Settings** button either opens the **Specify Schema** dialog box or the **Configure validation engine** dialog box.

◦ Specify Schema Dialog Box

This dialog box allows you to specify a custom schema to be used for the validation process.

Figure 169. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document](#) (on page 585).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down,

the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* (on page 2679) to be used during the validation.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

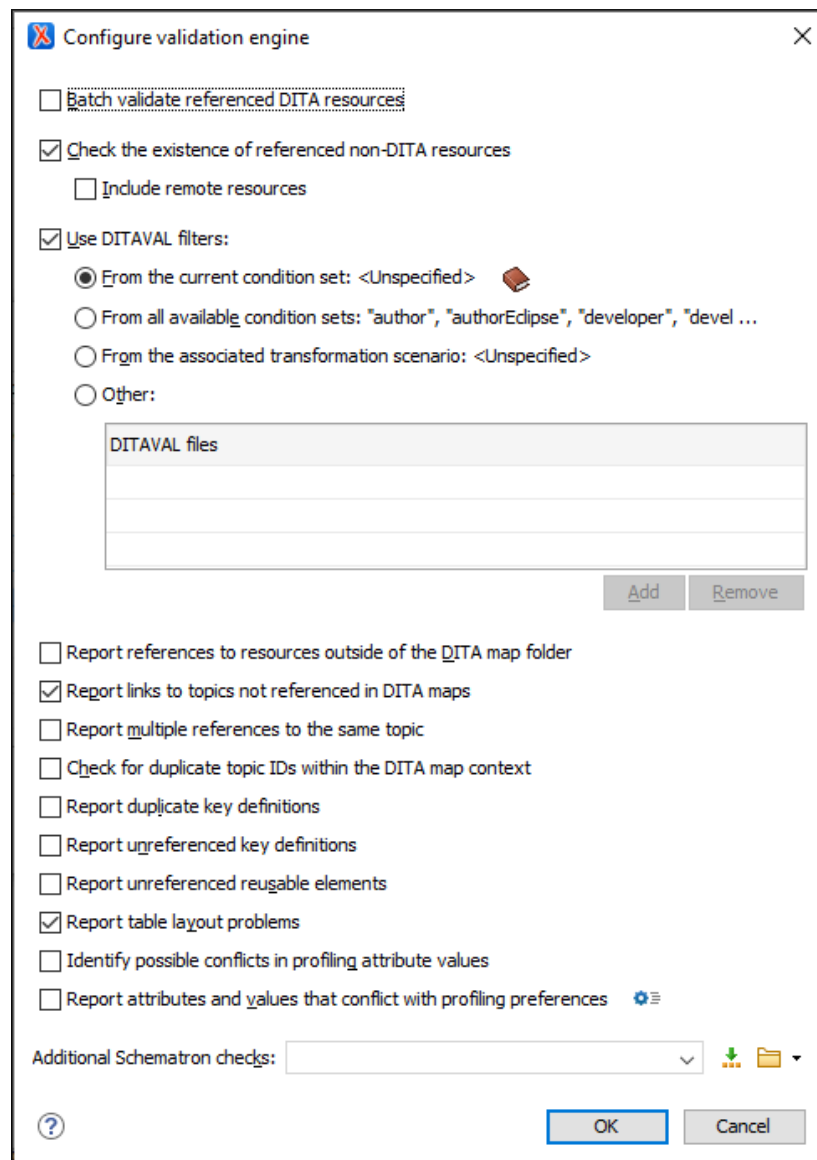

◦ **Configure Validation Engine Dialog Box**

This dialog box allows you to configure options for checking the DITA map document and all referenced topics and maps (similar to the process done when using the  **Validate and Check for Completeness** action (on page 2382) in the **DITA Maps Manager**).

Note:

The options presented in the **Configure validation engine** dialog box depends on type of validation engine. For example, when configuring the **DITA-OT Project Validation and Completeness Check** validation engine, the dialog box has slightly fewer options (omitting those that are not applicable).

Figure 170. Example of the Configure Validation Engine Dialog Box

The **Configure Validation Engine** dialog box contains the following options:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated [validation scenario \(on page 557\)](#).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a profiling condition set before validation. You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the **DITA Maps Manager view** (on page 2337). Clicking the  **Details** icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* (on page 2682) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes *key scopes (on page 2503)* into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2" />
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2" />
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a *key scope (on page 2503)* on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITaval filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page \(on page 145\)](#) (you can click the  **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.

**Advanced Tip:**

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLTExtensionFunctionUtil](#).

↑ Move Up

Moves the selected validation unit up one spot in the list.

↓ Move Down

Moves the selected validation unit down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

- Configure any of the existing validation units according to the information above, and you can use the buttons at the bottom of the table to add, remove, or move validation units. Note that if you add a Schematron validation unit, you can also select the **validation phase**.
- When you are done configuring the scenario, click **OK**.
The modified validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. If you chose to duplicate an existing one, the modified scenario will be listed with the word *copy* at the end of its name.

Sharing Validation Scenarios

The validation scenarios and their settings can be shared with other users by [exporting them to a specialized scenarios file \(on page 217\)](#) that can then be imported.

Resolving References to Remote Schemas with an XML Catalog

When a reference to a remote schema must be used in the validated XML document for interoperability purposes, but a local copy of the schema should actually be used for performance reasons, the reference can be resolved to the local copy of the schema with an [XML Catalog \(on page 2683\)](#).

For example, if the XML document contains a reference to a remote schema `docbook.rng` like this:

```
<?xml-model href="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
  type="application/xml" schematypens="http://relaxng.org/ns/structure/1.0"?>
```

it can be resolved to a local copy with a catalog entry like this:

```
<uri name="http://www.oasis-open.org/docbook/xml/5.0/rng/docbook.rng"
      uri="rng/docbook.rng" />
```

An *XML Catalog* can also be used to map an XML Schema specified with a URN in the `@xsi:schemaLocation` attribute of an XML document to a local copy of the schema. For example, if the XML document specifies the schema with:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
       xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

the URN can be resolved to a local schema file with a catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
      uri="topic.xsd" />
```

Related Information:

[Working with XML Catalogs \(on page 594\)](#)

Validation Example - A DocBook Validation Error

In the following DocBook 4 document, the content of the `<listitem>` element does not match the rules of the DocBook 4 schema (`docbookx.dtd`).

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.4//EN"
      "http://www.docbook.org/xml/4.4/docbookx.dtd">
<article>
  <title>Article Title</title>
  <sect1>
    <title>Section1 Title</title>
    <itemizedlist>
      <listitem>
        <link>a link here</link>
      </listitem>
    </itemizedlist>
  </sect1>
</article>
```

The  **Validate Document** action will return the following error:

```
Unexpected element "link". The content of the parent element type must match
"(calloutlist|glosslist|bibliolist|itemizedlist|orderedlist|segmentedlist|simplelist
|variablelist|caution|important|note|tip|warning|literallayout|programlisting
|programlistingco|screen|screenco|screenshot|synopsis|cmdsynopsis|funcsynopsis
|classsynopsis|fieldsynopsis|constructorsynopsis|destructorsynopsis|methodsynopsis
```

```
|formalpara|para|simpara|address|blockquote|graphic|graphicco|mediaobject|mediaobjectco
|informalequation|informalexample|informalfigure|informaltable|equation|example|figure
|table|msgset|procedure|sidebar|qandaset|task|anchor|bridgehead|remark|highlights
|abstract|authorblurb|epigraph|indexterm|beginpage)+".
```

This error message is a little more difficult to understand, so understanding of the syntax or processing rules for the DocBook XML DTD `<listitem>` element is recommended. However, the error message does offer a clue as to the source of the problem, indicating that *"The content of element type must match"*.

Fortunately, most standards-based DTDs, XML Schemas, and Relax NG schemas are supplied with reference documentation. This enables you to read about the element. In this case, you should learn about the child elements of `<listitem>` and their nesting rules. Once you have correctly inserted the required child element and nested it in accordance with the XML rules, the document will become valid.

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor Eclipse plugin supports Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
    schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

Note:

When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor Eclipse plugin provides two built-in validation scenarios: **Validate XML Schema**

with embedded Schematron for XML schema, and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron in Relax NG Schema

```
<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
  <start>
    .....
  </start>
</grammar>
```

Related Information:

[Embedding Schematron Quick Fixes in Relax NG or XML Schema \(on page 997\)](#)

XML Quick Fixes

The Oxygen XML Editor Eclipse plugin [Quick Fix support \(on page 2682\)](#) helps you resolve errors that appear in an XML document by offering *Quick Fixes* to problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode

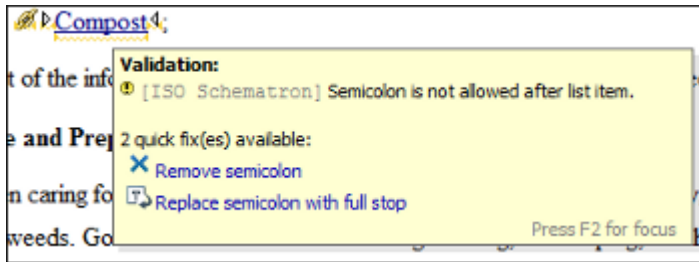

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals may be presented in a tooltip pop-up window and the available quick *Quick Fixes* include a link that can be used to perform the fix.

Figure 171. Quick Fix Presented in a Tooltip in Text Mode

Figure 172. Quick Fix Presented in a Tooltip in Author Mode

- When hovering over the error or warning in **Author** mode, a small *Quick Fix* drop-down menu is presented. You can use the drop-down menu to display a list of available *Quick Fixes* to select from for the particular error or warning.

Figure 173. Quick Fix Drop-Down Menu in Author Mode

- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (🔧) is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor Eclipse plugin displays the list of available fixes.

Figure 174. Quick Fix Menu Invoked by Clicking on the 🔧 Icon

- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Ctrl + 1 (Command + 1 on macOS)** on your keyboard.

Whenever you make a modification in the XML document or you apply a fix, the list of *Quick Fixes* is recomputed to ensure that you always have valid proposals.

**Note:**

A *Quick Fix* that adds an element inserts it along with required and optional elements, and required and fixed attributes, depending on how the [Content Completion preferences \(on page 119\)](#) are configured.

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor Eclipse plugin offers *Quick Fixes (on page 2682)* for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:**

For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor Eclipse plugin provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

[Schematron Quick Fixes \(SQF\) \(on page 584\)](#)

Schematron Quick Fixes (SQF)

Oxygen XML Editor Eclipse plugin provides support for Schematron *Quick Fixes* (on page 2682) (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions. For more details and examples, see the following blog post: <https://blog.oxygenxml.com/topics/SchematronBCs.html>.

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

Figure 175. Example of a Schematron Quick Fix

Related Information:

[Editing Schematron Quick Fixes \(on page 970\)](#)

[Schematron Quick Fix Specifications](#)

[Presenting Schematron Validation Issues \(on page 956\)](#)

[Examples of Schematron Rules and Quick Fixes \(on page 943\)](#)

Associating a Schema to XML Documents

To provide as-you-type validation and to compute valid proposals for the *Content Completion Assistant* (on page 2677), Oxygen XML Editor Eclipse plugin requires a schema to be associated with the XML document. The schema specifies how the internal structure of the XML is defined.

Supported Types of Schema

The following schema types are supported:

- **W3C XML Schema 1.0 and 1.1** (with and without embedded Schematron rules) - The association with an XML Schema is added as an attribute of the root element with one of the following:
 - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
 - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.

- **Relax NG - XML Syntax** (with and without embedded Schematron rules) - The association is added as an *xml-model processing instruction*.
- **Relax NG - Compact Syntax** - The association is added as an *xml-model processing instruction*.
- **NVDL** - The association is added as an *xml-model processing instruction*.
- **Schematron** (both ISO Schematron and Schematron 1.5) - The association is added as an *xml-model processing instruction*.

Detecting the Schema(s) for Validation

For validation, Oxygen XML Editor Eclipse plugin tries to detect one or more schemas by searching multiple locations, in the following order:

1. The schema or multiple schemas [referenced in validation stages from the validation scenario\(s\)](#) ([on page 586](#)) associated with the current XML document.
2. If no validation scenario is selected to be used with the current XML document, then it falls back to the schema or multiple schemas [defined in validation stages from the validation scenarios specified as default in the particular document type configuration](#) ([on page 590](#)).
3. If a schema is still not detected, then it falls back to the [schema or multiple schemas associated directly in the XML document](#) ([on page 591](#)).

Tip:

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **XML** menu).

4. If a schema is still not detected, then it falls back to the [schema defined in the **Schema** tab of a framework \(document type\) configuration](#) ([on page 593](#)).

Detecting a Schema for Content Completion

For content completion, Oxygen XML Editor Eclipse plugin uses just one schema and tries to detect that schema by searching multiple locations, in the following order:

1. If no schema is detected in the document, then it falls back to the highest ranking [schema defined in validation stages from the validation scenario\(s\)](#) associated with the current document ([on page 586](#)).
2. If a schema is still not detecting, then it falls back to the highest ranking [schema defined in validation stages from validation scenarios specified as default in the particular document type configuration](#) ([on page 590](#)).
3. Oxygen XML Editor Eclipse plugin determines the most appropriate or highest ranking [schema that is associated directly in the XML document](#) ([on page 591](#)) and uses it for content completion.
4. If a schema is still not detecting, then it falls back to the [schema defined in the **Schema** tab of a framework \(document type\) configuration](#) ([on page 593](#)).

Related Information:[W3C: Associating Schemas with XML Documents](#)

Associating a Schema Through a Validation Scenario

Oxygen XML Editor Eclipse plugin uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your XML documents. You can specify the schema to be used for validation directly in [validation scenarios \(on page 557\)](#) and there are several methods that can be used to do so.

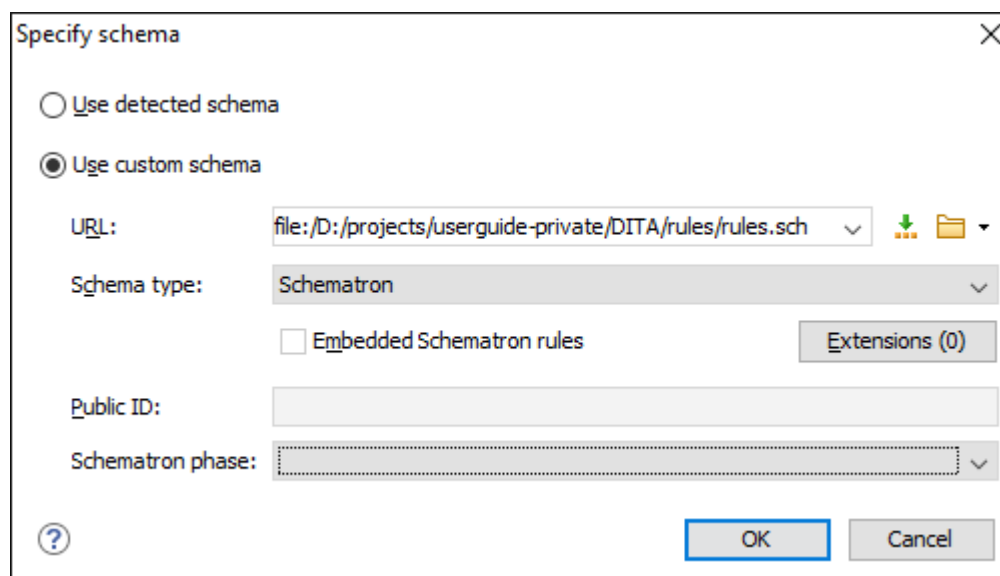

Configure a Validation Scenario and Specify the Schema

To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the  **Configure Validation Scenario(s)** from the toolbar, or from the **XML** menu (or the **Validate** submenu when invoking the contextual menu on a file in the **Project Explorer** view [\(on page 269\)](#)).
2. Click the **New** button to create a new validation scenario or the **Edit** button to modify an existing one.
3. [Add or configure validation units \(on page 570\)](#) according to your needs and click the  **Specify Schema** button.

Step Result: The **Specify Schema** dialog box is displayed:

Figure 176. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document \(on page 585\)](#).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.
 - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
 - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
 - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
 - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* (on page 2679) to be used during the validation.
 - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
4. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.
 5. Click **OK** on both dialog boxes.

Result: The schema is now associated with that validation scenario whenever it is invoked.

Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the  **Validation** drop-down menu on the toolbar (or **XML** menu).

Step Result: The **Validate with** dialog box is displayed:

Figure 177. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.
 - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
 - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
 - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
 - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* (on page 2679) to be used during the validation.
 - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
2. Select the schema to be associated with the manual validation and configure the rest of the options according to your preferences.
 3. Click **OK**.

Result: The current document is validated using the schema you specified.

 **Tip:**

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **XML** menu).

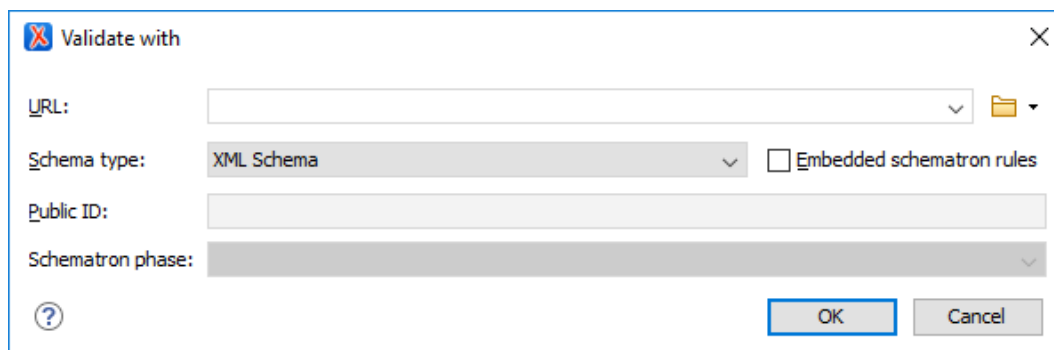

Use the Validate with Schema Action to Specify a Schema for Validating all Selected Documents

To validate multiple documents using a specified schema, follow these steps:

1. Select all the documents you want to validate in the **Project Explorer** view.
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

Step Result: The **Validate with** dialog box is displayed:

Figure 178. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.
 - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
 - **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
 - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
 - **Extensions**- Opens a dialog box that allows you to specify *Java extension JARs* (on page 2679) to be used during the validation.
 - **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.
3. Select the schema that you want to use to validate all selected documents and configure the rest of the options according to your preferences.
 4. Click **OK**.

Result: The selected documents are validated using the schema you specified.

Associating a Schema in Validation Scenarios Defined in the Document Type

To report errors and warnings during automatic and manual validations that help maintain the structural integrity of particular XML document types, Oxygen XML Editor Eclipse plugin uses rules defined in the schema that is detected in the validation scenarios that are associated to each particular document type.

To associate a schema in validation scenarios defined in the *framework (on page 2679)* (document type) configuration, follow these steps:

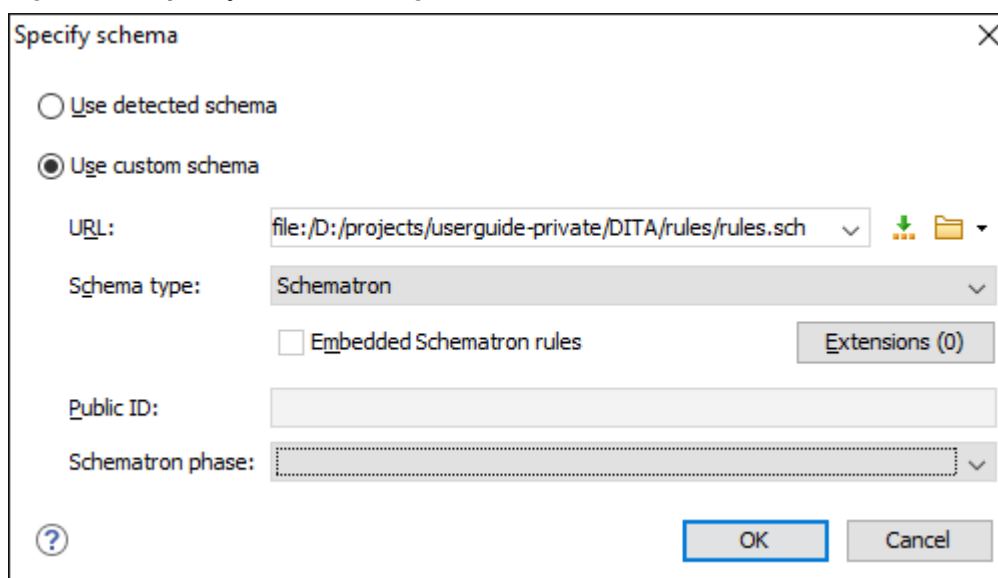

1. Open the **Preferences** dialog box *(on page 70)* and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** or **Duplicate** button to modify an existing *framework* (or use the **New** button to create a new one).

Step Result: This opens a **Document type** configuration dialog box *(on page 90)*.

3. Go to the **Validation** tab *(on page 116)*.
4. Create or edit a validation scenario:
 - a. To create a new validation scenario *(on page 558)*, click the **+ New** button.
 - b. To edit the properties of an existing validation scenario *(on page 568)*, select it and click the **Edit** button (you can also use the **Duplicate** button to copy an existing scenario and edit its properties).
5. Add or configure validation units *(on page 570)* according to your needs and click the **Specify Schema** button.

Step Result: The **Specify Schema** dialog box is displayed:

Figure 179. Specify Schema Dialog Box

The **Specify Schema** dialog box contains the following options:

Use detected schema

Uses the [schema detected for the particular document \(on page 585\)](#).

Use custom schema

Allows you to specify the schema using the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
- **Embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
- **Public ID** - Allows you to specify a public ID if you have selected a DTD.
- **Extensions** - Opens a dialog box that allows you to specify [Java extension JARs \(on page 2679\)](#) to be used during the validation.
- **Schematron phase** - If you select a Schematron schema, this drop-down list allows you to select a Schematron phase that you want to use for validation. The listed phases are defined in the Schematron document.

6. Select the schema to be associated with the validation unit and configure the rest of the options according to your preferences.

7. Click **OK** on both dialog boxes.

Result: The schema is now associated with the validation scenario you just configured for that particular document type.

Associating a Schema Directly in XML Documents

The schema used by the [Content Completion Assistant \(on page 2677\)](#) and document validation engine can be directly associated with the current document by using the  **Associate Schema** action. For most of the schema types, it uses the [xml-model processing instruction](#), with the exceptions of:

- **W3C XML Schema** - The `@xsi:schemaLocation` attribute or `@xsi:noNamespaceSchemaLocation` attribute is used.
- **DTD** - The `DOCTYPE` declaration is used.

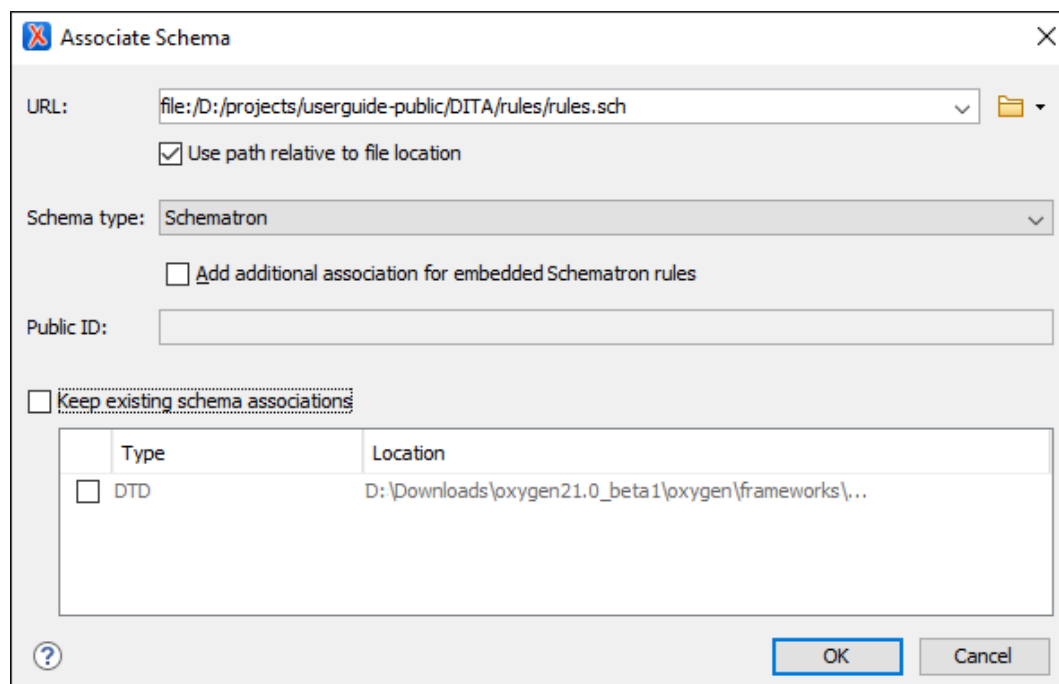

The association can specify a relative file path or a URL of the schema. The advantage of relative file path is that you can configure the schema at file level instead of [framework \(on page 2679\)](#) level.

To associate a schema to the current document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **Document > Schema** menu).

Step Result: The **Associate Schema** dialog box is displayed:

Figure 180. Associate Schema Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).
 - **Use path relative to file location** - Select this option if the XML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the XML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
 - **Schema type** - Select a possible schema type from this combo box that is populated based on the extension of the schema file that was entered in the **URL** field. The possible schema types are: XML Schema, DTD, Relax NG, Relax NG Compact, Schematron, or NVDL.
 - **Add additional association for embedded Schematron rules** - If you have selected XML Schema or Relax NG schemas with embedded Schematron rules and you want to use those embedded rules, select this option.
 - **Public ID** - Allows you to specify a public ID if you have selected a DTD.
 - **Keep existing schema associations** - Select this option to use the existing schema associations of the currently edited document.
2. Select the schema that will be associated with the XML document and configure the rest of the options according to your preferences.
 3. Click **OK**.

Result: The schema association is created based upon the specified type.

- **XML Schema** - The association with an XML Schema is added as an attribute of the root element with one of the following:
 - `@xsi:schemaLocation` attribute, if the root element of the document is in the namespace.
 - `@xsi:noNamespaceSchemaLocation` attribute, if the root element is not in the namespace.
- **DTD** - The association with a DTD is added as a `DOCTYPE` declaration.
- **Other** - The association with a Relax NG, Schematron, or NVDL schema is added as an *xml-model* processing instruction.

Tip:

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **XML** menu).

Related Information:

[Validating XML Documents \(on page 544\)](#)

[Content Completion Assistant in Text Mode \(on page 319\)](#)

[Content Completion Assistant in Author Mode \(on page 393\)](#)

Associating a Schema in a Framework (Document Type) Configuration

The schema used to compute valid proposals in the *Content Completion Assistant (on page 2677)* and by the document validation engine to report errors and warnings can be defined in each particular *framework (on page 2679)* (document type). This schema will be used only if one is not *detected in the current XML file (on page 591)*.

To associate a schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** ([on page 89](#)), **Extend** ([on page 89](#)), or **Duplicate** ([on page 89](#)) button to modify an existing *framework* (or use the **New** button to create a new one).

Step Result: This opens a **Document type** configuration dialog box ([on page 90](#)).

3. Go to the **Schema** tab ([on page 94](#)).
4. Select the schema type and its URI.
5. Click **OK**.

Result: The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current XML document.

Learn Document Structure When Schema is not Detected

When working with documents that do not specify a schema, or the schema is not known or does not exist, Oxygen XML Editor Eclipse plugin can learn the document structure by parsing the document internally to provide an initialization source for [content completion \(on page 319\)](#) and [document validation \(on page 544\)](#).

This feature is controlled by the [Learn on open document option \(on page 119\)](#) that is available in the **Editor > Content Completion** preferences page. This feature enabled by default. If you want to disable it, deselect the **Learn on open document** option.

You can choose to create a DTD from the learned structure and save it as a file using the **Learn Structure** and **Save Structure** actions.

Creating a DTD from Learned Document Structure

To create a DTD from the learned structure of an XML document, follow these steps:

1. Open the XML document that will be used to create the DTD.
2. Go to **XML > Learn Structure (Ctrl + Shift + L (Command + Shift + L on macOS))**. The **Learn Structure** action reads the mark-up structure of the current document. A **Learn completed** message is displayed in the application status bar when the action is finished.
3. Go to **XML > Save Structure (Ctrl + Shift + S (Command + Shift + S on macOS))** and enter the file path for the DTD.
4. Click the **Save** button.

Related Information:

[Detecting a Schema \(on page 584\)](#)

Working with XML Catalogs

Oxygen XML Editor Eclipse plugin uses [XML Catalogs \(on page 2683\)](#) to resolve references for validations and transformations and they are especially helpful for resolving external resources when internet access is not available or your connection is slow.

Oxygen XML Editor Eclipse plugin supports any *XML Catalog* file that conforms to one of the following:

1. [OASIS XML Catalogs Committee Specification v1.1](#).
2. [OASIS Technical Resolution 9401:1997](#), including the plain-text flavor described in that resolution.

The version 1.1 of the OASIS *XML Catalog* specification introduces the possibility to map a system ID, public ID, or a URI to a local copy using only a suffix of the ID or URI used in the actual document. This is done using the catalog elements [systemSuffix](#) and [uriSuffix](#).

Depending on the resource type, Oxygen XML Editor Eclipse plugin uses different catalog mappings.

Table 8. Catalog Mappings

Doc Type	Referenced Resource	Mappings
XML	DTD	<p><i>system</i> or <i>public</i></p> <p>The Prefer option (on page 189) controls which one of the mappings should be used.</p>
	XML Schema	<p>The following strategy is used (if one step fails to provide a resource, the next is applied):</p> <ol style="list-style-type: none"> 1. Resolve the schema using <i>URI</i> catalog mappings. 2. Resolve the schema using <i>system</i> catalog mappings. This happens only if the Resolve schema locations also through system mappings option (on page 190) is selected (it is by default). 3. Resolve the root <i>namespace</i> using <i>URI</i> catalog mappings.
	Relax NG	
	Schematron	
	NVDL	
XSL	XSL/ANY	<i>URI</i>
CSS	CSS	<i>URI</i>
JSON	JSON	<i>URI</i>
XPROC	XPROC	<i>URI</i>
XML Schema	XML Schema	<p>The following strategy is used (if one step fails to provide a resource, the next is applied):</p> <ol style="list-style-type: none"> 1. Resolve schema reference using <i>URI</i> catalog mappings. 2. Resolve schema reference using <i>system</i> catalog mappings. This happens only if the Resolve schema locations also through system mappings option (on page 190) is selected (it is by default). 3. Resolve schema <i>namespace</i> using <i>URI</i> catalog mappings. This happens only if the Process namespaces through URI mappings for XML Schema option (on page 190) is selected (it is not by default).
Relax NG	Relax NG	

Creating an XML Catalog with a Template

An *XML Catalog* ([on page 2683](#)) file can be easily created in Oxygen XML Editor Eclipse plugin starting from the document template called *OASIS XML Catalog*. It is available when [creating new document templates](#) ([on page 253](#)).

How Oxygen XML Editor Eclipse plugin Determines which Catalog to Use

Oxygen XML Editor Eclipse plugin uses *XML Catalogs (on page 2683)* to resolve references for validations and transformations and it maps such references to the built-in local copies of the schemas associated with the various *frameworks (on page 2679)* (DocBook, DITA, TEI, XHTML, SVG, etc.)

Oxygen XML Editor Eclipse plugin includes default global catalogs and default catalogs for each of the built-in *frameworks*, and you can also create your own.

Oxygen XML Editor Eclipse plugin looks for catalogs in the following order:

- Global user-defined catalogs that are set in the **XML Catalog preferences page (on page 189)**.
- User-defined catalogs that are set for each *framework (on page 2679)* in the **Catalog tab (on page 114)** of the **Document Type configuration dialog box (on page 90)**.
- Default built-in catalogs.

Example: Using an XML Catalog to map an Absolute XML Schema Reference to an XML Schema Located Relative to the XML Catalog

An *XML Catalog* can be used to map an XML Schema specified with a URN in the `@xsi:noNamespaceSchemaLocation` attribute of an XML document to a local copy of the schema.

Considering the following XML document code snippet:

```
<topic xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
      xsi:noNamespaceSchemaLocation="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1">
```

The URN can be resolved to a local schema file with an XML catalog entry like this:

```
<uri name="urn:oasis:names:tc:dita:xsd:topic.xsd:1.1"
      uri="topic.xsd"/>
```

Example: Using an XML Catalog to map an Imported XML Schema Reference to an XML Schema Located Relative to the XML Catalog

An *XML Catalog* can be used to map an `xs:import` or `xs:include` XML Schema reference to a local copy of the schema.

Considering the following `xs:include` inside an XML Schema:

```
<xs:include schemaLocation="someFolder/common.xsd"/>
```

The reference can be resolved to a local schema file with an XML catalog entry like this:

```
<uriSuffix uriSuffix="someFolder/common.xsd" uri="relative/path/to/common.xsd"/>
```

Related information

[XML Catalog Preferences \(on page 189\)](#)

Resolving Schema Locations Through XML Catalogs

Schema locations can be mapped using an *XML Catalog* (on page 2683). Oxygen XML Editor Eclipse plugin resolves the location of a schema in the following order:

- First, it attempts to resolve the schema location as a URI (`uri`, `uriSuffix`, `rewriteUri`, `delegateUri` mappings from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Resolve schema locations also through system mappings** option (on page 190) is selected in the **XML Catalog** preferences page, it attempts to resolve the schema location as a system ID (`system`, `systemSuffix`, `rewriteSuffix`, `rewriteSystem` from the *XML Catalog*). If this succeeds, the process ends here.
- If the **Process "schemaLocation" namespaces through URI mappings for XML Schema** option (on page 190) is selected in the **XML Catalog** preferences page, the target namespace of the imported XML Schema is resolved through URI mappings. If the schema specified in the `schemaLocation` attribute is not resolved successfully, the namespace of the root element is taken into account. If this succeeds, the process ends here.
- If none of these succeeds, the actual *schema location* (on page 585) is used.

Related Information:

[Working with XML Catalogs](#) (on page 594)

Modular Contextual XML Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex XML modular structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor Eclipse plugin provides the support for defining the main module (or modules), allowing you to edit any file from the hierarchy in the context of the *main files* (on page 2680).

You can set a main XML document either using the *main files support from the Project Explorer view* (on page 278), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main XML document. In this case, it considers the current module as the main XML document.

The advantages of working with modular XML files in the context of a *main file* (on page 2680) include:

- Correct validation of a module in the context of a larger XML structure.
- *Content Completion Assistant* (on page 2677) displays all collected entities and IDs starting from the *main files*.
- Oxygen XML Editor Eclipse plugin uses the schema defined in the *main file* when you edit a module that is included in the hierarchy through the *External Entity* mechanism.

- The *main files* defined for the current module determines the [scope of the search and refactoring actions \(on page 600\)](#) for ID/IDREFS values and for updating references when renaming/moving a resource. Oxygen XML Editor Eclipse plugin performs the search and refactoring actions in the context that the *main files* determine, improving the speed of execution.

Resources

For more information about editing modular XML files in the *main files* context, watch our video demonstration:

[Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#)

[XML Referenced/Dependent Resources View \(on page 600\)](#)

Search and Refactoring Actions for IDs and IDREFS

Oxygen XML Editor Eclipse plugin allows you to search for ID declarations and references (IDREFS) and to [define the scope of the search and refactor operations \(on page 600\)](#). These operations are available for XML documents that have an associated DTD, XML Schema, or Relax NG schema. These operations are available through the search and refactor actions in the contextual menu. In **Text** mode, these actions are also available in the **Quick Assist (on page 345)** menu.

The search and refactor actions from the contextual menu are grouped in the **Manage IDs** section:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and [choose the scope of the rename operation \(on page 600\)](#). For a preview of the changes you are about to make, click **Preview**.

This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File

Renames the ID you are editing and all its occurrences from the current file.

Note:

Available in the **Text** mode only.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project.

If you configure a scope using the [Select the scope for the Search and Refactor operations \(on page 600\)](#) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 600).

Search Declarations

Searches for the declaration of the ID reference. By default, the scope of this action is the current project. If you configure a scope using the **Select the scope for the Search and Refactor operations** (on page 600) dialog box, this scope will be used instead.

Note:

Available in the **Text** mode only.

Search Declarations in

Searches for the declaration of the ID reference. Selecting this action opens the **Select the scope for the Search and Refactor operations** (on page 600).

Note:

Available in the **Text** mode only.

Search Occurrences in file

Searches for the declaration and references of the ID in the current document.

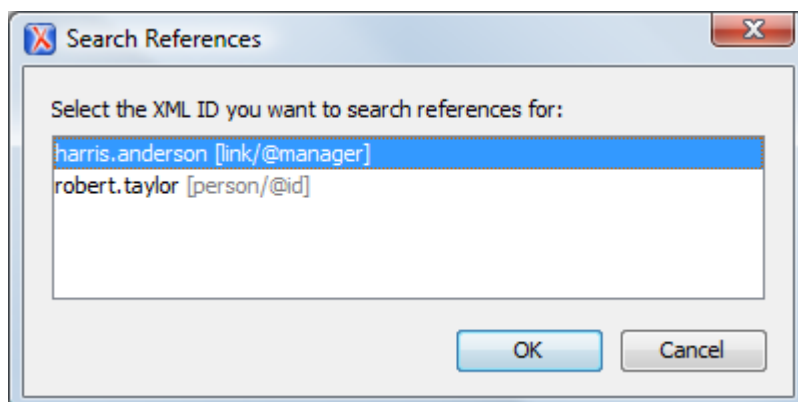

Tip:

A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on macOS)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor Eclipse plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

Figure 181. Selecting an ID in the Author Mode

Related Information:

Search and Refactor Operations Scope

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Fix* action set or on the **Referenced/Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets* (on page 2683). The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support (on page 278).

Figure 182. Change Scope Dialog Box

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* (on page 2683) structure.

XML Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in an XML document. The tree structure presented in this view is built based on the *Xinclude* and *External Entity* mechanisms. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy or dependencies of an XML document, select the document in the **Project Explorer** view (on page 269) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 183. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

**Note:**

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 602\)](#). Only the references made through the *XInclude* and *External Entity* mechanisms are handled.

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

Moving/Renaming XML Resources

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Combining XML Content Using DTD Entities and XInclude

When documenting large projects, it is likely that there are multiple people involved. In this case, it is usually more efficient to use a modular approach so that everyone involved in the project can work in parallel. Other advantages of modular documentation include: reusable content possibilities, smaller file units are easier to edit, and better version control.

Two possible solutions for this are to use **DTD Entities** or **XInclude** to combine XML content in a *main file* (on page 2680). A main document can be created with references to various document parts, users can edit those documents individually, and then apply an XSLT stylesheet over the main document to obtain the output files in various formats (for example, PDF or HTML).

Combining XML Document Content Using DTD Entities

There are two conditions for including a document fragment using DTD entities:

- The main document should declare the DTD to be used, while the external entities should declare the XML fragments to be referenced.
- The referenced documents that contain the fragments cannot also define the DTD because the main document will not be valid. If you want to validate the parts separately you have to [use XInclude](#) (on page 604) for assembling the parts together with the *main file*.

The main document looks like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE book SYSTEM "../xml/docbookx.dtd" [
<!ENTITY testing SYSTEM "testing.xml" > ]
>
<book>
<chapter> ...
```

The referenced document (*testing.xml*) looks like this:

```
<section> ... here is the section content ... </section>
```

Note:

The indicated DTD and the element names (*section*, *chapter*) are used here only for illustrating the inclusion mechanism. You can use any DTD and element names you need.

The content from the referenced file (in the example above, it is a `<section>` in the *test.xml* file) can be inserted somewhere in the main document:

```
... &testing; ...
```

To obtain output in various formats (for example, PDF or HTML), you simply need to apply an XSLT stylesheet over the main document using a transformation scenario.

Viewing the Expanded Content in Oxygen XML Editor Eclipse plugin

When a transformation scenario is applied on the *main file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to **Author** mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:math="http://www.w3.org/2005/xpath-functions/math"
  exclude-result-prefixes="xs math"
  version="3.0">
  <xsl:template match="node() | @">
    <xsl:copy>
      <xsl:apply-templates select="node() | @" />
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

Combining XML Documents and Fragments Using XInclude

XInclude is a standard for assembling XML instances into another XML document through inclusion. A *main file (on page 2680)* can be dynamically created from smaller XML documents without having to physically duplicate the content of the smaller files. The advantage of using XInclude instead of the [DTD Entities](#)

method (on page 603) is that each of the assembled documents is permitted to contain a Document Type Declaration (DOCTYPE). This means that each file is a valid XML instance and can be independently validated. It also means that the main document, which includes smaller instances, can be validated without having to remove or comment out the DOCTYPE (as is the case with External Entities).

Enabling XInclude Support in Oxygen XML Editor Eclipse plugin

The XInclude support in Oxygen XML Editor Eclipse plugin is enabled by default. It is controlled by the **Enable XInclude processing** option (*on page 192*) in the **XML > XML Parser** preferences page (*on page 192*). When enabled, Oxygen XML Editor Eclipse plugin will be able to validate and transform documents comprised of parts added using XInclude.

Example: Using XInclude to Combine Files

A chapter file (*introduction.xml*) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE chapter PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.oasis-open.org/docbook/xml/4.3/docbookx.dtd">
<chapter>
  <title>Getting started</title>
  <section>
    <title>Section title</title>
    <para>Para text</para>
  </section>
</chapter>
```

The main article (*main file*) looks like this:

```
<?xml version="1.0"?>
<!DOCTYPE article PUBLIC "-//OASIS//DTD DocBook XML V4.3//EN"
"http://www.docbook.org/xml/4.3/docbookx.dtd"
[ <!ENTITY % xinclude SYSTEM "../frameworks/docbook/dtd/xinclude.mod">
%xinclude:
]>
<article>
  <title>Install guide</title>
  <para>This is the install guide.</para>
  <xi:include xmlns:xi="http://www.w3.org/2001/XInclude"
             href="introduction.xml">
  <xi:fallback>
    <para>
      <emphasis>FIXME: MISSING XINCLUDE CONTENT</emphasis>
    </para>
  </xi:fallback>
```

```
</xi:include>
</article>
```

In this example, note the following:

- The DOCTYPE declaration defines an entity that references a file containing the information to add the *xi* namespace to certain elements defined by the DocBook DTD.
- The href attribute of the *xi:include* element specifies that the `introduction.xml` file will replace the *xi:include* element when the document is parsed.
- If the `introduction.xml` file cannot be found, the parser will use the value of the *xi:fallback* element - a *FIXME* message.

Example: Using XInclude to Combine Fragments of Files

If you want to include only a fragment of a file in the *main file (on page 2680)*, the fragment must be contained in a tag having an `@xml:id` attribute and you must use an XPointer expression pointing to the `@xml:id` value.

Notice:

Oxygen XML Editor Eclipse plugin supports the *XPointer Framework* and the *XPointer element() Scheme*, but it does NOT support the *XPointer xpointer() Scheme*.

For example, if the *main file* is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
  schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
  <xi:include href="a.xml" xpointer="a1"
    xmlns:xi="http://www.w3.org/2001/XInclude" />
</test>
```

and the file (`a.xml`) is:

```
<?xml version="1.0" encoding="UTF-8"?>
<test>
  <a xml:id="a1">test</a>
</test>
```

after resolving the XPointer reference, the document is:

```
<?xml version="1.0" encoding="UTF-8"?>
<?xml-model href="test.rng" type="application/xml"
  schematypens="http://relaxng.org/ns/structure/1.0"?>
<test>
```

```
<a xml:id="a1" xml:base="a.xml">test</a>
</test>
```

Viewing the Expanded Content in Oxygen XML Editor Eclipse plugin

When a transformation scenario is applied on the *main file*, an intermediary file combines all the referenced content and it will be expanded in the final output. If you want to see how the referenced content will be expanded before applying the transformation, you can do one of the following:

- Simply switch to **Author** mode.
- Create a minimal XSLT stylesheet that simply copies the XML content, then create a new XSLT transformation scenario that applies the stylesheet over the XML. The XSLT stylesheet would look like this:

```
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  xmlns:math="http://www.w3.org/2005/xpath-functions/math"
  exclude-result-prefixes="xs math"
  version="3.0">
  <xsl:template match="node() | @">
    <xsl:copy>
      <xsl:apply-templates select="node() | @" />
    </xsl:copy>
  </xsl:template>
</xsl:stylesheet>
```

XInclude 1.1 Features

Oxygen XML Editor Eclipse plugin offers partial support for XInclude 1.1 features. This includes support for fragment identifiers and attribute copying.

• Fragment Identifiers

You can use `<xi:include>` to reference a text file and specify the `@fragid` value so that you only get part of that text file in the main document. For some examples and to see how the `<xi:include>` gets expanded when the `@fragid` specifies a line range or character range, see [Textual Inclusion Examples with RFC5147 Fragment Identifiers](#).

• Attribute Copying

Any *namespaced* attribute defined on the `<xi:include>` element will be passed to the root element of the included content.

For example, if you have this:

```
<xi:include href="section2.xml" xmlns:xi="http://www.w3.org/2001/XInclude"
  set-xml-id="sectInner1" />
```

and `section2.xml` looks like this:

```
<sect2 xmlns="http://docbook.org/ns/docbook" version="5.0"
  xmlns:xlink="http://www.w3.org/1999/xlink" xml:id="section2">
  <title>FS2</title>
  <para>P2</para>
</sect2>
```

then the final processed result will have the original `xml:id="section2"` replaced with the value specified in the *xi:included* section.

For more information, see [Attribute Copying when Processing XML](#). Also, to see more examples, see [Attribute Copying Examples](#).

Related information

[W3C Specifications: XML Inclusions \(XInclude\) Version 1.1](#)

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor Eclipse plugin includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **XML Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project Explorer** view (*on page 269*).
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view (*on page 2337*).

**Note:**

The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were *finished (on page 611)* or *previewed (on page 611)* also appear in the **Refactoring** submenu of the contextual menu in the **DITA Maps Manager**.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

Figure 184. XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation.

The parameters are specific to the type of refactoring operation that is being performed. For

example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

Figure 185. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 186. XML Refactoring - Scope and Filters Wizard Page

Scope section

You can specify the scope for the operation by selecting from predefined resource sets or you can define your own set of resources by creating a *working set* (on

[page 2683](#)) (select **Working sets** and click the **Choose** button to the right). If you select **Project**, all files attached to the current project will be used for the scope of the operation. If you select **Current DITA Map hierarchy**, the current DITA map that is open in the DITA Maps Manager along with all of its referenced topics and submaps (and topics referenced in those submaps) are used for the scope.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor Eclipse plugin provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Troubleshooting:

If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:

If an operation takes longer than expected you can use the  **Stop** button in the progress bar to cancel the operation.

Restriction:

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the

operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to get the names and namespaces of the current element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

**Tip:**

Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the **Operation mode**:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.

Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section**Element**

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section**Local name**

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

New element section**Local name**

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($\$1$, $\$2$, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

**Note:**

Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA* Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
 - Removes the `@lockmeta` attribute.
 - Removes the `<topicset>` and `<topicsetref>` elements.
 - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
 - Migrates the `@navtitle` attribute as a `<navtitle>` element.
 - Migrates the `@title` attribute as a `<title>` element.
 - Converts the `@copy-to` attribute to a `<resourceid>` element.
 - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
 - Convert topicmeta `<linktext>` to `<linktitle>`.
 - Removed `<hasInstance>`, `<hasKind>`, `<hasNarrower>`, `<hasPart>`, `<hasRelated>`, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>`, `<subjectRelHeader>`, `<subjectRel>`, and `<subjectRole>`.
- DITA task changes:
 - Converts the `<substep>` element to a `<step>` element.
 - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
 - Removes the `@type` attribute with the value `fastpath`.
 - Converts the `@alt` attribute to an `<alt>` element.
 - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
 - Removes the `<itemgroup>` element.
 - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
 - Removes the `@domains` attribute.
 - Renames `<sectiondiv>` to `<div>`.
 - Remove `@query` attribute from `<link>` element.

- Remove `@specentry` attribute from `<stentry>` element.

Remove the `@spectitle` attribute.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes. For more information and instructions for using this operation, see [Converting Conrefs to Conkeyrefs \(on page 2486\)](#).

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2337))

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2337))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Rename Key

Use this operation to rename a key. It also updates all references to it.

**Note:**

It does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for *DITA* Maps

Convert DITA Bookmap to Map

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute. The new value is modified and reflected in DITA maps, DITA topics, and DITAVAL files.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (`<xref>` or `<link>`) with a direct reference to another DITA topic or an element with a `@conref`, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the **Validate and check for completeness** action from the **DITA Maps Manager** toolbar to manually fix those problems. You can enable the **Report duplicate keys** checkbox to also report any keys that are defined more than once.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as `*` or `?`).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

Element

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

Element

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

Element section

Local name

The local name of the element to be inserted.

Namespace

The namespace of the element to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

Target elements (XPath)

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

New local name

The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

Target elements (XPath)

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element*.

Namespace

The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element* that will surround the content of the target.

Namespace

The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these *JATSKit* refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for *Processing Instructions*

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.

Note:

Processing instructions that are outside the root element are not deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom [HTML page layout files \(on page 1375\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 21.0.

Migrate HTML Page Layout Files to v22

Use this operation to convert custom [HTML page layout files \(on page 1375\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 22.0.

Update HTML Pages

Attention:

This operation is only used by Oxygen XML Editor Eclipse plugin and should not be used manually.

Additional Notes:

- There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-XQUERY > XPath \(on page 203\)](#) page. This preferences page can be

easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

Custom Refactoring Operations

While Oxygen XML Editor Eclipse plugin includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor Eclipse plugin will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure 187. Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations** wizard page (*on page 609*), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor Eclipse plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
 - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
 - The DTD entities will be processed without being expanded.
 - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.
- When saving the updated XML document:
 - The `DOCTYPE` will be preserved.

Note:

This can be changed using [Saxon extension functions in XSLT \(on page 641\)](#).

- The DTD entities will be preserved as they are in the original document when the document is saved.
- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

Note:

To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

Restriction:

Comments or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use [Saxon extension functions and the XSLT stylesheet method \(on page 641\)](#) to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an [XQuery Update script \(on page 631\)](#) or [XSLT stylesheet file \(on page 636\)](#).
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: [Example descriptor file for an XQuery Update script \(on page 634\)](#) or [Example descriptor file for an XSLT stylesheet \(on page 639\)](#).
3. Store both files in one of the locations that Oxygen XML Editor Eclipse plugin ([on page 643](#)) scans when loading the custom operations.

Result: Once you run the **XML Refactoring** tool again, the custom operation appears in the **Refactoring Operations** wizard page ([on page 609](#)).

Related information

[Storing and Sharing Refactoring Operations \(on page 643\)](#)

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an [XQuery Update script \(on page 631\)](#) or [XSLT stylesheet \(on page 636\)](#) that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use the [XQuery method example \(on page 631\)](#) or [XSLT method example \(on page 636\)](#) to help you with the content.

There are cases when it is necessary to add parameters in the [XQuery script \(on page 631\)](#) or [XSLT stylesheet \(on page 636\)](#). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

Note:

The XQuery Update processing is disabled by default in Oxygen XML Editor Eclipse plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an [XQuery transformation scenario \(on page 1288\)](#) and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the [Saxon processor advanced options \(on page 1228\)](#).

Note:

If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the [XML /XSLT-XQuery / XPath preferences page \(on page 203\)](#).

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the [XQuery Update script \(on page 634\)](#) or [XSLT stylesheet \(on page 639\)](#).

Related Information:

[XQuery Update Script for Creating a Custom Operation \(on page 631\)](#)

[XSLT Stylesheet for Creating a Custom Operation \(on page 636\)](#)

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This descriptor file root element specifies required attributes to define the operation `@name`, `@description`, and `@id` which are necessarily when loading an XML Refactoring operation. It also contains the path to the [XQuery Update script \(on page 631\)](#) or [XSLT stylesheet \(on page 636\)](#) that is associated with the particular operation through the `<script>` element.

The optional `@filesFilter` attribute can be specified to filter the resources by using a file pattern or list of file patterns separated by a comma (for example: `filesFilter="*.dita, *.xml"`). When set, its value is automatically populated in the **Include files** field within the **Scope and Filters** wizard page (on page 611) as a default value.

You can specify a *category* for your custom operations to logically group certain operations. The `<category>` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page (on page 609) for that particular operation.

The value of the first `<description>` element in the `<parameters>` section will be displayed at the top of the **Configure Operation Parameters** wizard page (on page 609).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:

- **TEXT** - Generic type used to specify a simple text fragment.
- **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor Eclipse plugin will use a text input with corresponding content completion and syntax highlighting.

**Note:**

The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

**Note:**

A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:**

When writing XPath expressions, you can only use prefixes declared in the [Options > Preferences > XML > XSLT-XQuery > XPath](#) (on page 203) options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor Eclipse plugin will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName* (on page 2681) for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor Eclipse plugin renders each possible value as a radio button option.
- **optional** - Specifies whether the parameter is optional or required. For optional parameters, the end user is not required to fill in a value in the XML refactoring wizard.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
```

```
<value name="firstChild">First child</value>
<value name="lastChild">Last child</value>
</possibleValues>
```

On a `<value>`, you can specify the `@default` attribute with the value `true` to mark it as the default presented value in the XML refactoring wizard. The text specified inside the `<value>` element is displayed as placeholder default text in the text entry box. If the dialog box is accepted with the placeholder text in place, the `@name` attribute value is passed to the refactoring script. Example:

```
<value name="my-actual-default-value" default="true">[default displayed]</value>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor Eclipse plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to `true`, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the `element` and `attribute` text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to `true`, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute" >
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as label of the associated combo. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `@allowsAny` attribute, the application will propose `<ANY>` as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

**Note:**

An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

Grouping Parameters in the Descriptor File

You can use `<section>` elements to group related parameters in the descriptor file:

```
<section label="Parent element">
  <elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </elementParameter>
</section>
```

**Note:**

All built-in operations are loaded from the `[OXYGEN_INSTALL_DIR]/refactoring` folder.

[Example of an Operation Descriptor File with an XSLT Stylesheet \(on page 639\)](#)

[Example of an Operation Descriptor File with an XQuery Update script \(on page 634\)](#)

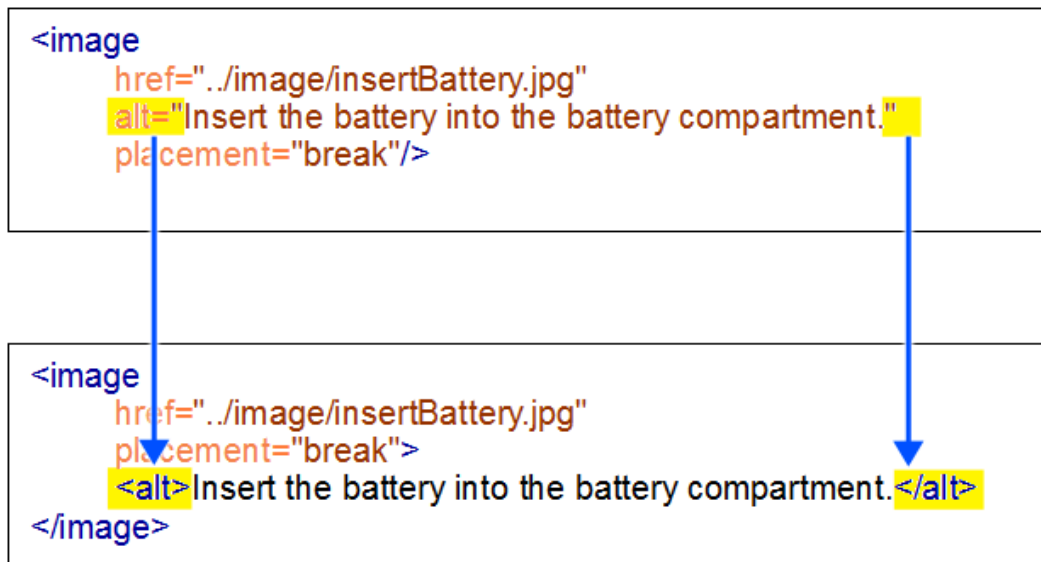

XQuery Update Script for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and

you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 188. Example: Custom XML Refactoring Operation

An XQuery Update script can be used to implement the new custom XML refactoring operation. The second requirement is an [XML Refactoring operation descriptor file \(on page 634\)](#) that contains the path to the XQuery Update script.

Restriction:

There is a limitation to using an XQuery script in that *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. However, as a work around to this limitation, you can use [Saxon extension functions and the XSLT stylesheet method \(on page 641\)](#) to implement the new custom XML refactoring operation.

Example of an XQuery Update Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XQuery Update script does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Computes the *QName (on page 2681)* of the new element to be inserted and inserts it as the first child of the parent element.

```

(:
  XQuery document used to implement 'Convert attribute to element'
  operation from XML Refactoring tool.
:)

declare namespace output = "http://www.w3.org/2010/xslt-xquery-serialization";
declare option output:method    "xml";
declare option output:indent    "no";

(: Local name of the attribute's parent element. :)
declare variable $element_localName as xs:string external;

(: Namespace of the attribute's parent element. :)
declare variable $element_namespace as xs:string external;

(: The local name of the attribute to be converted :)
declare variable $attribute_localName as xs:string external;

(: The namespace of the attribute to be converted :)
declare variable $attribute_namespace as xs:string external;

(: Local name of the new element. :)
declare variable $new_element_localName as xs:string external;

(: Namespace of the new element. :)
declare variable $new_element_namespace as xs:string external;

(: Convert attribute to element:)
for $node in /**
(: Find the attribute to convert :)
let $attribute :=
  $node/@*[local-name() = $attribute_localName and
  ($attribute_namespace = '<ANY>' or $attribute_namespace = namespace-uri())]

(: Compute the prefix for the new element to insert :)
let $prefix :=
  for $p in in-scope-prefixes($node)
  where $new_element_namespace = namespace-uri-for-prefix($p, $node)
return $p

(: Compute the qname for the new element to insert :)
let $new_element_qName :=

```

```

if (empty($prefix) or $prefix[1] = '') then $new_element_localName
else $prefix[1] || ':' || $new_element_localName

where ('<ANY>' = $element_localName or local-name($node) = $element_localName)
and
($element_namespace = '<ANY>' or $element_namespace = namespace-uri($node))

return

if (exists($attribute)) then
  (insert node element {QName($new_element_namespace, $new_element_qName)}
  {string($attribute)} as first into $node,
  delete node $attribute)
else ()

```

Example of an Operation Descriptor File That References the XQuery Script for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XQuery script (for example, named `convert-attribute-to-element.xq`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

</section>
</parameters>
</refactoringOperationDescriptor>

```

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor Eclipse plugin when it loads the custom operation (*on page 643*). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 189. Example: XML Refactoring Wizard for a Custom Operation

Debugging XQuery Refactoring Operations

You can use the XQuery `trace()` function to generate debugging information messages in the application's **Results** view (on page 335).

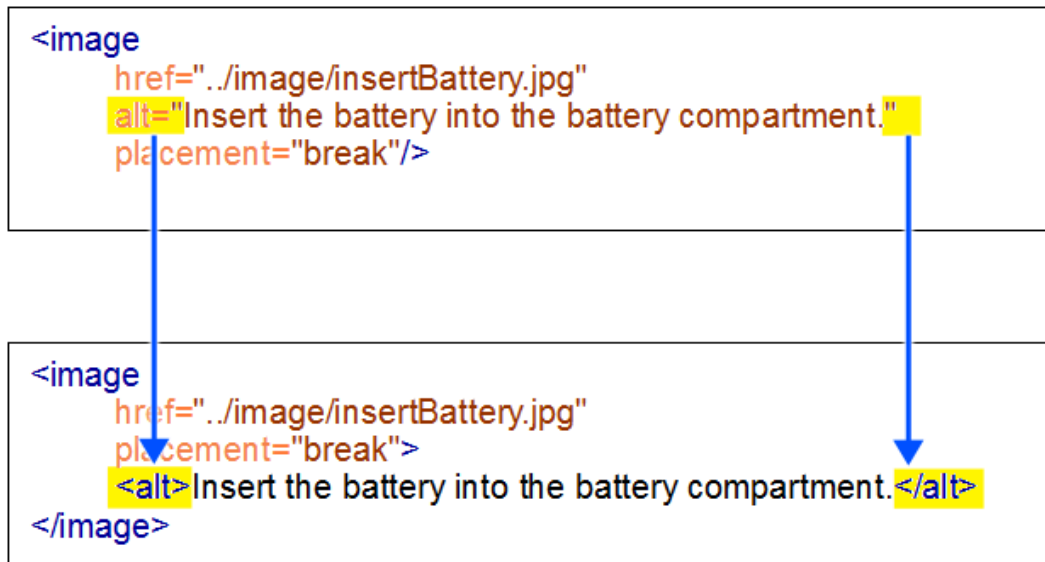

The Saxon processor used for XQuery update processing also supports the `EXPath` extensions, which also allow you to write debugging information to an output file.

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 190. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file ([on page 639](#)) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">

  <xsl:import
href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl" />

  <xsl:param name="element_localName" as="xs:string" required="yes" />
  <xsl:param name="element_namespace" as="xs:string" required="yes" />
  <xsl:param name="attribute_localName" as="xs:string" required="yes" />
  <xsl:param name="attribute_namespace" as="xs:string" required="yes" />
  <xsl:param name="new_element_localName" as="xs:string" required="yes" />
```

```

<xsl:param name="new_element_namespace" as="xs:string" required="yes" />

<xsl:template match="node() | @">
  <xsl:copy>
    <xsl:apply-templates select="node() | @" />
  </xsl:copy>
</xsl:template>

<xsl:template match="//*[xr:check-local-name($element_localName, ., true())
and
xr:check-namespace-uri($element_namespace, .)]">

  <xsl:variable name="attributeToConvert"
    select="@[xr:check-local-name($attribute_localName, ., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)">
      <xsl:copy>
        <xsl:apply-templates select="node() | @" />
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@[empty(. intersect $attributeToConvert)]">
          <xsl:copy-of select="."/>
        </xsl:for-each>
        <!-- The new element namespace -->
        <xsl:variable name="nsURI" as="xs:string">
          <xsl:choose>
            <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
              <xsl:value-of select="'" />
            </xsl:when>
            <xsl:otherwise>
              <xsl:value-of select="$new_element_namespace" />
            </xsl:otherwise>
          </xsl:choose>
        </xsl:variable>
        <xsl:element name="{ $new_element_localName }" namespace="{ $nsURI }">
          <xsl:value-of select="$attributeToConvert" />
        </xsl:element>
      </xsl:copy>
    </xsl:otherwise>
  </xsl:choose>
</xsl:template>

```

```

</xsl:copy>
</xsl:otherwise>
</xsl:choose>
</xsl:template>
</xsl:stylesheet>

```

**Note:**

The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an [XML Catalog \(on page 2683\)](#) set in the XML Refactoring framework (on page 2679).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet (for example, named `convert-attribute-to-element.xsl`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element.
    The new element will be inserted as first child of the attribute's
    parent element.</description>
  <script type="XSLT" href="convert-attribute-to-element.xsl"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID">
        <localName label="Name" name="element_localName" allowsAny="true">
          <description>Local name of the parent element.</description>
        </localName>
        <namespace label="Namespace" name="element_namespace" allowsAny="true">
          <description>Local name of the parent element</description>
        </namespace>
      </elementParameter>
    </section>

```

```

<section label="Attribute">
  <attributeParameter dependsOn="elemID">
    <localName label="Name" name="attribute_localName">
      <description>Name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
  </attributeParameter>
</section>
<section label="New element">
  <elementParameter>
    <localName label="Name" name="new_element_localName">
      <description>The name of the new element.</description>
    </localName>
    <namespace label="Namespace" name="new_element_namespace">
      <description>The namespace of the new element.</description>
    </namespace>
  </elementParameter>
</section>
</parameters>
</refactoringOperationDescriptor>

```

**Note:**

If you are using an XSLT file, the line with the `<script>` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

The code exemplified above and other refactoring examples can be found on the [DITA Refactoring GitHub sample project](#).

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor Eclipse plugin when it loads the custom operation (*on page 643*). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 191. Example: XML Refactoring Wizard for a Custom Operation

Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an [XQuery Update script \(on page 631\)](#) in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note:

They belong to the <http://www.oxygenxml.com/ns/xmlRefactoring/functions> namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<!-- comment after root -->
<?pi after root ?>
```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root><!-- Inserted comment -->
```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<!-- Inserted comment --><root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
```

```

xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
<xsl:template match="/">
  <!-- The comment content that will be inserted after the root element -->
  <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
</xsl:variable>
  <!-- Retrieve the content after the root element as is -->
  <xsl:variable name="after-root-content" as="xs:string"
    select="xrf:get-content-after-root()"/>
  <xsl:variable name="processedContent"
    select="concat($after-root-content, $commentAsText)"/>
  <!-- Update the content after the root element -->
  <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>
  <xsl:apply-templates/>
</xsl:template>
<xsl:template match="node() | @">
  <xsl:copy>
    <xsl:apply-templates select="node() | @"/>
  </xsl:copy>
</xsl:template>
</xsl:stylesheet>

```

**Note:**

The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor Eclipse plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A folder named `refactoring`, created inside the folder of the *framework* you are customizing. In the **Classpath** tab of the **Document type** configuration dialog box (*on page 95*), you need to add a reference to the `refactoring` folder specific for the framework.
- A folder that you specify in the **Load additional refactoring operations from text box** (*on page 196*) in the **XML Refactoring** preferences page (*on page 196*).
- The `refactoring` folder from the Oxygen XML Editor Eclipse plugin installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor Eclipse plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework* (on page 2679) or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor Eclipse plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `<description>` of the `<parameters>` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor Eclipse plugin scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to [open the Preferences dialog box](#) (on page 70), go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- The `refactoring/i18n` folder from the Oxygen XML Editor Eclipse plugin installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
  name="${i18n(Remove_text_content)}">
  <description>${i18n(Remove_text_content_description)}</description>
  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
</refactoringOperationDescriptor>
```

```

<parameters>
  <description>${i18n(parameters_description)}</description>
  <parameter label="${i18n(Element_name)}" name="element_localName"
    type="NC_NAME">
    <description>${i18n(Element_name_descriptor)}</description>
    <possibleValues>
      <value default="true" name="value1">${i18n(value_1)}</value>
      <value name="value2">${i18n(value_2)}</value>
    </possibleValues>
  </parameter>
</parameters>
</refactoringOperationDescriptor>

```

XML Digital Signatures

This chapter explains how to apply and verify digital signatures on XML documents.

Digital Signatures Overview

Digital signatures are widely used as security tokens, not just in XML. A *digital signature* provides a mechanism for assuring integrity of data, the authentication of its signer, and the non-repudiation of the entire signature to an external party:

- A *digital signature* must provide a way to verify that the data has not been modified or replaced to ensure integrity.
- The *signature* must provide a way to establish the identity of the data's signer for authentication.
- The *signature* must provide the ability for the data's integrity and authentication to be provable to a third party for non-repudiation.

A *public key system* is used to create the digital signature and it is also used for verification. The signature binds the signer to the document because digitally signing a document requires the originator to create a hash of the message and then encrypt that hash value with their own private key. Only the originator has that private key and that person is the only one who can encrypt the hash so that it can be unencrypted using their public key. The recipient, upon receiving both the message and the encrypted hash value, can decrypt the hash value, knowing the originator's public key. The recipient must also try to generate the hash value of the message and compare the newly generated hash value with the unencrypted hash value received from the originator. If the hash values are identical, it proves that the originator created the message, because only the actual originator could encrypt the hash value correctly.

XML Signatures can be applied to any digital content (data object), including XML (see W3C Recommendation, [XML-Signature Syntax and Processing](#)). An XML Signature may be applied to the content of one or more resources:

- Enveloped or enveloping signatures are applied over data within the same XML document as the signature
- Detached signatures are applied over data external to the signature element; the signature is "detached" from the content it signs. This definition typically applies to separate data objects, but it also includes the instance where the signature and data object reside within the same XML document but are sibling elements.

The *XML Signature* is a method of associating a key with referenced data. It does not normatively specify how keys are associated with persons or institutions, nor the meaning of the data being referenced and signed.

The original data is not actually signed. Instead, the signature is applied to the output of a chain of *canonicalization* (on page 2677) and transformation algorithms, which are applied to the data in a designated sequence. This system provides the flexibility to accommodate whatever "normalization" or desired preprocessing of the data that might be required or desired before subjecting it to being signed.

Since the signature is dependent on the content it is signing, a signature produced from a *non-canonicalized* document could possibly be different from one produced from a *canonicalized* (on page 2677) document. The *canonical* (on page 2677) form of an XML document is physical representation of the document produced by the method described in this specification. The *XML canonicalization* (on page 2677) method is the algorithm defined by this specification that generates the canonical form of a given XML document or document subset. *XML canonicalization* is designed to be useful for applications that require the ability to test whether or not the information content of a document or document subset has been changed. This is done by comparing the *canonical* form of the original document before application processing with the *canonical* form of the document result of the application processing.

A digital signature over the *canonical* (on page 2677) form of an XML document or document subset allows the signature digest calculations to be oblivious to changes in the original document's physical representation. During signature generation, the digest is computed over the *canonical* form of the document. The document is then transferred to the relying party, which validates the signature by reading the document and computing a digest of the *canonical* form of the received document. The equivalence of the digests computed by the signing and relying parties (hence, the equivalence of the *canonical* forms that they were computed for) ensures that the information content of the document has not been altered since it was signed.

The following *canonicalization algorithms* are used in Oxygen XML Editor Eclipse plugin:

- **Canonical XML (or Inclusive XML Canonicalization) (XMLC14N)** - Used for XML where the context doesn't change.

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Exclusive XML Canonicalization (EXCC14N)** - Designed for *canonicalization* where the context might change.

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

The *canonicalization* (on page 2677) method can specify whether or not comments should be included in the *canonical* form output by the *XML canonicalization* method. If a *canonical* form contains comments corresponding to the comment nodes in the input node-set, the result is called *canonical XML with comments*. In an uncommented *canonical* form, comments are removed, including the delimiter for comments outside the document element.

The three operations. **Canonicalize** (on page 648), **Sign** (on page 649), and **Verify Signature** (on page 652), are available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

Related Information:

[Certificates \(on page 647\)](#)

[Canonicalizing Files \(on page 648\)](#)

[Signing Files \(on page 649\)](#)

[Verifying Signature \(on page 652\)](#)

[Example of How to Digitally Sign XML Files or Content \(on page 652\)](#)

Certificates

A certificate is a digitally signed statement from the issuer (an individual, an organization, a website or a firm), saying that the public key (and some other information) of some other entity has a particular value. When data is digitally signed, the signature can be verified to check the data integrity and authenticity. Integrity means that the data has not been modified. Authenticity means the data comes indeed from the entity that claims to have created and signed it. Certificates are kept in special repositories called *keystores* (on page 2680).

All *keystore* entries (key and trusted certificate entries) are accessed via unique aliases. An alias must be assigned for every new entry of either a key or certificate as a reference for that entity. No *keystore* can store an entity if its alias already exists in that *keystore* and cannot store trusted certificates generated with keys in its *keystore*.

Oxygen XML Editor Eclipse plugin provides two types of *keystores*: Java Key Store (JKS) and Public-Key Cryptography Standards version 12 (PKCS-12). A *keystore* file is protected by a password. In a PKCS 12 *keystore* you should not store a certificate without alias together with other certificates, with or without alias, as in such a case the certificate without alias cannot be extracted from the *keystore*.

To configure the options for a certificate or to validate it, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Signing Certificates**. This opens [the certificates preferences page \(on page 197\)](#).

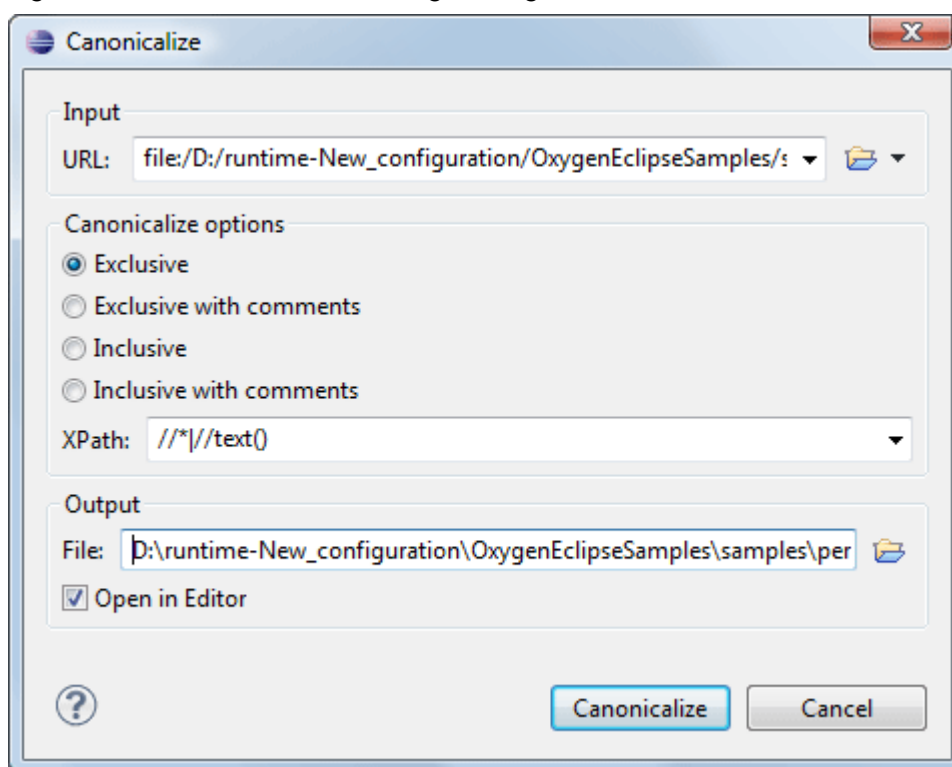

Related Information:

[Digital Signatures Overview \(on page 645\)](#)

Canonicalizing Files

You can select the [canonicalization \(on page 2677\)](#) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

Figure 192. Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) [canonicalization \(on page 2677\)](#) method is used.

Note:

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-

signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* (on page 2677) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* (on page 2677) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* (on page 2677) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

[Digital Signatures Overview](#) (on page 645)

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

Figure 193. Signature Settings Dialog Box

The following options are available:

Note:

If Oxygen XML Editor Eclipse plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page \(on page 197\)](#) where you can configure a valid certificate.

 Could not obtain a valid certificate. You must configure a valid certificate.

- **Input** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview \(on page 645\)](#) section for more information about these options.
 - **None** - If selected, no [canonicalization \(on page 2677\)](#) algorithm is used.
 - **Exclusive** - If selected, the exclusive (uncommented) [canonicalization \(on page 2677\)](#) method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* (on page 2677) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* (on page 2677) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* (on page 2677) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) (on page 645) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) (on page 645) for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor Eclipse plugin.

Related Information:[Digital Signatures Overview \(on page 645\)](#)[Verifying Signature \(on page 652\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 652\)](#)

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:[Digital Signatures Overview \(on page 645\)](#)[Signing Files \(on page 649\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 652\)](#)

Example of How to Digitally Sign XML Files or Content

Suppose you want to digitally sign an XML document, but more specifically, suppose you have multiple instances of the same element in the document and you just want to sign a specific ID. Oxygen XML Editor Eclipse plugin includes a signature tool that allows you to digitally sign XML documents or specific content.

The Oxygen XML Editor Eclipse plugin installation directory includes a `samples` folder that contains a file called `personal.xml`. For the purposes of this example, this file will be used to demonstrate how to digitally sign specific content. Notice that this file has multiple `<person>` elements inside the `<personnel>` element. Suppose you want to digitally sign the specific `<person>` element that contains the `id=robert.taylor`. To do this, follow this procedure:

1. Open the `personal.xml` file in Oxygen XML Editor Eclipse plugin in **Text** editing mode.
2. Right-click anywhere in the editor and select the **Sign** action from the **Source** submenu.
The **Sign** dialog box is displayed.

**Tip:**

If you want to sign a file but create a new output file so that the original file remains unchanged, use the **Sign** action from the **XML Tools** menu. Selecting the action from this menu will allow you to choose an input file and output file in the **Sign** dialog box.

3. If Oxygen XML Editor Eclipse plugin cannot find a valid certificate, click the link at the top of the dialog box to **configure a valid certificate**. This opens the [XML Signing Certificates preferences page \(on page 197\)](#) that allows you to configure and validate a certificate.
4. Once a valid certificate is recognized, continue to configure the **Sign** dialog box.

- a. Select one of the **Transformation Options** (on page 650). For the purposes of this example, select the **Inclusive with comments** option.
- b. Specify the appropriate **XPath** expression for the specific element that needs to be signed. For this example, type `/personnel/person` in the **XPath** text box.
- c. Enter the specific **ID** that needs to be signed. For this example, type `robert.taylor` in the **ID** field.
- d. Select the **Envelope option** (on page 651) and leave the other options as their default values.

The digital signature is added at the end of the XML document, just before the end tag. It is always added at the end of the document, even if you only sign specific content within the document.

5. You can verify the signature by choosing the **Verify Signature** action from the **Source** submenu of the contextual menu.

[Signing Files](#) (on page 649)

[Verifying Signature](#) (on page 652)

Editing XSLT Stylesheets

Oxygen XML Editor Eclipse plugin includes a built-in editor for XSLT stylesheets. This section presents the features of the XSLT editor and how these features can be used. The features of the XSLT editor include:

- **Create new XSLT files and templates** - You can use the built-in new file wizards to [create new XSLT documents or templates](#) (on page 246).
- **Open and Edit XSLT files** - XSLT files can be opened and edited in the source editor (**Text mode** (on page 307)).
- **Visual Editing** - XSLT stylesheets are rendered, and can be edited, in the **visual Author editing mode** (on page 367).
- **Validation** - Presents validation errors in XSLT files.
- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor Eclipse plugin makes XSLT files more readable.

Resources

For more information about working with XSLT in Oxygen XML Editor Eclipse plugin, see the following resources:

- Webinar: [Introduction to XSLT Using Oxygen](#).
- Webinar: [XSLT Quick Fixes](#).

Modular Contextual XSLT Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex stylesheet cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a function defined in a main stylesheet is not visible when you edit an included or imported module. Oxygen XML Editor Eclipse plugin provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger stylesheet structure.

You can set a main XSLT stylesheet either using the *main files* support from the **Project Explorer** view ([on page 278](#)), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main stylesheet. In this case, it considers the current module as the main stylesheet.

The advantages of editing in the context of *main file* ([on page 2680](#)) include:

- Correct validation of a module in the context of a larger stylesheet structure.
- *Content Completion Assistant* ([on page 2677](#)) displays all components valid in the current context.
- The **Outline** view ([on page 667](#)) displays the components collected from the entire stylesheet structure.

Resources

For more information about editing XSLT stylesheets in the *main files* context, watch our video demonstration:

<https://www.youtube.com/embed/UZwg385RKNw>

[XSLT Referenced/Dependent Resources View \(on page 673\)](#)

[XSLT Component Dependencies View \(on page 676\)](#)

Validating XSLT Stylesheets

Numerous XSLT code quality assurance checks are done during automatic validation to help you keep your stylesheets valid and well-formed. Oxygen XML Editor Eclipse plugin performs the validation of XSLT documents with the help of an XSLT processor [that you can configure in the preferences pages \(on page 206\)](#) according to the XSLT version.

For XSLT 1.0, the options are: Xalan (Deprecated), Saxon 6.5.5 and Saxon 12.3. For XSLT 2.0, the option is: Saxon 12.3. For XSLT 3.0, the option is Saxon 12.3.

Creating a Validation Scenario for XSLT Stylesheets

You can validate an XSLT document using the engine defined in the transformation scenario, or a custom validation scenario. If you choose to validate using the engine from transformation scenario, and a

transformation scenario is not associated with the current document or the engine has no validation support, the default engine is used. To set the default engine, open the **Preferences** dialog box (on page 70) and go to **XML > XSLT/FO/XQuery > XSLT**.

You can also create new validation scenarios or edit existing ones, and you can add *JARS* (on page 2679) and classes that contain extension functions. To create or edit a validation scenario for an XSLT stylesheet, follow these steps:

1. With the XSLT file open in Oxygen XML Editor Eclipse plugin, select the  **Configure Validation Scenario(s)** from the **XML** menu, or the toolbar, or from the **Validate** submenu when invoking the contextual menu on the XSLT file in the **Project Explorer** view (on page 269).
The **Configure Validation Scenario(s)** dialog box is displayed. It contains the existing scenarios, organized in categories depending on the type of file they apply to. You can use the options in the  **Settings** drop-down menu to filter which scenarios are shown.
2. To edit an existing scenario, select the scenario and click the **Edit** button. If you try to edit one of the *read-only* built-in scenarios, Oxygen XML Editor Eclipse plugin creates a customizable duplicate (you can also use the **Duplicate** button).
3. To add a new scenario, click the  **New** button.
The **New scenarios** dialog box is displayed. It lists all validation units of the scenario.

Figure 194. Add / Edit a Validation Unit

4. Configure the following information in this dialog box:
 - a. **Name** - The name of the validation scenario.
 - b. **URL of the file to validate** - In most cases, leave this field as the default selection (the URL of the current file). If you want to specify a different URL, click its cell and enter the URL in the text field, select it from the drop-down list, or use the  **Browse** drop-down menu or  **Insert Editor Variable** (on page 218) button.
 - c. **File type** - The file type should be **XSLT Document**.

- d. **Validation engine** - Click the cell to select a validation engine. You must select an engine to be able to add or edit extensions.
 - e. **Automatic validation** - If this option is selected, the validation operation defined by this row is also used by [the automatic validation feature \(on page 547\)](#).
5. To add or edit extensions, click the  **Edit extensions** button. This button is only available if the **File type** is set as **XSLT Document** and a **Validation engine** is chosen.
The **Libraries** dialog box is opened. It is used to specify the *JARS* and classes that contain extension functions called from the XSLT file of the current validation scenario. They will be searched, in the specified extensions, in the order displayed in this dialog box. To change the order of the items, select the item and click the  **Move up** or  **Move down** buttons.
 6. Click **OK** to close the **New scenario** dialog box.
The newly created validation scenario is now included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current XSLT document and click the **Apply associated** button to run the validation scenario.

Validating XSLT Stylesheets with Custom Engines

If you need to validate an XSLT stylesheet with a validation engine that is different from the built-in engine, you can configure external engines as custom XSLT validation engines in the Oxygen XML Editor Eclipse plugin preferences. After a custom validation engine is [properly configured \(on page 133\)](#), it can be applied on the current document by selecting it from the list of custom validation engines in the  **Validation** toolbar drop-down menu. The document is validated against the schema declared in the document.

By default, there are two validators that are configured for XSLT stylesheets:

- **MSXML 4.0 (Deprecated)** - included in Oxygen XML Editor Eclipse plugin (Windows edition). It is associated to the XSL Editor type in [Preferences page. \(on page 133\)](#)
- **MSXML.NET (Deprecated)** - included in Oxygen XML Editor Eclipse plugin (Windows edition). It is associated to the XSL Editor type in [Preferences page. \(on page 133\)](#)

Validating XSLT Stylesheets that Call Java Extensions

It is possible to validate an XSLT that calls Java extensions. This is achieved through a transformation scenario where the Java extensions are specified, and the default validation will be processed using the parameters defined in the transformation scenario.

To validate XSLT with Java extensions, follow this procedure:

1. Create an [XSLT transformation on XML scenario \(on page 1258\)](#) for your XSLT document (select  **Configure Transformation Scenario(s)** action from the toolbar, then click **New**, and select **XSLT transformation on XML**).
2. In the **New scenario** dialog box, click the **Extensions** button (in the **XSLT** tab), specify the Java extensions (JAR libraries) that are needed, and click **OK**.

- Once you are finished configuring the transformation scenario, click **OK**, then select **Save and close**.
- Use the  **Validate** button on the toolbar and the default validation will detect and use the transformation scenario profile you just configured and saved.

Related Information:

[Debugging XSLT that Call Java Extensions \(on page 1939\)](#)

XSLT Quick Fix Support

The Oxygen XML Editor Eclipse plugin [Quick Fix support \(on page 2682\)](#) helps you resolve various errors that appear in a stylesheet by proposing *Quick Fixes* to problems such as missing templates, misspelled template names, missing functions, or references to an undeclared variable or parameter.

To activate this feature, hover over or place the cursor in the highlighted area of text where a validation error or warning occurs. If a *Quick Fix* is available for that particular error or warning, you can access the *Quick Fix* proposals with any of the following methods:

- When hovering over the error or warning, the proposals are presented in a tooltip pop-up window.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon () is displayed in the stripe on the left side of the editor. If you click this icon, Oxygen XML Editor Eclipse plugin displays the list of available fixes.
- With the cursor placed in the highlighted area of the error or warning, you can also invoke the *Quick Fix* menu by pressing **Ctrl + 1 (Command + 1 on macOS)** on your keyboard.

**Note:**

The *Quick Fixes* are available only when validating an XSLT file with Saxon HE/PE/EE.

Figure 195. Example of an Undefined XSLT Functions Quick Fix

Figure 196. Example of an Undeclared XSLT Variables/Parameters Quick Fix

Oxygen XML Editor Eclipse plugin provides XSLT *Quick Fixes* for the following types of instances:

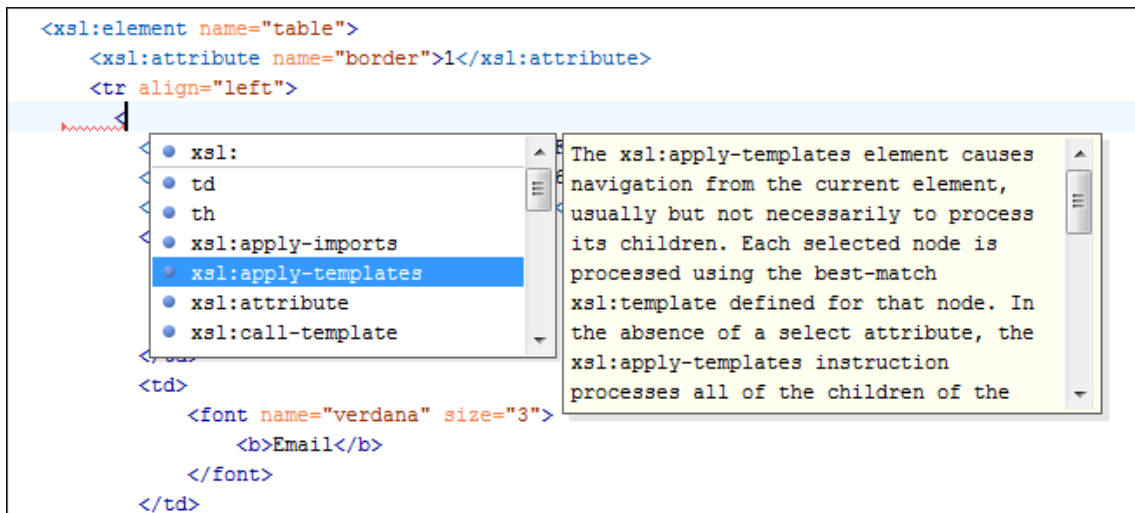

- **Template does not exist**, when the template name referenced in a `<call-template>` element does not exist. The following fixes are available:
 - **Create template "templateName"** - creates a template and generates its corresponding parameters. The template name and parameter names and types are collected from the `<call-template>` element.
 - **Change reference to "newTemplateName"** - changes the name of the missing template referenced in the `<call-template>` element. The proposed new names are the existing templates with names similar with the missing one.
- **Variable/Parameter not declared**, when a parameter or variable reference cannot be found. The following fixes are available:
 - **Create global variable "varName"** - creates a global variable with the specified name in the current stylesheet. The new variable is added at the beginning of the stylesheet after the last global variable or parameter declaration.
 - **Create global parameter "paramName"** - creates a global parameter with the specified name in the current stylesheet. The new parameter is added at the beginning of the stylesheet after the last global parameter or variable declaration.
 - **Create local variable "varName"** - creates a local variable with the specified name before the current element.
 - **Create template parameter "paramName"** - creates a new parameter with the specified name in the current template. This fix is available if the error is located inside a template.
 - **Create function parameter "paramName"** - creates a new parameter with the specified name in the current function. This fix is available if the error is located inside a function.
 - **Change reference to "varName"** - changes the name of the referenced variable/parameter to an existing local or global variable/parameter, that has a similar name with the current one.
- **Parameter from a called template is not declared**, when a parameter referenced from a `<call-template>` element is not declared. The following fixes are available:

- **Create parameter "paramName" in the template "templateName"** - creates a new parameter with the specified name in the referenced template.
- **Change "paramName" parameter reference to "newParamName"** - changes the parameter reference from the `<call-template>` element to a parameter that is declared in the called template.
- **Remove parameter "paramName" from call-template** - removes the parameter with the specified name from the `<call-template>` element.
- **No value supplied for required parameter**, when a required parameter from a template is not referenced in a `<call-template>` element. The **Add parameter "paramName" in call-template** quick-fix is available. It creates a new parameter with the specified name in call-template element.
- **Function "prefix:functionName()" has not been defined**, when a function declaration is not found. The following *Quick Fixes* are available:
 - **Create function "prefix:functionName(param1, param2)"** - creates a new function with the specified signature, after the current top-level element from stylesheet.
 - **Change function to "newFunctionName(..)"** - changes the referenced function name to an already defined function. The proposed names are collected from functions with similar names and the same number of parameters.
- **Attribute-set "attrSetName" does not exist**, when the referenced attribute set does not exist. The following *Quick Fixes* are available:
 - **Create attribute-set "attrSetName"** - creates a new attribute set with the specified name, after the current top-level element from stylesheet.
 - **Change reference to "attrSetName"** - changes the referenced attribute set to an already defined one.
- **Character-map "chacterMap" has not been defined**, when the referenced character map declaration is not found. The following *Quick Fixes* are available:
 - **Create character-map "characterMapName"** - creates a new character map with the specified name, after the current top-level element from stylesheet.
 - **Change reference to "characterMapName"** - changes the referenced character map to an already defined one.

Content Completion in XSLT Stylesheets

The list of proposals offered by the *Content Completion Assistant (on page 2677)* in XSLT are context-sensitive and includes proposals that are valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

You can enhance the list of proposals by specifying an additional schema. This schema is defined in the **Content Completion / XSLT preferences (on page 132)** page and can be any of the following: XML Schema, DTD, RELAX NG schema, or NVDL schema.

Figure 197. XSLT Content Completion Assistant

The feature is activated in **Text** mode in the following situations:

- After you enter the `<` character when inserting an element, it is automatically activated after a short delay. You can adjust the activation delay with the [Activation delay of the proposals window \(ms\) option \(on page 121\)](#) from the **Content Completion** preferences page.
- After typing a partial element or attribute name, you can manually activate it by pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**. If there is only one valid proposal at the current location, it is inserted without displaying the list of proposals.

The *Content Completion Assistant* proposes numerous item types (such as templates, variables, parameters, keys, etc.) that are defined in the current stylesheet, and in the imported and included XSLT stylesheets. The *Content Completion Assistant* also includes [code templates that can be used to quickly insert code fragments \(on page 323\)](#) into stylesheets.

**Note:**

For XSL and XSD resources, the *Content Completion Assistant* collects its components starting from the [main files \(on page 2680\)](#). The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level \(on page 278\)](#).

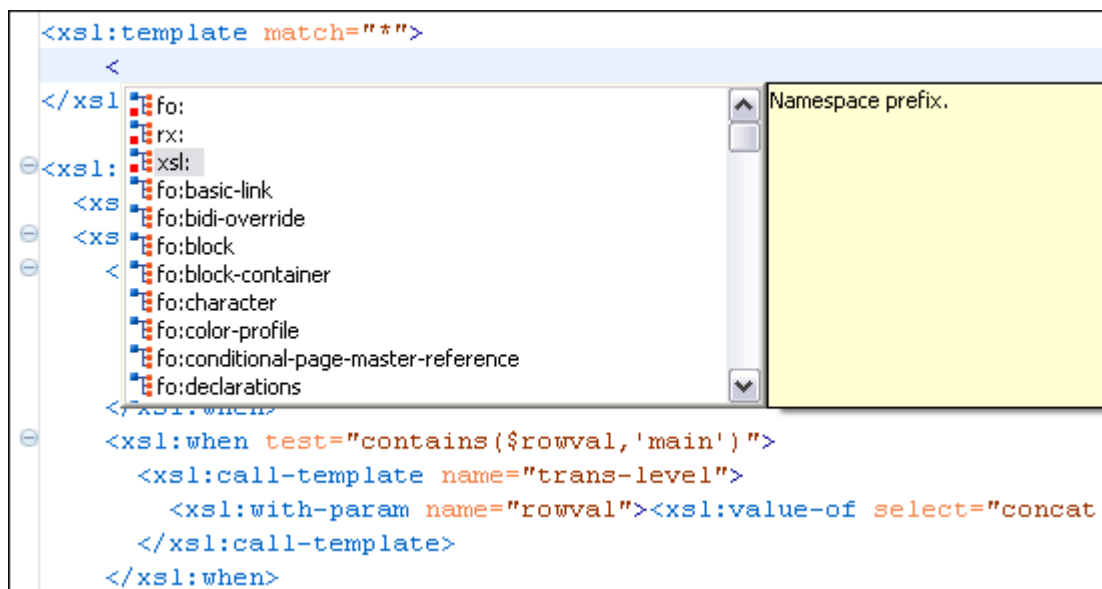

The extension functions included in the Saxon 6.5.5 and 12.3 transformation engines are presented in the content completion list only if the Saxon namespace (<http://saxon.sf.net> for XSLT version 2.0 / 3.0 or <http://icl.com/saxon> for XSLT version 1.0) is declared and one of the following conditions is true:

- The edited file has a transformation scenario that uses as transformation engine Saxon 6.5.5 (for XSLT version 1.0), Saxon 12.3 PE or Saxon 12.3 EE (for XSLT version 2.0 / 3.0).
- The edited file has a validation scenario that uses as validation engine Saxon 6.5.5 (for version 1.0), Saxon 12.3 PE or Saxon 12.3 EE (for version 2.0 / 3.0).
- The validation engine specified in [Options \(on page 206\)](#) page is Saxon 6.5.5 (for version 1.0), Saxon 12.3 PE or Saxon 12.3 EE (for version 2.0 / 3.0).

Additionally, the Saxon-CE-specific extension functions and instructions are presented in the list of content completion assistance proposals only if the <http://saxonica.com/ns/interactiveXSLT> namespace is declared.

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

Figure 198. Namespace Prefixes in the Content Completion Assistant

For the common namespaces such as XSL namespace (<http://www.w3.org/1999/XSL/Transform>), XML Schema namespace (<http://www.w3.org/2001/XMLSchema>), or Saxon namespace (<http://icl.com/saxon> for version 1.0, <http://saxon.sf.net/> for version 2.0 / 3.0), Oxygen XML Editor Eclipse plugin provides an easy mode to declare them by proposing a prefix for these namespaces.

Note:

For XSLT documents that are unversioned or have an unsupported version, the content completion in Oxygen XML Editor Eclipse plugin uses version 3.0 as the fallback.

Content Completion in XPath Expressions

In XSLT stylesheets, the *Content Completion Assistant* (on page 2677) provides all the features available in the XML editor (on page 319) and also adds some enhancements. In XPath expressions used in attributes of XSLT stylesheets (such as `@match`, `@select`, and `@test`), the *Content Completion Assistant* offers the names of XPath and XSLT functions, XSLT axes, and user-defined functions (the name of the function and its parameters). If a transformation scenario was defined and associated to the edited stylesheet, the *Content Completion Assistant* computes and presents elements and attributes based on:

- The input XML document selected in the scenario.
- The current context in the stylesheet.

The associated document is displayed in the **XSLT/XQuery Input** view (on page 671).

Content completion for XPath expressions is started:

- On XPath operators detected in one of the `@match`, `@select`, and `@test` attributes of XSLT elements: `"`, `'`, `/`, `//`, `(`, `[`, `|`, `:`, `::`, `$`
- For attribute value templates of non-XSLT elements, that is the `{` character when detected as the first character of the attribute value.
- On request, if the combination **Ctrl + Space** is pressed inside an edited XPath expression.

The proposals presented in the *Content Completion Assistant* are dependent on:

- The context of the current XSLT element.
- The XML document associated with the edited stylesheet in the stylesheet transformation scenario.
- The XSLT version of the stylesheet (1.0, 2.0, or 3.0).

Note:

The XSLT 3.0 content completion list of proposals includes specific elements and attributes for the 3.0 version.

For example, if the document associated with the edited stylesheet is:

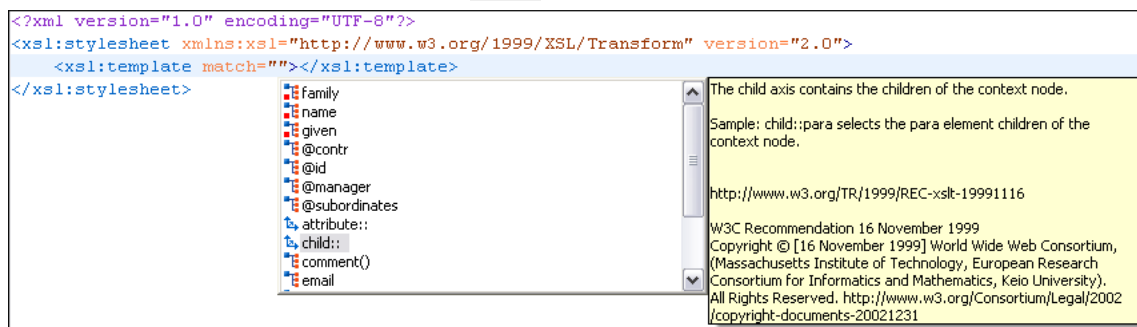

```
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinatates="one.worker" />
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss" />
  </person>
</personnel>
```

If you enter an `<xsl:template>` element using the *Content Completion Assistant*, the following actions are triggered:

- The `@match` attribute is inserted automatically.
- The cursor is placed between the quotes.
- The XPath *Content Completion Assistant* automatically displays a pop-up window with all the XSLT axes, XPath functions and elements and attributes from the XML input document that can be inserted in the current context.

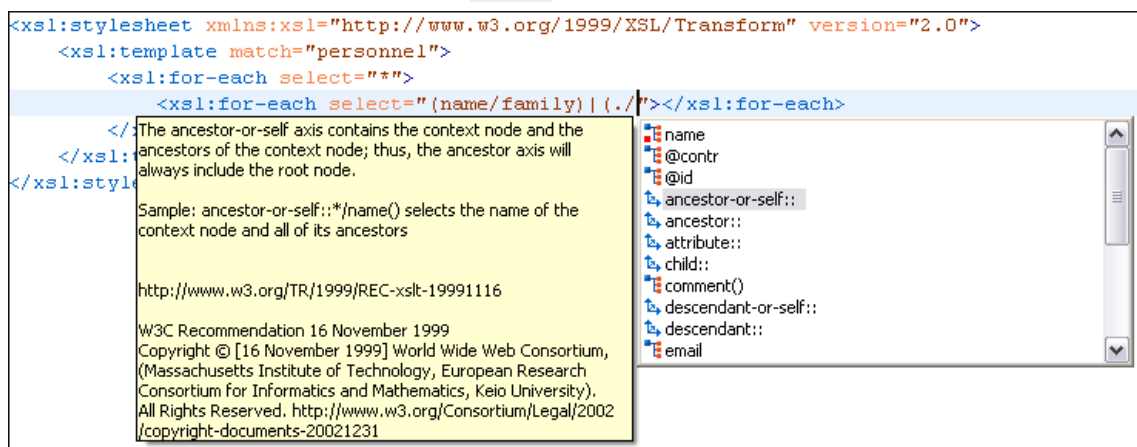

The set of XPath functions depends on the XSLT version declared in the root element `xsl:stylesheet`: 1.0, 2.0, or 3.0. Functions from other namespaces, such as `maps`, `arrays`, and `math`, are presented only if the namespaces are declared.

Figure 199. Content Completion in the `@match` Attribute

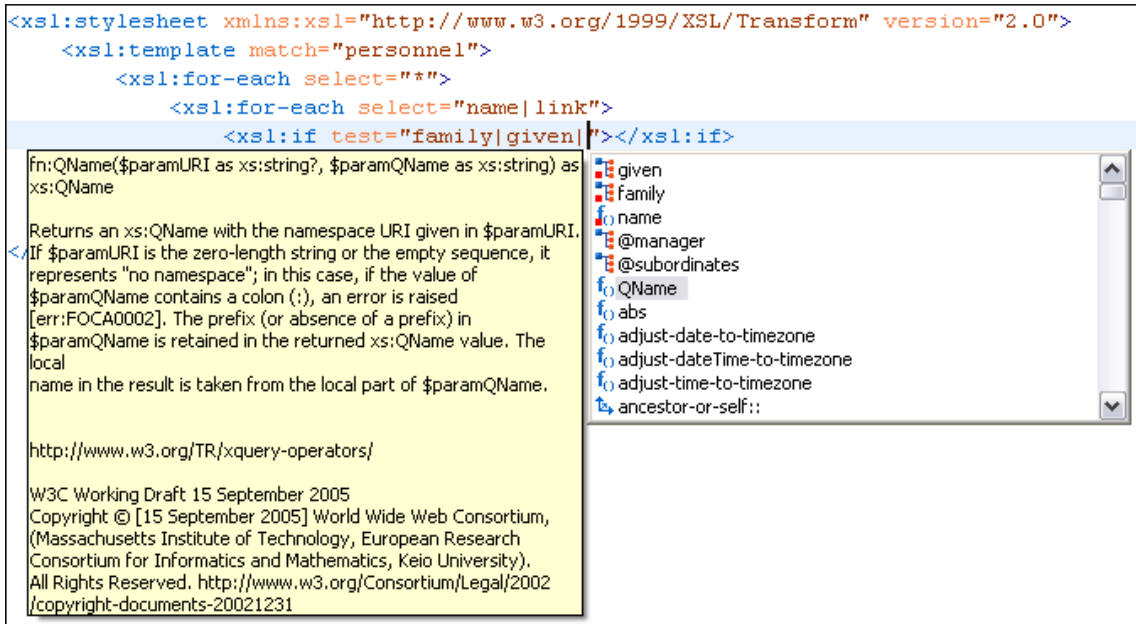

If the cursor is inside the `@select` attribute of an `<xsl:for-each>`, `<xsl:apply-templates>`, `<xsl:value-of>` or `<xsl:copy-of>` element the content completion proposals depend on the path obtained by concatenating the XPath expressions of the parent XSLT elements `<xsl:template>` and `<xsl:for-each>` as shown in the following figure:

Figure 200. Content Completion in the `@select` Attribute

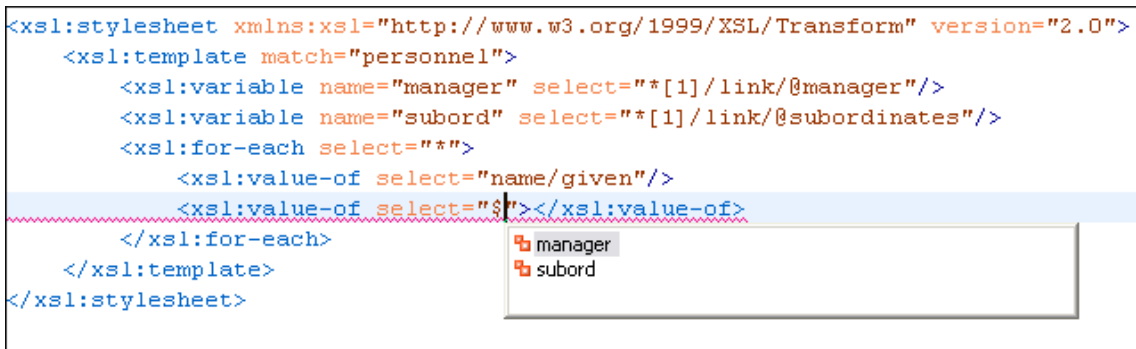

Also XPath expressions typed in the `@test` attribute of an `<xsl:if>` or `<xsl:when>` element benefit of the assistance of the content completion.

Figure 201. Content Completion in the @test Attribute

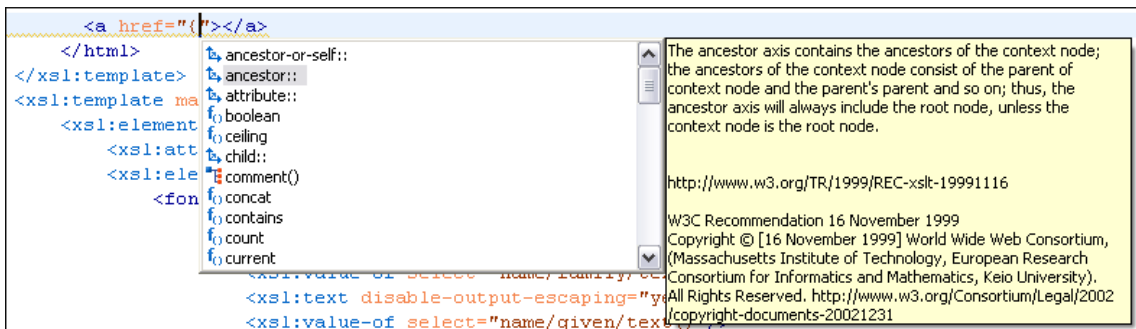

XSLT variable references are easier to insert in XPath expressions with the help of the content completion pop-up triggered by the `$` character, which signals the start of such a reference in an XPath expression.

Figure 202. Content Completion in the @test Attribute

If the `{` character is the first one in the value of the attribute, the same *Content Completion Assistant* is available also in attribute value templates of non-XSLT elements.

Figure 203. Content Completion in Attribute Value Templates

The time delay (configured in the **Content Completion** preferences page (on page 121)) is also applied for the content completion in XPath expressions.

Related Information:

[Working with XPath Expressions \(on page 1817\)](#)

Tooltip Helper for the XPath Functions Arguments

When editing the arguments of an XPath/XSLT function, Oxygen XML Editor Eclipse plugin tracks the current entered argument by displaying a tooltip containing the function signature. The currently edited argument is highlighted with a bolder font.

When moving the cursor through the expression, the tooltip is updated to reflect the argument found at the cursor position.

Examples:

If you want to concatenate the absolute values of two variables, named *v1* and *v2*:

```
<xsl:template match="/">
  <xsl:value-of select="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
```

When moving the cursor before the first `abs` function, Oxygen XML Editor Eclipse plugin identifies it as the first argument of the `concat` function. The tooltip shows in bold font the following information about the first argument:

- Its name is `$arg1`.
- Its type is `xdt:anyAtomicType`.
- It is optional (note the `?` sign after the argument type).

The function also takes other arguments that have the same type and returns a `xs:string`.

Figure 204. XPath Tooltip Helper - Identify the `concat` Function's First Argument

Moving the cursor on the first variable `$v1`, the editor identifies the `abs` as context function and shows its signature:

Figure 205. XPath Tooltip Helper - Identify the `abs` Function's Argument

```

name="v2" se
> match="/"> abs($arg as numeric?) as numeric?
elect="concat(abs($v1), abs($v2))"></xsl:value-of>
</xsl:template>
:stylesheet>

```

Further, clicking the second `abs` function name, the editor detects that it represents the second argument of the `concat` function. The tooltip is repainted to display the second argument in bold font.

Figure 206. XPath Tooltip Helper - Identify the `concat` Function's Second Argument

```

name=
> match="/"> concat($arg1 as xdt:anyAtomicType?, $arg2 as xdt:anyAtomicType?, ...) as xs:string
elect="concat(abs($v1), abs($v2)")"></xsl:value-of>
</xsl:template>
:stylesheet>

```

**Note:**

The tooltip helper is also available in the [XPath Builder view \(on page 1817\)](#).

Related Information:

[Working with XPath Expressions \(on page 1817\)](#)

Syntax Highlighting in XSLT

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XSLT files, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)).
2. Go to **Editor > Syntax Highlight** ([on page 176](#)).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSL** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page ([on page 176](#)).

Related Information:

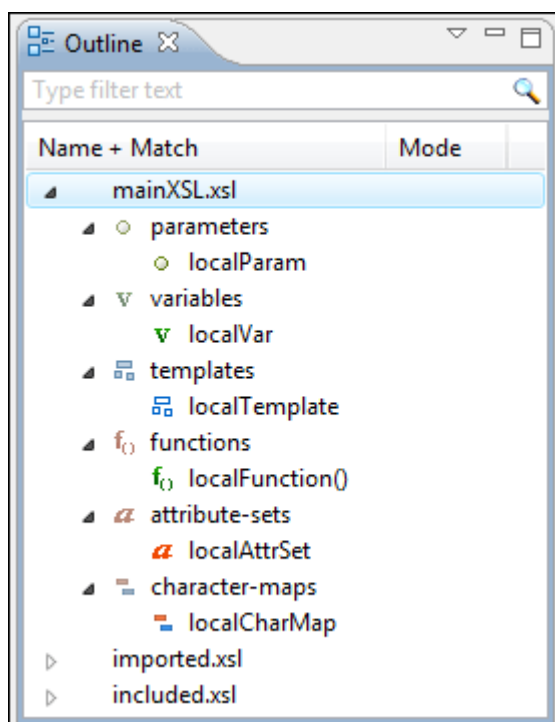

[Customize Syntax Highlight colors \(on page 176\)](#)

XSLT Outline View

The **Outline** view for XSLT stylesheets displays the list of all the components (templates, attribute-sets, character-maps, variables, functions, keys, outputs) from both the edited stylesheet and its imports or includes. For XSL and XSD resources, the **Outline** view collects its components starting from the *main files* (on page 2680). The main files can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level](#) (on page 278).

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 207. XSLT Outline View

The following actions are available in the **View Menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the XSLT editor.

Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

When the  **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML document structure in a tree-like structure.

Show all components

Displays all components that were collected starting from the *main file* (on page 2680). This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/type

The stylesheet components can be grouped by location and type.

When the  **Show XML structure** option is selected, the following actions are available:

Show components

Switches the **Outline** view to the components display mode.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from the **Outline preferences panel** (on page 214).

Configure displayed attributes

Displays the **XML Structured Outline preferences page** (on page 214).

The following contextual menu actions are also available when the  **Show components** option is selected in the **View menu**:

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of the selected node.

Cut

Cuts the currently selected node.

Copy

Copies the currently selected node.

 **Delete**

Deletes the currently selected node.

 **Search References Ctrl + Shift + R (Command + Shift + R on macOS)**

Searches all references of the item found at current cursor position in the defined scope, if any. See [Finding XSLT References and Declarations \(on page 678\)](#) for more details.

Search References in

Searches all references of the item found at current cursor position in the specified scope. See [Finding XSLT References and Declarations \(on page 678\)](#) for more details.

Component Dependencies

Opens the **Component Dependencies** view ([on page 676](#)) that allows you to see the dependencies for the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources** view ([on page 673](#)) that displays the references for the currently selected resource.

Show dependent resources

Opens the **Referenced/Dependent Resources** view ([on page 673](#)) that displays the dependencies of the currently selected resource.

 **Rename Component in**

Renames the selected component. See [XSLT Refactoring Actions \(on page 682\)](#) for more details.

The following contextual menu actions are available in the **Outline** view when the  **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

 **Edit Attributes**

Opens a small in-place editor that allows you to edit the attributes of the selected node.

 **Toggle Comment**

Comments/uncomments the currently selected element.

 **Search references**

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

 **Component dependencies**

Opens the **Component Dependencies view** (*on page 676*) that displays the dependencies of the currently selected component.

 **Rename Component in**

Renames the currently selected component in the context of a scope that you define.

 **Cut**

Cuts the currently selected component.

 **Copy**

Copies the currently selected component.

 **Delete**

Deletes the currently selected component.

 **Expand All**

Expands the structure of a component in the **Outline** view.

 **Collapse All**

Collapses the structure of all the component in the **Outline** view.

The stylesheet components information is presented on two columns: the first column presents the `@name` and `@match` attributes, the second column the `@mode` attribute. If you know the component name, match or mode, you can search it in the **Outline** view by typing one of these pieces of information in the filter text field from the top of the view or directly on the tree structure. When you type the component name, match or mode in the text field, you can switch to the tree structure using:

- Keyboard arrow keys
- **Enter** key
- **Tab** key
- **Shift-Tab** key combination

To switch from tree structure to the filter text field, you can use **Tab** and **Shift-Tab**.

 **Tip:**

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

Oxygen XML Editor Eclipse plugin allows you to sort the components of the tree in the **Outline** view.

**Note:**

Sorting groups in the **Outline** view is not supported.

Oxygen XML Editor Eclipse plugin has a predefined order of the groups in the **Outline** view:

- For location, the names of the files are sorted alphabetically. The file you are editing is located at the top of the list.
- For type, the order is: parameters, variables, templates, functions, set attributes, character-map.

**Note:**

When no grouping is available and the table is not sorted, Oxygen XML Editor Eclipse plugin sorts the components depending on their order in the document. Oxygen XML Editor Eclipse plugin also takes into account the name of the file that the components are part of.

XSLT Input View

The structure of the XML document associated to the edited XSLT stylesheet is displayed in a tree form in a view called the **XSLT Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

If you click a node in the **XSLT Input** view, the corresponding template from the stylesheet is highlighted.

A node can be dragged from this view and dropped in the editor area for quickly inserting `<xsl:template>`, `<xsl:for-each>`, or other XSLT elements that have the `@match`, `@select`, or `@test` attribute already completed. The value of the attribute is the correct XPath expression that refers to the dragged tree node. This value is based on the current editing context of the drop spot.

Figure 208. XSLT Input View

**Example:**

For the following XML document:

```
<personnel>
  <person id="Big.Boss">
    <name>
      <family>Boss</family>
      <given>Big</given>
    </name>
    <email>chief@oxygenxml.com</email>
    <link subordinates="one.worker" />
  </person>
  <person id="one.worker">
    <name>
      <family>Worker</family>
      <given>One</given>
    </name>
    <email>one@oxygenxml.com</email>
    <link manager="Big.Boss" />
  </person>
</personnel>
```

and the following XSLT stylesheet:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
```

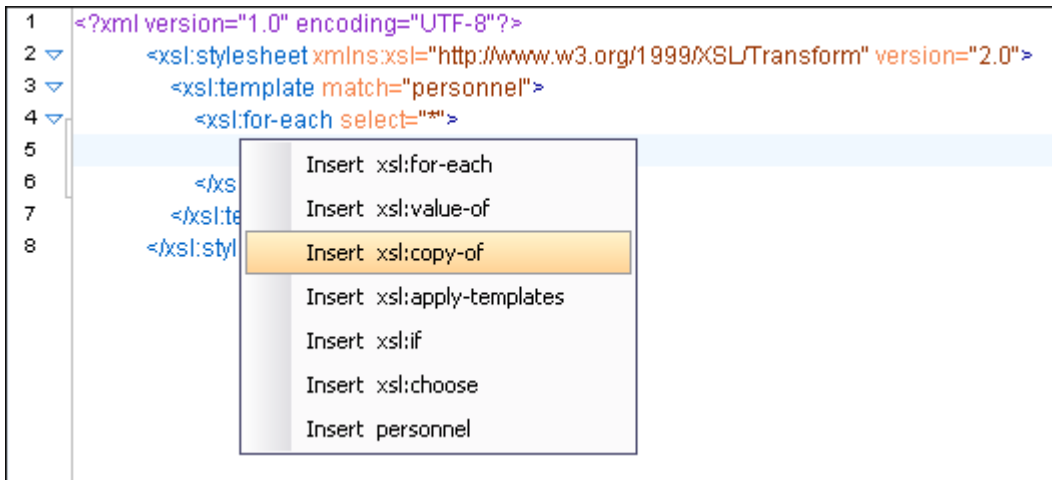

```

    </xsl:for-each>
  </xsl:template>
</xsl:stylesheet>

```

if you drag the `<given>` element and drop it inside the `<xsl:for-each>` element, the following pop-up menu is displayed:

if you select **Insert xsl:copy-of** (for example), the resulting document will look like this:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
  <xsl:template match="personnel">
    <xsl:for-each select="*">
      <xsl:copy-of select="name/given"/>
    </xsl:for-each>
  </xsl:template>
</xsl:stylesheet>

```

XSLT Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in a stylesheet. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the references or dependencies of a stylesheet, select the desired stylesheet in the **Project Explorer** view (on page 269) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 209. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

 **Refresh**

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

Moving/Renaming XSLT Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

XSLT Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an XSLT component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (templates, variables, parameters, attribute sets, keys, functions, outputs).

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 210. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

 **History**

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

Highlight Component Occurrences

When a component (for example variable or named template) is found at current cursor position, Oxygen XML Editor Eclipse plugin performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document.

**Note:**

Oxygen XML Editor Eclipse plugin also supports occurrences highlight for template modes.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is enabled by default. To configure it, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on macOS))** contextual menu action. Matches are displayed in separate tabs of the [Results view \(on page 335\)](#).

Finding XSLT References and Declarations

The following search actions related with XSLT references and declarations are available from the **Search** submenu of the contextual menu:

**Search References (Also available from the XSL menu)**

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of determined resources, a warning dialog box is displayed that allows you to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when a scope is defined.

**Search Declarations (Also available from the XSL menu)**

Searches all declarations of the item found at current cursor position in the defined scope, if any. If a scope is defined but the currently edited resource is not part of the range of resources determined by this scope, a warning dialog box is displayed that allows you to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when a scope is defined.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

Go to Definition

Moves the cursor to the location of the definition of the current item.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

XSLT Stylesheet Component Documentation Support

Oxygen XML Editor Eclipse plugin offers built-in support for documenting XSLT stylesheets. If the expanded *QName (on page 2681)* of the element has a non-null namespace URI, the `<xsl:stylesheet>` element may contain any element not from the XSLT namespace. Such elements are referenced as user-defined data elements. Such elements can contain the documentation for the stylesheet and its elements (top-level elements whose names are in the XSLT namespace). Oxygen XML Editor Eclipse plugin offers its own XML schema that defines such documentation elements. The schema is named `stylesheet_documentation.xsd` and can be found in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. The user can also specify a custom schema in [XSL Content Completion options \(on page 132\)](#).

Content Completion

When content completion is invoked inside an XSLT editor by pressing **Ctrl + Space**, it offers elements from the XSLT documentation schema (either the built-in one or one specified by user).

Adding Documentation Blocks

In **Text** mode, to add documentation blocks, press **Ctrl + Alt + D (Command + Option + D on macOS)** or select **Add component documentation** from the contextual menu.

In **Author** mode, the following stylesheet documentation actions are available in the contextual menu, **Component Documentation** submenu:

- **Add component documentation** - Adds documentation blocks for the component at the cursor position.
- **Paragraph** - Inserts a new documentation paragraph.
- **Bold** - Makes the selected documentation text bold.
- **Italic** - Makes the selected documentation text italic.
- **List** - Inserts a new list.
- **List Item** - Inserts a list item.
- **Reference** - Inserts a documentation reference.

If the cursor is positioned inside the `<xsl:stylesheet>` element context, documentation blocks are generated for all XSLT elements. If the cursor is positioned inside a specific XSLT element (such as a template or function), a documentation block is generated for that element only.

Example: Documentation Block Using Oxygen XML Editor Eclipse plugin Built-in Schema

```
<xd:doc>
  <xd:desc>
    <xd:p>Search inside parameter <xd:i>string</xd:i>
      for the last occurrence of parameter
    <xd:i>searched</xd:i>. The substring starting from the 0 position
      to the identified last occurrence will be returned.
    <xd:ref name="f:substring-after-last" type="function"
      xmlns:f="http://www.oxygenxml.com/doc/xsl/functions">See also
    </xd:ref>
  </xd:p>
</xd:desc>
<xd:param name="string">
  <xd:p>String to be analyzed</xd:p>
</xd:param>
<xd:param name="searched">
  <xd:p>Marker string. Its last occurrence will be identified</xd:p>
</xd:param>
<xd:return>
  <xd:p>A substring starting from the beginning of <xd:i>string</xd:i>
    to the last occurrence of <xd:i>searched</xd:i>.
    If no occurrence is found an empty string will be returned.
  </xd:p>
</xd:return>
</xd:doc>
```

XSLT Documentation Links

Oxygen XML Editor Eclipse plugin includes support for links inside XSLT documentation blocks. Using a construct like `<xd:a docid="user-defined-id">TEXT</xd:a>` will cause the browser to scroll to the particular anchor (the defined ID) in the current document. Using a construct like `<xd:a href="http://www.my-web-site">TEXT</xd:a>` or `<xd:a href="local-file-path/filename">TEXT</xd:a>` will open the referenced link in a new tab.

Example: Documentation Links

```
<xd:doc xmlns:xd="http://www.oxygenxml.com/ns/doc/xsl" id="thisDoc">
  <xd:desc>
    <xd:p>
      <xd:ref name="test" type="variable">My test variable</xd:ref>
```

```

        <xd:a docid="thisDoc">Link to this documentation, see
the the id="thisDoc" above</xd:a>

        <xd:a docid="otherDocID" href="included.xsl">Link to
otherDocID defined in included.xsl</xd:a>

    </xd:p>
</xd:desc>
</xd:doc>

```

Related Information:

[Generating Documentation for an XSLT Stylesheet \(on page 691\)](#)

XSLT 3.0 Text Value Templates

Oxygen XML Editor Eclipse plugin offers built-in support for *XSLT 3.0 Text Value Templates*, including content completion to present the variables, functions, and parameters from the current context and syntax highlighting.

A text node in the stylesheet is treated as a *text value template* if the following things are true:

- It is part of a [sequence constructor](#) or a child of an `<xsl:text>` instruction.
- There is an ancestor element with an `@[xsl:]expand-text` attribute and on the innermost ancestor element that has such an attribute, the value of the attribute is `yes`.

Example:

```

<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
xmlns:xs="http://www.w3.org/2001/XMLSchema"
expand-text="yes"
version="3.0">

    <xsl:param name="seq" as="xs:string*" select="'c', 'a', 'b', 'z'"/>

    <xsl:template name="main">
        {sort($seq)}
    </xsl:template>
</xsl:stylesheet>

```

For more information, see: [W3C XSLT Specifications: Text Value Templates](#).

Related Information:

[Content Completion in XPath Expressions \(on page 661\)](#)

XSLT 3.0 Packages (xsl:package Element)

Oxygen XML Editor Eclipse plugin offers built-in support for *XSLT 3.0 Packages* (`<xsl:package>` element). This element defines a set of stylesheet modules that can be compiled as a unit, independently of other packages.

Oxygen XML Editor Eclipse plugin includes a new document template called **XSLT Package** to help you easily create an XSLT 3.0 file with the `<xsl:package>` element set as the document's root element. It is available when creating [new documents from templates \(on page 253\)](#) and can be found in the **New Document** folder or by typing `xslt package` in the search field.

Also, when editing XSLT 3.0 documents, the `<xsl:package>` element is offered as one of the proposals for the document's root element in the content completion window.

XSLT Refactoring Actions

Oxygen XML Editor Eclipse plugin offers a set of actions that allow you to change the structure of an XSLT stylesheet without changing the results of running it in an XSLT transformation. Depending on the selected text, the following XSLT refactoring actions are available from the **Refactoring** submenu of the contextual menu:

Extract template (Active only when the selection contains well-formed elements)

Extracts the selected XSLT instructions sequence into a new template. It opens a dialog box that allows you to specify the name of the new template to be created. The possible changes to perform on the document can be previewed before altering the document. After pressing OK, the template is created and the selection is replaced with the `<xsl:call-template>` instruction referencing the newly created template.

Note:

The newly created template is indented and its name is highlighted in the `<xsl:call-template>` element.

Extract function

Extracts the selected XSLT instructions sequence into a new function. It opens a dialog box that allows you to specify the name of the new function. It then moves the selected lines to a newly created XSLT function and inserts a function call in the place of the selected lines. XPath expressions are rebuilt based on the current context and the context is passed as parameters in the new functions. You can also use parts of an XPath expression to create the new functions.

Create local variable

Creates an XSLT variable, wrapped around the selection. It opens a dialog box that allows you to specify the name of the new variable. It then wraps the selection in the variable and you can reference it at anytime in the code.

Move to another stylesheet (Active only when entire components are selected)

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet. It opens a dialog box that allows you to specify where the selected components will be moved to. Follow these steps when using the dialog box:

1. Choose whether you want to move the selected components to a new stylesheet or an existing one.
2. If you choose to move the components to an existing one, select the destination stylesheet. Click the **Choose** button to select the destination stylesheet file. Oxygen XML Editor Eclipse plugin will automatically check if the destination stylesheet is already contained by the hierarchy of the current stylesheet. If it is not contained, choose whether or not the destination stylesheet will be referenced (imported or included) from the current stylesheet. The following options are available:
 - **Include** - The current stylesheet will use an `<xsl:include>` instruction to reference the destination stylesheet.
 - **Import** - The current stylesheet will use an `<xsl:import>` instruction to reference the destination stylesheet.
 - **None** - There will be created no relation between the current and destination stylesheets.
3. Click the **Move** button to move the components to the destination. The moved components are highlighted in the destination stylesheet.

Convert attributes to xsl:attributes

Converts the attributes from the selected element and represents each of them with an `<xsl:attribute>` instruction. For example, the following element:

```
<person id="Big{test}Boss" />
```

is converted to:

```
<person>
  <xsl:attribute name="id">
    <xsl:text>Big</xsl:text>
    <xsl:value-of select="test"/>
    <xsl:text>Boss</xsl:text>
  </xsl:attribute>
</person>
```

Convert xsl:attributes to attributes

Converts `<xsl:attribute>` elements to inline attributes for elements outside the XSL namespace. For example, the following element: It is the reverse of the **Convert attributes to xsl:attributes** action with the following limitations:

- The `<xsl:attribute>` element is "text only".
- The `<xsl:attribute>` element has a single `<xsl:text>` child element.
- The `<xsl:attribute>` element has a single `<xsl:value-of>` child element. In this case, the value of the attribute will be the XPath expression from the `@select` attribute surrounded by curly brackets (*text value template*).

```

<person>
  <xsl:attribute name="id">john.doe</xsl:attribute>
  <xsl:attribute name="email"><xsl:text>john.doe@example.com</xsl:text>
</xsl:attribute>
  <xsl:attribute name="manager"><xsl:value-of select="person[@id='boss']/name"/>
</xsl:attribute>
</person>

```

is converted to:

```

<person id="john.doe" email="john.doe@example.com" manager="{person[@id='boss']/name}" />

```

Convert xsl:if into xsl:choose/xsl:when

Converts one or more `<xsl:if>` element blocks into one or more `<xsl:when>` blocks surrounded by an `<xsl:choose>` element. If it is invoked on a selection, the selection must contain a well-formed fragment. If there is no selection, the `<xsl:if>` element that surrounds the content at the current cursor position is converted.

For example, the following block:

```

<xsl:if test="a">
  <!-- XSLT code -->
</xsl:if>

```

is converted to:

```

<xsl:choose>
  <xsl:when test="a">
    <!-- XSLT code -->
  </xsl:when>
  <xsl:otherwise>
    |
  </xsl:otherwise>
</xsl:choose>

```

where the `|` character is the current cursor position.

Convert xsl:choose/xsl:when into xsl:if

Converts each `<xsl:when>` block into an `<xsl:if>` block. For the `<xsl:otherwise>` branch, it also adds an *and* statement to each negated form of the conditions. For example, the following block:

```

<xsl:choose>
  <xsl:when test="c1">
    <!-- XSLT statement 1 -->
  </xsl:when>
  <xsl:when test="c2">

```

```

        <!-- XSLT statement 2 -->
    </xsl:when>
    <xsl:when test="c3">
        <!-- XSLT statement 3 -->
    </xsl:when>
    <xsl:otherwise>
        <!-- XSLT "otherwise" statement-->
    </xsl:otherwise>
</xsl:choose>

```

is converted to:

```

<xsl:if test="c1">
    <!-- XSLT statement 1 -->
</xsl:if>
<xsl:if test="c2">
    <!-- XSLT statement 2 -->
</xsl:if>
<xsl:if test="c3">
    <!-- XSLT statement 3 -->
</xsl:if>
<xsl:if test="not(c1) and not(c2) and not(c3)">
    <!-- XSLT "otherwise" statement-->
</xsl:if>

```

▼ Extract local variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new local variable by extracting the selected XPath expression. After creating the new local variable before the current element, Oxygen XML Editor Eclipse plugin allows you to edit the name of the variable.

▼ Extract global variable (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new global variable by extracting the selected XPath expression. After creating the new global variable, Oxygen XML Editor Eclipse plugin allows you to edit the name of the variable.

Note:

Oxygen XML Editor Eclipse plugin checks if the selected expression depends on local variables or parameters that are not available in the global context where the new variable is created.

○ Extract template parameter (Active on a selection made inside an attribute that contains an XPath expression)

Allows you to create a new template parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor Eclipse plugin allows you to edit the name of the parameter.

• **Extract global parameter (Active on a selection made inside an attribute that contains an XPath expression)**

Allows you to create a new global parameter by extracting the selected XPath expression. After creating the new parameter, Oxygen XML Editor Eclipse plugin allows you to edit the name of the parameter.

Note:

Oxygen XML Editor Eclipse plugin checks if the selected expression depends on local variables or parameters that are not available in the global context where the new parameter is created.

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

 **Rename Component in**

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 211. Rename Identity Constraint Dialog Box**Note:**

Many of these refactoring actions are also proposed by the [Quick Assist support \(on page 687\)](#).

Resources

For more information about XSLT refactoring, watch our video demonstration:

<https://www.youtube.com/embed/4ir5XWyp8Zo>

XSLT Quick Assist Support

The [Quick Assist support \(on page 2681\)](#) helps you to rapidly access search and refactoring actions. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *Quick Assist* menu by using the **Ctrl + 1 (Meta 1)** on macOS) keyboard shortcuts.

Two categories of actions are available in the *Quick Assist* menu:

- Actions available on a selection made inside an attribute that contains an XPath expression:

**Extract template**

Extracts the selected XSLT instructions sequence into a new template.

**Move to another stylesheet**

Allows you to move one or more XSLT global components (templates, functions, or parameters) to another stylesheet.

▼ Extract local variable

Allows you to create a new local variable by extracting the selected XPath expression.

▼ Extract global variable

Allows you to create a new global variable by extracting the selected XPath expression.

○ Extract template parameter

Allows you to create a new template parameter by extracting the selected XPath expression.

● Extract global parameter

Allows you to create a new global parameter by extracting the selected XPath expression.

Figure 212. XSLT Quick Assist Support - Refactoring Actions

- Actions available when the cursor is positioned over the name of a component:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

XSLT Unit Test (XSpec)

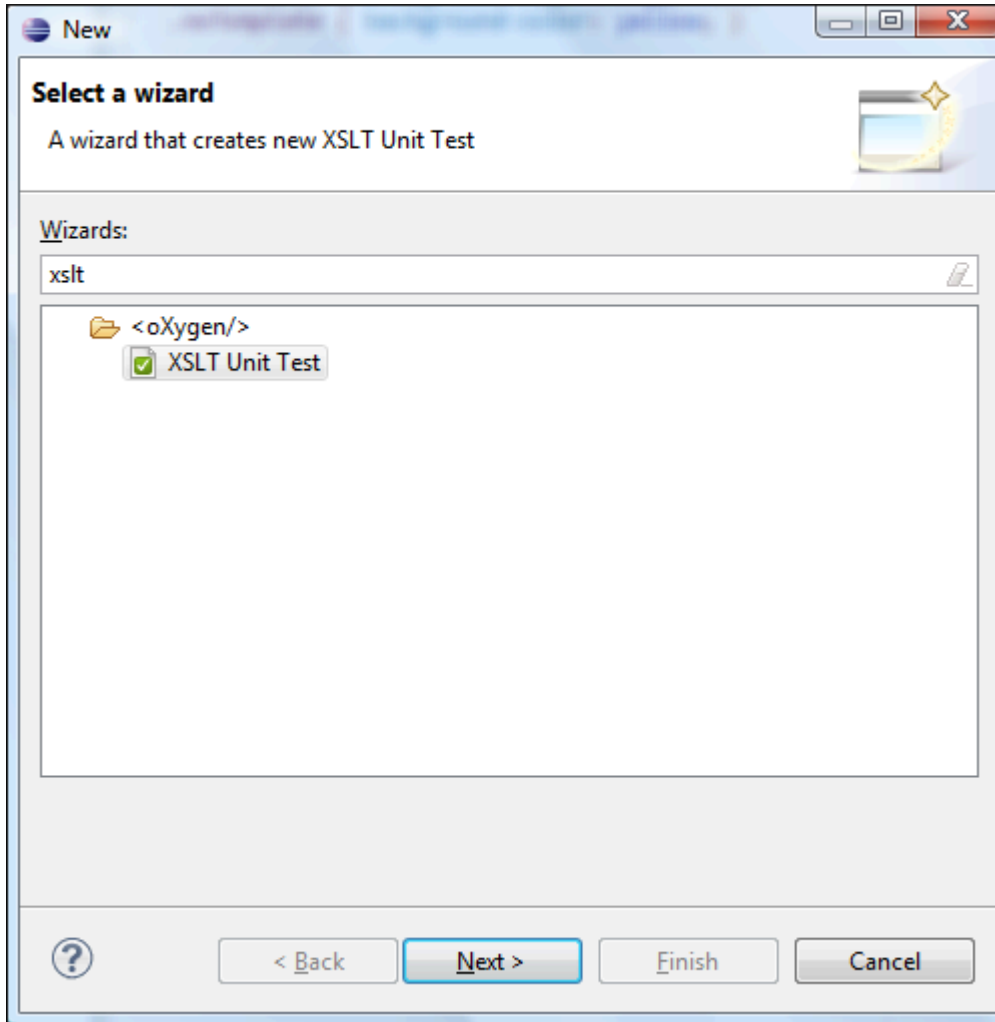

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating an XSLT Unit Test

To create an XSLT Unit Test, go to **File > New > XSLT Unit Test**. You can also create an XSLT Unit Test from the contextual menu of an XSL file in the **Project Explorer view (on page 269)**. Oxygen XML Editor Eclipse plugin allows you to customize the XSpec document when you create it. In the customization dialog box, you can enter the path to an XSL document or to a main XSL document.

When you create an XSpec document based on an XSL document, Oxygen XML Editor Eclipse plugin uses information from the validation and transformation scenarios associated with the XSL file. From the transformation scenario Oxygen XML Editor Eclipse plugin uses extensions and properties of Saxon 12.3, improving the Ant scenario associated with the XSpec document.

Figure 214. New XSLT Unit Test Wizard

Running an XSLT Unit Test

To run a Unit Test, open the XSpec file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework (on page 2679)*.

Testing a Stylesheet

An XSpec file contains one or more test scenarios. You can test a stylesheet in one of the following ways:

- **Test an entire stylesheet** - Testing is performed in a certain context. You can define a context as follows:
 - Inline context, building the test based on a string.

```
<x:scenario label="when processing a para element">
  <x:context>
    <para>...</para>
  </x:context>
  ...
</x:scenario>
```

- Based on an external file, or on a part of an external file extracted with an XPath expression.

```
<x:scenario label="when processing a para element">
  <x:context href="source/test.xml" select="/doc/body/p[1]" />
  ...
</x:scenario>
```

- **Test a function:**

```
<x:scenario label="when capitalising a string">
  <x:call function="eg:capital-case">
    <x:param select="'an example string'" />
    <x:param select="true()" />
  </x:call>
  ...
</x:scenario>
```

- **Test a template with a name:**

```
<x:scenario label="when creating a table">
  <x:call template="createTable">
    <x:param name="nodes">
      <value>A</value>
      <value>B</value>
    </x:param>
    <x:param name="cols" select="2" />
  </x:call>
</x:scenario>
```

You can reference test files between each other, which allows you to define a suite of tests. For further details about test scenarios, go to <https://github.com/xspec/xspec/wiki/Writing-Scenarios>.

Adding a Catalog to an XSpec Transformation

If your XSLT needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a [project \(on page 268\)](#) in Oxygen XML Editor Eclipse plugin, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- [Edit \(on page 1297\)](#) the **Run XSpec Test** transformation scenario, go to the **Parameters** tab [\(on page 1250\)](#), and set the value of the `catalog` parameter to the location of your catalog file.

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for

each of them. The elements are hyperlinked. To generate documentation in a [custom output format \(on page 697\)](#), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate Stylesheet Documentation** action from the contextual menu of the **Project Explorer** view ([on page 269](#)).

Figure 215. XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 695\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 697\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box ([on page 698](#)) where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

Note:

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure 216. Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets.**

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
 - Oxygen XML Editor Eclipse plugin built-in XSLT documentation schema.
 - A subset of DocBook 5 elements. The recognized elements are: *section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist*.
 - A subset of DITA elements. The recognized elements are: *concept, topic, task, codeblock, p, b, i, ul, ol, pre, sl, sli, step, steps, li, title, xref*.
 - Full XHTML 1.0 support.
 - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
 - DOXSL documentation [framework \(on page 2679\)](#). Supported elements are: *codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listitem, module, parameter, template, attribute-set*.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a [custom format \(on page 697\)](#) instead of the built-in [HTML format \(on page 695\)](#) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

**Tip:**

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

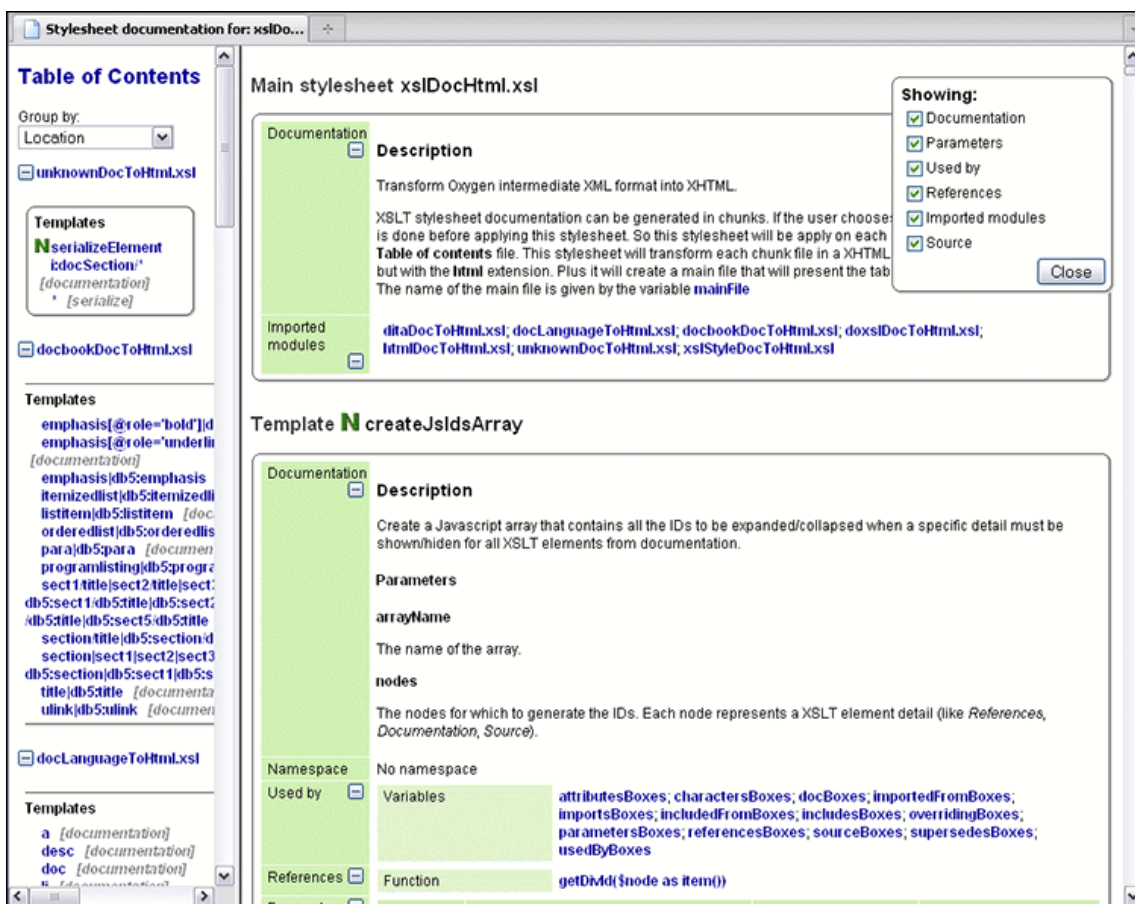

Related Information:

[XSLT Stylesheet Component Documentation Support \(on page 679\)](#)

Generate XSLT Documentation in HTML Format

When using the [XSLT Stylesheet Documentation dialog box \(on page 691\)](#) to generate XSLT documentation in HTML format, it is presented in a visual diagram style with various sections, hyperlinks, and options.

Figure 217. XSLT Stylesheet Documentation Example

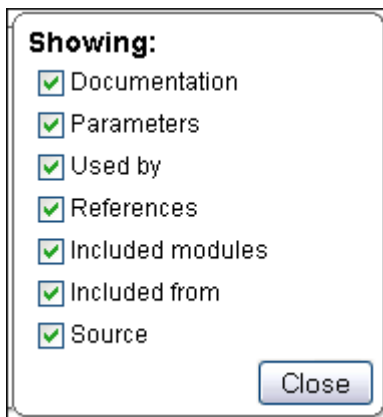

The generated documentation includes the following:

- Table of Contents - You can group the contents by namespace, location, or component type. The XSLT elements from each group are sorted alphabetically (named templates are presented first and the `<match>` elements second).
- Information about main, imported, and included stylesheets. This information consists of:
 - XSLT modules included or imported by the current stylesheet.
 - The XSLT stylesheets where the current stylesheet is imported or included.
 - The stylesheet location.

Figure 218. Information About an XSLT Stylesheet

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped using the same criteria as the split.

After the documentation is generated, you can collapse or expand details for some stylesheet XSLT elements by using the **Showing** options or the **Collapse** or **Expand** buttons.

Figure 219. Showing Options

For each element included in the documentation, the section presents the element type followed by the element name (value of the `@name` or `@match` attribute for match templates).

Figure 220. Documentation for an XSLT Element

Generate XSLT Documentation in a Custom Format

XSLT stylesheet documentation can be also generated in a custom format. You must write your custom stylesheet based on the schema `xslDocSchema.xsd` from `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, and DocBook formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/stylesheet_documentation/xsl`.

To generate XSLT documentation in a custom format:

1. Select **Tools > Generate Documentation > XSLT Stylesheet Documentation** to open the [XSLT Stylesheet Documentation dialog box](#) (on page 691).
2. Select **Custom** for the **Format** and click the **Options** button.
3. In this next dialog box, specify your own stylesheet to transform the intermediary XML generated in the documentation process.
4. You can also choose to copy additional resources into the output folder or choose whether or not to keep the intermediate XML files created during the documentation process.
5. Click **OK** to close this dialog box and then click **Generate**.

Figure 221. Custom Format Options Dialog Box

Compiling an XSL Stylesheet for Saxon

As of Saxon 12.3, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a *stylesheet export file* or SEF). Oxygen XML Editor Eclipse plugin includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **XML Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the [Saxon-JS product](#) to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
  window.onload = function() {
    SaxonJS.transform({
      stylesheetLocation: "books.sef",
      sourceLocation: "books.xml"
    });
  }
</script>
```

- **Use SEF to run transformations in Oxygen XML Editor Eclipse plugin** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Editor Eclipse plugin to apply an XSLT transformation over an XML file. This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file ([on page 699](#)). When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field ([on page 1207](#)).

Compiling an SEF File

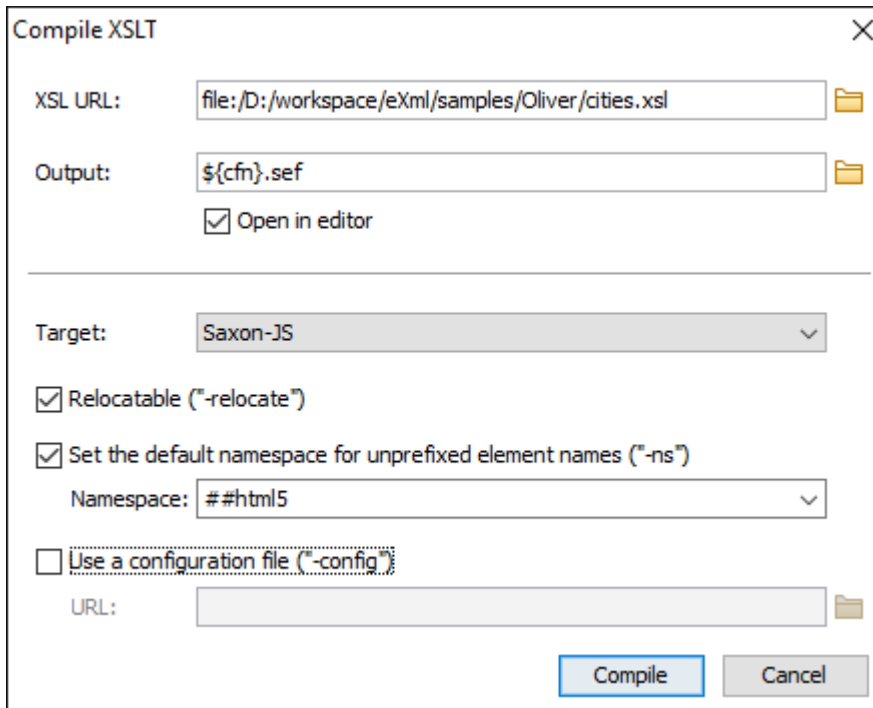

The **Compile XSL Stylesheet for Saxon** tool can be found in the **XML Tools** menu and it compiles a specified stylesheet as a JSON or an XML file (*stylesheet export file*).

If you choose **Saxon-JS** as the **Target** (the type of Saxon product that the export file will be used with), then the compiled stylesheet will be a JSON file with a file extension of `.sef` by default.

If you choose **Saxon-EE**, **Saxon-PE**, or **Saxon-HE** for the **Target**, then the compiled stylesheet will be an XML file with a file extension of **.xsef** by default.

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

Figure 222. Compile XSLT Stylesheet for Saxon Dialog Box

This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Editor Eclipse plugin editing pane.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Relocatable

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

Set the default namespace for unprefix element names ("-ns")

Can be used to control the `-ns:(uri|##any|##html5)` Saxon parameter that defines the handling of unprefix element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The **##any** value declares that unprefix names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The **##html5** value declares that an unprefix element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for `xpath-default-namespace`). Note that an explicit value for this attribute takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Compile

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

Editing XML Schemas (XSD)

An XML Schema (XSD) describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor Eclipse plugin offers support for both XML Schema 1.0 and 1.1 and you can edit XML Schema files in the following editing modes:

- **Text editing mode (on page 742)** - Allows you to edit XML Schema files in a source editing mode.
- **Grid editing mode (on page 242)** - Displays XML Schema files in a structured spreadsheet-like grid.

- **Design editing mode (on page 243)** - Visual schema designer that helps you understand the structure and develop complex schemas.
- **Author editing mode (on page 367)** - The visual **Author** mode is also available for XML Schema, allowing you to visually edit the schema annotations. It presents a polished and compact view of the XML Schema, with support for links on imported/included schemas.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents \(on page 584\)](#).

Resources

For more information about editing XML Schemas, see our video demonstration:

<https://www.youtube.com/embed/vz1eIZELQgc>

Related Information:

[Associating a Schema to XML Documents \(on page 584\)](#)

XML Schema Design Mode (XML Schema Diagram Editor)

This section includes topics that describe how to work with XML Schema documents in **Design** mode, including various features, actions that are available, and much more.

The **Design** mode in Oxygen XML Editor Eclipse plugin provides a simple and expressive XML Schema diagram editor for working with XML Schema documents. The schema diagram helps both the content authors who want to understand a schema and schema designers who develop complex schemas.

To switch to this mode, select **Design** at the bottom of the editing area.

Resources

For more information about designing XML Schemas, watch our video demonstration:

<https://www.youtube.com/embed/vz1eIZELQgc>

Navigation in the XML Schema Design Mode

The following editing and navigation features work for all types of schema components in the XML Schema **Design** mode:

- Move/reference components in the diagram using drag-and-drop actions.
- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on macOS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.

- Use *Home/End* keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on macOS)** key combination to go to the diagram root and **Ctrl + End (Command + End on macOS)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second attribute from an attribute group and you press the left arrow key to jump to the attribute group, when you press the right arrow key, then the selection will be moved to the second attribute.
- Go back and forward between components viewed or edited in the diagram by selecting them in the **Outline view (on page 746)**:
 -  **Back** (go to previous schema component).
 -  **Forward** (go to next schema component).
 -  **Go to Last Modification** (go to last modified schema component).
- Copy, reference, or move global components, attributes, and identity constraints to another position and from one schema to another using the **Cut/Copy** and **Paste/Paste as Reference** actions.
- Go to the definition of an element or attribute with the **Go to Definition** action.
- You can expand and see the contents of the imports/includes/redefines in the diagram. To edit components from other schemas, the schema for each component will be opened as a separate file in Oxygen XML Editor Eclipse plugin.

**Tip:**

If an XML Schema referenced by the currently open schema was modified on disk, the change will be detected and you will be asked to refresh the current schema contents.

- Recursive references are marked with a *recurse symbol* (). Click this symbol to navigate between the element declaration and its reference.

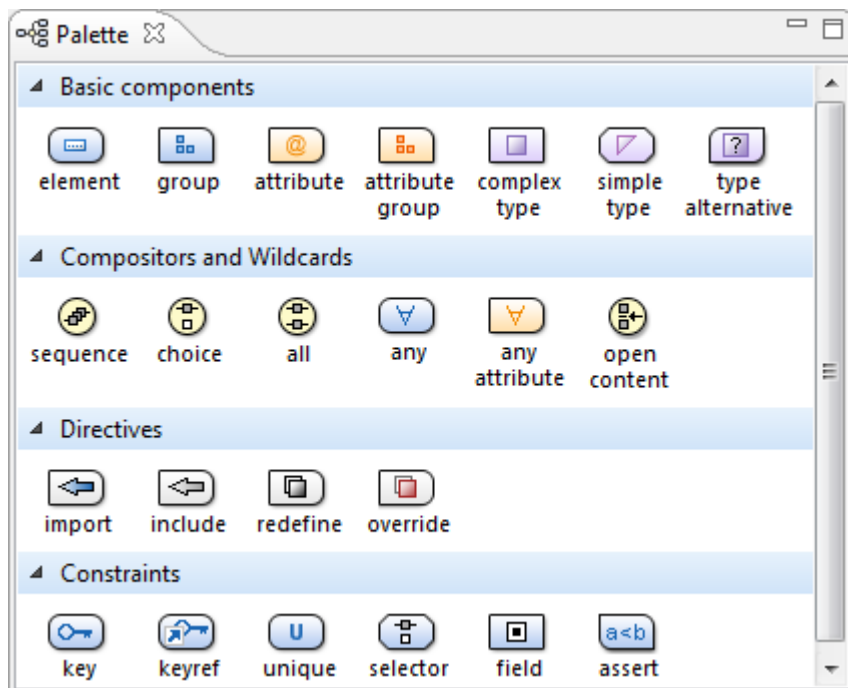

Figure 223. Recursive Reference

XML Schema Palette View (Available in Design Mode)

The **Palette** view is designed to offer quick access to XML Schema components and to improve the usability of the XML Schema diagram builder. You can use the **Palette** to drag and drop components in the **Design** mode. The components offered in the **Palette** view depend on the XML schema version set in the **XML Schema preferences page (on page 195)**. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 224. Palette View

Figure 225. Palette View

Components are organized functionally into 4 collapsible categories:

- Basic components: *elements, group, attribute, attribute group, complex type, simple type, type alternative.*
- Compositors and Wildcards: *sequence, choice, all, any, any attribute, open content.*
- Directives: *import, include, redefine, override.*
- Identity constraints: *key, keyref, unique, selector, field, assert.*

Note:

The *type alternative, open content, override, and assert* components are available for XML Schema 1.1.

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

Note:

You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option (*on page 133*) (default color is red).

Resources

For more information about the Schema palette, watch our video demonstration:

<https://www.youtube.com/embed/KalHUXmpuAA>

XML Schema Facets View (Available in Design Mode)

The **Facets** view for XML Schemas presents the facets for the selected component, if available. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 226. Facets View

Facet Name	Value	Icon
length		🔒
minLength	12	🔒
maxLength	23	🚩
whiteSpace	preserve	🔒
Enumerations		
enumeration	a	
enumeration	b	
Patterns		

The default value of a facet is rendered in the **Facets** view with a blue color. The facets that can not be edited are rendered with a gray color. The grouping categories (for example: **Enumerations** and **Patterns**) are not editable. If these categories contain at least one child they are rendered with bold. Bold facets are facets with values set explicitly to them.

Important:

Usually inherited facets are presented as default in the **Facets** view but if patterns are inherited from a base type and also specified in the current simple type only the current specified patterns will be presented. You can see the effective pattern value obtained by combining the inherited and the specified patterns as a tooltip on the **Patterns** category.

Facets for components that do not belong to the currently edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a facet by double-clicking it or by pressing Enter, when that facet is selected. For some facets you can choose valid values from a list or you can specify another value. If a facet has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, facets with errors are presented with red and the facets with warnings with yellow. You can customize the error colors from the [Document Checking user preferences \(on page 133\)](#).

The **Facets** view provides the following actions in its toolbar and contextual menu:

 **Add**

Allows you to add a new enumeration or a new pattern.

 **Remove**

Allows you to remove the value of a facet.

Edit Annotations

Allows you to edit an annotation for the selected facet.

 **Move Up**

Allows you to move up the current enumeration/pattern in **Enumerations/Patterns** category.

 **Move Down**

Allows you to move down the current enumeration/pattern in **Enumerations/Patterns** category.

 **Copy**

Copy the attribute value.

Open in Regular Expressions Builder

Rather than editing regular expressions manually, this action allows you to open the pattern in the [XML Schema Regular Expressions Builder \(on page 780\)](#) that guides you through the process of testing and constructing the pattern..

Facets can be fixed to prevent a derivation from modifying its value. To fix a facet value just click the  **Pin** button.

Schema Editing Actions

You can edit an XML schema using drag and drop operations or contextual menu actions.

Drag and drop is the easiest way to move the existing components to other locations in an XML schema. For example, you can quickly insert an element reference in the diagram with a drag and drop from the **Outline view (on page 746)** to a compositor in the diagram. Also, the components order in an `<xs:sequence>` can be easily changed using drag and drop.

If this property has not been set, you can easily set the attribute/element type by dragging over it a simple type or complex type from the diagram. If the type property for a simple type or complex type is not already set, you can set it by dragging over it a simple or complex type.

Depending on the drop area, various actions are available:

- **Move** - Context dependent, the selected component is moved to the destination.
- **Reference** - Context dependent, the selected component is referenced from the parent.
- **Copy** - If the **Ctrl (Meta on macOS)** key is pressed, a copy of the selected component is inserted to the destination.

Visual clues about the operation type are indicated by the mouse pointer shape:

-  - When moving a component.
-  - When referencing a component.
-  - When copying a component.

You can edit some schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double-clicking the value you want to edit. If you want to edit the name of a selected component, you can also press **Enter**. The list of properties that can be displayed for each component can be customized [in the Preferences \(on page 160\)](#).

When editing references, you can choose from a list of available components. A component from an imported schema whose target namespace does not have an associated prefix is displayed in the list as `componentName#targetNamespace`. If the reference is from a target namespace that was not yet mapped, you are prompted to add prefix mappings for the inserted component namespace in the currently edited schema.

You can also change the compositor by double-clicking it and choose the compositor you want from the proposals list.

There are some components that cannot be edited directly in the diagram: imports, includes, redefines. The editing action can be performed if you double-click or press **Enter** on an import/include/define component. An edit dialog box is displayed, allowing you to customize the directives.

Contextual Menu Actions in the Design Mode

The contextual menu of the **Design** mode includes the following actions:

Go to Definition (Ctrl + Shift + Enter)

Shows the definition for the currently selected component. For references, this action is available by clicking the arrow displayed in its bottom right corner.

Open Schema (Ctrl + Shift + Enter)

Opens the selected schema. This action is available for `<xsd:import>`, `<xsd:include>` and `<xsd:redefine>` elements. If the file you try to open does not exist, a warning message is displayed and you have the possibility to create the file.

Edit Attributes (Alt + Shift + Enter)

Allows you to edit the attributes of the selected component in a small in-place editor that presents the same attributes as in the **Attributes view** (on page 748) and the **Facets view** (on page 704). The actions that can be performed on attributes in this dialog box are the same actions presented in the two views.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

New global

Inserts a global component in the schema diagram. This action does not depend on the current context. If you choose to insert an import you have to specify the URL of the imported file, the target namespace and the import ID. The same information, excluding the target namespace, is requested for an `<xsd:include>` or `<xsd:redefine>` element.

Note:

If the imported file has declared a target namespace, the field **Namespace** is completed automatically.

Edit Schema Namespaces

When performed on the schema root, it allows you to edit the schema target namespace and namespace mappings. You can also invoke the action by double-clicking the target namespace property from **Attributes view** (on page 748) for the schema or by double-clicking the schema component.

Edit Annotations

Allows you to edit the annotation for the selected schema component in the **Edit Annotations** dialog box. You can perform the following operations in the dialog box:

- **Edit all `appinfo/documentation` items for a specific annotation** - All `appinfo/documentation` items for a specific annotation are presented in a table and can be easily edited. Information about an annotation item includes: type (`documentation/appinfo`), content,

source (optional, specify the source of the `documentation/appinfo` element) and `xml:lang`. The content of a `documentation/appinfo` item can be edited in the **Content** area below the table.

- **Insert/Insert before/Remove `documentation/appinfo`** - The **+** **Add** button allows you to insert a new annotation item (`documentation/appinfo`). You can add a new item before the item selected in table by pressing the **+** **Insert Before** button. Also, you can delete the selected item using the **X** **Remove** button.
- **Move items up/down** - Do this by using the **↑** **Move up** and **↓** **Move down** buttons.
- **Insert/Insert before/Remove annotation** - Available for components that allow multiple annotations such as schemas or redefines.
- **Specify an ID for the component annotation** - An optional identifier for the annotation.

Annotations are rendered by default under the graphical representation of the component. When you have a reference to a component with annotations, these annotations are also presented in the diagram below the referenced component. To edit the annotations, use the **Edit Annotations** action from the contextual menu. If the reference component does not have annotations, you can edit the annotations of the referenced component by double-clicking the annotations area. Otherwise, you can edit the referenced component annotations only if you go to the definition of the component.

Note:

For imported/included components that do not belong to the currently edited schema, the **Edit Annotations** dialog box presents the annotation as read-only. To edit its annotation, open the schema where the component is defined.

Change XML Schema Version

Use this action to change the XML Schema version of the current document.

Extract Global Element

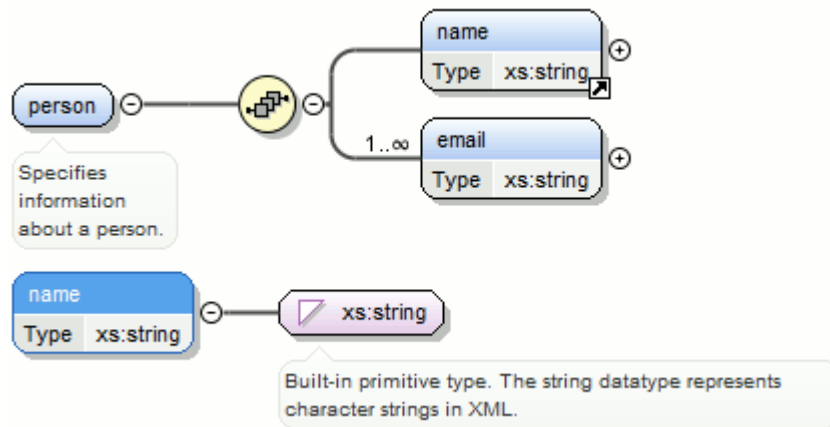

This action is available for local elements. A local element is made global and is replaced with a reference to the global element. The local element properties that are also valid for the global element declaration are kept.

Figure 227. Extracting a Global Element

If you use the **Extract Global Element** action on a `<name>` element, the result is:

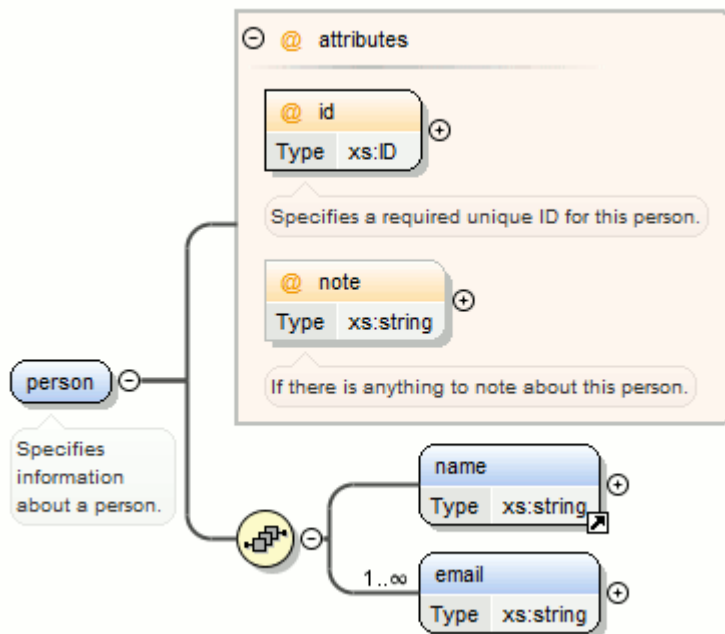

Figure 228. Extracting a Global Element on a <name> Element

Extract Global Attribute

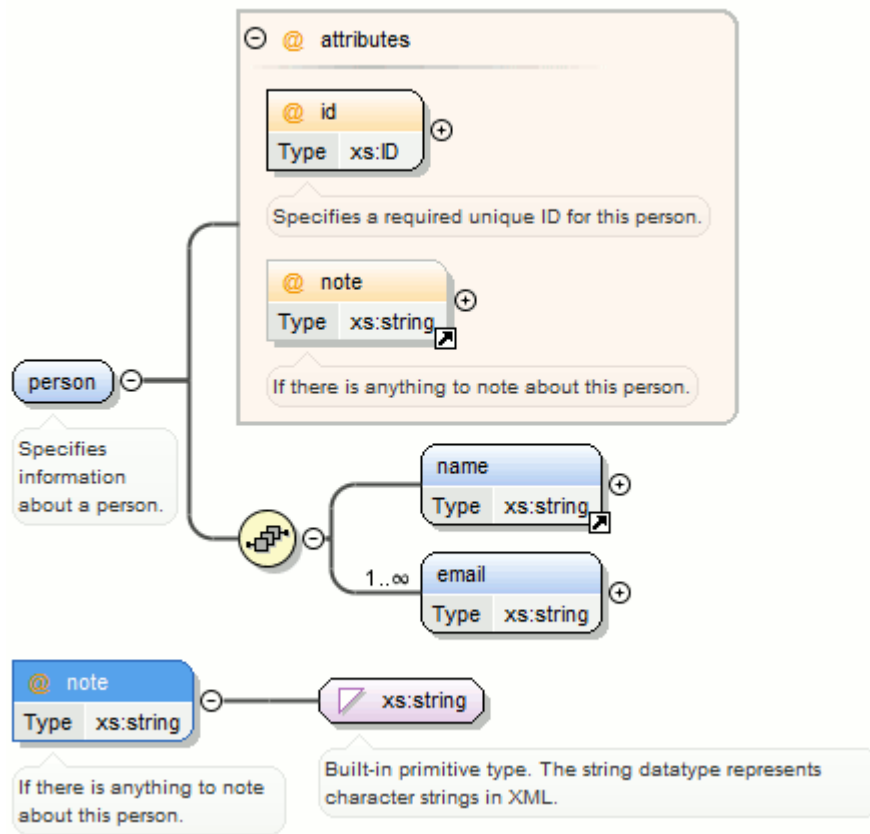

This action is available for local attributes. A local attribute is made global and replaced with a reference to the global attribute. The properties of local attribute that are also valid in the global attribute declaration are kept.

Figure 229. Extracting a Global Attribute

If you use the **Extract Global Attribute** action on a `@note` attribute, the result is:

Figure 230. Extracting a Global Attribute on a @note Attribute

Extract Global Group

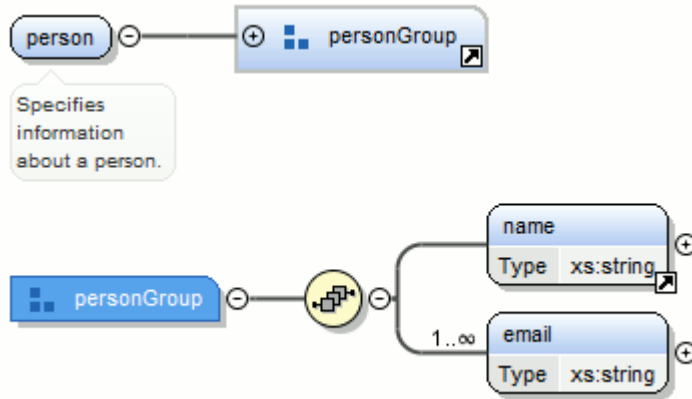

This action is available for compositors (sequence, choice, all). This action extracts a global group and makes a reference to it. The action is available only if the parent of the compositor is not a group.

Figure 231. Extracting a Global Group

If you use the **Extract Global Group** action on the `<sequence>` element, the **Extract Global Component** dialog box is displayed and you can choose a name for the group. If you type `personGroup`, the result is:

Figure 232. Extracting a Global Group on a `<sequence>` Element

Extract Global Type

This action is used to extract an anonymous simple type or an anonymous complex type as global. For anonymous complex types, the action is available on the parent element.

Figure 233. Extracting a Global Simple Type

If you use the action on the `union` component and choose `numericST` for the new global simple type name, the result is:

Figure 234. Extracting a Global Simple Type on a `union` Component

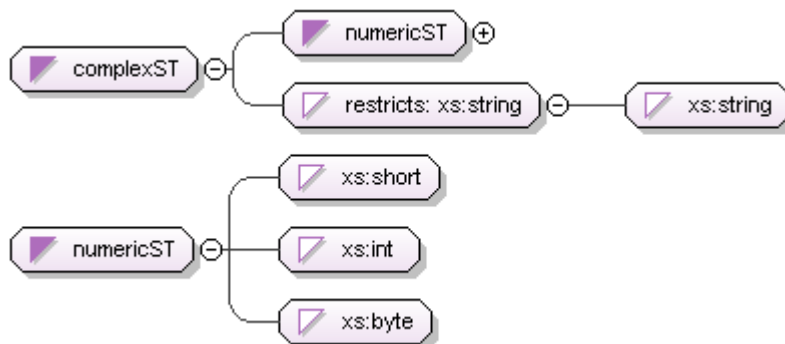

Figure 235. Extracting a Global Complex Type

If you use the action on a `<person>` element and choose `person_type` for the new complex type name, the result is:

Figure 236. Extracting a Global Complex Type on a `<person>` Element

Rename Component in

Renames the selected component.

Cut Ctrl + X (Command + X on macOS)

Cuts the selected component(s).

Copy Ctrl + C (Command + C on macOS)

Copies the selected component(s) to the clipboard.

Copy XPath

This action copies an XPath expression that identifies the selected element or attribute in an instance XML document of the edited schema and places it in the clipboard.

Paste Ctrl + V (Command + V on macOS)

Pastes the component(s) from the clipboard as children of the selected component.

Paste as Reference

Creates references to the copied component(s). If not possible, a warning message is displayed.

Remove Delete

Removes the selected component(s).

Override component

Copies the overridden component in the current XML Schema. This option is available for `xs:override` components.

Redefine component

The referenced component is added in the current XML Schema. This option is available for `xs:redefine` components.

Optional

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `minOccurs` property is set to 0 and the `use` property for attributes is set to `optional`.

Unbounded

Can be performed on element/attribute/group references, local attributes, elements, compositors, and element wildcards. The `maxOccurs` property is set to `unbounded` and the `use` property for attributes is set to `required`.

Search

Can be performed on local elements or attributes. This action makes a reference to a global element or attribute.

Search References

Searches all references of the item found at current cursor position in the defined scope if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Search Occurrences in File

Searches all occurrences of the item found at current cursor position in the current file.

Component Dependencies

Opens the **Component Dependencies view** (*on page 753*) that allows you to see the dependencies for the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources view** (*on page 750*) that allows you to see the references for the currently selected resource.

Show dependent resources

Allows you to see the dependencies for the currently selected resource.

Expand All

Recursively expands all sub-components of the selected component.

Collapse All

Recursively collapses all sub-components of the selected component.

Save as Image

Saves the diagram as image, in JPEG, BMP, SVG or PNG format.

Generate Sample XML Files

Generates XML files using the current opened schema. The selected component is the XML document root. See more in the [Generate Sample XML Files \(on page 758\)](#) section.

Flatten Schema

Recursively adds the components of included Schema files to the main one. It also flattens every imported XML Schema from the hierarchy.

Options

Opens the [Schema preferences page \(on page 160\)](#).

XML Schema Components

A schema diagram contains a series of interconnected components. To quickly identify the relation between two connected components, the connection is represented as:

- A thick line to identify a connection with a required component (in the following image, `<family>` is a required element).

Figure 237. Example: Required Component

- A thin line to identify a connection with an optional component (in the following image, `<email>` is an optional element).

Figure 238. Example: Optional Component

The topics in this section provide details about all of the available components and their symbols as they appear in an XML schema diagram.

xs:schema

Figure 239. The *xs:schema* Component

Defines the root element of a schema. A schema document contains representations for a collection of schema components, such as type definitions and element declarations, that have a common target namespace. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-schema>.

By default, it displays the *targetNamespace* property when rendered.

Table 9. *xs:schema* Properties

Property Name	Description	Possible Values
Target Namespace	The schema target namespace	Any URI
Element Form Default	Determining whether or not local element declarations will be namespace-qualified by default	qualified, unqualified, [Empty] (default value is unqualified)
Attribute Form Default	Determining whether or not local attribute declarations will be namespace-qualified by default	qualified, unqualified, [Empty] (default value is unqualified)
Block Default	Default value of the <i>block</i> attribute of <i>xs:element</i> and <i>xs:complexType</i>	#all, extension, restriction, substitution, restriction extension, restriction substitution, extension substitution, restriction extension substitution, [Empty]
Final Default	Default value of the <i>final</i> attribute of <i>xs:element</i> and <i>xs:complexType</i>	#all, restriction, extension, restriction extension, [Empty]
Default Attributes	Specifies a set of attributes that apply to every complex Type in a schema document	Any
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##defaultNamespace, ##targetNamespace, ##local
Version	Schema version	Any token

Table 9. *xs:schema* Properties (continued)

Property Name	Description	Possible Values
ID	The schema ID	Any ID
Component	The edited component name	Not editable property
System-ID	The schema system ID	Not editable property

xs:element

Figure 240. The *xs:element* Component

Defines an element. An element declaration is an association of a name with a type definition, either simple or complex, an (optional) default value and a (possibly empty) set of identity-constraint definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-element>.

An element by default displays the following properties when rendered in the diagram: *default*, *fixed*, *abstract* and *type*. When referenced or declared locally, the element graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the element are drawn using dotted lines if the element is optional.

Table 10. *xs:element* Properties

Property Name	Description	Possible Values	Mentions
Name	The element name (always required)	Any NCName for global or local elements, any <i>QName</i> (on page 2681) for element references	If missing, will be displayed as '[element]' in diagram
Is Reference	When set, the local element is a reference to a global element	true/false	Appears only for local elements
Type	The element type	All declared or built-in types. In addition, the fol-	For all elements.

Table 10. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
		lowing anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC].	For references, the value is set in the referenced element.
Base Type	The extended/restricted base type	All declared or built-in types	For elements with complex type, with simple or complex content
Mixed	Defines if the complex type content model will be mixed	true/false	For elements with complex type
Content	The content of the complex type	simple/complex	For elements with complex type that extends/restricts a base type. It is automatically detected
Content Mixed	Defines if the complex content model will be mixed	true/false	For elements with complex type that has a complex content

Table 10. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
Default	Default value of the element. A default value is automatically assigned to the element when no other value is specified	Any string	The fixed and default attributes are mutually exclusive
Fixed	A simple content element may be fixed to a specific value using this attribute. A fixed value is also automatically assigned to the element and you cannot specify another value.	Any string	The fixed and default attributes are mutually exclusive
Min Occurs	Minimum number of occurrences of the element	A numeric positive value. Default value is 1	Only for references/local elements
Max Occurs	Maximum number of occurrences of the element	A numeric positive value (default value is 1)	Only for references/local elements
Substitution Group	Qualified name of the head of the substitution group that this element belongs to	All declared elements. For XML Schema 1.1 this property supports multiple values.	For global and reference elements
Abstract	Controls whether or not the element may be used directly in instance XML documents. When set to true, the element may still be used to define content models, but it must be substituted through a substitution group in the instance document.	true/false	For global elements and element references
Form	Defines if the element is "qualified" (belongs to the target namespace) or "unqualified" (doesn't belong to any namespace)	unqualified/qualified	Only for local elements

Table 10. *xs:element* Properties (continued)

Property Name	Description	Possible Values	Mentions
Nil-able	When this attribute is set to true, the element can be declared as nil using an <i>xsi:nil</i> attribute in the instance documents	true/false	For global elements and element references
Target Namespace	Specifies the target namespace for local element and attribute declarations. The namespace URI may be different from the schema target namespace. This property is available for local elements only.	Not editable property	For all elements
Block	Controls if the element can be subject to a type or substitution group substitution. '#all' blocks any substitution, 'substitution' blocks any substitution through substitution groups and 'extension'/'restriction' block any substitution (both through <i>xsi:type</i> and substitution groups) by elements or types, derived respectively by extension or restriction from the type of the element. Its default value is defined by the <i>blockDefault</i> attribute of the parent <i>xs:schema</i> .	#all, restriction, extension, substitution, extension restriction, extension substitution, restriction substitution, restriction extension substitution	For global elements and element references
Final	Controls whether the element can be used as the head of a substitution group for elements whose types are derived by extension or restriction from the type of the element. Its default value is defined by the <i>finalDefault</i> attribute of the parent <i>xs:schema</i> .	#all, restriction, extension, restriction extension, [Empty]	For global elements and element references
ID	The component ID	Any ID	For all elements
Component	The edited component name	Not editable property	For all elements
Namespace	The component namespace	Not editable property	For all elements
System ID	The component system ID	Not editable property	For all elements

xs:attribute

Figure 241. The *xs:attribute* Component

Defines an attribute. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-attribute>.

An attribute by default displays the following properties when rendered in the diagram: *default*, *fixed*, *use* and *type*. Connectors to the attribute are drawn using dotted lines if the attribute use is optional. The attribute name is stroked out if prohibited.

Table 11. *xs:attribute* Properties

Property Name	Description	Possible Value	Mentions
Name	Attribute name (always required)	Any NCName for global/local attributes, all declared attributes' <i>QName (on page 2681)</i> for references	For all local or global attributes. If missing, will be displayed as '[attribute]' in the diagram.
Is Reference	When set, the local attribute is a reference	true/false	For local attributes
Type	Qualified name of a simple type	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for creating anonymous simple types more easily.	For all attributes. For references, the type is set to the referenced attribute.
Default	Default value. When specified, an attribute is added by the schema processor (if it is missing from the instance XML document) and it is given this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.

Table 11. *xs:attribute* Properties (continued)

Property Name	Description	Possible Value	Mentions
Fixed	When specified, the value of the attribute is fixed and must be equal to this value. The default and fixed attributes are mutually exclusive.	Any string	For all local or global attributes. For references the value is from the referenced attribute.
Use	Possible usage of the attribute. Marking an attribute "prohibited" is useful to exclude attributes during derivations by restriction.	optional, required, prohibited	For local attributes
Form	Specifies whether or not the attribute is qualified (must have a namespace prefix in the instance XML document). The default value for this attribute is specified by the <i>attributeFormDefault</i> attribute of the <i>xs:schema</i> document element.	unqualified/qualified	For local attributes
In-heri-table	Specifies if the attribute is inheritable. Inheritable attributes can be used by <alternative> element on descendant elements	true/false	For all local or global attributes. The default value is false. This property is available for XML Schema 1.1.
Target Name-space	Specifies the target namespace for local attribute declarations. The namespace URI may be different from the schema target namespace.	Any URI	Setting a target namespace for local attribute is useful only when restricts attributes of a complex type that is declared in other schema with a different target namespace. This property is available for XML Schema 1.1.
ID	The component ID	Any ID	For all attributes
Component	The edited component name	Not editable property	For all attributes
Name-space	The component namespace	Not editable property	For all attributes

Table 11. *xs:attribute* Properties (continued)

Property Name	Description	Possible Value	Mentions
Sys-tem ID	The component system ID	Not editable property	For all attributes

xs:attributeGroup

Figure 242. The *xs:attributeGroup* Component

Defines an attribute group to be used in complex type definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-attributeGroup>.

Table 12. *xs:attributeGroup* Properties

Property Name	Description	Possible Values	Mentions
Name	Attribute group name (always required)	Any NCName for global attribute groups, all declared attribute groups for reference	For all global or referenced attribute groups. If missing, will be displayed as '[attribute-Group]' in diagram.
ID	The component ID	Any ID	For all attribute groups
Component	The edited component name	Not editable property	For all attribute groups
Name-space	The component namespace	Not editable property	For all attribute groups
Sys-tem ID	The component system ID	Not editable property	For all attribute groups

xs:complexType

Figure 243. The *xs:complexType* Component

Defines a top-level complex type. Complex Type Definitions provide for: See more data at <http://www.w3.org/TR/xmlschema11-1/#element-complexType>.

- Constraining element information items by providing Attribute Declarations governing the appearance and content of attributes.
- Constraining element information item children to be empty, or to conform to a specified element-only or mixed content model, or else constraining the character information item children to conform to a specified simple type definition.
- Using the mechanisms of Type Definition Hierarchy to derive a complex type from another simple or complex type.
- Specifying post-schema-validation info set contributions for elements.
- Limiting the ability to derive additional types from a given complex type.
- Controlling the permission to substitute, in an instance, elements of a derived type for elements declared in a content model to be of a given complex type.

Tip:

A complex type that is a base type to another type will be rendered with yellow background.

Table 13. *xs:complexType* Properties

Property Name	Description	Possible Values	Mentions
Name	The name of the complex type (always required)	Any NC-Name	Only for global complex types. If missing, will be displayed as '[complexType]' in diagram.
Base Type Definition	The name of the extended/restricted types	Any from the declared simple or complex types	For complex types with simple or complex content
Derivation Method	The derivation method	restriction/ extension	Only when base type is set. If the base type is a simple type, the derivation method

Table 13. *xs:complexType* Properties (continued)

Property Name	Description	Possible Values	Mentions
			is always extension.
Content	The content of the complex type	simple/ complex	For complex types that extend/restrict a base type. It is automatically detected.
Content Mixed	Specifies if the complex content model will be mixed	true/ false	For complex contents
Mixed	Specifies if the complex type content model will be mixed	true/ false	For global and anonymous complex types
Abstract	When set to <i>true</i> , this complex type cannot be used directly in the instance documents and needs to be substituted using an <i>xsi:type</i> attribute	true/ false	For global and anonymous complex types
Block	Controls if a substitution (either through a <i>xsi:type</i> or substitution groups) can be performed for a complex type, which is an extension or a restriction of the current complex type. This attribute can only block such substitutions (it cannot "unblock" them), which can also be blocked in the element definition. The default value is defined by the <i>blockDefault</i> attribute of <i>xs:schema</i> .	all, extension, restriction, extension restriction, [Empty]	For global complex types
Final	Controls whether the complex type can be further derived by extension or restriction to create new complex types	all, extension, restriction, extension restriction, [Empty]	For global complex types

Table 13. *xs:complexType* Properties (continued)

Property Name	Description	Possible Values	Mentions
Default Attributes Apply	The <i>schema</i> element can carry a <i>defaultAttributes</i> attribute, which identifies an attribute group. Each <i>complexType</i> defined in the schema document then automatically includes that attribute group, unless this is overridden by the <i>defaultAttributesApply</i> attribute on the <i>complexType</i> element.	true/ false	This property is available only for XML Schema 1.1
ID	The component ID	Any ID	For all complex types
Component	The edited component name	Not editable property	For all complex types
Namespace	The component namespace	Not editable property	For all complex types
System ID	The component system ID	Not editable property	For all complex types

xs:simpleType

Figure 244. The *xs:simpleType* Component

Defines a simple type. A simple type definition is a set of constraints on strings and information about the values they encode, applicable to the normalized value of an attribute information item or of an element information item with no element children. Informally, it applies to the values of attributes and the text-only content of elements. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-simpleType>.

**Tip:**

A simple type that is a base type to another type will be rendered with yellow background.

Table 14. *xs:simpleType* Properties

Name	Descrip- tion	Possible Values	Scope
Name	Simple type name. Always required.	Any NCName	Only for global simple types. If missing, will be displayed as '[simpleType]' in diagram.
Derivation	A simple type category	restriction, list, or union	For all simple types
Base Type	A simple type definition component. Required if derivation method is set to restriction.	All global simple types and built-in simple types. In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to restriction
Item Type	A simple type definition component. Required if derivation method is set to list.	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous restriction], [anonymous list], [anonymous union] for easily create anonymous simple types.	For global and anonymous simple types with the derivation method set to list. Derivation by list is the process of transforming a simple datatype (named the item type) into a whitespace-separated list of values from this datatype. The item type can be defined inline by adding a simpleType definition as a child element of the list element, or by reference, using the itemType attribute (it is an error to use both).
Member Types	Category for grouping union members	Not editable property	For global and anonymous simple types with the derivation method set to union
Member	A simple type definition component. Re-	All global simple types and built-in simple types(from schema for schema). In addition another 3 proposals are present: [anonymous re-	For global and anonymous simple types with the derivation method set to union. Deriving a simple datatype by union merges the lexical spaces of several simple datatypes (called member types) to create a new simple datatype. The member types can be defined either by ref-

Table 14. *xs:simpleType* Properties (continued)

Name	Description	Possible Values	Scope
	quired if derivation method is set to union.	striction], [anonymous list], [anonymous union] for easily create anonymous simple types.	erence (through the memberTypes attribute) or embedded as simple datatype local definitions in the xs:union element. Both styles can be mixed.
Final	Blocks any further derivations of this datatype (by list, union, derivation or all)	#all, list, restriction, union, list restriction, list union, restriction union. In addition, [Empty] proposal is present for set empty string as value.	Only for global simple types
ID	The component ID	Any ID	For all simple types
Component	The name of the edited component	Not editable property	Only for global and local simple types
Namespace	The component namespace	Not editable property	For global simple types
System ID	The component system ID	Not editable property	Not present for built-in simple types

xs:alternative

The *type alternatives* mechanism allows you to specify type substitutions on an element declaration.

Note:

xs:alternative is available for XML Schema 1.1.

Figure 245. The *xs:alternative* Component

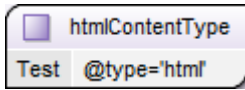

Table 15. *xs:alternative* Properties

Name	Description	Possible Values
Type	Specifies type substitutions for an element, depending on the value of the attributes	All declared or built-in types. In addition, the following anonymous types are available: [ST-restriction], [ST-union], [ST-list], [CT-anonymous], [CT-extension SC], [CT-restriction SC], [CT-restriction CC], [CT-extension CC]
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##defaultNamespace, ##targetNamespace, ##local
ID	Specifies the component ID	Any ID
Component	Specifies the type of XML schema component	Not editable property
System ID	Points to the document location of the schema	Not editable property

xs:group

Figure 246. The *xs:group* Component

Defines a group of elements to be used in complex type definitions. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-group>.

When referenced, the graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the group are drawn using dotted lines if the group is optional.

Table 16. *xs:group* Properties

Property Name	Description	Possible Values	Mentions
Name	The group name (always required)	Any NCName for global groups, all declared groups for reference	If missing, will be displayed as '[group]' in diagram
Min Occurs	Minimum number of occurrences of the group	A numeric positive value. Default value is 1	Appears only for reference groups
Max Occurs	Maximum number of occurrences of the group	A numeric positive value. Default value is 1	Appears only for reference groups
ID	The component ID	Any ID	For all groups
Component	The edited component name	Not editable property	For all groups
Name-space	The component name-space	Not editable property	For all groups
System ID	The component system ID	Not editable property	For all groups

xs:include

Figure 247. The *xs:include* Component

Adds multiple schemas with the same target namespace to a document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-include>.

Table 17. *xs:include* properties

Property Name	Description	Possible Values
Schema Location	Included schema location	Any URI
ID	Include ID	Any ID
Component	The component name	Not editable property

xs:import

Figure 248. The *xs:import* Component

Adds multiple schemas with a different target namespace to a document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-import>.

Table 18. *xs:import* Properties

Property Name	Description	Possible Values
Schema Location	Imported schema location	Any URI
Namespace	Imported schema namespace	Any URI
ID	Import ID	Any ID
Component	The component name	Not editable property

xs:redefine

Figure 249. The *xs:redefine* Component

Redefines simple and complex types, groups, and attribute groups from an external schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-redefine>.

Table 19. *xs:redefine* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location	Any URI
ID	Redefine ID	Any ID
Component	The component name	Not editable property

xs:override

Figure 250. The *xs:override* Component

The override construct allows replacements of old components with new ones without any constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-override>.

Table 20. *xs:override* Properties

Property Name	Description	Possible Values
Schema Location	Redefine schema location	Any URI
ID	Redefine ID	Any ID

xs:notation

Figure 251. The *xs:notation* Component

Describes the format of non-XML data within an XML document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-notation>.

Table 21. *xs:notation* Properties

Property Name	Description	Possible values	Mentions
Name	The notation name (always required)	Any NCName	If missing, will be displayed as '[notation]' in diagram
System Identifier	The notation system identifier	Any URI	Required if public identifier is absent (otherwise, optional)
Public Identifier	The notation public identifier	A Public ID value	Required if system identifier is absent (otherwise, optional)
ID	The component ID	Any ID	For all notations
Component	The edited component name	Not editable property	For all notations
Namespace	The component namespace	Not editable property	For all notations
System ID	The component system ID	Not editable property	For all notations

xs:sequence / xs:choice / xs:all

Figure 252. *xs:sequence*

xs:sequence specifies that the child elements must appear in a sequence. Each child element occurs once by default. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-sequence>.

Figure 253. *xs:choice*

xs:choice allows only one of the elements contained in the declaration to be present within the containing element. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-choice>.

Figure 254. *xs:all*

xs:all specifies that the child elements can appear in any order. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-all>.

The compositor graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the compositor are drawn using dotted lines if the compositor is optional.

Table 22. *xs:sequence*, *xs:choice*, *xs:all* Properties

Property Name	Description	Possible Values	Mentions
Compositor	Compositor type	sequence, choice, all	'all' is only available as a child of a group or complex type
Min Occurs	Minimum occurrences of compositor	A numeric positive value. Default is 1	The property is not present if compositor is 'all' and is child of a group
Max Occurs	Maximum occurrences of compositor	A numeric positive value. Default is 1	The property is not present if compositor is 'all' and is child of a group
ID	The component ID	Any ID	For all compositors
Component	The edited component name	Not editable property	For all compositors
System ID	The component system ID	Not editable property	For all compositors

xs:any

Figure 255. The *xs:any* Component

Enables the author to extend the XML document with elements not specified by the schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-any>.

The graphical representation also contains the value for the *minOccurs* and *maxOccurs* properties (for 0..1 and 1..1 occurs the values are implied by the connector style) and the connectors to the wildcard are drawn using dotted lines if the wildcard is optional.

Table 23. xs:any Properties

Property Name	Description	Possible Values
Name-space	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
not-Name-space	Specifies the namespace that extension elements or attributes cannot come from	##local, ##targetNamespace
notQ-Name	Specifies an element or attribute that is not allowed	##defined
Process-Contents	Type of validation required on the elements allowed for this wildcard	skip, lax, strict
Min Occurs	Minimum occurrences of any	A numeric positive value. Default is 1
Max Occurs	Maximum occurrences of any	A numeric positive value. Default is 1
ID	The component ID	Any ID
Component	The name of the edited component	Not editable property
System ID	The component system ID	Not editable property

xs:anyAttribute

Figure 256. The *xs:anyAttribute* Component

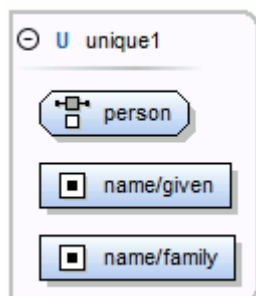

Enables the author to extend the XML document with attributes not specified by the schema. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-anyAttribute>.

Table 24. *xs:anyAttribute* Properties

Property Name	Description	Possible Value
Name-space	The list of allowed namespaces. The namespace attribute expects a list of namespace URIs. In this list, two values have a specific meaning: '##targetNamespace' stands for the target namespace, and '##local' stands for local attributes (without namespaces).	##any, ##other, ##targetNamespace, ##local or anyURI
Process-Contents	Type of validation required on the elements allowed for this wildcard	skip, lax, strict
ID	The component ID	Any ID
Component	The name of the edited component	Not editable property
System ID	The component system ID	Not editable property

xs:unique

Figure 257. The *xs:unique* Component

Defines that an element or an attribute value must be unique within the scope. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-unique>.

Table 25. *xs:unique* Properties

Property Name	Description	Possible Values
Name	The unique name (always required)	Any NCName
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:key

Figure 258. The *xs:key* Component

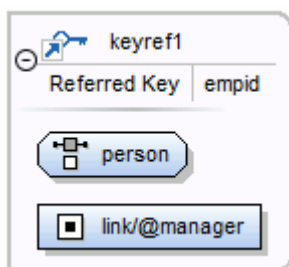

Specifies an attribute or element value as a key (unique, non-nullable and always present) within the containing element in an instance document. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-key>.

Table 26. *xs:key* Properties

Property Name	Description	Possible Value
Name	The key name (always required)	Any NCName
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:keyRef

Figure 259. The *xs:keyRef* Component

Specifies that an attribute or element value corresponds to that of the specified key or unique element. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-keyref>.

A keyref by default displays the *Referenced Key* property when rendered.

Table 27. *xs:keyRef* Properties

Property Name	Description	Possible Values
Name	The keyref name (always required)	Any NCName
Referenced Key	The name of referenced key	Any declared element constraints
ID	The component ID	Any ID
Component	The edited component name	Not editable property
Namespace	The component namespace	Not editable property
System ID	The component system ID	Not editable property

xs:selector

Figure 260. The *xs:selector* Component

Specifies an XPath expression that selects a set of elements for an identity constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-selector>.

Table 28. *xs:selector* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the element that the constraint applies to	An XPath expression
ID	The component ID	Any ID

Table 28. *xs:selector* Properties (continued)

Property Name	Description	Possible Values
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:field

Figure 261. The *xs:field* Component

Specifies an XPath expression that specifies the value used to define an identity constraint. See more info at <http://www.w3.org/TR/xmlschema11-1/#element-field>.

Table 29. *xs:field* Properties

Property Name	Description	Possible Values
XPath	Relative XPath expression identifying the field(s) composing the key, key reference, or unique constraint	An XPath expression
ID	The component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:assert

Assertions provide a flexible way to control the occurrence and values of elements and attributes available in an XML Schema.

**Note:**

xs:assert is available for XML Schema 1.1.

Figure 262. The *xs:assert* Component

Table 30. *xs:assert* Properties

Property Name	Description	Possible Values
Test	Specifies an XPath expression. If the XPath condition is valid, the specified type is selected as the element type. The expressions allowed are limited to a subset of XPath 2.0. Only the attributes of the current element and inheritable attributes from ancestor elements are accessible in the XPath expression. When you edit this property, the content completion list of proposals offers XPath expressions.	An XPath expression
XPath Default Namespace	The default namespace used when the XPath expression is evaluated	##default-namespace, ##target-namespace, ##local
ID	Specifies the component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

xs:openContent

Figure 263. The *xs:openContent* Component

The *openContent* element enables instance documents to contain extension elements to be inserted amongst the elements declared by the schema. You can declare open content for your elements at one place (within the *complexType* definition) or at the schema level.

For further details about the *openContent* component, go to <http://www.w3.org/TR/xmlschema11-1/#element-openContent>.

Table 31. *xs:openContent* Properties

Property Name	Description	Possible Value
Mode	Specifies where the extension elements can be inserted	The value can be: "interleave", "suffix" or "none". The default value is "interleave".
ID	The component ID	Any ID
Component	The edited component name	Not editable property
System ID	The component system ID	Not editable property

**Note:**

This component is available for XML Schema 1.1 only. To change the version of the XML Schema, open the **Preferences** dialog box (on page 70) and go to **XML > XML Parser > XML Schema**.

Constructs Used to Group Schema Components

This section explains the components that can be used for grouping other schema components.

Attributes

Figure 264. Attributes Construct

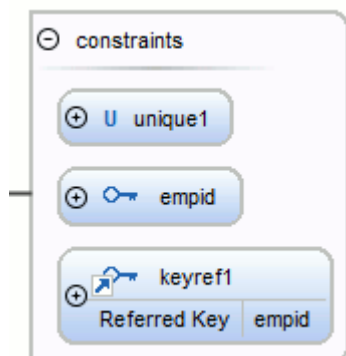

Groups all attributes and attribute groups belonging to a complex type.

Table 32. *attributes* Properties

Property Name	Description	Possible Values
Component	The element that has the attributes displayed	Not editable property
System ID	The component system ID	Not editable property

Constraints

Figure 265. Constraints Construct

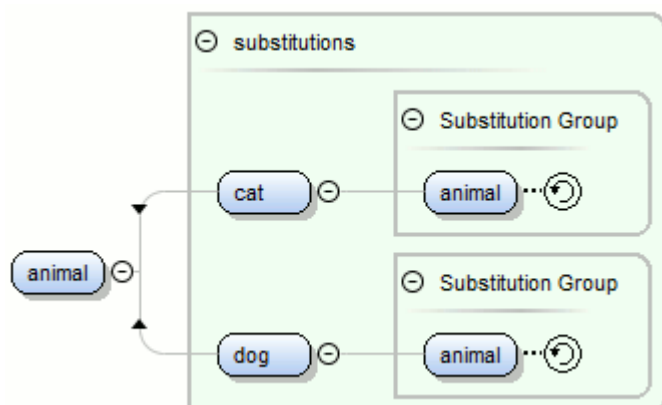

Groups all constraints (*xs:key* (on page 735), *xs:keyRef* (on page 736), or *xs:unique* (on page 734)) belonging to an element.

Table 33. *constraints* Properties

Property Name	Description	Possible Values
Component	The element that has the constraints displayed	Not editable property
System ID	The component system ID	Not editable property

Substitutions

Figure 266. Substitutions Construct

Groups all elements that can substitute the current element.

Table 34. *substitutions* Properties

Property Name	Description	Possible Values
Component	The element that has the substitutions displayed	Not editable property
System ID	The component system ID	Not editable property

Schema Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor Eclipse plugin [XML documents validation \(on page 544\)](#) capability.

Figure 267. XML Schema Validation

A schema validation error is presented by highlighting the invalid component:

- In the [Attributes View \(on page 748\)](#).
- In the diagram by surrounding the component that has the error with a red border.

Invalid facets for a component are highlighted in the [Facets View \(on page 704\)](#).

Components with invalid properties are rendered with a red border. This is a default color, but you can customize it in the [Document checking user preferences \(on page 133\)](#). When hovering an invalid component, the tooltip will present the validation errors associated with that component.

When editing a value that is supposed to be a qualified or unqualified XML name, the application provides automatic validation of the entered value. This proves to be very useful in avoiding setting invalid XML names for the given property.

If you validate the entire schema using the **Validate** action from the **XML** menu or from the **Validation** toolbar drop-down menu, all validation errors will be presented in the **Errors** tab. To resolve an error, just click it (or double-click for errors located in other schemas) and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Important:

If the schema imports only the namespace of other schema without specifying the schema location and a [catalog is set up \(on page 594\)](#) that maps the namespace to a certain location both the validation and the diagram will correctly identify the imported schema.

**Tip:**

If the validation action finds that the schema contains unresolved references, the application will suggest the use of validation scenarios, but only if the currently edited schema is an XML Schema module.

Edit Schema Namespaces

You can use the **XML Schema Namespaces** dialog box to easily set a target namespace and define namespace mappings for a newly created XML Schema. In the **Design** mode these namespaces can be modified anytime by choosing **Edit Schema Namespaces** from the contextual menu. You can also do this by double-clicking the schema root in the diagram.

The **XML Schema Namespaces** dialog box allows you to edit the following information:

- **Target namespace** - The target namespace of the schema.
- **Prefixes** - The dialog box displays a table with namespaces and the mapped prefixes. You can add a new prefix mapping or remove an already existing one.

Editing XML Schema in Text Editing Mode

The Oxygen XML Editor Eclipse plugin **Text** editing mode can be used for editing XML Schema in a source editing mode. It offers powerful content completion support, a synchronized Outline view, and multiple [refactoring actions \(on page 755\)](#). The Outline view has two display modes: the [standard outline \(on page 326\)](#) mode and the [components \(on page 746\)](#) mode.

A diagram of the XML Schema can be presented side by side with the text. To activate the diagram presentation, select the [Show Full Model XML Schema diagram option \(on page 161\)](#) in the **Diagram preferences page (on page 161)**.

Modular Contextual XML Schema Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex XML Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor Eclipse plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main XML document either using the [main files support from the Project Explorer view \(on page 278\)](#), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of a [main file \(on page 2680\)](#) include:

- Correct validation of a module in the context of a larger schema structure.
- *Content Completion Assistant* (on page 2677) displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.
- The **Outline view** (on page 746) displays the components collected from the entire schema structure.

Validating XML Schema Documents

By default, XML Schema files are validated as you type. To change this, open the **Preferences** dialog box (on page 70), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (on page 133).

To validate an XML Schema document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor Eclipse plugin validates an XML Schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Some validation messages have an icon () in the **Info** column in the *Results view* (on page 335) or at the bottom of the main editor and clicking it opens a dialog box with additional information and a link to the W3C specification exactly at the location where the error is described, thus allowing you to understand the reason for that error.

Validation of an XML Schema containing a type definition with a `@minOccurs` or `@maxOccurs` attribute having a value larger than 256 limits the value to 256 and issues a warning about this restriction in the Message panel at the bottom of the Oxygen XML Editor Eclipse plugin window. Otherwise, for large values of the `@minOccurs` and `@maxOccurs` attributes, the validator fails with an **OutOfMemory** error that might make Oxygen XML Editor Eclipse plugin unusable without restarting the entire application.

Important:

If the schema imports only a namespace without specifying the schema location and a `catalog` is set up (on page 594) to map the namespace to a certain location, both validation and the schema components will correctly identify the imported schema.

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor Eclipse plugin offers *Quick Fixes* (on page 2682) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:**

For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor Eclipse plugin provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

[Schematron Quick Fixes \(SQF\) \(on page 584\)](#)

Content Completion in XML Schema

The intelligent *Content Completion Assistant* (on page 2677) allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (on page 70), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 119).

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list,

the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

Depending on the [selected schema version \(on page 783\)](#), Oxygen XML Editor Eclipse plugin populates the proposals list with information taken either from XML Schema 1.0 or 1.1.

Oxygen XML Editor Eclipse plugin helps you to easily reference a component by providing the list of proposals (complex types, simple types, elements, attributes, groups, attribute groups, or notations) valid in the current context. The components are collected from the current file or from the imported/included schemas.

When editing `<xs:annotation>` or `<xs:appinfo>` elements of an XML Schema, the *Content Completion Assistant* proposes elements and attributes from a custom schema (by default ISO Schematron). This feature can be configured from the [XSD Content Completion \(on page 131\)](#) preferences page.

Syntax Highlighting in XML Schema

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XML Schema files, follow these steps:

1. Open the **Preferences** dialog box [\(on page 70\)](#).
2. Go to **Editor > Syntax Highlight** [\(on page 176\)](#).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XSD** tab in the **Preview** pane to see the effects of your changes.

Tip:

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the [Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page \(on page 176\)](#).

Related Information:

[Customize Syntax Highlight colors \(on page 176\)](#)

XML Schema Outline View

The **Outline** view for XML Schemas presents all the global components grouped by their location, namespace, or type. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 268. Outline View for XML Schema

The **Outline** view provides the following options in the **View Menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches;

Selection update on cursor move

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram is also selected in the **Outline** view.

Sort

Allows you to sort alphabetically the schema components.

Show all components

Displays all components that were collected starting from the *main files (on page 2680)*. Components that are not referable from the current file are marked with an orange underline. To reference them, add an import directive with the `componentNS` namespace.

Show referable components

Displays all components (collected starting from the *main files (on page 2680)*) that can be referenced from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

These three operations allow you to group the components by location, namespace, or type. When grouping by namespace, the main schema target namespace is the first presented in the **Outline** view.

The following contextual menu actions are available in the **Outline** view:

Remove (Delete)

Removes the selected item from the diagram.

Search References

Searches all references of the item found at current cursor position in the defined scope, if any.

Search References in

Searches all references of the item found at current cursor position in the specified scope.

Component Dependencies

Opens the **Component Dependencies view (on page 753)** that allows you to see the dependencies for the currently selected component.

Show referenced resources (F4)

Opens the **Referenced/Dependent Resources view (on page 600)** that allows you to see the references for the currently selected resource.

Show dependent resources (Shift + F4)

Opens the **Referenced/Dependent Resources view (on page 600)** that allows you to see the dependencies for the currently selected resource.

Rename Component in

Renames the selected component.

Generate Sample XML Files

Generate XML files using the currently open schema. The selected component is the XML document root.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

**Tip:**

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search will be searched as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

[XML Schema Component Dependencies View \(on page 753\)](#)

[XML Schema Referenced/Dependent Resources View \(on page 750\)](#)

[Generating Sample XML Files \(on page 758\)](#)

[Modular Contextual Relax NG Schema Editing Using 'Main Files' Support \(on page 830\)](#)

XML Schema Attributes View

The **Attributes** view for XML Schemas presents the properties for the selected component in the schema diagram. By default, it is displayed on the right side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 269. Attributes View

Name	family
Type	[ST - union]
Member Types	
Member	[anonymous restriction]
Base Type	xs:string
Default	
Fixed	
Substitution Group	
Abstract	false
Nillable	false
Block	
Final	
ID	
Component	element
Namespace	
System ID	personal.xsd

The default value of a property is presented in the **Attributes** view with blue foreground. The properties that can not be edited are rendered with gray foreground. A non-editable category that contains at least one child is rendered with bold. Bold properties are properties with values set explicitly to them.

Properties for components that do not belong to the currently edited schema are read-only but if you double-click them you can choose to open the corresponding schema and edit them.

You can edit a property by double-clicking by pressing Enter. For most properties you can choose valid values from a list or you can specify another value. If a property has an invalid value or a warning, it will be highlighted in the table with the corresponding foreground color. By default, properties with errors are highlighted with red and the properties with warnings are highlighted with yellow. You can customize these colors from the [Document checking user preferences \(on page 133\)](#).

For imports, includes and redefines, the properties are not edited directly in the **Attributes** view. A dialog box will open that allows you to specify properties for them.

The schema namespace mappings are not presented in **Attributes** view. You can view/edit these by choosing **Edit Schema Namespaces** from the contextual menu on the schema root. See more in the [Edit Schema Namespaces \(on page 742\)](#) section.

The **Attributes** view has five actions available on the toolbar and also on the contextual menu:

+ Add

Allows you to add a new member type to an union's member types category.

× Remove

Allows you to remove the value of a property.

 **Move Up**

Allows you to move up the current member to an union's member types category.

 **Move Down**

Allows you to move down the current member to an union's member types category.

 **Copy**

Copy the attribute value.

 **Go to Definition**

Shows the definition for the selected type.

Show Facets

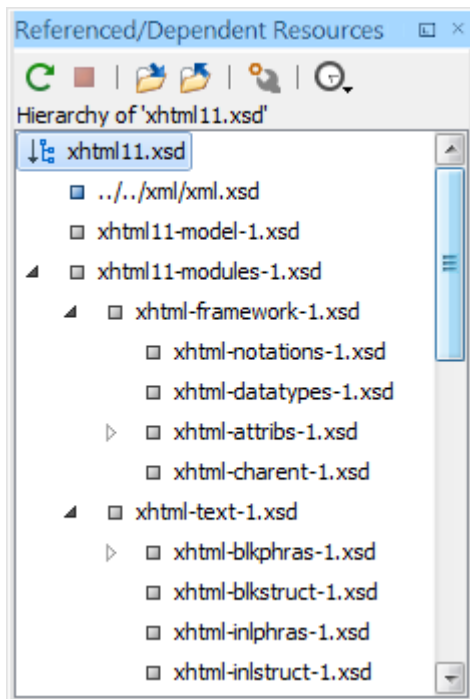

Allows you to edit the facets for a simple type.

XML Schema Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in an XML Schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **Referenced/Dependent Resources** is useful when you want to start from an XML Schema (XSD) file and build and review the hierarchy of all the other XSD files that are imported, included or redefined in the given XSD file. The view is also able to build the tree structure, that is the structure of all other XSD files that import, include or redefine the given XSD file. The scope of the search is configurable (the current project, a set of local folders, etc.)

If you want to see the references or dependencies of an XML schema, select the desired schema in the **Project Explorer view** ([on page 269](#)) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 270. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

 **Refresh**

Refreshes the resource structure.

 **Stop**

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

**Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

**Note:**

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 752\)](#).

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

Moving/Renaming XML Schema Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

XML Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an XML Schema component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named components (for example, elements or attributes).

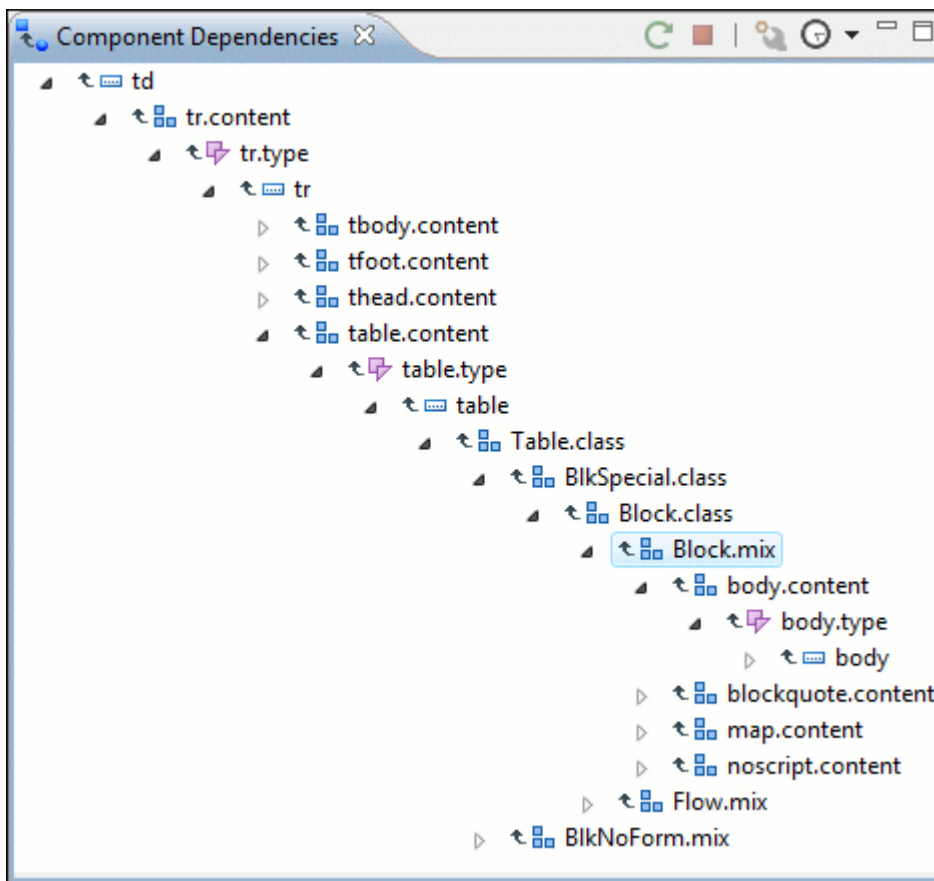

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 271. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

 **History**

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

[Search and Refactor Operations Scope \(on page 600\)](#)

Highlight Component Occurrences

When a component (for example types, elements, attributes) is found at current cursor position, Oxygen XML Editor Eclipse plugin performs a search over the entire document to find the component declaration and all its references. When found, they are highlighted both in the document and in the stripe bar, at the right side of the document. Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected and a new search is performed. All occurrences are removed when you start to edit the document.

This feature is on by default. To configured it, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Mark Occurrences**. A search can also be triggered with the **Search > Search Occurrences in File ()** contextual menu action. All matches are displayed in a separate tab of the **Results view (on page 335)**.

Searching and Refactoring Actions in XML Schemas

Search Actions

The following search actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Search** submenu in the contextual menu of the current editor:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources

determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

Go to Definition

Moves the cursor to the definition of the referenced XML Schema item.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `attribute`, `attributeGroup`, `element`, `group`, `key`, `unique`, `keyref`, `notation`, `simple`, or `complex` types and are available from the **Refactoring** submenu in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 272. Rename Identity Constraint Dialog Box

**Related Information:**

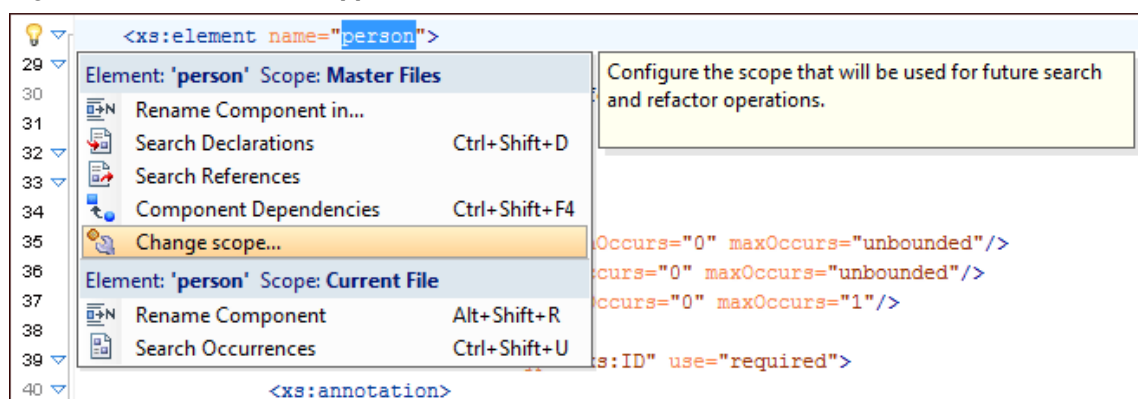

[Search and Refactor Operations Scope \(on page 600\)](#)

XML Schema Quick Assist Support

The *Quick Assist* support (on page 2681) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature (on page 2681) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on macOS) keyboard shortcuts.

Figure 273. Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

 **Rename Component in**

Renames the component and all its dependencies.

 **Search Declarations**

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

 **Search References**

Searches all references of the component in a predefined scope.

 **Component Dependencies**

Searches the component dependencies in a predefined scope.

 **Change Scope**

Configures the scope that will be used for future search or refactor operations.

 **Rename Component**

Allows you to rename the current component in-place.

 **Search Occurrences**

Searches all occurrences of the component within the current file.

Resources

For more information about improving schema development using the **Quick Assist** action set, watch our video demonstration:

<https://www.youtube.com/embed/X-2-gkrFSGU>

[Searching and Refactoring Actions \(on page 755\)](#)

Generating Sample XML Files

Oxygen XML Editor Eclipse plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in [XML Schema preferences page \(on page 195\)](#).

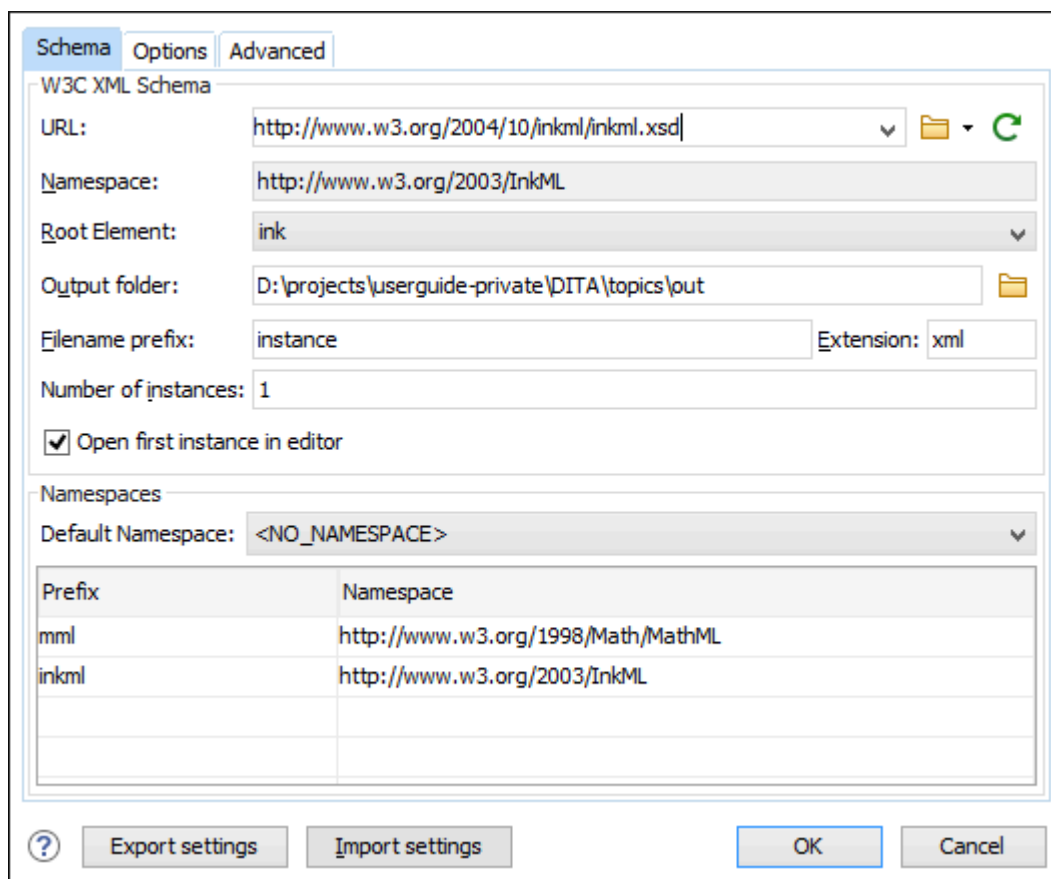

To generate sample XML files from an XML Schema, use the  **Generate Sample XML Files** action from the **XML Tools** menu. This action is also available in the contextual menu of the schema [Design mode \(on page 705\)](#). The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the [Sample XML Files Generator preferences page \(on page 187\)](#).

Schema Tab

The first set of options for the  **Generate Sample XML Files** tool are found in the **Schema** tab.

Figure 274. Generate Sample XML Files Dialog Box (Schema Tab)

This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab

The **Options** tab allows you to set specific options for namespaces and elements.

Figure 275. Generate Sample XML Files Dialog Box (Options Tab)

Namespace	Element
<ANY>	<ANY>

Settings Element values Attribute values

Namespace: <ANY>
 Element: <ANY>

Generate optional elements
 Generate optional attributes

Values of elements and attributes: Default (ignore restrictions)

Preferred number of repetitions: 2
 Maximum recursivity level: 1
 Type alternative strategy: First

"Choice" and "Substitution Group"

Choice strategy: Random

Generate the other options as comments

This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:

If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

- At least one of the restrictions is a `regex`.
- The value generated after applying the `regex` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xsd:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xsd:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xsd:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xsd:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xsd:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.

Figure 276. Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Generating Documentation for an XML Schema

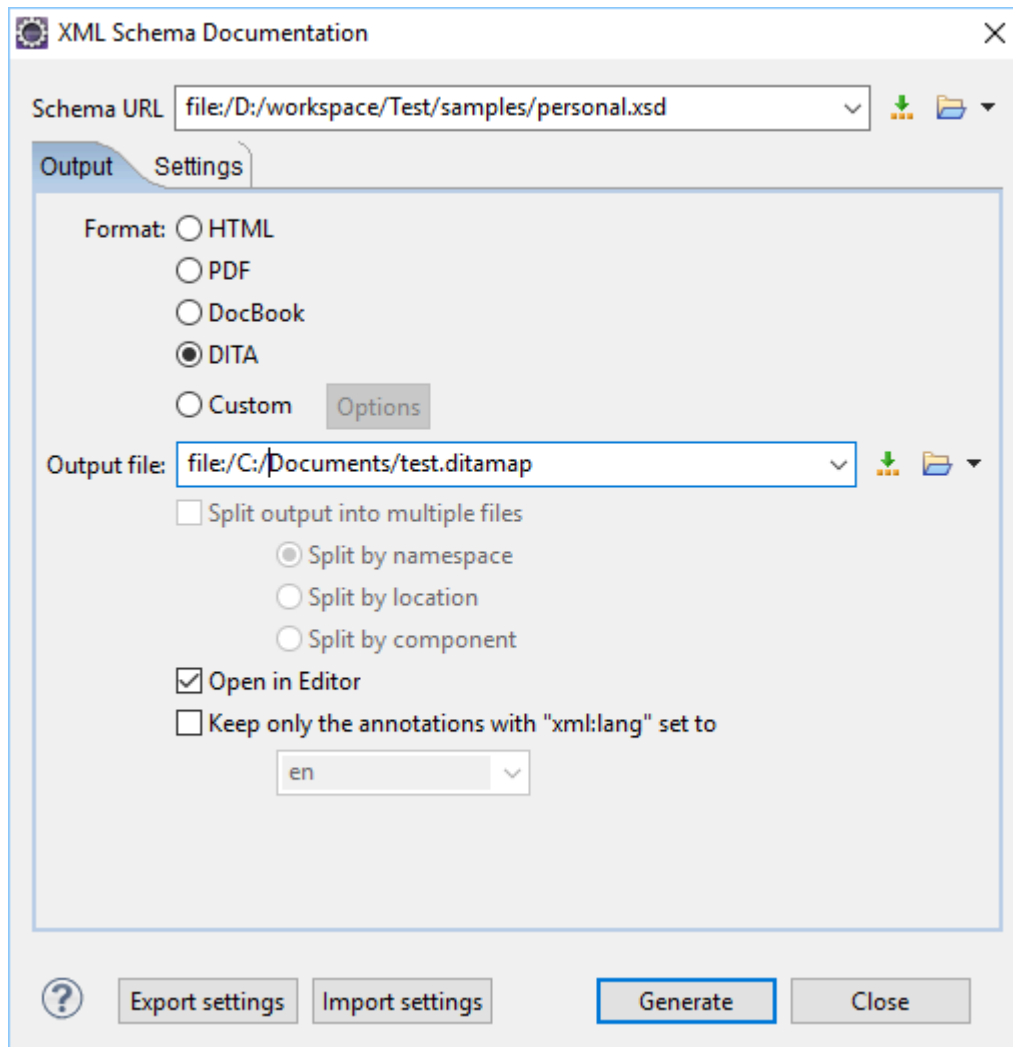

Oxygen XML Editor Eclipse plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

**Note:**

You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate XML Schema Documentation** action from the contextual menu of the **Project Explorer** view (*on page 269*).

Figure 277. XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 769\)](#).
 - **PDF** - The documentation is generated in [PDF output format \(on page 772\)](#).
 - **DocBook** - The documentation is generated in [DocBook output format \(on page 772\)](#).
 - **DITA** - The documentation is generated in [DITA output format \(on page 772\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 772\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor Eclipse plugin (in the current editor).

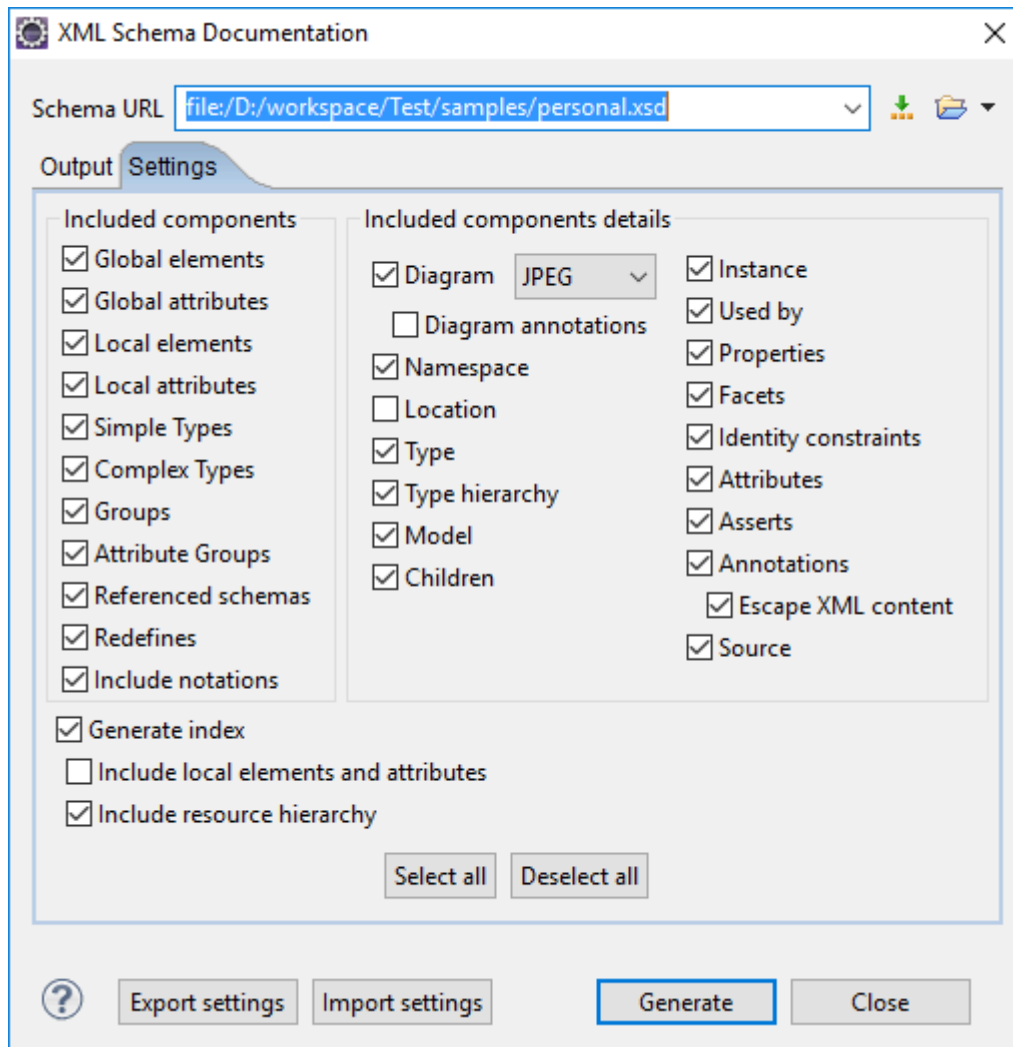

Note:

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure 278. Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties \(on page 160\)](#) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:

- **xs:all** - Its children will be separated by space characters.
- **xs:sequence** - Its children will be separated by comma characters.
- **xs:choice** - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Related Information:

[Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 773\)](#)

Output Formats for Generating XML Schema Documentation

XML Schema documentation can be generated in HTML, PDF, DocBook, or a custom format. You can choose the format from the [Schema Documentation \(on page 764\)](#) dialog box. For the PDF and DocBook formats, the option to split the output in multiple files is not available.

HTML Output Format

The XML Schema documentation generated in HTML format contains images corresponding to the same schema definitions as the ones displayed by [the schema diagram editor](#). (on page 243) These images are divided in clickable areas that are linked to the definitions of the names of types or elements. The documentation of a definition includes a **Used By** section with links to the other definitions that reference it. If the **Escape XML Content** option is unchecked, the HTML or XHTML tags used inside the `<xs:documentation>` elements of the input XML Schema for formatting the documentation text (for example, ``, `<i>`, `<u>`, ``, ``, etc.) are rendered in the generated HTML documentation.

The generated images format is **PNG**. The image of an XML Schema component contains the graphical representation of that component as it is rendered in [the schema diagram panel of the Oxygen XML Editor Eclipse plugin XSD editor panel](#). (on page 244)

Figure 279. XML Schema Documentation Example

The screenshot shows the Oxygen XML Editor's XML Schema Documentation interface. On the left is a 'Table of Contents' with a 'Group by:' dropdown set to 'Location' and a list of elements (email, family, given, link, name, person, personnel, url) and notations (gif). The main area is titled 'Element name' and shows details for the 'name' element. It includes a 'Diagram' showing a graphical representation of the element structure, a 'Properties' section (Content: complex), 'Used by' (Element: person), 'Model' (ALL(family given)), 'Children' (family, given), and 'Instance' (XML code). On the right is a 'Showing:' panel with checkboxes for Annotations, Attributes, Diagrams, Facets, Identity Constraints, Instances, Model, Properties, Source, and Used by.

The generated documentation includes a table of contents. You can group the contents by namespace, location, or component type. After the table of contents there is some information about the main, imported, included, and redefined schemas. This information contains the schema target namespace, schema properties (attribute form default, element form default, version), and schema location.

Figure 280. Information About a Schema

Namespace	No namespace	
Properties 	Attribute Form Default:	unqualified
	Element Form Default:	unqualified
Schema location	file:/D:/personal.xsd	

If you choose to split the output into multiple files, the table of contents is displayed in the left frame. The contents are grouped in the same mode. If you split the output by location, each file contains a schema description and the components that you have chosen to include. If you split the output by namespace, each file contains information about schemas from that namespace and the list with all included components. If you choose to split the output by component, each file contains information about a schema component.

After the documentation is generated, you can collapse or expand details for some schema components by using the **Showing** options or the  **Collapse** or  **Expand** buttons.

Figure 281. Showing Options

Showing:

- Annotations
- Attributes
- Diagrams
- Facets
- Identity Constraints
- Instances
- Properties
- Source
- Used by

For each component included in the documentation, the section presents the component type followed by the component name. For local elements and attributes, the name of the component is specified as *parent name/component name*. You can easily go to the parent documentation by clicking the parent name.

Figure 282. Documentation for a Schema Component

Namespace	No namespace
Annotations	Specifies the person family and given name.
Diagram	<pre> graph LR name((name)) --- complex(()) complex --- family[family Type xs:string] complex --- given[given Type xs:string] </pre>
Properties	Content: complex
Used by	Element: person
Model	ALL(family given)
Children	family, given
Instance	<pre> <name> <family>{1,1}</family> <given>{1,1}</given> </name> </pre>
Source	<pre> <xs:element name="name"> <xs:annotation> <xs:documentation>Specifies the person family and given name.</xs:documentation> </xs:annotation> <xs:complexType> <xs:all> <xs:element ref="family"/> <xs:element ref="given"/> </xs:all> </xs:complexType> </xs:element> </pre>

If the schema contains imported or included modules, their dependencies tree is generated in the documentation.

Figure 283. Example: Generated Documentation

```

[-] mainOffice.xsd
  [+ ↙] dml-chart.xsd
  [+ ↙] dml-main.xsd
  ↙ opc-contentTypes.xsd
  [+ ↙] opc-coreProperties.xsd
  ↙ opc-relationships.xsd
  [+ ↙] pml.xsd
  [+ ↙] shared-documentPropertiesCustom.xsd
  [+ ↙] shared-documentPropertiesExtended.xsd
  [+ ↙] sml.xsd
  [+ ↙] wml.xsd
  
```

PDF Output Format

For the PDF output format, the documentation is generated in DocBook format and a transformation using the FOP processor is applied to obtain the PDF file. To configure the FOP processor, see the [FO Processors \(on page 183\)](#) preferences page.

For information about customizing the PDF output, see [Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 773\)](#).

DocBook Output Format

If you generate the documentation in DocBook output format, the documentation is generated as a DocBook XML file. You can then apply a [built-in DocBook transformation scenario \(on page 1200\)](#) (such as, *DocBook PDF* or *DocBook HTML*) on the output file, or [configure your own transformation scenario \(on page 1206\)](#) to convert it into whatever format you desire.

For information about customizing the DocBook output, see [Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 773\)](#).

DITA Output Format

If you generate the documentation in DITA output format, each element of the schema is converted to a DITA *Topic* and all the generated topics are referenced in a [DITA map \(on page 2678\)](#) file. You can then apply a built-in DITA transformation scenario (such as, *DITA Map PDF* or *DITA Map XHTML*), or [configure your own DITA-OT transformation scenario \(on page 1233\)](#) to convert it into whatever format you desire.

For information about customizing the DITA output, see [Customizing DITA Output of Generated XML Schema \(on page 774\)](#).

Custom Output Format

For the custom format, you can specify a stylesheet to transform the intermediary XML file generated in the documentation process. You have to edit your stylesheet based on the schema `xsdDocSchema.xsd` from `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation`. You can create a custom format starting from one of the stylesheets used in the built-in HTML, PDF, DocBook, and DITA formats. These stylesheets are available in `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl`.

When using a custom format you can also copy additional resources into the output folder and choose to keep the intermediate XML files created during the documentation process.

Important:

If you create a custom format for DITA, you must select the [Split output into multiple files](#) option in the [Output tab \(on page 766\)](#) and choose **Split by component**.

Customizing PDF or DocBook Output of Generated XML Schema Documentation

To customize the PDF or DocBook output of the generated XML Schema documentation, use the following procedure:

1. Customize the `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl` stylesheet to include the content that you want to add in the PDF or DocBook output. Add the content in the XSLT template with the `match="schemaDoc"` attribute between the `<info>` and `<xsl:apply-templates>` elements, as commented in the following example:

```
<info>
  <pubdate><xsl:value-of select="format-date(current-date(),
    '[Mn] [D], [Y]', 'en', (), ())" /></pubdate>
</info>

<!-- Add the XSLT template content with match="schemaDoc" attribute here -->

<xsl:apply-templates select="schemaHierarchy" />
```

2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
 - a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
 - b. Select **Custom** for the output format and click the **Options** button.
 - c. In the **Custom format options** dialog box, do the following:
 - i. Enter the customized stylesheet in the **Custom XSL** field
(`[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDocbook.xsl`).
 - ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
 - iii. Click **OK**.
 - d. When you return to the **XML Schema Documentation** dialog box, just click the **Generate** button to generate a DocBook XML file with an intermediary form of the Schema documentation.
3. If you want the DocBook file to be transformed into a PDF document, follow these steps:
 - a. Use the  **Configure Transformation Scenario(s)** action from the toolbar or the **XML** menu, click **New**, and select **XML transformation with XSLT**.
 - b. In the **New Scenario** dialog box, go to the **XSL URL** field and choose the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/oxygen/xsdDocDocbookCustomizationFO.xsl` file.
 - c. Go to the **FO Processor** tab and select the **Perform FO Processing** and **XSLT result as input** options.
 - d. Go to the **Output** tab and select the directory where you want to store the XML Schema documentation output and click **OK**.
 - e. Click **Apply Associated**.

Customizing DITA Output of Generated XML Schema

To customize the DITA output of the generated XML Schema documentation, use the following procedure:

1. Customize the `[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDita.xsl` stylesheet to incorporate your desired changes.
2. Create an intermediary file that holds the content of your XML Schema documentation by following these steps:
 - a. Go to **Tools > Generate Documentation > XML Schema Documentation**.
 - b. Select **Custom** for the output format and click the **Options** button.
 - c. In the **Custom format options** dialog box, do the following:
 - i. Enter the customized stylesheet in the **Custom XSL** field (`[OXYGEN_INSTALL_DIR]/frameworks/schema_documentation/xsl/xsdDocDita.xsl`).
 - ii. Select the **Copy additional resources to the output folder** option and leave the default selection in the **Resources** field.
 - iii. Click **OK**.
 - d. Make sure the **Split output into multiple files** option (*on page 766*) is selected and choose **Split by component**.
 - e. When you return to the **XML Schema Documentation** dialog box, just click the **Generate** button to generate a DITA map file that contains the XML Schema documentation.

Converting Schema to Another Schema Language

The  **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor Eclipse plugin generates an approximation of the source schema. Oxygen XML Editor Eclipse plugin uses the *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the  **Generate/Convert Schema (Ctrl + Shift + BackSlash (Command + Shift + BackSlash on macOS))** action from the **XML Tools** menu. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

Figure 284. Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advanced options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a `@prefix:defaultValue` annotation attribute where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.
- **strict-any** - Preserves the exact semantics of ANY content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings** table - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor Eclipse plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources preferences page (on page 74)** where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:
 - **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
 - **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

Result: The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.
6. If you selected **Hierarchical schema** for the format, you can configure the database columns.
 - a. Select the database column you want to configure.
 - b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
 - c. You can also change the name of the selected database column by changing it in the **Name** text field.
7. Click **Generate XML Schema**.

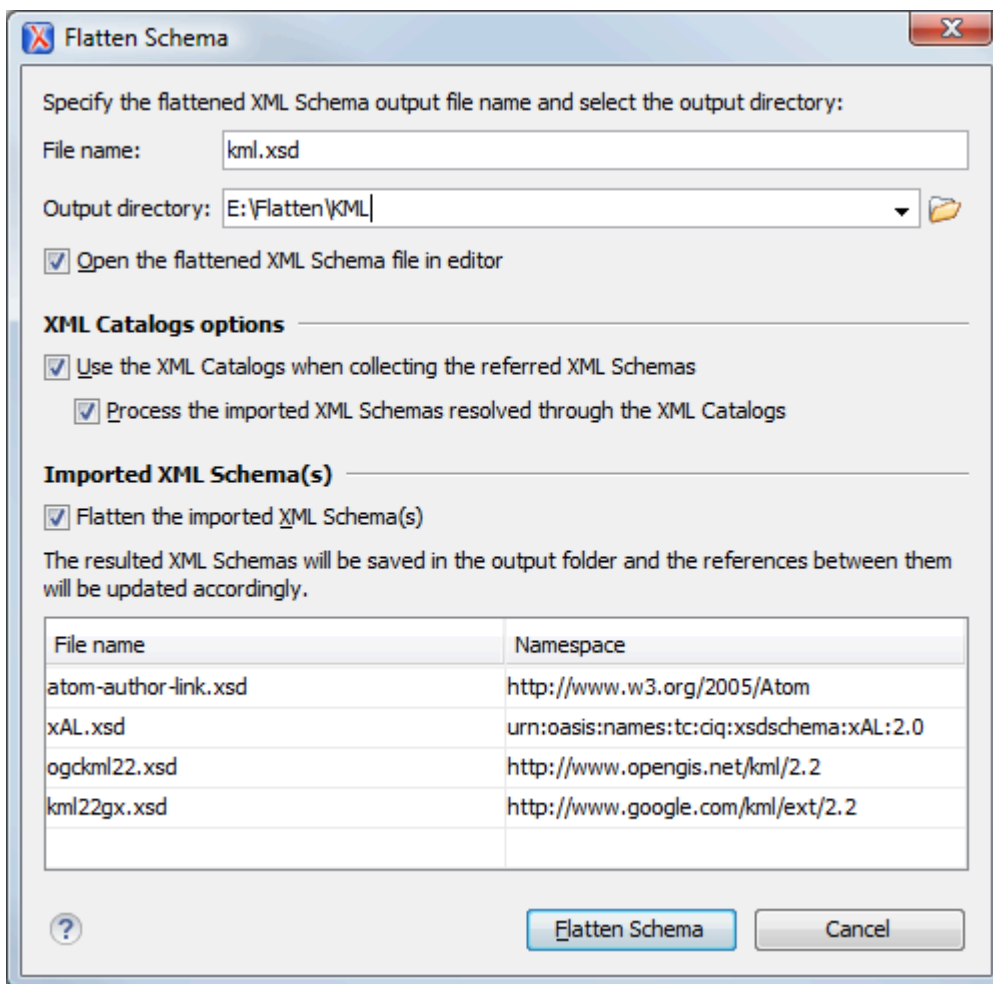

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Flatten an XML Schema

You can organize an XML schema linked by `<xs:include>` and `<xs:import>` statements on several levels. In some cases, working on such a schema as if it were a single file is more convenient than working on multiple files separately. The **Flatten Schema** operation allows you to flatten an entire hierarchy of XML schemas. Starting with the main XML schema, Oxygen XML Editor Eclipse plugin calculates its hierarchy by processing the `<xs:include>` and `<xs:import>` statements.

The **Flatten Schema** action is available from the **Refactoring** submenu in the contextual menu in **Text** mode. This action opens the **Flatten Schema** dialog box that allows you to configure the operation.

Figure 285. Flatten Schema Dialog Box

For the main schema file and for each imported schema, a new flattened schema is generated in the specified output folder. These schemas have the same name as the original ones.

Note:

If necessary, the operation renames the resulted schemas to avoid duplicated file names.

A flattened XML schema is obtained by recursively adding the components of the included schemas into the main one. This means Oxygen XML Editor Eclipse plugin replaces the `<xs:include>`, `<xs:redefine>`, and `<xs:override>` elements with the ones coming from the included files.

Options in the Flatten Schema Dialog Box

The following options are available in the **Flatten Schema** dialog box:

File name

The name of the output file.

Output directory

The path of the output directory where the flattened schema file will be saved.

Open the flattened XML Schema file in editor

Opens the main flattened schema in the editing area after the operation completes.

Use the XML Catalogs when collecting the referenced XML Schemas

Enables the imported and included schemas to be resolved through the available *XML Catalogs* (on page 2683).

Note:

Changing this option triggers the recalculation of the dependencies graph for the main schema.

Process the imported XML Schemas resolved through the XML Catalogs

Specifies whether or not the imported schemas that were resolved through an *XML Catalog* (on page 2683) are also processed.

Flatten the imported XML Schema(s)

Specifies whether or not the imported schemas are flattened.

Note:

For the schemas skipped by the flatten operation, no files are created in the output folder and the corresponding import statements remain unchanged.

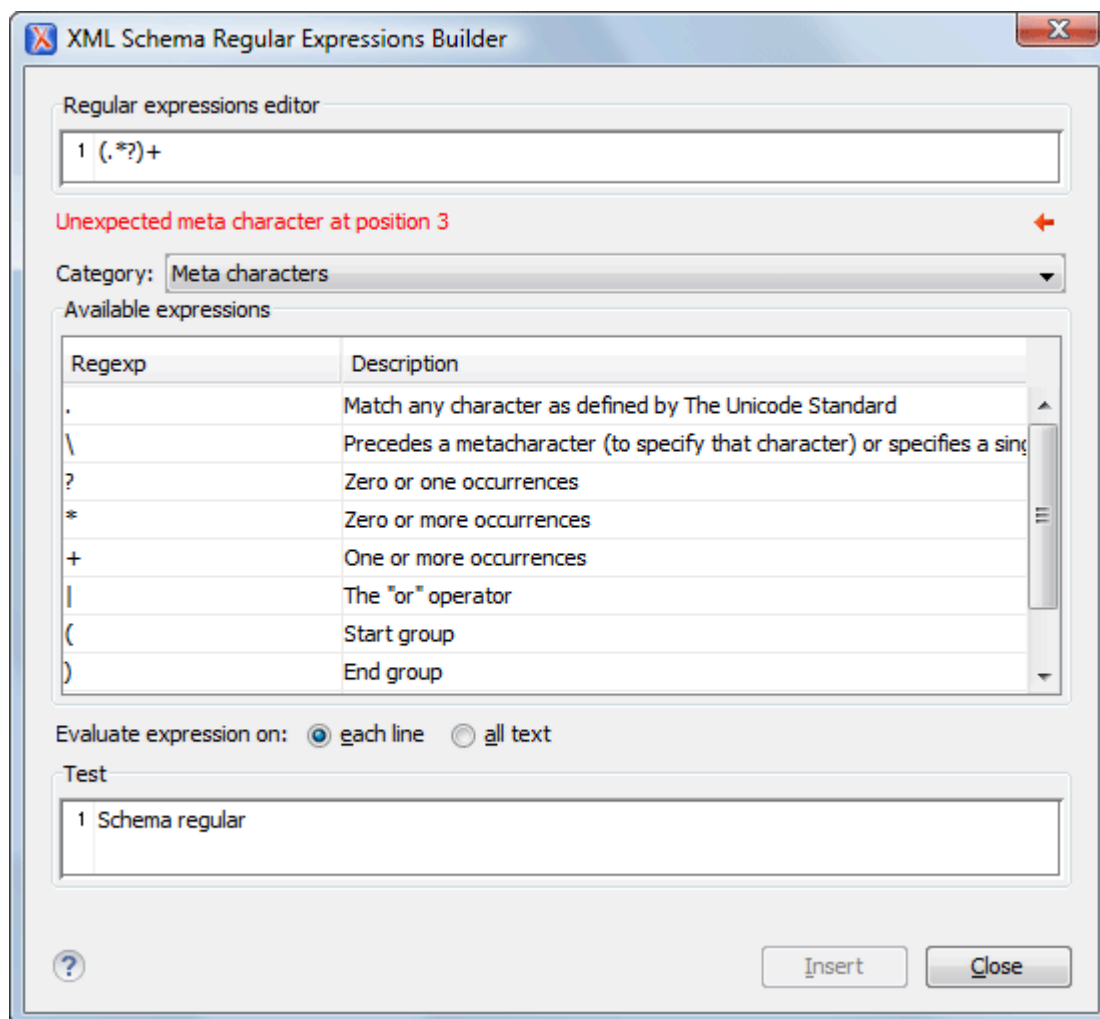

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen](#) (on page 2642).

XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **XML Tools** menu.

Figure 286. XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (↔) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** ([on page 242](#)) or **schema Design mode** ([on page 243](#)). Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note:

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

XML Schema 1.1

Oxygen XML Editor Eclipse plugin offers full support for XML Schema 1.1, including:

- XML Documents [Validation](#) ([on page 544](#)) and [Content Completion](#) ([on page 319](#)) based on XML Schema 1.1.
- XML Schema 1.1 [Validation](#) ([on page 743](#)) and [Content Completion](#) ([on page 744](#)).
- Editing XML Schema 1.1 files in the **Schema Design mode** ([on page 243](#)).
- The [Flatten Schema](#) ([on page 778](#)) action.
- [Referenced/Dependent Resources](#) ([on page 750](#)) and [Refactoring Actions](#) ([on page 755](#)).
- [Main files](#) ([on page 2680](#)).
- [Generating Documentation for XML Schema 1.1](#) ([on page 764](#)).
- Support for generating XML instances based on XML Schema.

- Support for validating XML documents with an NVDL schema that contains an XML Schema 1.1 validation step.

**Note:**

To enable XML Schema 1.1 validation in NVDL, you need to pass the following option to the validation engine to specify the schema version: `http://www.thaiopensource.com/validate/xsd-version` (the possible values are 1.0 or 1.1).

**Tip:**

To enable the full XPath expression in assertions and type alternatives, you need to set the `http://www.thaiopensource.com/validate/full-xpath` option.

XML Schema 1.1 is a superset of XML Schema 1.0, that offers lots of new powerful capabilities.

Figure 287. XML Schema 1.1

The significant new features in XSD 1.1 are:

- **Assertions** - Support to define assertions against the document content using XPath 2.0 expressions (an idea borrowed from Schematron).
- **Conditional type assignment** - The ability to select the type of schema an element is validated against, based on the values of the attribute of the element.
- **Open content** - Content models can use the `<openContent>` element to specify content models with *open content*. These content models allow elements not explicitly mentioned in the content model to appear in the document instance. It is as if wildcards were automatically inserted at appropriate points within the content model. A default may be set that causes all content models to be open unless specified otherwise.

To see the complete list with changes since version 1.0, go to http://www.w3.org/TR/xmlschema11-1/#ch_specs.

XML Schema 1.1 is intended to be mostly compatible with XML Schema 1.0 and to have approximately the same scope. It also addresses bug fixes and brings improvements that are consistent with the constraints on scope and compatibility.

**Note:**

An XML document conforming to a 1.0 schema can be validated using a 1.1 validator, but an XML document conforming to a 1.1 schema may not validate using a 1.0 validator.

If you are constrained to use XML Schema 1.0 (for example, if you develop schemas for a server that uses an XML Schema 1.0 validator that cannot be updated), change the default XML Schema version to 1.0. If you keep the default XML Schema version set to 1.1, the *Content Completion Assistant (on page 2677)* presents XML Schema 1.1 elements that you can insert accidentally in an 1.0 XML Schema. So even if you make a document invalid conforming with XML Schema 1.0, the validation process does not signal any issues.

To change the default XML Schema version, [open the Preferences dialog box \(on page 70\)](#) and go to **XML > XML Parser > XML Schema**.

Resources

For more information about the XML Schema 1.1 support, watch our video demonstration:

<https://www.youtube.com/embed/DAkrubQNm0w>

Related Information:

[Setting the XML Schema Version \(on page 783\)](#)

Setting the XML Schema Version

Oxygen XML Editor Eclipse plugin lets you set the version of the XML Schema you are editing either in the **XML Schema** preferences page, or through the versioning attributes. If you want to use the versioning attributes, set the *minVersion* and *maxVersion* attributes, from the <http://www.w3.org/2007/XMLSchema-versioning> namespace, on the *schema* root element.

**Note:**

The versioning attributes take priority over the XML Schema version defined in the preferences page.

Table 35. Using the *minVersion* and *maxVersion* Attributes to Set the XML Schema Version

Versioning Attributes	XML Schema Version
minVersion = "1.0" maxVersion = "1.1"	1.0
minVersion = "1.1"	1.1
minVersion = "1.0" maxVersion = greater than "1.1"	The XML Schema version defined in the XML Schema preferences page (on page 195)

Table 35. Using the *minVersion* and *maxVersion* Attributes to Set the XML Schema Version (continued)

Versioning Attributes	XML Schema Version
Not set in the XML Schema document	The XML Schema version defined in the XML Schema preferences page (on page 195)

To change the XML Schema version of the current document, use the **Change XML Schema version** action from the contextual menu. This is available both in the **Text** mode, and in the **Design** mode and opens the **Change XML Schema version** dialog box. The following options are available:

- **XML Schema 1.0** - Inserts the *minVersion* and *maxVersion* attributes on the *schema* element and gives them the values "1.0" and "1.1" respectively. Also, the namespace declaration (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) is inserted automatically if it does not exist.
- **XML Schema 1.1** - Inserts the *minVersion* attribute on the *schema* element and gives it the value "1.1". Also, removes the *maxVersion* attribute if it exists and adds the versioning namespace (*xmlns:vc=http://www.w3.org/2007/XMLSchema-versioning*) if it is not declared.
- **Default XML Schema version** - Removes the *minVersion* and *maxVersion* attributes from the *schema* element. The default schema version, defined in the **XML Schema** preferences page, is used.

**Note:**

The **Change XML Schema version** action is also available in the informative panel presented at the top of the edited XML Schema. If you close this panel, it will no longer appear until you restore Oxygen XML Editor Eclipse plugin to its default options.

Oxygen XML Editor Eclipse plugin automatically uses the version set through the versioning attributes, or the default version if the versioning attributes are not declared, when proposing content completion elements and validating an XML Schema. Also, the XML instance validation against an XML Schema is aware of the versioning attributes defined in the XML Schema.

When you generate sample XML files from an XML Schema, Oxygen XML Editor Eclipse plugin takes into account the *minVersion* and *maxVersion* attributes defined in the XML Schema.

[XML Schema 1.1 \(on page 781\)](#)

Editing XQuery Documents

XQuery is the query language for XML and is officially defined by a [W3C Recommendation document](#). Oxygen XML Editor Eclipse plugin provides support for XQuery 3.1, which is also backwards compatible with XQuery 3.0 and 1.0.

The many benefits of XQuery include:

- XQuery allows you to work in one common model no matter what type of data you are working with: relational, XML, or object data.
- XQuery is ideal for queries that must represent results as XML, to query XML stored inside or outside the database, and to span relational and XML sources.
- XQuery allows you to create many different types of XML representations of the same data.
- XQuery allows you to query both relational sources and XML sources, and create one XML result.

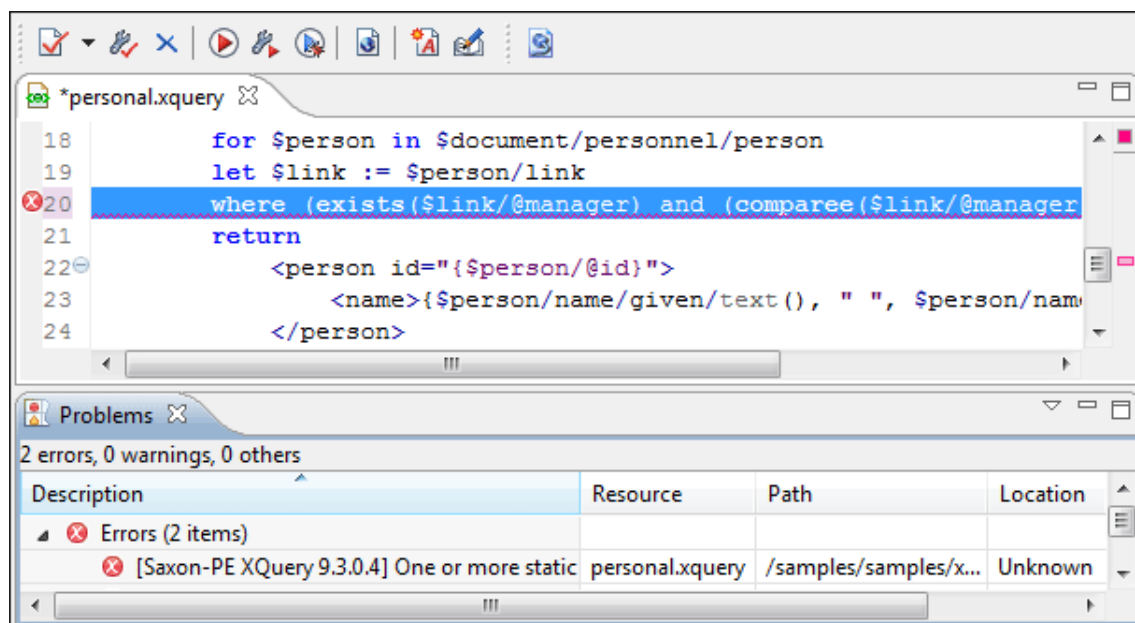

Related Information:

[XQuery and Databases \(on page 1885\)](#)

XQuery Validation

With Oxygen XML Editor Eclipse plugin, you can validate your documents before using them in your transformation scenarios. The validation uses the Saxon 12.3 PE, EE, or HE processor, or you can use some database engines (such as MarkLogic or eXist) if you installed them. Any other XQuery processor that offers an [XQJ API implementation \(on page 1875\)](#) can also be used. This is in conformance with [the XQuery Working Draft](#). The processor is used in two cases: validation of the expression and execution. Although the execution implies a validation, it is faster to check the expression syntactically, without executing it. The errors that occurred in the document are presented in the messages view at the bottom of editor window, with a full description message. As with all error messages, if you click an entry, the line where the error appeared is highlighted.

Figure 288. XQuery Validation

Note:

If you choose a processor that does not support XQuery validation, Oxygen XML Editor Eclipse plugin displays a warning when trying to validate.

When you open an XQuery document from a connection that supports validation (for example, MarkLogic, or eXist), by default Oxygen XML Editor Eclipse plugin uses this connection for validation. If you open an XQuery file using a MarkLogic connection, the validation resolves imports better.

Content Completion in XQuery

Oxygen XML Editor Eclipse plugin provides content completion for keywords and all known XQuery functions and operators. The *Content Completion Assistant (on page 2677)* can be manually activated with the **(Ctrl + Space)** shortcut. The functions and operators are presented together with a description of the parameters and functionality, depending on the validation or transformation engine.

For some supported database engines such as MarkLogic and eXist, the content completion list offers the specific XQuery functions implemented by that engine. This feature is available when the XQuery file has an associated transformation scenario that uses one of these database engines or the XQuery validation engine is set to one of them via a validation scenario or in the *XQuery Preferences (on page 203)* page. For more information about the support for working with XQuery with regard to databases, see *XQuery and Databases (on page 1885)*.

The extension functions included in the Saxon engine are available on content completion if one of the following conditions are true:

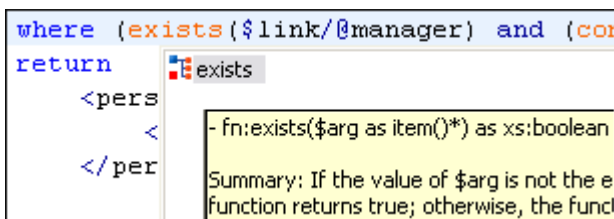

- The edited file has a transformation scenario associated that uses as transformation engine Saxon 12.3 PE or Saxon 12.3 EE.
- The edited file has a validation scenario associated that use as validation engine Saxon 12.3 PE or Saxon 12.3 EE.
- The validation engine specified in *Preferences (on page 203)* is Saxon 12.3 PE or Saxon 12.3 EE.

If the Saxon namespace (<http://saxon.sf.net>) is mapped to a prefix, the functions are presented using this prefix. Otherwise, the default prefix for the Saxon namespace (`saxon`) is used.

If you want to use a function from a namespace mapped to a prefix, just type that prefix and the content completion displays all the XQuery functions from that namespace. When the default namespace is mapped to a prefix, the XQuery functions from this namespace offered by content completion are also prefixed. Otherwise, only the function name being used.

The content completion pop-up window presents all the variables and functions from both the edited XQuery file and its imports.

Figure 289. XQuery Content Completion

Syntax Highlighting in XQuery

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for XQuery files, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)).
2. Go to **Editor > Syntax Highlight** ([on page 176](#)).
3. Select and expand the **XQuery/XPath** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Customize Syntax Highlight colors \(on page 176\)](#)

Formatting and Indenting XQuery Documents

Editing XQuery documents may lead to large chunks of content that are not easily readable by human audience. Also, each developer may have a particular way of writing XQuery code. Oxygen XML Editor Eclipse plugin assists you in maintaining a consistent code writing style with the  **Format and Indent** action that is available in the **Document > Source** menu and also on the toolbar..

The  **Format and Indent** action achieves this by performing the following steps:

- Manages whitespaces, by collapsing or inserting space characters where needed.
- Formats complex expressions on multiple, more readable lines by properly indenting each of them. The amount of whitespaces that form an indent unit is controlled through one of the **Indent with tabs** and **Indent size** options from the [Format Preferences page \(on page 162\)](#).

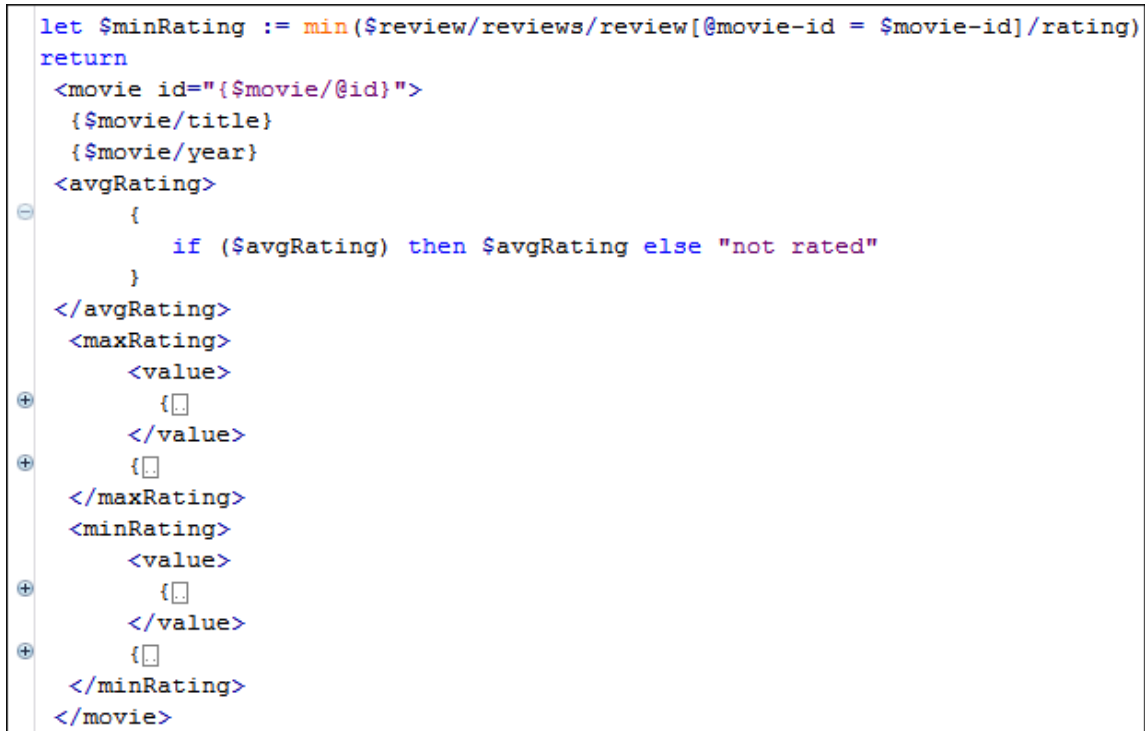

Note:

These operations can be performed only if your XQuery document conforms with XQuery 1.0, 3.0, 3.1, or XQuery Update Facility 1.0 specifications. If the *Format and Indent* operation fails, the document is left unaltered and an error message is presented in the [Results view \(on page 335\)](#).

Folding in XQuery Documents

In a large XQuery document, the instructions enclosed in the '{' and '}' characters can be collapsed so that only the needed instructions remain in focus. The same [folding features available for XML documents \(on page 316\)](#) are also available in XQuery documents.

Figure 290. Folding in XQuery Documents

```

let $minRating := min($review/reviews/review[@movie-id = $movie-id]/rating)
return
<movie id="{ $movie/@id }">
  { $movie/title }
  { $movie/year }
  <avgRating>
    {
      if ($avgRating) then $avgRating else "not rated"
    }
  </avgRating>
  <maxRating>
    <value>
      { }
    </value>
  </maxRating>
  <minRating>
    <value>
      { }
    </value>
  </minRating>
</movie>

```

There is available the action **Go to Matching Bracket Ctrl + Shift + G (Command + Shift + G on macOS)** on contextual menu of XQuery editor for going to matching character when cursor is located at '{' character or '}' character. It helps for finding quickly matching character of current *folding element* (on page 2679).

XQuery Outline View

The XQuery document structure is presented in the **Outline** view. The outline tree presents the list of all the components (namespaces, imports, variables, and functions) from both the edited XQuery file and its imports and it allows quick access to components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 291. XQuery Outline View

The following actions are available in the **View menu** on the **Outline** view action bar:

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes performed in the XQuery editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Sort

Allows you to alphabetically sort the XQuery components.

Show all components

Displays all collected components starting from the current file. This option is set by default.

Show only local components

Displays the components defined in the current file only.

Group by location/namespace/type

Allows you to group the components by location, namespace, and type. When grouping by namespace, the main XQuery module namespace is presented first in the **Outline** view.

If you know the component name, you can search it in the **Outline** view by typing its name in the filter text field from the top of the view or directly on the tree structure. When you type the component name in the filter text field you can switch to the tree structure using the arrow keys of the keyboard, **Enter**, **Tab**, **Shift-Tab**. To switch from tree structure to the filter text field, you can use **Tab**, **Shift-Tab**.

**Tip:**

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

XQuery Builder View

The **XPath/XQuery Builder** view allows you to compose complex XQuery expressions and execute them over the currently edited XML document. You can use the `doc()` function to specify the source file that will have the expressions executed. When you connect to a database, the expressions are executed over that database. If you are using the **XPath/XQuery Builder** view and the current file is an XSLT document, Oxygen XML Editor Eclipse plugin executes the expressions over the XML document in the associated scenario.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the view contains the following actions:

XPath version chooser drop-down menu

A drop-down menu that allows you to select the type of the expression you want to execute. You can choose between:

- XPath 1.0 (Xerces-driven)
- XPath 2.0, XPath 2.0 SA, XPath 3.1, XPath 3.1 SA, Saxon-HE XQuery, Saxon-PE XQuery, or Saxon-EE XQuery (all of them are Saxon-driven)
- Custom connection to XML databases that can execute XQuery expressions

**Note:**

The results returned by XPath 2.0 SA and XPath 3.1 SA have a location limited to the line number of the start element (there are no column information and no end specified).

**Note:**

Oxygen XML Editor Eclipse plugin uses Saxon to execute XPath 3.1 expressions. Since Saxon implements a part of the 3.1 functions, when using a function that is not implemented, Oxygen XML Editor Eclipse plugin returns a compilation error.

Execute XPath button

Use this button to start the execution of the XPath or XQuery expression you are editing. The result of the execution is displayed in the **Results view** (*on page 335*).

Favorites button

Allows you to save certain expressions that you can later reuse. To add an expression as a favorite, click this button and enter a name for it. The star turns yellow to confirm that the expression was saved. Expand the drop-down menu next to the star button to see all your favorites. Oxygen XML Editor Eclipse plugin automatically groups favorites in folders named after the method of execution.

History drop-down menu

Keeps a list of the last 15 executed XPath or XQuery expressions. Use the  **Clear history** action from the bottom of the list to remove them.

Settings drop-down menu

Contains the following three options:

Update on cursor move

When selected and you navigate through a document, the XPath expression corresponding to the XML node at the current cursor position is displayed. For JSON documents, it displays the XPath expression for the current property.

Evaluate as you type

When you select this option, the XPath expression you are composing is evaluated in real time.

Note:

This option and the automatic validation are disabled when the scope is other than **Current file**.

Options

Opens the Preferences page of the currently selected processing engine.

XPath scope menu

Oxygen XML Editor Eclipse plugin allows you to define a scope for the XPath operation to be executed. You can choose where the XPath expression will be executed:

-  **Current file** - Currently selected file only.
-  **Enclosing project** - All the files of the project that encloses the currently edited file.

-  **Workspace selected files** - The files selected in the workspace. The files are collected from the last selected resource provider view (**Project Explorer** (on page 269) or **Package Explorer**).
-  **All opened files** - All files that are opened in the application.
-  **Current DITA Map hierarchy** - All resources referenced in the currently selected *DITA map* that is open in the **DITA Maps Manager** view (on page 2337).
-  **Opened archive** - Files that are opened in the **Archive Browser** view (on page 1825).
-  **Working sets** - The selected *working sets* (on page 2683).

At the bottom of the scope menu the following scope configuration actions are available:

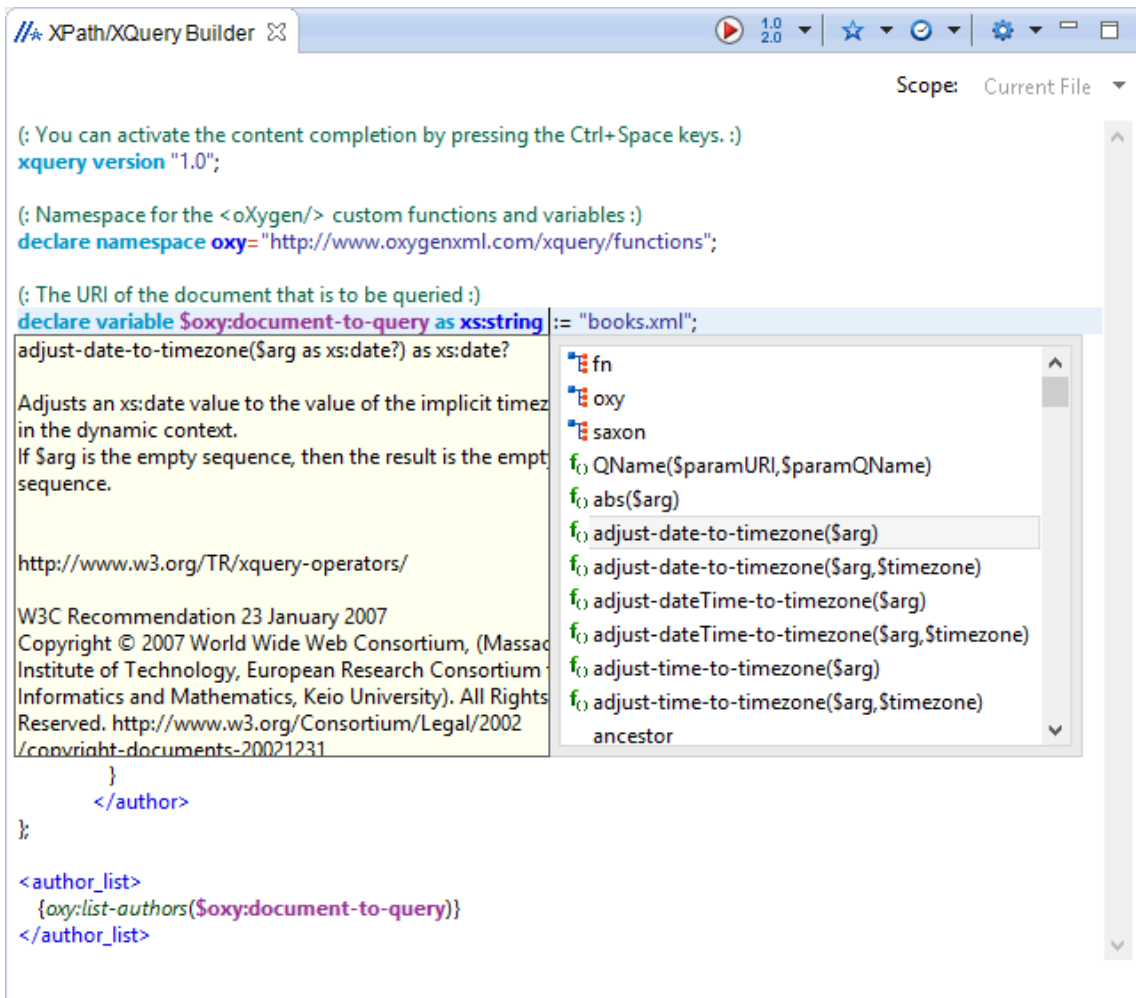

-  **Configure XPath working sets** - Allows you to configure and manage collections of files and folders, encapsulated in logical containers called *working sets* (on page 2683).
-  **XPath file filter** - You can filter the files from the selected scope that will have the XPath expression executed. By default, the XPath expression will be executed only on XML or JSON files, but you can also define a set of patterns that will filter out files from the current scope.

Figure 292. XPath/XQuery Builder View

When you hover your cursor over the version icon ([1.0](#)), a tooltip is displayed to let you know what engine Oxygen XML Editor Eclipse plugin is currently using.

While you edit an XPath or XQuery expression, Oxygen XML Editor Eclipse plugin assists you with the following features:

- *Content Completion Assistant (on page 2677)* - It offers context-dependent proposals and takes into account the cursor position in the document you are editing. The set of functions proposed by the *Content Completion Assistant* also depends on the engine version. Select the engine version from the drop-down menu available in the toolbar.
- Syntax Highlighting - Allows you to identify the components of an expression. To customize the colors of the components of the expression, open the **Preferences dialog box (on page 70)** and go to **Editor > Syntax Highlight (on page 176)**.
- Automatic validation of the expression as you type.

Note:

When you type invalid syntax, a red serrated line underlines the invalid fragments.

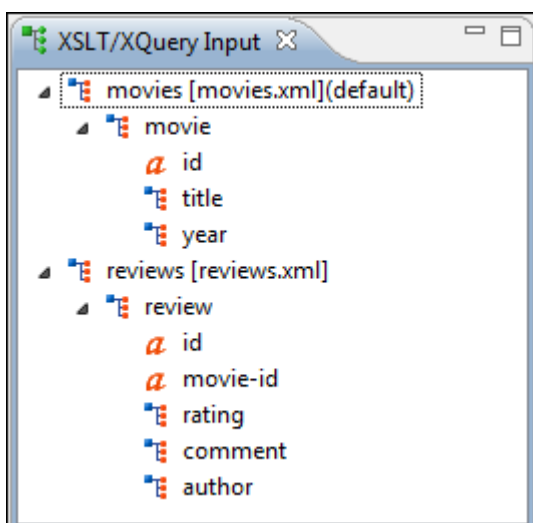

- Function signature and documentation balloon, when the cursor is located inside a function.

XQuery Input View

The structure of the source documents of an edited XQuery is displayed in a tree form in a view called the **XQuery Input** view. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu. The tree nodes represent the elements of the documents.

You can use the **XQuery Input** view to drag and drop a node into the editing area to quickly insert XQuery expressions.

Figure 293. XQuery Input View

Example:

For the following XML documents:

```

<movies>

<movie id="1">
<title>The Green Mile</title>
<year>1999</year>
</movie>

<movie id="2">
<title>Taxi Driver</title>
<year>1976</year>
</movie>
</movies>

```

```

<reviews>

<review id="100" movie-id="1">
<rating>5</rating>
<comment>It is made after a great Stephen King book.
</comment>
<author>Paul</author>
</review>

<review id="101" movie-id="1">
<rating>3</rating>
<comment>Tom Hanks does a really nice acting.</comment>
<author>Beatrice</author>
</review>

<review id="104" movie-id="2">
<rating>4</rating>
<comment>Robert De Niro is my favorite actor.</comment>
<author>Maria</author>
</review>
</reviews>

```

and the following XQuery:

```

let $review := doc("reviews.xml")
for $movie in doc("movies.xml")/movies/movie
let $movie-id := $movie/@id
return
<movie id="{ $movie/@id }">
  { $movie/title }
  { $movie/year }
<maxRating>
  {

```

```

    }
  </maxRating>
</movie>

```

If you drag the **review** element and drop it between the braces, the following pop-up menu is displayed:

```

37 {
38
39   where ((
40     and
41     return $r
42   }) eq 0)
43 </minRating>

```

Select **FLWOR review**, the resulting document will look like this:

```

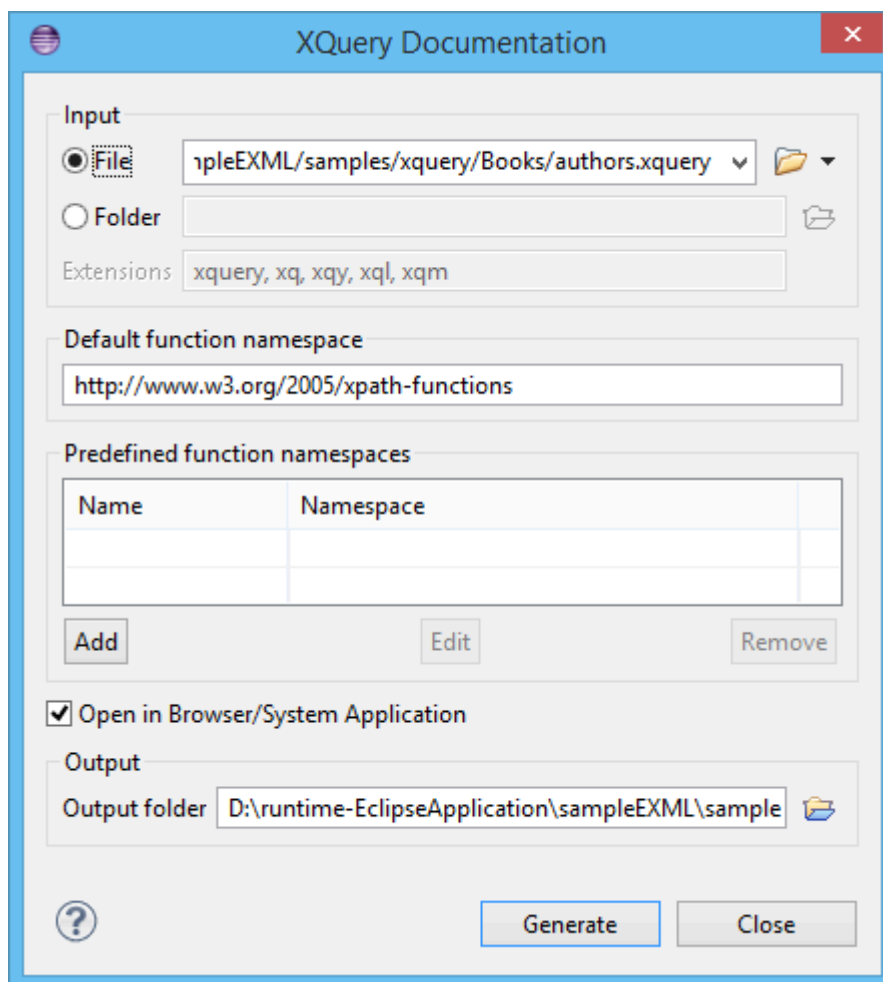

37 {
38   for $review in doc("reviews.xml")/reviews/review
39   return
40   where ((compare($rev/rating/text(), string($minRating)) eq 0)
41     and ($rev/@movie-id = $movie/@id))
42   return $rev/author
43 }

```

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **XML Tools > Generate Documentation** menu or from the **Generate XQuery Documentation** action from the contextual menu of the **Project Explorer** view (on page 269).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure 294. XQuery Documentation Dialog Box

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
 - **URLFile** - The URL of the file to be used for generating the documentation.
 - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

**Note:**

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

Transforming XML Documents Using XQuery

XQuery is similar to XSL stylesheets, both being capable of transforming an XML input into another format. You specify the input URL when you [define the transformation scenario \(on page 1206\)](#). The result can be saved and opened in the associated application. You can even run a [FO processor \(on page 1273\)](#) on the output of an XQuery. The transformation scenarios may be shared between many XQuery files, are [exported \(on page 217\)](#) together with the XSLT scenarios and can be managed in the [Configure Transformation Scenario dialog box \(on page 1300\)](#), or in the [Scenarios view \(on page 1306\)](#). The transformation can be performed on the XML document specified in the **XML URL** field, or, if this field is empty, the documents referenced from the query expression. The parameters of XQuery transforms must be set in the [Parameters dialog box \(on page 1206\)](#). Parameters that are in a namespace must be specified using the qualified name (for example, a `param` parameter in the `http://www.oxygenxml.com/ns` namespace must be set with the name `{http://www.oxygenxml.com/ns}param`).

The transformation uses one of the Saxon 12.3 HE, Saxon 12.3 PE, Saxon 12.3 EE processors, a database connection (details can be found in the [Working with Databases \(on page 1831\)](#) chapter - in the [XQuery transformation \(on page 1886\)](#) section) or any XQuery processor that provides an XQJ API implementation.

The Saxon 12.3 EE processor also supports XQuery 3.1 transformations.

Related Information:

[XQuery and Databases \(on page 1885\)](#)

Display XQuery Result in Sequence View

The result of an XQuery executed on a database can be very large and sometimes only a part of the full result is needed. To avoid the long time necessary for fetching the full result, select the [Present as a sequence option \(on page 1229\)](#) in the **Output** tab of the **Edit scenario** dialog box. This option fetches only the first chunk of the result. Clicking the **More results available** label that is displayed at the bottom of the **Sequence** view fetches the next chunk of results.

The size of a chunk can be set with the [Size limit of Sequence view option \(on page 204\)](#). The  **XQuery options** button from the **More results available** label provides a quick access to this option by opening the [XQuery preferences page \(on page 203\)](#) where the option can be modified.

Figure 295. XQuery transformation result displayed in Sequence view

A chunk of the XQuery transformation result is displayed in the **Sequence** view.

Figure 296. XQuery transformation result displayed in Sequence view

Tip:

You can right-click the results in the **Sequence** view and if the item is an XML element, the **Go to definition** action will open the XML file from where the queried node was obtained.

Advanced Saxon HE/PE/EE XQuery Transformation Options

The XQuery transformation scenario allows you to configure advanced options that are specific for the Saxon HE (Home Edition), PE (Professional Edition), and EE (Enterprise Edition) engines. They are the same options as [those in the Saxon HE/PE/EE preferences page \(on page 204\)](#) but they are configured as a specific set of transformation options for each transformation scenario, while the values set in the preferences page apply as global options. The advanced options configured in a transformation scenario override the global options defined in the preferences page.

Saxon-HE/PE/EE Options

The advanced options for Saxon 12.3 Home Edition (HE), Professional Edition (PE), and Enterprise Edition (EE) are as follows:

Use a configuration file ("-config")

Sets a Saxon 12.3 configuration file that is used for XQuery transformation and validation scenarios.

Enable Optimizations ("-opt")

This option is selected by default, which means that optimization is enabled. If not selected, the optimization is suppressed, which is helpful when reducing the compiling time is important, optimization conflicts with debugging, or optimization causes extension functions with side-effects to behave unpredictably.

Use linked tree model ("-tree:linked")

This option activates the linked tree model.

Strip whitespaces ("-strip")

Specifies how the *strip whitespaces* operation is handled. You can choose one of the following values:

- **All ("all")** - Strips *all* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document.
- **Ignore ("ignorable")** - Strips all *ignorable* whitespace text nodes from source documents before any further processing, regardless of any `@xml:space` attributes in the source document. Whitespace text nodes are ignorable if they appear in elements defined in the DTD or schema as having element-only content.
- **None ("none")** - Strips *no* whitespace before further processing.

Enable profiling ("-TP")

If selected, profiling of the execution time in a query is enabled. The corresponding text field is used to specify the path to the output file where the profiling information will be saved. As long as the option is selected, and the output file specified, it will gather timed tracing information and create a profile report to the specified file.

**Note:**

The profiling support works only if the **Present as a sequence** transformation option ([on page 1229](#)) is not set.

Saxon-PE/EE Options

The following advanced options are specific for Saxon 12.3 Professional Edition (PE) and Enterprise Edition (EE) only:

Allow calls on extension functions ("-ext")

If selected, calls on external functions are allowed. Selecting this option is not recommended in an environment where untrusted stylesheets may be executed. It also disables user-defined extension elements and the writing of multiple output files, both of which carry similar security risks.

Saxon-EE Options

The advanced options that are specific for Saxon 12.3 Enterprise Edition (EE) are as follows:

Validation of the source file ("-val")

Requests schema-based validation of the source file and of any files read using `document()` or similar functions. It can have the following values:

- **Schema validation ("strict")** - This mode requires an XML Schema and allows for parsing the source documents with strict schema-validation enabled.
- **Lax schema validation ("lax")** - If an XML Schema is provided, this mode allows for parsing the source documents with schema-validation enabled but the validation will not fail if, for example, element declarations are not found.
- **Disable schema validation** - This specifies that the source documents should be parsed with schema-validation disabled.

Validation errors in the result tree treated as warnings ("-outval")

Normally, if validation of result documents is requested, a validation error is fatal. Selecting this option causes such validation failures to be treated as warnings.

Write comments for non-fatal validation errors of the result document

The validation messages for non-fatal errors are written (wherever possible) as a comment in the result document itself.

Enable XQuery update ("-update:(on|off)")

This option controls whether or not XQuery update syntax is accepted. The default value is off.

Backup files updated by XQuery ("-backup:(on|off)")

If selected, backup versions for any XML files updated with an XQuery Update are generated. This option is available when the **Enable XQuery update** option is selected.

Other Options

Initializer class

Equivalent to the `-init` Saxon command-line argument. The value is the name of a user-supplied class that implements the `net.sf.saxon.lib.Initializer` interface. This initializer is called during the initialization process, and may be used to set any options required on the configuration programmatically. It is particularly useful for tasks such as registering extension functions, collations, or external object models, especially in Saxon-HE where the option cannot be set via a configuration file. Saxon only calls the initializer when running from the command line, but the same code may be invoked to perform initialization when running user application code.

Updating XML Documents using XQuery Update 1.0

Using the bundled Saxon 12.3 EE XQuery processor Oxygen XML Editor Eclipse plugin offers support for XQuery Update 1.0. The XQuery Update Facility provides expressions that can be used to make persistent changes to instances of the XQuery 1.0 and XPath 2.0 Data Model. Thus, besides querying XML documents, you can modify them using the various insert/delete/modify/create methods available in the [XQuery Update 1.0](#) standard.

Choose Saxon 12.3 EE as a transformer in the scenario associated with the XQuery files containing update statements and Oxygen XML Editor Eclipse plugin will notify you if the update was successful.

Example: Using XQuery Update to modify a tag name in an XML file

```
rename node doc("books.xml")//publisher[1]//book[1] as "firstBook"
```

XQuery Unit Test (XSpec)

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating an XQuery Unit Test

To create a XQuery Unit Test, go to **File > New > XQuery Unit Test**. This is simple document template to help you get started.

Running an XQuery Unit Test

To run a Unit Test, open the XSpec file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework* (on page 2679).

Testing an XQuery file

An XSpec file contains one or more test scenarios.

Example:

Suppose you have this XQuery function that takes a string as its argument. The first character of the string passed to the function is capitalized and concatenated to the rest of the string. Finally, the new string with the first character capitalized is returned to the calling method.

```
module namespace functx = "http://www.functx.com";

declare function functx:capitalize-first
($arg as xs:string?) as xs:string? {
  concat(upper-case(substring($arg, 1, 1)),
  substring($arg, 2))
};
```

The XSpec test invokes the XQuery function and passes the string `hello` as a parameter. The expected value that should be returned by the function (the string `Hello`) is contained in the `@select` attribute of the `x:expect` element.

```
<x:scenario label="Calling function capitalize-first">
  <x:call function="functx:capitalize-first">
    <x:param select="'hello'"/>
  </x:call>

  <x:expect label="should capitalize the first character of the string" select="'Hello'"/>
</x:scenario>
```

For more details about how to write XQuery tests and various samples, see <https://github.com/xspec/xspec/wiki/Getting-Started-with-XSpec-and-XQuery>.

Editing WSDL Documents (Deprecated)

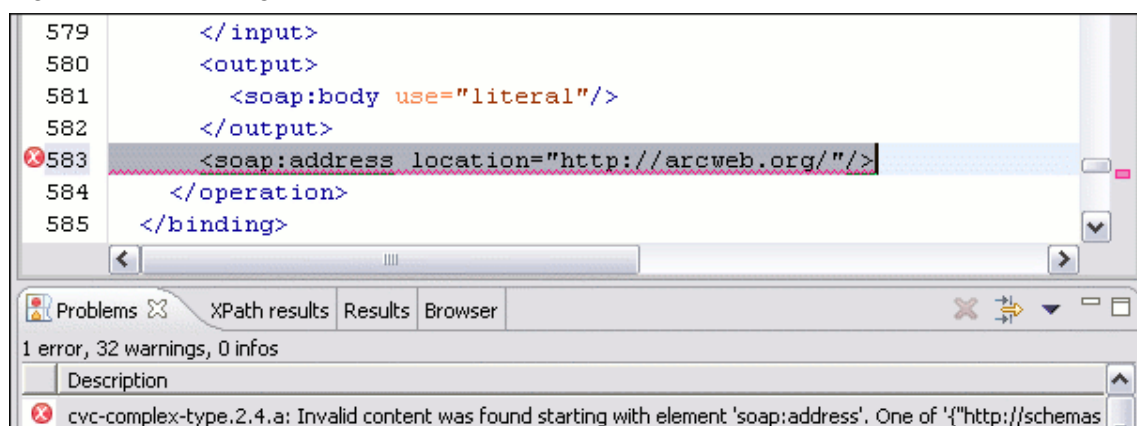

WSDL is an XML format for describing network services as a set of endpoints operating on messages containing either document-oriented or procedure-oriented information. The operations and messages are described abstractly, and then bound to a concrete network protocol and message format to define an endpoint. Related concrete endpoints are combined into abstract endpoints (services).

Oxygen XML Editor Eclipse plugin provides a special type of editor dedicated to WSDL documents. The WSDL editor offers support for validation, a specialized *Content Completion Assistant (on page 2677)*, a component oriented **Outline view (on page 806)**, searching and refactoring operations, and support to generate documentation.

Both WSDL version 1.1 and 2.0 are supported and SOAP versions 1.1 and 1.2. That means that in the location where a SOAP extension can be inserted the *Content Completion Assistant* offers elements from both SOAP 1.1 and SOAP 1.2. Validation of SOAP requests is executed first against a SOAP 1.1 schema and then against a SOAP 1.2 schema. In addition to validation against the XSD schemas, Oxygen XML Editor Eclipse plugin also checks if the WSDL file conforms with the WSDL specification (available only for WSDL 1.1 and SOAP 1.1).

In the following example you can see how the errors are reported.

Figure 297. Validating a WSDL file

Resources

For more information about the WSDL editing support in Oxygen XML Editor Eclipse plugin, watch our video demonstration:

<https://www.youtube.com/embed/OS5Ucm9b8sY>

Related Information:

[Editing XML Documents in Text Mode \(on page 307\)](#)

Modular Contextual WSDL Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex WSDL structure cannot be correctly edited or validated individually, due to their interdependency with other modules. Oxygen XML Editor Eclipse plugin provides the support for defining the main module (or modules), allowing you to edit any of the imported/included files in the context of the larger WSDL structure.

You can set a main WSDL document either using the *main files* support from the **Project Explorer** view (on page 278), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main modules. Oxygen XML Editor Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main WSDL document. In this case, it considers the current module as the main WSDL document.

The advantages of editing in the context of a *main file* (on page 2680) include:

- Correct validation of a module in the context of a larger WSDL structure.
- *Content Completion Assistant* (on page 2677) displays all components valid in the current context.
- The **Outline** view (on page 806) displays the components collected from the entire WSDL structure.

**Note:**

When you edit an XML schema document that has a WSDL document set as the main file, the validation operation is performed over the main WSDL document.

Resources

For more information about editing WSDL documents in the *main files* context, watch our video demonstration:

https://www.youtube.com/embed/gn_YPD5xDCo

Validating WSDL Documents

By default, WSDL files are validated as you type. To change this, open the **Preferences** dialog box (on page 70), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (on page 133).

To validate a WSDL document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

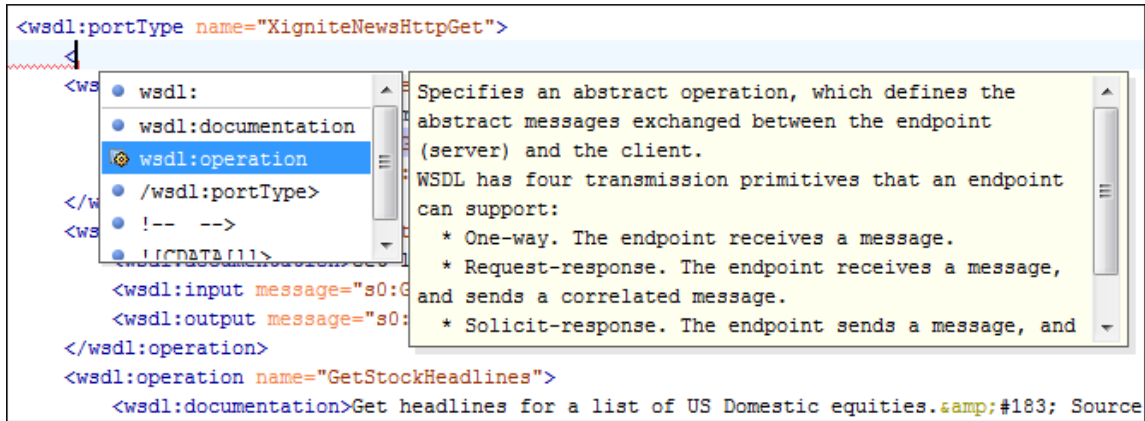

Content Completion Assistance in WSDL Documents

The *Content Completion Assistant* (on page 2677) is a powerful feature that enhances the editing of WSDL documents. It helps you define WSDL components by proposing context-sensitive element names. It can be manually activated with the **Ctrl + Space** shortcut.

Another important capability of the *Content Completion Assistant* is to propose references to the defined components when you edit attribute values. For example, when you edit the `@type` attribute of a `<binding>` element, the *Content Completion Assistant* proposes all the defined port types. Each proposal that the *Content Completion Assistant* offers is accompanied by a documentation hint.

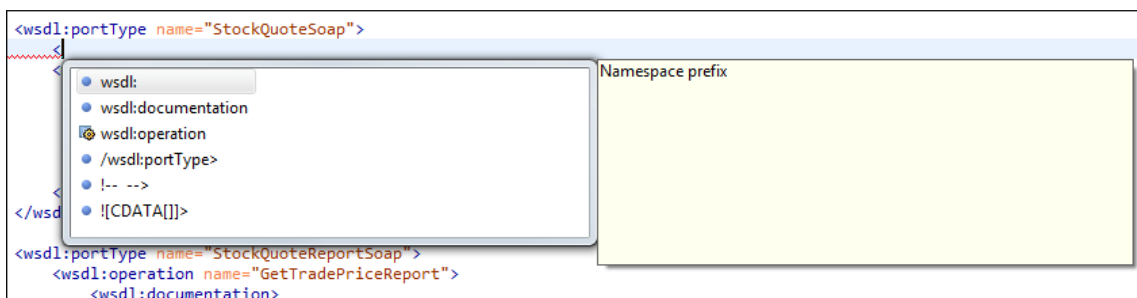

**Note:**

XML schema-specific elements and attributes are offered when the current editing context is the internal XML schema of a WSDL document.

Figure 298. WSDL Content Completion Assistant**Note:**

If you are using the concept of [main files \(on page 2680\)](#) to import/include modules, the *Content Completion Assistant* collects its components starting from the *main files*. The *main files* can be defined in the project or in the associated validation scenario. For more information about the *Main Files* support in Oxygen XML Editor Eclipse plugin, see [Defining Main Files at Project Level \(on page 278\)](#).

Namespace prefixes in the scope of the current context are presented at the top of the content completion assistance window to speed up the insertion into the document of prefixed elements.

Figure 299. Namespace Prefixes in the Content Completion Assistant

For the common namespaces, such as XML Schema namespace (<http://www.w3.org/2001/XMLSchema>) or SOAP namespace (<http://schemas.xmlsoap.org/wsdl/soap/>), Oxygen XML Editor Eclipse plugin provides an easy mode to declare them by proposing a prefix for these namespaces.

WSDL Syntax Highlighting

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for WSDL files, follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)).
2. Go to **Editor > Syntax Highlight** ([on page 176](#)).

3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (*on page 176*).

Related Information:

[Customize Syntax Highlight colors \(on page 176\)](#)

WSDL Outline View

The **Outline** view for WSDL documents displays the list of all the components (services, bindings, port types and so on) of the currently open WSDL document along with the components of its imports.

If you use the **Main Files** support (*on page 278*), the **Outline** view collects the components of a WSDL document starting from the *main files* of the current document.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 300. WSDL Outline View

The **Outline** view can display both the components of the current document and its XML structure, organized in a tree-like fashion. You can switch between the display modes by using the  **Show XML structure** and  **Show components** actions in the **View menu** on the **Outline** view action bar. The following actions are available:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between the **Outline** view and the current document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the WSDL editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the current document.

When the  **Show components** option is selected, the following actions are available:

Show XML structure

Displays the XML structure of the current document in a tree-like manner.

Sort

Sorts the components in the **Outline** view alphabetically.

Show all components

Displays all the components that were collected starting from current document or from the main document, if it is defined.

Show referable components

Displays all the components that you can reference from the current document.

Show only local components

Displays the components defined in the current file only.

Group by location

Groups the WSDL components by their location.

Group by type

Groups the WSDL components by their type.

Group by namespace

Groups the WSDL components by their namespace.

Note:

By default, all the three grouping criteria are active.

When the  **Show XML structure** option is selected, the following actions are available:

 **Show components**

Switches the **Outline** view to the components display mode.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel \(on page 214\)](#).

 **Configure displayed attributes**

Displays the [XML Structured Outline preferences page \(on page 214\)](#).

The following contextual menu actions are available in the **Outline** view when the  **Show components** option is selected in the **View menu**:

 **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Cut**

Cuts the currently selected component.

 **Copy**

Copies the currently selected component.

 **Delete**

Deletes the currently selected component.

 **Search references**

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view (*on page 813*) that displays the dependencies of the currently selected component.

Show referenced resources

Opens the **Referenced/Dependent Resources** view (*on page 810*) that displays the references for the currently selected resource.

Show dependent resources

Opens the **Referenced/Dependent Resources** view (*on page 810*) that displays the dependencies of the currently selected resource.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

The following contextual menu actions are available in the **Outline** view when the  **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Search references

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

Component dependencies

Opens the **Component Dependencies** view (*on page 813*) that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

**Cut**

Cuts the currently selected component.

**Copy**

Copies the currently selected component.

**Delete**

Deletes the currently selected component.

**Expand All**

Expands the structure of a component in the **Outline** view.

**Collapse All**

Collapses the structure of all the component in the **Outline** view.

To switch from the tree structure to the text filter, use **Tab** and **Shift-Tab**.

**Tip:**

The search filter is case insensitive. The following wildcards are accepted:

- * - any string
- ? - any character
- , - patterns separator

If no wildcards are specified, the string to search is used as a partial match.

The content of the **Outline** view and the editing area are synchronized. When you select a component in the **Outline** view, its definition is highlighted in the editing area.

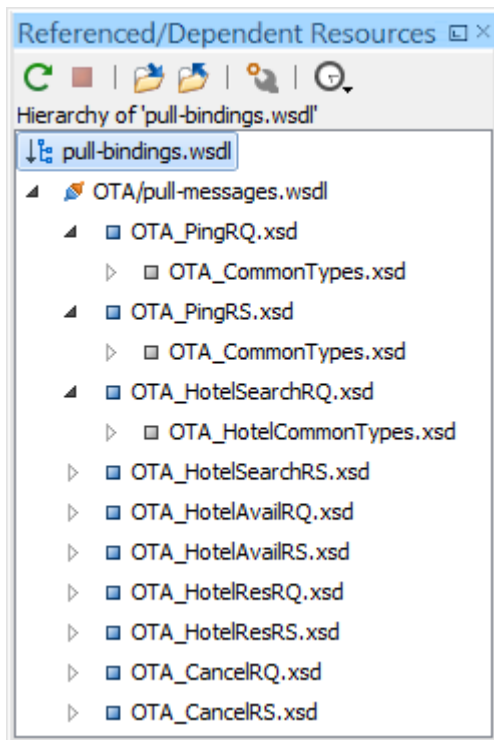

WSDL Referenced/Dependent Resources View in WSDL Documents

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for a WSDL resource. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

**Note:**

The hierarchy of a WSDL resource includes the hierarchy of imported XML Schema resources. The dependencies of an XML Schema resource present the WSDL documents that import the schema.

To view the references or dependencies of a WSDL document, select the document in the **Project Explorer** view (on page 269) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 301. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

Tip:

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Note:

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 812\)](#).

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

Moving/Renaming WSDL Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

WSDL Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of a WSDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

This action is available for all WSDL components (`messages`, `port types`, `operations`, `bindings`, and so on).

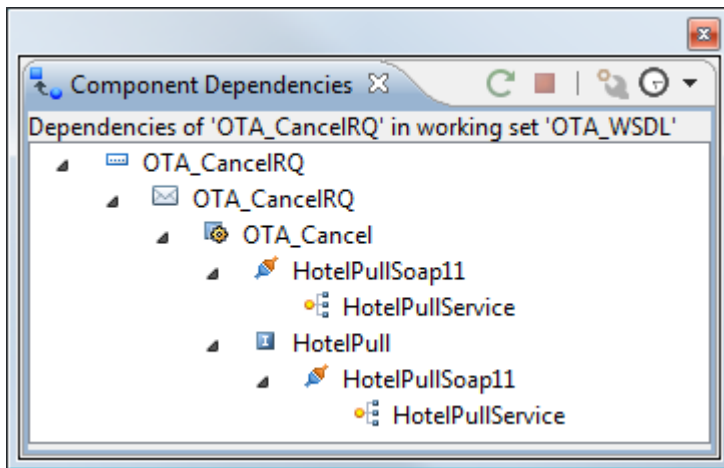

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 302. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

 **History**

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:

[Searching and Refactoring Operations Scope in WSDL Documents \(on page 816\)](#)

Highlight Component Occurrences in WSDL Documents

When you position your mouse cursor over a component in a WSDL document, Oxygen XML Editor Eclipse plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box (on page 70) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File ()** action from contextual menu. Matches are displayed in separate tabs of the **Results** view (on page 335).

Searching and Refactoring Operations in WSDL Documents

Search Actions

The following search actions are available from the **Search** submenu in the contextual menu of the current editor:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **WSDL** menu:

Go to Definition

Takes you to the location of the definition of the current item.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions are available from the **Refactoring** submenu in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 303. Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in WSDL Documents

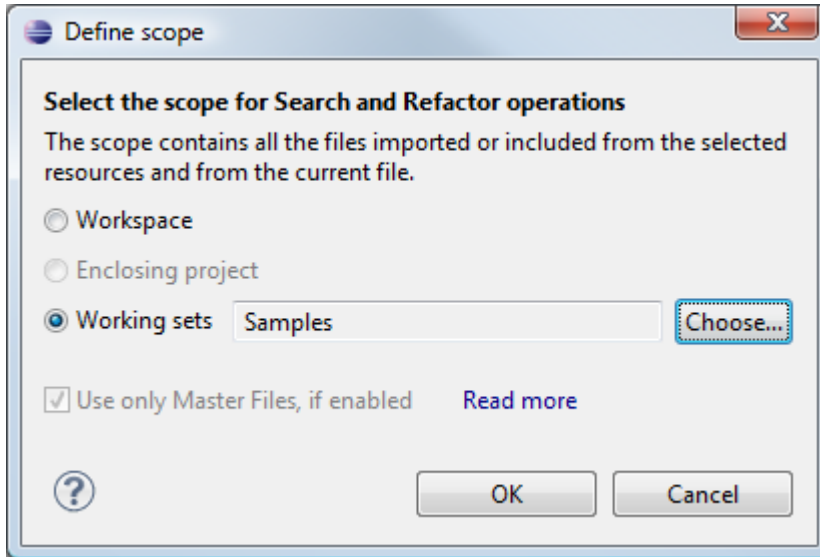

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Fix* action set or on the **Referenced/Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets* (on page 2683). The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support (on page 278).

Figure 304. Change Scope Dialog Box

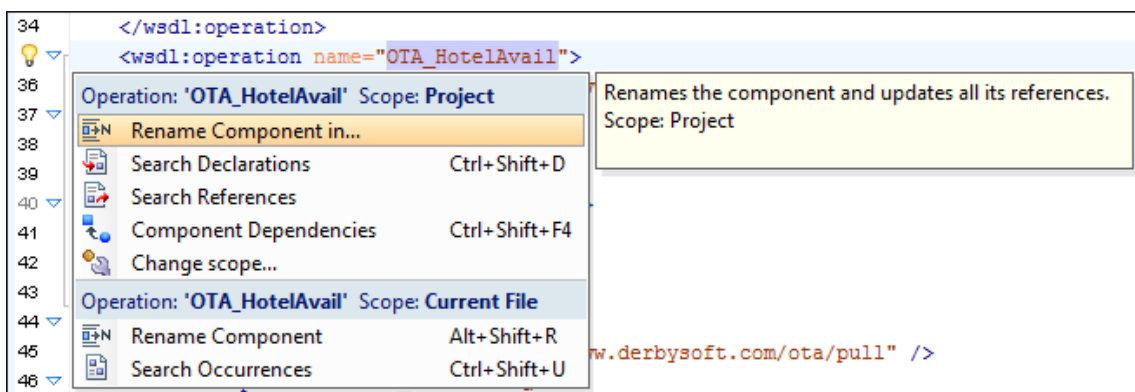

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* (on page 2683) structure.

Quick Assist Support in WSDL Documents

The *Quick Assist* feature (on page 2681) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on macOS) keyboard shortcuts.

Figure 305. WSDL Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Generating Documentation for WSDL Documents (Deprecated)

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a [custom output format \(on page 823\)](#) by using a custom stylesheet.

Note:

The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Project Explorer** view ([on page 269](#)).

Figure 306. WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 821\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 823\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

Note:

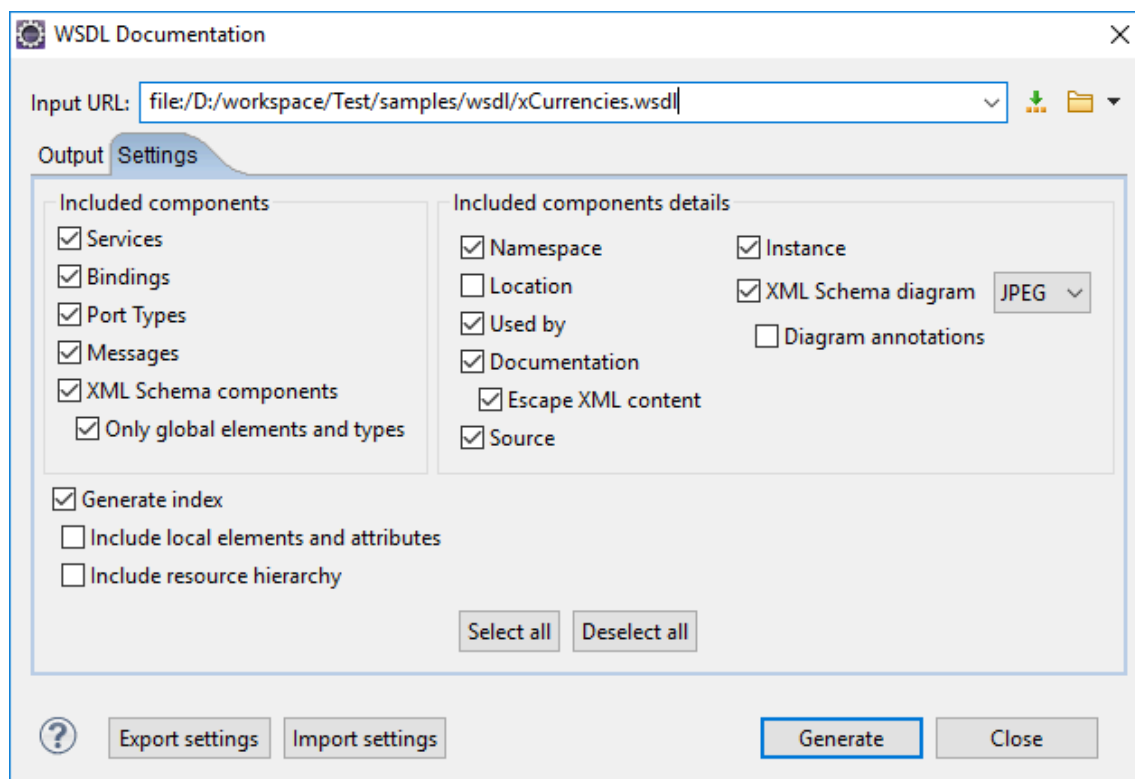

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

Figure 307. Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
 - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
 - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
 - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.

- **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
 - **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
 - **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.
- **Component Details**
 - **Namespace** - Presents the namespace information for WSDL or XML Schema components.
 - **Location** - Presents the location information for each WSDL or XML Schema component.
 - **Used by** - Presents the list of components that reference the current one.
 - **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
 - **Source** - Presents the XML fragment that defines the current component.
 - **Instance** - Generates a sample XML instance for the current component.

**Note:**

This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
 - **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

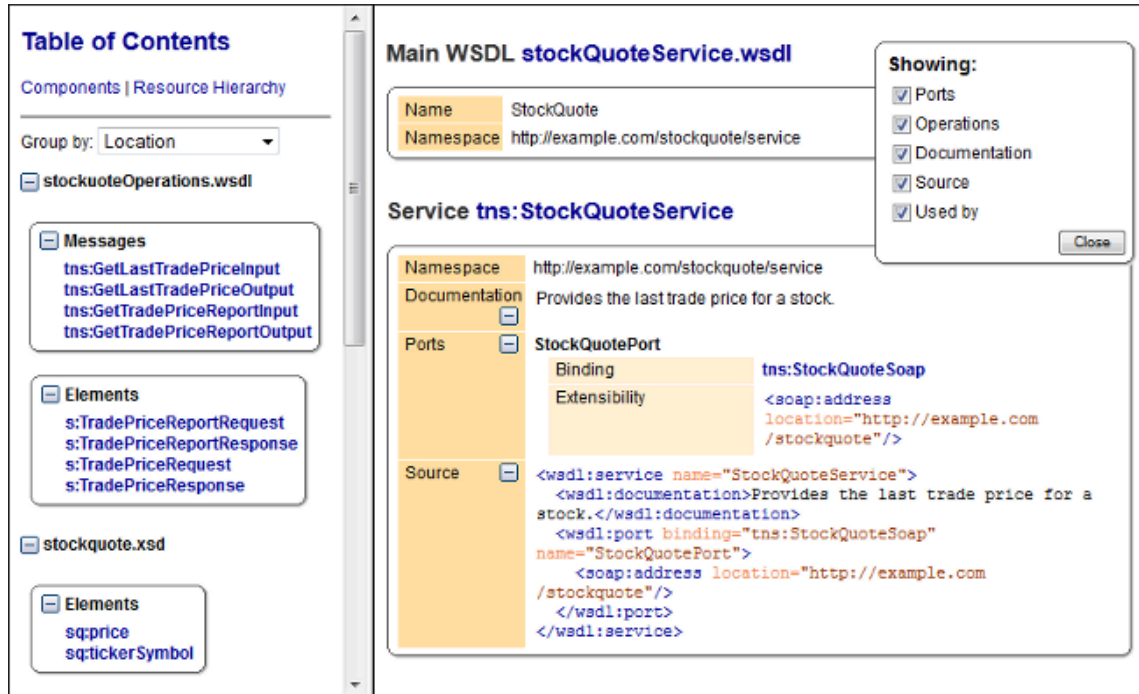

**Tip:**

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Generating WSDL Documentation in HTML Format

The WSDL documentation generated in HTML format is presented in a visual diagram style with various sections, hyperlinks, and options.

Figure 308. WSDL Documentation in HTML Format

The documentation of each component is presented in a separate section. The title of the section is composed of the component type and the component name. The component information (namespace, documentation, etc.) is presented in a tabular form.

If you choose to split the output into multiple files, the table of contents is displayed in the left frame and is divided in two tabs: **Components** and **Resource Hierarchy**.

The **Components** tab allows you to group the contents by namespace, location, or component type. The WSDL components from each group are sorted alphabetically. The **Resource Hierarchy** tab displays the dependencies between WSDL and XML Schema modules in a tree-like fashion. The root of the tree is the WSDL document that you generate documentation for.

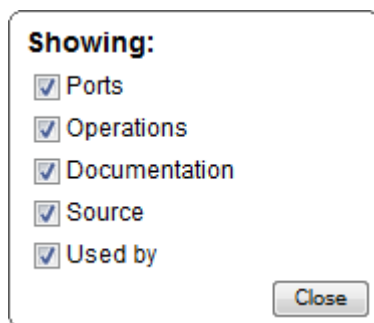

After the documentation is generated, you can collapse or expand details for some WSDL components by using the **Showing** options or the  **Collapse** or  **Expand** buttons.

Figure 309. Showing Options

Generating WSDL Documentation in a Custom Format

To obtain the default HTML documentation output from a WSDL document, Oxygen XML Editor Eclipse plugin uses an intermediary XML document to which it applies an XSLT stylesheet. To create a custom output from your WSDL document, edit the `wslDocHtml.xsl` XSLT stylesheet or create your own.

Note:

The `wslDocHtml.xsl` stylesheet that is used to obtain the HTML documentation is located in the `[OXYGEN_INSTALL_DIR]/frameworks/wsl_documentation/xsl` folder.

Note:

The intermediary XML document complies with the `wslDocSchema.xsd` XML Schema. This schema is located in the `[OXYGEN_INSTALL_DIR]/frameworks/wsl_documentation` folder.

Figure 310. Custom Format Options Dialog Box

When using a custom format, you can also copy additional resources into the output folder or choose to keep the intermediate XML files created during the documentation process.

WSDL SOAP Analyzer Tool (Deprecated)

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **WSDL** menu).

Oxygen XML Editor Eclipse plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

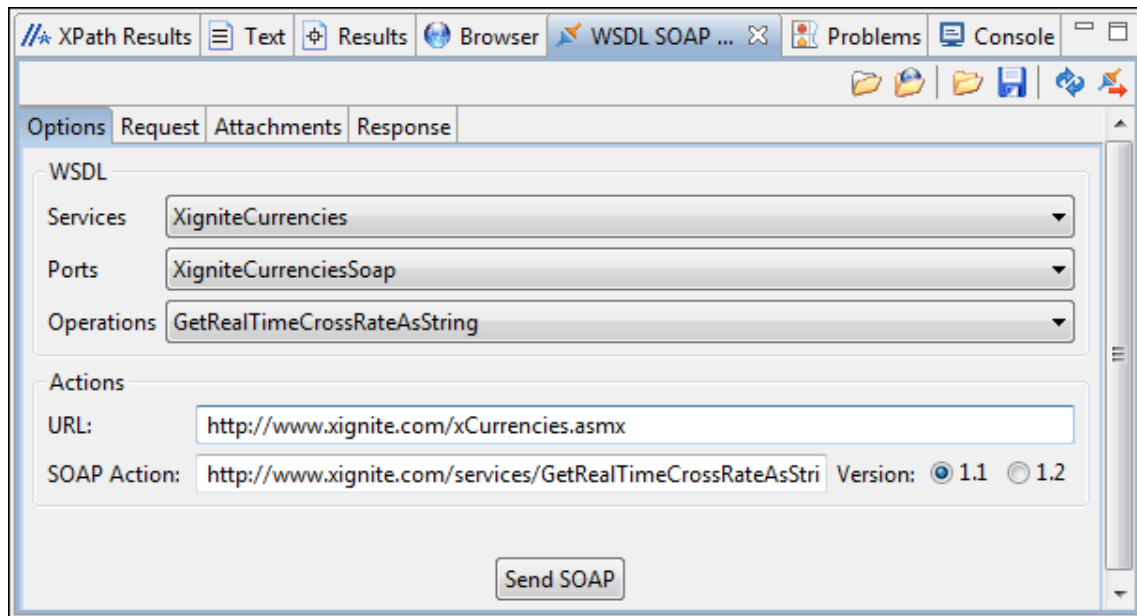

- Click the  **WSDL SOAP Analyzer** toolbar button.
- Use the  **WSDL SOAP Analyzer** action from the **WSDL** menu.
- Go to **Open with > WSDL Editor** in the contextual menu of the **Project Explorer** (on page 269) view.

Figure 311. WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor Eclipse plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The [Content Completion Assistant \(on page 2677\)](#) is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor Eclipse plugin remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message

received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor Eclipse plugin prompts you to save them, then tries to open them with the associated system application.

- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.
- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor Eclipse plugin is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the [Testing Remote WSDL Files \(on page 825\)](#) section.

Note:

SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Window > Show View > Other > Oxygen XML Editor Eclipse plugin >  WSDL SOAP Analyzer**.
2. Click the **Choose WSDL** button and enter the URL of the remote WSDL file.
3. Click the **OK** button.

This will open the **WSDL SOAP Analyzer tool (on page 823)**. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

Editing CSS Stylesheets

Oxygen XML Editor Eclipse plugin includes a built-in editor for CSS stylesheets. This section presents the features of the CSS editor and how these features should be used. The features of the CSS editor include:

- **Create new CSS files and templates** - You can use the built-in new file wizards to [create new CSS documents or templates \(on page 246\)](#).
- **Open and Edit CSS files** - CSS files can be opened and edited in a source editing mode.
- **Validation** - Presents validation errors in CSS files.

- **Content completion** - Offers proposals for properties and the values that are available for each property.
- **Syntax highlighting** - The syntax highlighting in Oxygen XML Editor Eclipse plugin makes CSS files more readable.
- **Shortcut to open resources** - You can use **Ctrl + Single-Click (Command + Single-Click on macOS)** to open imported stylesheets or other resources (such as images) in the default system application for the particular type of resource.

Related Information:

[CSS Support in Author Mode \(on page 2117\)](#)

[Supported CSS Selectors \(on page 2122\)](#)

[Supported CSS Properties \(on page 2130\)](#)

[CSS Extensions \(on page 2143\)](#)

Validating CSS Stylesheets

Oxygen XML Editor Eclipse plugin includes a built-in *CSS Validator*, integrated with general validation support. This makes the usual validation features for presenting errors also available for CSS stylesheets.

The CSS properties accepted by the validator are those included in the current CSS profile that is selected in the [CSS validation preferences \(on page 73\)](#). The **CSS 3 with Oxygen extensions** profile includes all the CSS 3 standard properties plus the [CSS extensions specific for Oxygen \(on page 2143\)](#) that can be used in [Author mode \(on page 242\)](#). That means all **Oxygen**-specific extensions are accepted in a CSS stylesheet by the built-in CSS validator [\(on page 826\)](#) when this profile is selected.

Specify Custom CSS Properties

To specify custom CSS properties, follow these steps:

1. Create a file named `CustomProperties.xml` that has the following structure:

```
<?xml version="1.0" encoding="UTF-8"?>
<css_keywords
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:schemaLocation="http://www.oxygenxml.com/ns/css
  http://www.oxygenxml.com/ns/css/CssProperties.xsd"
  xmlns="http://www.oxygenxml.com/ns/css">
  <property name="custom">
    <summary>Description for custom property.</summary>
    <value name="customValue" />
    <value name="anotherCustomValue" />
  </property>
</css_keywords>
```

2. Go to your desktop and create the `builtin/css-validator/` folder structure.

3. Press and hold **Shift** and right-click anywhere on your desktop. From the contextual menu, select **Open Command Window Here**.
4. In the command line, run the `jar cvf custom_props.jar builtin/` command.
The `custom_props.jar` file is created.
5. Go to `[OXYGEN_INSTALL_DIR]/lib` and create the `endorsed` folder. Copy the `custom_props.jar` file to `[OXYGEN_INSTALL_DIR]/lib/endorsed`.

Content Completion in CSS Stylesheets

A *Content Completion Assistant* (on page 2677), similar to the one available for XML documents (on page 319), offers the CSS properties and the values available for each property. It can be manually activated with the **Ctrl + Space** shortcut and is context-sensitive when invoked for the value of a property. The *Content Completion Assistant* also includes *code templates that can be used to quickly insert code fragments* (on page 323) into CSS stylesheets. The code templates that are proposed include form controls, actions, and **Author** mode operations.

Figure 312. Content Completion in CSS Stylesheets

The properties and values available are dependent on the CSS Profile selected in the **CSS preferences** (on page 73). The CSS 2.1 set of properties and property values is used for most of the profiles. However, with CSS 1 and CSS 3 specific proposal sets are used.

The profile *CSS 3 with Oxygen extensions* includes all the CSS 3 standard properties plus the **CSS extensions specific for Oxygen XML Editor Eclipse plugin** (on page 2143) that can be used in **Author mode** (on page 242).

Proposals for CSS Selectors - After inserting a *CSS selector*, the content completion assistance will propose a list of pseudo-elements and pseudo-classes that are available for the selected CSS profile.

Proposals for @media and @import Rules - After inserting `@media` or `@import <url>` rules, the content completion assistance will propose a list of supported media types.

Related Information:

[Specify Custom CSS Properties \(on page 826\)](#)

Syntax Highlighting in CSS Files

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for CSS files, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*).
2. Go to **Editor > Syntax Highlight** (*on page 176*).
3. Select and expand the **CSS** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences](#) (*on page 176*)

CSS Outline View

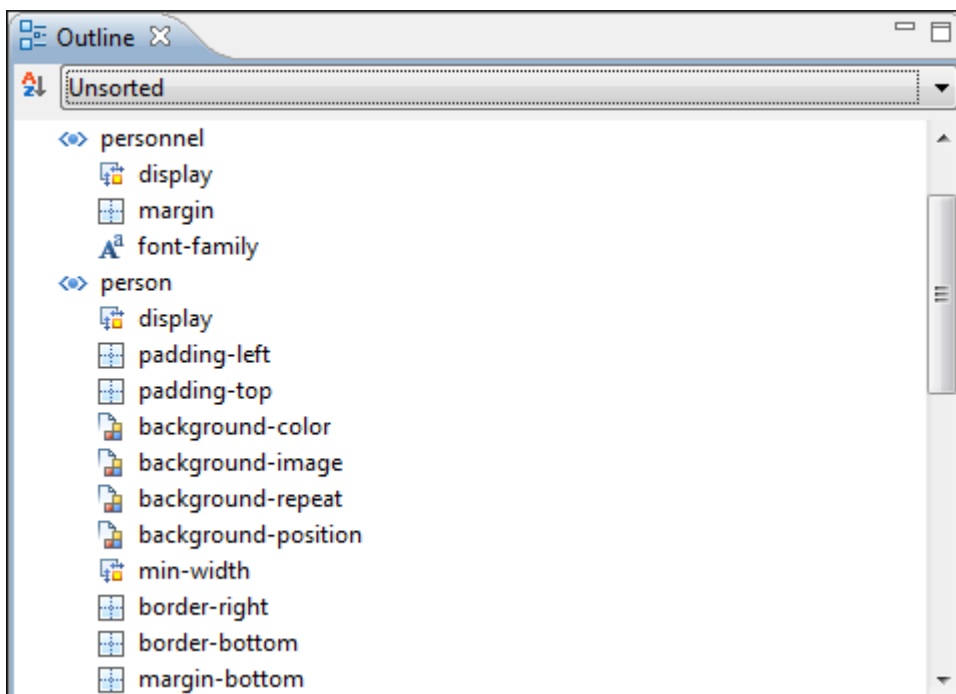

The **Outline** view for CSS stylesheets presents the import declarations for other CSS stylesheet files and all the selectors defined in the current CSS document. The selector entries can be presented as follows:

- In the order they appear in the document.
- Sorted by the element name used in the selector.
- Sorted by the entire selector string representation.

You can synchronize the selection in the **Outline** view with the cursor moves or changes you make in the stylesheet document. When you select an entry from the **Outline** view, Oxygen XML Editor Eclipse plugin highlights the corresponding import or selector in the CSS editor.

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 313. CSS Outline View

The selectors presented in this view can be found quickly using the key search field. When you press a sequence of character keys while the focus is in the view, the first selector that starts with that sequence is selected automatically.

Folding in CSS Stylesheets

In a large CSS stylesheet document, some styles can be collapsed so that only the styles that are needed remain in focus. The same folding features available for XML documents are also available in CSS stylesheets.

**Note:**

To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Formatting and Indenting CSS Stylesheets (Pretty Print)

If the edited CSS stylesheet becomes unreadable because of the bad alignment of the text lines, the format and indent operation available for XML documents is also available for CSS stylesheets. It works in the same way as for XML documents and is available as the same menu and toolbar action.

Minifying CSS Stylesheets

Minification (or *compression*) of a CSS document is the practice of removing unnecessary code without affecting the functionality of the stylesheet.

To minify a CSS, invoke the contextual menu anywhere in the edited document and choose the **Minify CSS** action. Oxygen XML Editor Eclipse plugin opens a dialog box that allows you to:

- Set the location of the resulting CSS.
- Place each style rule on a new line.

After pressing **OK**, Oxygen XML Editor Eclipse plugin performs the following actions:

- All spaces are normalized (all leading and trailing spaces are removed, while sequences of white spaces are replaced with single space characters).
- All comments are removed.

**Note:**

The CSS minifier relies heavily upon the W3C CSS specification. If the content of the CSS file you are trying to minify does not conform with the specifications, an error dialog box will be displayed, listing all errors encountered during the processing.

The resulting CSS stylesheet gains a lot in terms of execution performance, but loses in terms of readability. The source CSS document is left unaffected.

**Note:**

To restore the readability of a minified CSS, invoke the **Format and Indent** action from the **XML** menu, the **Source** submenu from the contextual menu, or **Source** toolbar. However, this action will not recover any of the deleted comments.

Editing Relax NG Schemas

An XML Schema describes the structure of an XML document and is used to validate XML document instances against it, to check that the XML instances conform to the specified requirements. If an XML instance conforms to the schema then it is said to be valid. Otherwise, it is invalid.

Oxygen XML Editor Eclipse plugin offers support for editing Relax NG schema files in the following editing modes:

- **Text editing mode (on page 742)** - Allows you to edit Relax NG schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View (on page 831)** and **Logical Model View (on page 832)**.
- **Grid editing mode (on page 242)** - Displays Relax NG schema files in a structured spreadsheet-like grid.
- **Author editing mode (on page 367)** - The visual **Author** mode is also available for Relax NG schema files, presenting the schema similar to the Relax NG compact syntax. It links to imported schemas and external references. Embedded Schematron is also supported in Relax NG schemas with XML syntax.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents \(on page 584\)](#).

Related Information:

[Associating a Schema to XML Documents \(on page 584\)](#)

Modular Contextual Relax NG Schema Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex Relax NG Schema cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, an element defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor Eclipse plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Relax NG document either using the *main files* support from the **Project Explorer** view (on [page 278](#)), or using a validation scenario.

To set a *main file* using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The main advantage of editing in the context of a *main file* (on page 2680) is that it provides correct validation of a module in the context of a larger schema structure.

Related Information:

[Creating a New Validation Scenario](#) (on page 558)

[XML Schema Outline View](#) (on page 746)

Relax NG Schema Diagram Editor

This section explains how to use the graphical diagram editor for Relax NG schemas.

Introduction to Relax NG Schema Diagram Editor

Oxygen XML Editor Eclipse plugin provides a simple, expressive, and easy-to-read schema diagram editor for Relax NG schemas.

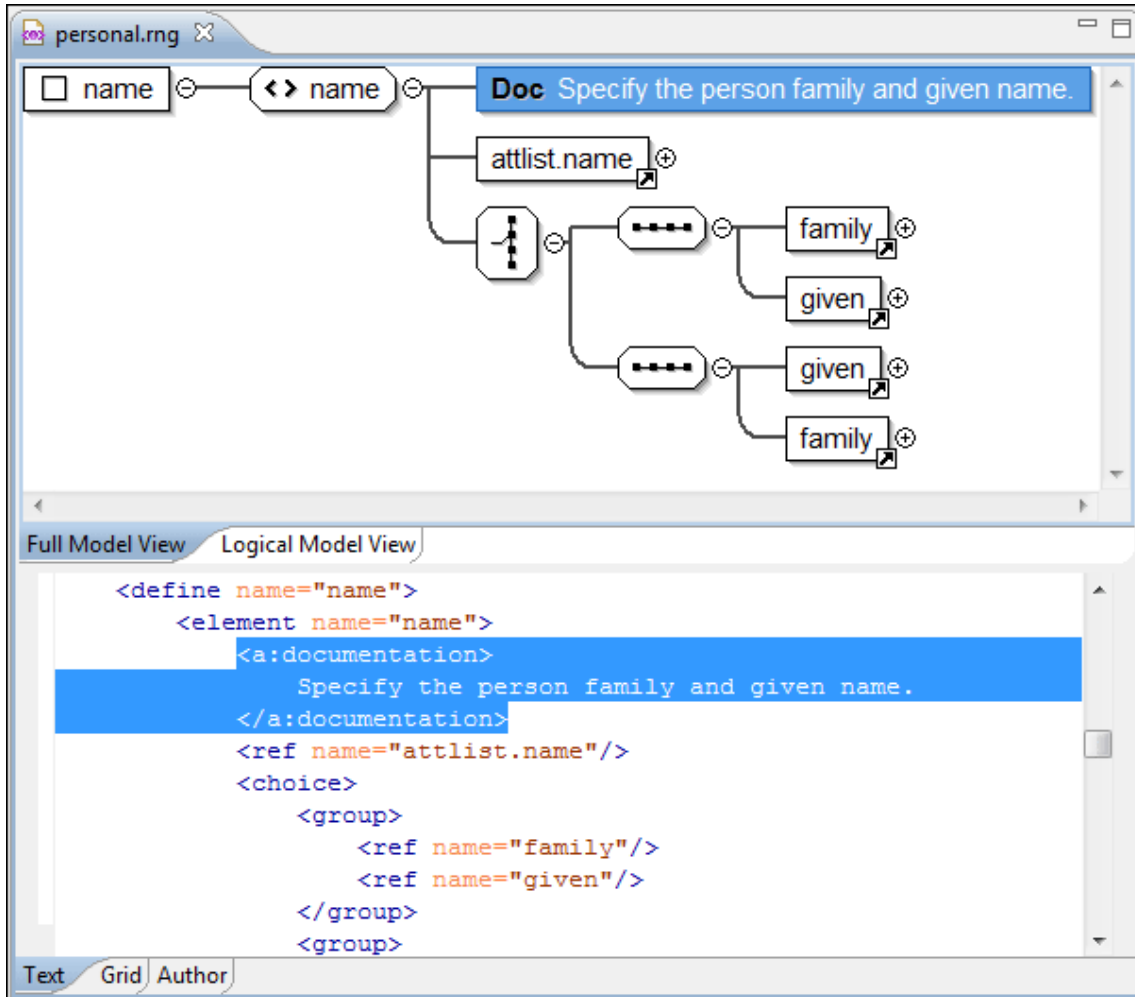

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, or BMP images. It helps both schema authors in developing the schema and content authors who are using the schema to understand it.

Oxygen XML Editor Eclipse plugin provides a side-by-side source and diagram presentation with real-time synchronization:

- The changes you make in the editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a new schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The schema diagram editor has two tabs that offer a **Full Model View** and **Logical Model View** (on page 832).

Figure 314. Relax NG Schema Editor - Full Model View

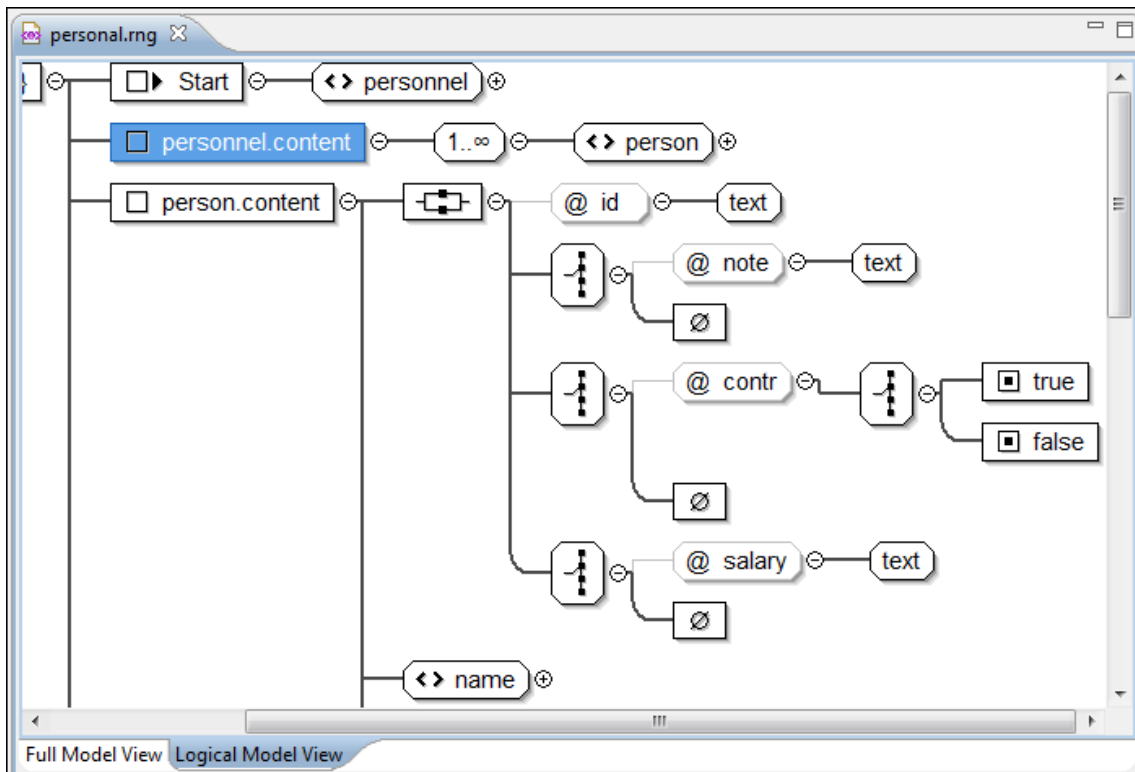

The following references can be expanded in place: patterns, includes, and external references. This expansion mechanism, coupled with the synchronization support, makes the schema navigation easy.

All the element and attribute names are editable by double-clicking the names.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top-level patterns with generated names. These names are generated depending of the elements name class.

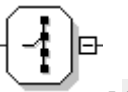

Figure 315. Logical Model View for a Relax NG Schema

Symbols Used in the Schema Diagram

The views in the schema diagram editor renders all the Relax NG schema patterns with the following intuitive symbols:

-  `name`  - define pattern with the `@name` attribute set to the value shown inside the rectangle (in this example `name`).
-  `attlist.person`  - define pattern with the `@combine` attribute set to `interleave` and the `@name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
-  `attlist.person`  - define pattern with the `@combine` attribute set to `choice` and the `@name` attribute set to the value shown inside the rectangle (in this example `attlist.person`).
-  `name`  - element pattern with the `@name` attribute set to the value shown inside the rectangle (in this example `name`).
-  `@ note`  - attribute pattern with the `@name` attribute set to the value shown inside the rectangle (in this case `note`).
-  `family`  - ref pattern with the `@name` attribute set to the value shown inside the rectangle (in this case `family`).

-  - oneOrMore pattern.
-  - zeroOrMore pattern.
-  - optional pattern.
-  - choice pattern.
-  - value pattern (for example, used inside a choice pattern).
-  - group pattern.
-  - A pattern from the Relax NG Annotations namespace (<http://relaxng.org/ns/compatibility/annotations/1.0>) that is treated as a documentation element in a Relax NG schema.
-  - text pattern.
-  - empty pattern.

Actions Available in the Schema Diagram Editor

When editing Relax NG schemas in **Full Model View** (*on page 831*), the contextual menu offers the following actions:

Go to definition (Available for imported components)

This action is available for imported components from other RNG files, and it shows where that component is defined.

Append child

Appends a child to the selected component.

Insert Before

Inserts a component before the selected component.

Insert After

Inserts a component after the selected component.

Edit attributes

Edits the attributes of the selected component.

Remove

Removes the selected component.

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. If you select it and then edit a top-level element or you make a refresh, the diagram is expanded until it reaches referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as JPEG, BMP, SVG or PNG image.

Refresh

Refreshes the schema diagram according to the changes in your code. They represent changes in your imported documents or changes that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** ([on page 832](#)) instead of the diagram.

Validating Relax NG Schema Documents

By default, Relax NG schema files are validated as you type. To change this, [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option ([on page 133](#)).

To validate a Relax NG schema document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor Eclipse plugin validates a Relax NG schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

[Presenting Validation Errors in Text Mode \(on page 549\)](#)

Content Completion in Relax NG Schemas

The intelligent *Content Completion Assistant* (on page 2677) allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (on page 70), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 119).

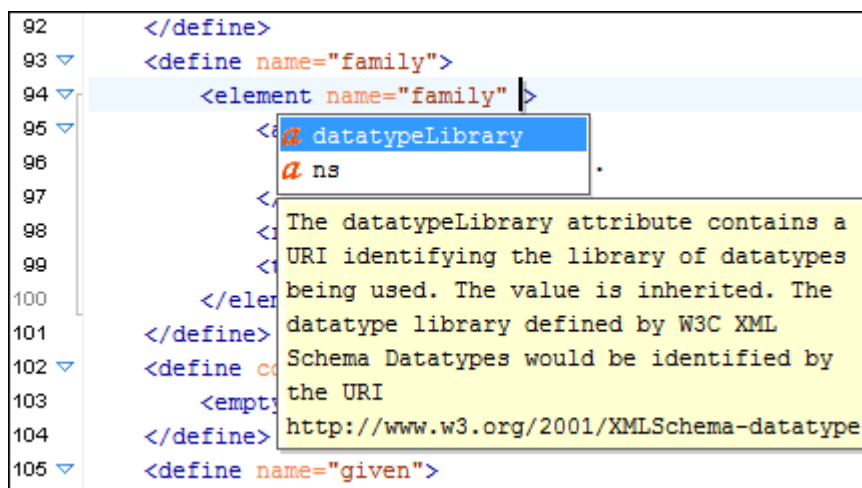

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list, the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *main files* (on page 2680) to import/include modules, the *Content Completion Assistant* collects its components starting from the *main files*. The *main files* can be defined in the project or in the associated validation scenario. For more information about the *Main Files* support in Oxygen XML Editor Eclipse plugin, see [Defining Main Files at Project Level \(on page 278\)](#).

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Figure 316. Relax NG Content Completion Assistant

Syntax Highlighting in Relax NG Schemas

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Relax NG schemas, follow these steps:

1. Open the **Preferences** dialog box (on page 70).
2. Go to **Editor > Syntax Highlight** (on page 176).
3. Select and expand the **XML** section in the top pane (for RELAX NG Compact Syntax schemas, select and expand the **RNC** section).
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes (for RELAX NG Compact Syntax schemas, the tab is **RNC**).

Tip:

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (on page 176).

Related Information:

[Syntax Highlight Preferences \(on page 176\)](#)

Quick Fixes for DTD, XSD, and Relax NG Errors

Oxygen XML Editor Eclipse plugin offers [Quick Fixes \(on page 2682\)](#) for common errors that appear in XML documents that are validated against DTD, XSD, or Relax NG schemas.

**Note:**

For XML documents validated against XSD schemas, the *Quick Fixes* are only available if you use the default Xerces validation engine.

Quick Fixes are available in **Text** mode and **Author** mode.

Oxygen XML Editor Eclipse plugin provides *Quick Fixes* for numerous types of problems, including the following:

Problem Type	Available Quick Fixes
A specific element is required in the current context	Insert the required element
An element is invalid in the current context	Remove the invalid element
The content of the element should be empty	Remove the element content
An element is not allowed to have child elements	Remove all child elements
Text is not allowed in the current element	Remove the text content
A required attribute is missing	Insert the required attribute
An attribute is not allowed to be set for the current element	Remove the attribute
The attribute value is invalid	Propose the correct attribute values
ID value is already defined	Generate a unique ID value
References to an invalid ID	Change the reference to an already defined ID

Related Information:

[Schematron Quick Fixes \(SQF\) \(on page 584\)](#)

Relax NG Outline View

The **Outline** view for Relax NG schemas presents a list with the patterns that appear in the diagram in both the **Full Model View** (on page 831) and **Logical Model View** (on page 832) cases and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 317. Relax NG Outline View

This view has two modes, with the tree showing either the XML structure or the defined pattern (components) collected from the current document. By default, the **Outline** view presents the components.

When the  **Show components** option is selected in the **View menu** on the **Outline** view action bar, the following option is available:

 **Show XML structure**

Shows the XML structure of the current document in a tree-like manner.

The following actions are available in the **View menu** on the **Outline** view action bar when the  **Show XML structure** option is selected:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

 **Selection update on cursor move**

Allows a synchronization between **Outline** view and schema diagram. The selected view from the diagram will be also selected in the **Outline** view.

 **Show components**

Shows the defined pattern collected from the current document.

 **Flat presentation mode of the filtered results**

When active, the application flattens the filtered result elements to a single level.

 **Show comments and processing instructions**

Show/hide comments and processing instructions in the **Outline** view.

 **Show element name**

Show/hide element name.

 **Show text**

Show/hide additional text content for the displayed elements.

 **Show attributes**

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel \(on page 214\)](#).

 **Configure displayed attributes**

Displays the **XML Structured Outline** preferences page [\(on page 214\)](#).

The following contextual menu actions are also available in the **Outline** view when the  **Show XML structure** option is selected in the **View menu**:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

 **Edit Attributes**

Opens a dialog box that allows you to edit the attributes of the currently selected component.

 **Toggle Comment**

Comments/uncomments the currently selected element.

 **Search references**

Searches for the references of the currently selected component.

Search references in

Searches for the references of the currently selected component in the context of a scope that you define.

 **Component dependencies**

Opens the **Component Dependencies** view ([on page 844](#)) that displays the dependencies of the currently selected component.

Rename Component in

Renames the currently selected component in the context of a scope that you define.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as * or ?) and separate multiple patterns with commas.

RNG Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the references or dependencies for resources included in an RNG schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy or dependencies of an RNG schema, select the desired schema in the **Project Explorer** view ([on page 269](#)) and choose **Show referenced resources** or **Show dependent resources** from the contextual menu.

Figure 318. Referenced View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

**Note:**

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 812\)](#).

Related Information:

[Search and Refactor Operations Scope \(on page 600\)](#)

Moving/Renaming RNG Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

**Note:**

Updating the references of a resource that is resolved through a catalog is not supported. Also, the update references operation is not supported if the path to the renamed or moved resource contains entities.

Relax NG Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

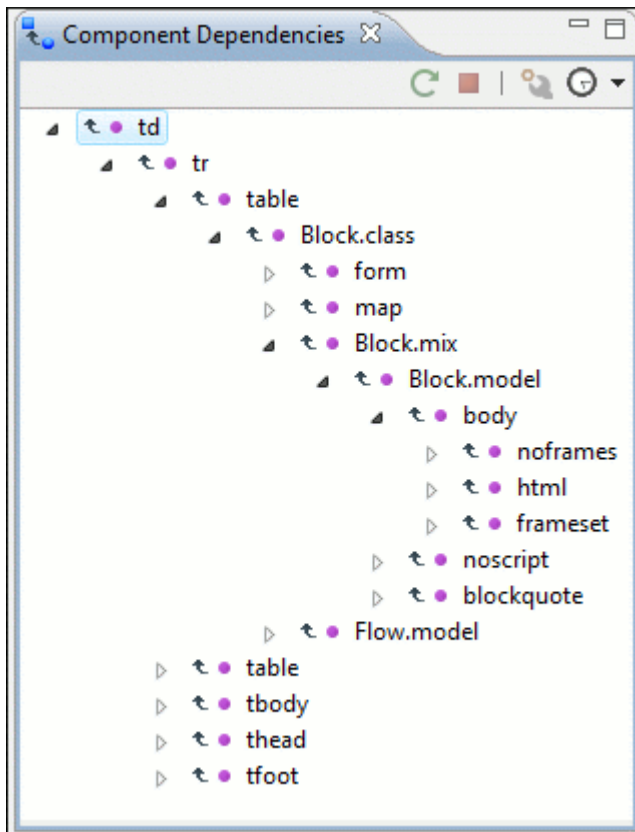

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of a Relax NG component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named defines.

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon

Figure 319. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

 **History**

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Related Information:[Search and Refactor Operations Scope \(on page 600\)](#)

Searching and Refactoring Actions in RNG Schemas

Search Actions

The following search actions can be applied on named *defines* and are available from the **Search** submenu in the contextual menu of the current editor:

 **Search References**

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

 **Search Declarations**

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

 **Search Occurrences in File**

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

 **Go to Definition**

Moves the cursor to the definition of the current element in the Relax NG (full syntax) schema.

**Note:**

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on named *defines* and are available from the **Refactoring** submenu in the contextual menu of the current editor:

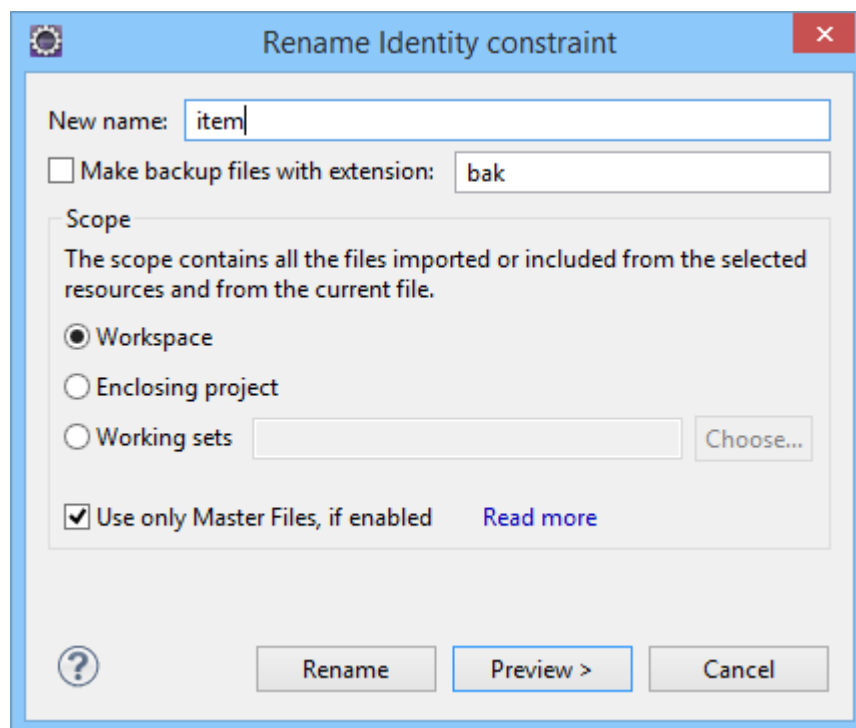

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 320. Rename Identity Constraint Dialog Box

RNG Quick Assist Support

The *Quick Assist* support (on page 2681) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature (on page 2681) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on macOS) keyboard shortcuts.

Figure 321. RNG Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Configuring a Custom Datatype Library for a RELAX NG Schema

A RELAX NG schema can declare a custom datatype library for the values of elements found in XML document instances. The datatype library must be developed in Java and it must implement the interface specified on the www.thaiopensource.com website.

The *JAR* (on page 2679) file containing the custom library and any other dependent *JAR* file must be added to the classpath of the application, that is the *JAR* files must be added to the folder `[ECLIPSE-INSTALL-DIR]/lib` and a line `<library name="lib/custom-library.jar"/>` must be added for each *JAR* file to the file `[ECLIPSE-INSTALL-DIR]/plugin.xml` in the `<runtime>` element.

To load the custom library, restart the Eclipse platform.

Editing NVDL Schemas

Some complex XML documents are composed by combining elements and attributes from namespaces. Furthermore, the schemas that define these namespaces are not even developed in the same schema language. In such cases, it is difficult to specify in the document all the schemas that must be taken into account for validation of the XML document or for content completion. An NVDL (Namespace Validation Definition Language) schema can be used. This schema allows the application to combine and interleave multiple schemas of different types (W3C XML Schema, RELAX NG schema, Schematron schema) in the same XML document.

Oxygen XML Editor Eclipse plugin offers support for editing NVDL schema files in the following editing modes:

- **Text editing mode** (on page 742) - Allows you to edit NVDL schema files in a source editing mode, along with a schema design pane with two tabs that offer a **Full Model View** (on page 850) and **Logical Model View** (on page 851).
- **Grid editing mode** (on page 242) - Displays NVDL schema files in a structured spreadsheet-like grid.
- **Author editing mode** - The visual **Author** mode is also available for Relax NG schema files, presenting them in a compact and easy to understand representation.

For information about applying and detecting schemas, see [Associating a Schema to XML Documents](#) (on page 584).

Related Information:

[Associating a Schema to XML Documents](#) (on page 584)

NVDL Schema Diagram

This section explains how to use the graphical diagram of a NVDL schema.

Introduction to NVDL Schema Diagram Editor

Oxygen XML Editor Eclipse plugin provides a simple, expressive, and easy-to-read schema diagram editor for NVDL schemas.

With this new feature you can easily develop complex schemas, print them on multiple pages or save them as JPEG, PNG, and BMP images. It helps both schema authors in developing the schema and content authors that are using the schema to understand it.

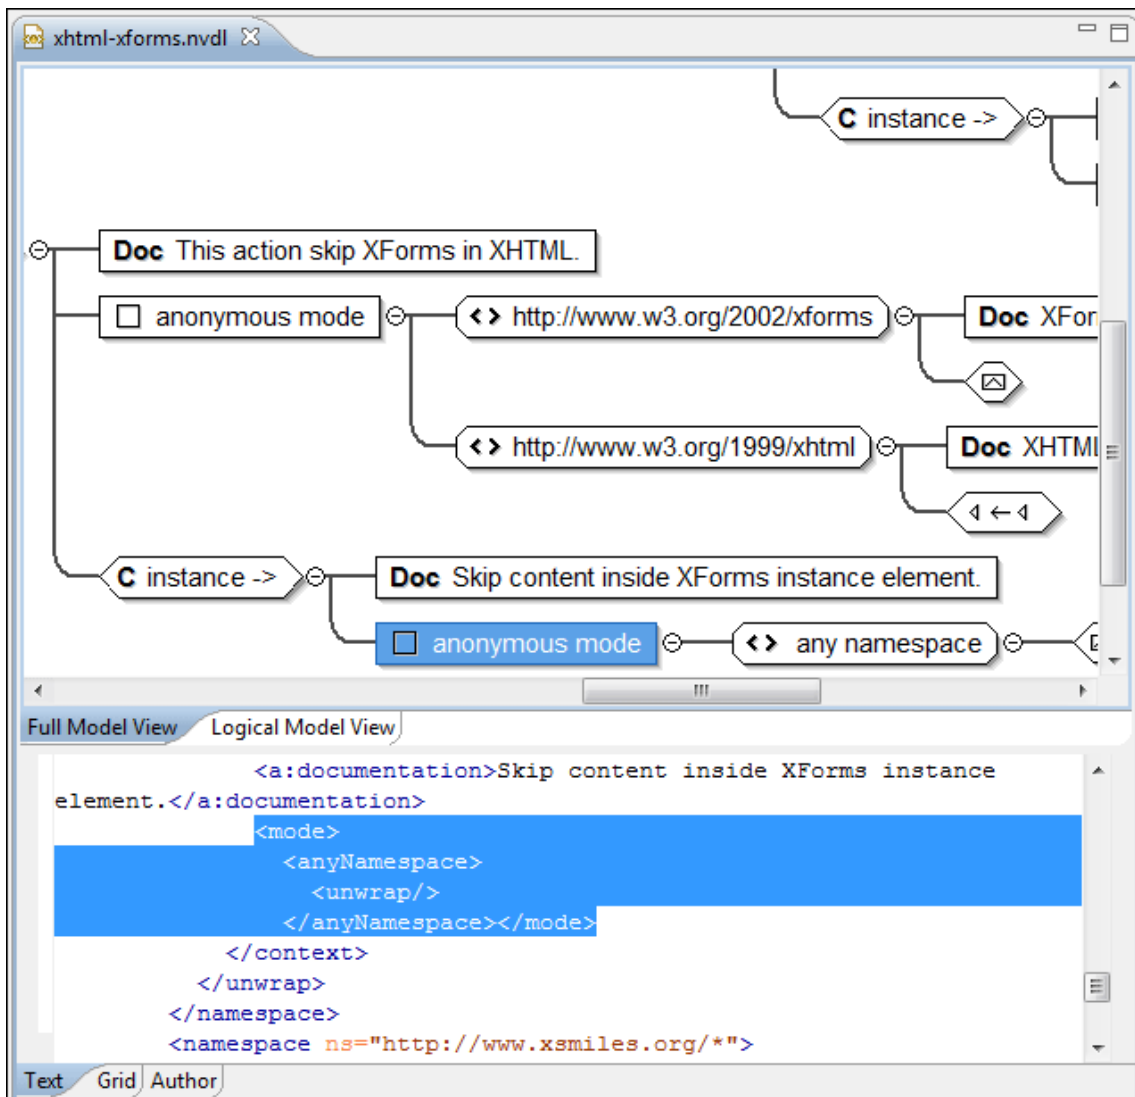

Oxygen XML Editor Eclipse plugin provides a side-by-side source and diagram presentation with real-time synchronization:

- The changes you make in the editor are immediately visible in the Diagram (no background parsing).
- Changing the selected element in the diagram selects the underlying code in the source editor.

Full Model View

When you create a schema document or open an existing one, the editor panel is divided in two sections: one containing the schema diagram and the second the source code. The diagram view has two tabbed panes offering a **Full Model View** and a **Logical Model View** (on page 851).

Figure 322. NVDL Schema Editor - Full Model View

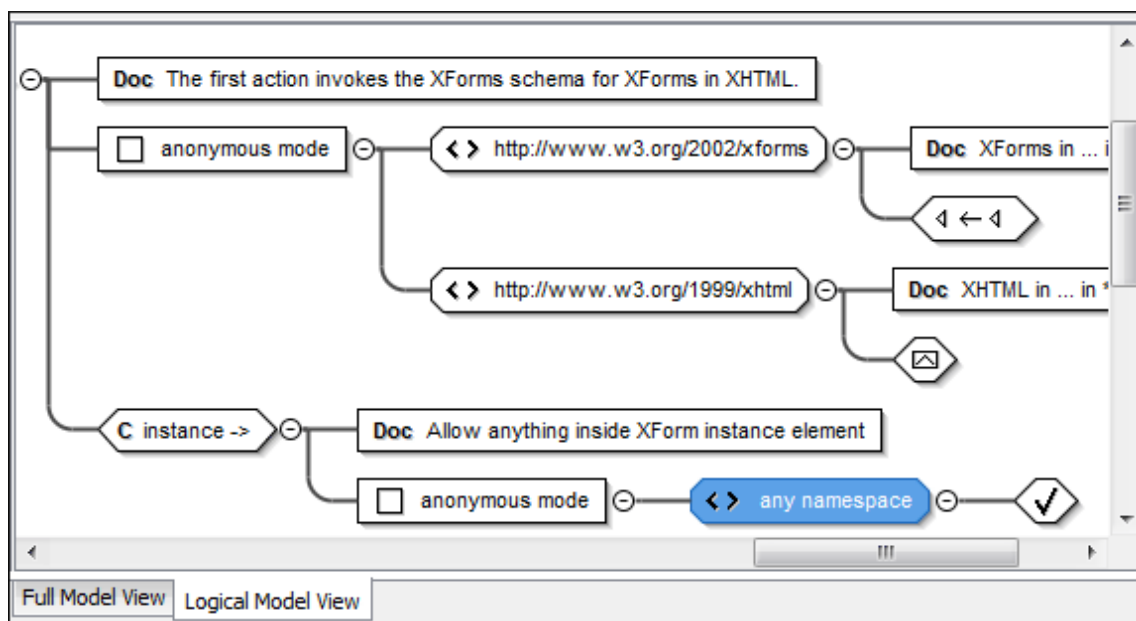

The **Full Model View** renders all the NVDL elements with intuitive icons. This representation coupled with the synchronization support makes the schema navigation easy.

Double-click any diagram component to edit its properties.

Logical Model View

The **Logical Model View** presents the compiled schema in the form of a single pattern. The patterns that form the element content are defined as top-level patterns with generated names. These names are generated depending of the elements name class.

Figure 323. Logical Model View for an NVDL Schema

Actions Available in the Diagram Editor

The contextual menu offers the following actions:

Show only the selected component

Depending on its state (selected/not selected), either the selected component or all the diagram components are shown.

Show Annotations

Depending on its state (selected/not selected), the documentation nodes are shown or hidden.

Auto expand to references

This option controls how the schema diagram is automatically expanded. For instance, if you select it and then edit a top-level element or you trigger a diagram refresh, the diagram will be expanded until it reaches the referenced components. If this option is left unchecked, only the first level of the diagram is expanded, showing the top-level elements. For large schemas, the editor disables this option automatically.

Collapse Children

Collapses the children of the selected view.

Expand Children

Expands the children of the selected view.

Print Selection

Prints the selected view.

Save as Image

Saves the current selection as image, in JPEG, BMP, SVG or PNG format.

Refresh

Refreshes the schema diagram according to the changes in your code (changes in your imported documents or those that are not reflected automatically in the compiled schema).

If the schema is not valid, you see only an error message in the **Logical Model View** ([on page 851](#)) instead of the diagram.

Validating NVDL Schema Documents

By default, NVDL schema files are validated as you type. To change this, open the **Preferences** dialog box ([on page 70](#)), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option ([on page 133](#)).

To validate an NVDL schema document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor Eclipse plugin validates an NVDL schema file, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

[Validating XML Documents Against a Schema \(on page 546\)](#)

[Presenting Validation Errors in Text Mode \(on page 549\)](#)

Content Completion in NVDL Schemas

The intelligent *Content Completion Assistant* ([on page 2677](#)) allows you to quickly identify and insert elements, attributes, and attribute values that are valid in the current editing context. All available proposals are listed in a pop-up menu displayed at the current cursor position.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box ([on page 70](#)), go to **Editor > Content Completion**, and deselect the **Enable content completion** option ([on page 119](#)).

When active, the *Content Completion Assistant* displays a list of context-sensitive proposals valid at the current cursor position. It can be manually activated with the **Ctrl + Space** shortcut. You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. For each selected item in the list,

the *Content Completion Assistant* displays a documentation window. You can customize the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal in **Text** mode, do one of the following:

- Press **Enter** or **Tab** to insert both the start and end tags and position the cursor inside the start tag in a position suitable for inserting attributes.
- Press **Ctrl + Enter (Command + Enter on macOS)** to insert both the start and end tags and positions the cursor between the tags in a position where you can start typing content.

If you are using the concept of *main files (on page 2680)* to import/include modules, the *Content Completion Assistant* collects its components starting from the *main files*. The *main files* can be defined in the project or in the associated validation scenario. For more information about the *Main Files* support in Oxygen XML Editor Eclipse plugin, see *Defining Main Files at Project Level (on page 278)*.

The *Content Completion Assistant* also offers additional information for the element and attribute proposals in the form of schema annotations that is displayed in a tooltip.

Figure 324. NVDL Content Completion Assistant

Syntax Highlighting in NVDL Schemas

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for NVDL schemas, follow these steps:

1. Open the **Preferences** dialog box (on page 70).
2. Go to **Editor > Syntax Highlight** (on page 176).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

**Tip:**

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the [Editor > Syntax Highlight > Elements/Attributes by Prefix preferences page \(on page 176\)](#).

Related Information:

[Syntax Highlight Preferences \(on page 176\)](#)

NVDL Outline View

The **Outline** view for NVDL schemas presents a list with the named or anonymous rules that appear in the diagram and it allows for quick access to a rule by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

NVDL Schema Component Dependencies View

The **Component Dependencies** view allows you to see the dependencies for a selected component. This is helpful if you want to see where components are used in the entire hierarchy. For example, if you want to find all the references where a given component is used.

If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

To see the dependencies of an NVDL component:

1. Right-click the desired component in the editor or **Outline** view.
2. Select the **Component Dependencies** action from the contextual menu.

The action is available for all named modes.

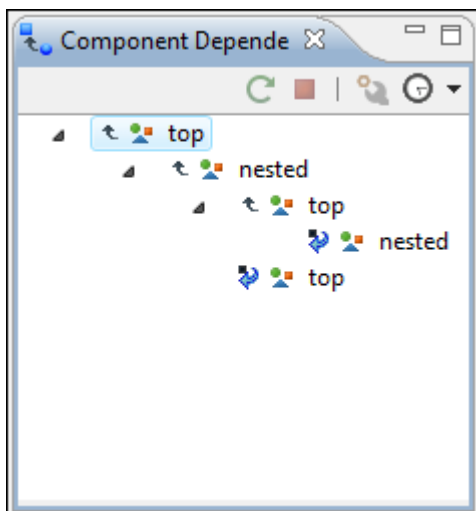

If a component contains multiple references, a small table is displayed at the bottom of the view that contains all the references. When a recursive reference is encountered, it is marked with a special icon .

Figure 325. Component Dependencies View

The **Component Dependencies** view includes the following toolbar actions:

 **Refresh**

Refreshes the dependencies structure.

 **Stop**

Stops the dependency computation.

 **Configure**

Allows you to choose the search scope for computing the dependencies structure. This is helpful for making sure all imported/included resources are computed.

 **History**

Allows you to select from a list of the most recently used dependency computations.

In addition, the following actions are available in the contextual menu:

Go to First Reference

Selects the first reference of the currently selected component in the dependencies tree.

Go to Component

Shows the definition of the currently selected component in the dependencies tree.

Searching and Refactoring Actions in NVDL Schemas

Search Actions

The following search actions can be applied on `@name`, `@useMode`, and `@startMode` attributes and are available from the **Search** submenu in the contextual menu of the current editor:

 **Search References**

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

The following action is available from the **XSL** menu:

Go to Definition

Moves the cursor to its definition in the schema used by the NVDL to validate it.

Note:

You can also use the **Ctrl + Single-Click (Command + Single-Click on macOS)** shortcut on a reference to display its definition.

Refactoring Actions

The following refactoring actions can be applied on `@name`, `@useMode`, and `@startMode` attributes and are available from the **Refactoring** submenu in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 326. Rename Identity Constraint Dialog Box

Editing JSON Documents

This section explains the features of the Oxygen XML Editor Eclipse plugin and how to use them.

Resources

For more information about the JSON support in Oxygen XML Editor Eclipse plugin, see the following resources:

- [Video: JSON Editing](#)
- [Video: JSON Tools in Oxygen](#)
- [Webinar: JSON and JSON Schema Support in Oxygen](#)
- [Webinar: Introducing Oxygen JSON Editor - The Ultimate Solution for JSON Editing](#)

JSON Editor

Oxygen XML Editor Eclipse plugin includes a specialized JSON editor with various editing features for files that have the `.json` file extension. It also includes a document template to help you get started with JSON documents. The template is called **JSON** and it can be found in the **New Document** folder in the **New from templates** wizard (*on page 253*).

**Tip:**

You can experiment with a sample of a JSON file available at: `[OXYGEN-INSTALL-DIR]/samples/json/personal.json`.

Text Mode Editor

When editing JSON documents in the **Text** editing mode, the usual text editing actions are available, along with other editor-specific actions, including:

- [Search and Find/Replace](#) (*on page 281*)
- Drag and Drop
- [Validation](#) (*on page 863*)
- Format and Indent (Pretty Print)

The JSON Text mode editor also offers unique features. For example, the property name is displayed after the ending bracket:

```
        "five.worker"  
      ] /subordinates  
    } /link  
  }, /person[0]  
  {  
    "id": "one.worker",
```

**Note:**

You can run XPath expressions on open JSON documents, but in **Text** mode the XPath results cannot be mapped in the document. However, they can be mapped in the **Grid** editing mode. You can use the **Grid** button at the bottom of the editor panel to switch to that editing mode.

Grid Mode Editor

Oxygen XML Editor Eclipse plugin allows you to view and edit the JSON documents in the **Grid** mode. The JSON is represented in **Grid** mode as a compound layout of nested tables and the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components.

Figure 327. JSON Editor Grid Mode

	id	name	family	given	email	link
1	"Big.Boss"	name	"Boss"	"chief@oxyg enxml.com"	link	
2	"one.worker"	name	"Worker"	"one@oxyge nxml.com"	link	
3	"two.worker"	name	"Worker"	"two@oxyge nxml.com"	link	
4	"three.worker"	name	"Worker"	"three@oxyg enxml.com"	link	
5	"four.worker"	name	"Worker"	"four@oxyge nxml.com"	link	
6	"five.worker"	name	"Worker"	"five@oxyge nxml.com"	link	

You can also use the following JSON-specific contextual actions:

Array

Useful when you want to convert a JSON *value* to *array*.

Insert value before

Inserts a value before the currently selected one.

Insert value after

Inserts a value after the currently selected one.

Append value as child

Appends a value as a child of the currently selected value.

You can [customize the JSON grid appearance \(on page 158\)](#) according to your needs. For instance, you can change the font, the cell background, foreground, or even the colors from the table header gradients. The default width of the columns can also be changed.

Author Visual Editor

You can edit JSON files in the visual **Author** editing mode and you have access to the various features and actions that are available when [editing XML documents in Author mode \(on page 367\)](#). When a JSON document is opened in **Author** mode, it is automatically converted to proper XML structure using the built-in [JSON to XML Converter \(on page 881\)](#). Additionally, for *Boolean*, *Number*, and *Null* types, an `oxy_Type="[symples_type]"` attribute structure is added in the XML to preserve the type of the value from the JSON document.

Figure 328. JSON Editor Author Mode

The screenshot shows the Oxygen XML Editor in Author Mode for a JSON document named 'residentCardForm.json'. The editor displays a form titled 'Application to Replace Permanent Resident Card' with two main sections: 'Part 1. Information About You' and 'Part 2. Application Type'. The form contains various input fields, checkboxes, and dropdown menus for user information and application details.

Application to Replace Permanent Resident Card

Part 1. Information About You

1. Gender Male Female

2. Class of Admission T1 - 1ST PREF SELECTED ALIEN

3. Date of Birth (mm/dd/yyyy) 01/11/1984

4. Date of Admission (mm/dd/yyyy) 01/02/2012

5. City/Town/Village of Birth Prague

6. U.S. Social Security number (if any)

7. Country of Birth Czech Republic

Part 2. Application Type

NOTE: If your conditional status is expiring within the next 90 days, then do not file this application.

My status is (Select only one box):

1.a. Permanent Resident

1.b. Permanent Resident - In Commuter Status

1.c. Conditional Permanent Resident

At the bottom of the editor, the 'Author' mode is selected, along with 'Text' and 'Grid' options.

You can also create your own custom JSON framework, similar to the [process for creating custom XML frameworks \(on page 1941\)](#). For example, to create a document type association (framework) for JSON documents, you could:

- Add a rule to match the `"JSON"` as the root local name.
- Add a rule to match the `topProperties` attribute that contains a value that is the name of the properties from the first level of the JSON document.
- Add a rule to match the `schema` attribute that contains a value that is the associated schema from the `schema` property.

**Note:**

The default JSON framework has the *Lowest* priority in the [Document Type Association preferences page \(on page 88\)](#). If you create a custom JSON framework, you need to set it to a higher priority. Otherwise, the **Author** mode rendering will revert to the default JSON framework.

**Tip:**

You can experiment with some samples of custom JSON frameworks available in the `[OXYGEN-INSTALL-DIR]/samples/json/author/` directory. There is a sample application form called `residentCardForm.json` and a sample travel guide called `travel-guide.json`, along with referenced resources in the `images` folder.

For more information about the visual editing support for JSON, watch our video demonstration:

https://www.youtube.com/embed/_C2dVpbGANQ

Navigating References in JSON Documents

When editing JSON documents (or JSON Schema), you can easily navigate *JSON Pointer* references and hyperlinks by using the **CTRL + Click** shortcut. Holding the **CTRL** key while hovering over a *JSON Pointer* reference or hyperlink will change the reference to a clickable link.

JSON Schema References

Referencing allows you to create modular, maintainable, and reusable schemas. It is particularly useful when you have multiple instances of a similar structure in your data and want to enforce consistency in validation rules.

A schema can reference another schema using the `$ref` (or `$dynamicRef`) keyword. Its value is a URI-reference that is resolved against the schema's **Base URI**. When evaluating a `$ref`, an implementation uses the resolved identifier to retrieve the referenced schema and applies that schema to the instance. For more details about structuring JSON schemas, see [Understanding JSON Schema: Structuring a complex schema](#).

- **Defining Reusable Schemas** - You can define reusable schema components using the `definitions` (or `$defs` for latest drafts) keyword. These definitions act as named schemas that you can reference using `$ref` (or `$dynamicRef`).

```
{
  "$defs": {
    "person": {
      "type": "object",
      "properties": {
        "name": { "type": "string" },
        "age": { "type": "integer" }
      }
    }
  }
}
(my_schema.json)
```

- **Referencing a Schema** - To reference a schema defined in a definitions block, use the `$ref` keyword followed by the JSON Pointer of the definition.

```
{
  ...
  "type": "object",
  "properties": {
    "person1": { "$ref": "#/$defs/person" },
    "person2": { "$ref": "#/$defs/person" }
  }
}
```

```
}
}
```

In this example, both `"person1"` and `"person2"` properties refer to the `"person"` schema defined in `$defs`.

- **External References** - You can also reference schemas from external files using their URI. This can be useful when you have multiple schema files.

```
{
  "$ref": "my_schema.json#/$defs/person"
}
```

Here, the schema at the specified URI is being referenced. You can also use `$id` to uniquely identify a schema resource and then reference it from another file using the same mechanism. The following example sets a custom id for the `"person"` schema:

```
{
  "$defs": {
    "person": {
      "$id": "#person_info"
      "type": "object",
      "properties": {
        "name": { "type": "string" },
        "age": { "type": "integer" }
      }
    }
  }
}
```

You can now reference this definition by its `$id`, not by its JSON Pointer:

```
{
  "$ref": "my_schema.json/#person_info"
}
```

Note:

Oxygen XML Editor Eclipse plugin allows `$id` only as an URI fragment, not as a relative pointer.

- **Combining References with Other Keywords** - You can use `$ref` in combination with other keywords. For instance, you might reference a schema within the `items` keyword to define an array of a specific type:

```
{
  ...
  "type": "array",
```

```
"items": { "$ref": "#/$defs/person" }
}
```

Starting with latest drafts, you can use `$ref` in conjunction with other type-specific keywords for stricter validation. For example, the previous schema can be modified to not allow extraneous properties for a "person" object:

```
{
  ...
  "type": "array",
  "items": {
    "$ref": "#/$defs/person",
    "additionalProperties": false
  }
}
```

Validating JSON Documents

Oxygen XML Editor Eclipse plugin includes a built-in JSON validator that is used to validate JSON documents against JSON Schemas, as well as a built-in JSON *Well-Formedness* validator (based on the free JAVA source code available at www.json.org). A built-in JSON Schematron Validator engine is also provided to validate JSON documents against a specified Schematron schema. Validation for JSON documents works in both **Text** mode and **Author** mode.

Resources

For more information, see the following video demonstration:

<https://www.youtube.com/embed/3JEL6nFUozQ>

Checking Well-Formedness in JSON Documents

A *Well-formed* JSON document is a sequence of Unicode code points that strictly conforms to the JSON grammar defined by the [JSON Data Interchange Syntax specification](#). By default, Oxygen XML Editor Eclipse plugin automatically checks the document for *Well-formedness* as you type.

Check for Well-Formedness Manually

To manually check documents for *Well-Formedness*:

- Select the  **Check Well-Formedness (Alt + Shift + V, W (Command + Option + V, W on macOS))** action from the  **Validation** drop-down menu on the toolbar or from the **XML** menu.
- A selection of files can be checked for well-formedness by selecting the  **Check Well-Formedness** action from the **Validate** submenu when invoking the contextual menu in the **Project Explorer** view ([on page 269](#)).

Result: If any errors are found, the result is displayed in the message panel at the bottom of the editor. Each error is displayed as one record in the result list and is accompanied by an error message. Clicking the record will open the document containing the error and highlight its approximate location.

Example: A non *Well-formed* JSON Document

```
{"person": { "name": "John Doe" }
```

This would result in the following error:

```
Expected a ',' or '}'
```

To resolve the error, click the record in the result list and it will locate and highlight the approximate position of the error. In this case, you would need to identify where the missing end bracket needs to be placed.

Validating JSON Documents Against JSON Schema or Schematron

A *valid* JSON document is a *well-formed* document that also conforms to the rules of a JSON Schema that defines the legal syntax of a JSON document. The purpose of the JSON schema is to define the legal properties and values of a JSON document.

This section contains topics that explain the automatic and manual validation possibilities in Oxygen XML Editor Eclipse plugin, how validation errors are presented, and information about built-in validation scenarios.

Oxygen XML Editor Eclipse plugin also includes a built-in JSON Schematron Validator engine to validate JSON documents against a Schematron schema specified in a custom validation scenario or using the **Validate with action** (*on page 865*).

Tip:

Inside the samples folder, there are a few files you can use to see how Schematron validation can be done with JSON files. The path of the folder containing these sample files is:

```
[OXYGEN_INSTALL_DIR]/samples/json/schematron/.
```

For information about how to associate a schema for the purposes of validation, see [Associating a JSON Schema Through a Validation Scenario](#) (*on page 873*).

Automatic Validation

By default, Oxygen XML Editor Eclipse plugin is configured to automatically mark validation errors in the JSON document as you are editing. The **Enable automatic validation option** (*on page 133*) in the **Document Checking preferences page** (*on page 133*) controls whether or not all validation errors and warnings will automatically be highlighted in the editor pane.

The automatic validation starts parsing the document and marking the errors after a **configurable delay** (*on page 133*) from the last typed key. Errors are highlighted with underline markers in the main editor pane and small rectangles on the right side ruler. Hovering over a validation error presents a tooltip message with more details about the error.

Related Information:[Manual Validation Actions \(on page 865\)](#)[Presenting Validation Errors in JSON Documents \(on page 866\)](#)

Manual Validation Actions

You can choose to validate JSON documents at any time by using the manual validation actions that are available in Oxygen XML Editor Eclipse plugin.

Manual Validation Actions

To manually validate the currently edited document, use one of the following actions:

 **Validate**

Available from the  **Validation** drop-down menu on the toolbar, the **JSON** menu, or from the **Validate** submenu when invoking the contextual menu on one or more JSON documents in the **Project Explorer** view (on page 269).

Validate with

Available from the  **Validation** drop-down menu on the toolbar or the **JSON** menu. This action opens a dialog box that allows you to [specify a schema for validating the current document \(on page 873\)](#).

Validate with Schema

Available from the **Validate** submenu when invoking the contextual menu on one or more JSON documents in the **Project Explorer** view (on page 269). This action opens a dialog box that allows you to specify a JSON or Schematron schema to be used for the validation.

Other Validation Options

To clear the error markers added to the **Problems** view in the last validation, select  **Clear Validation Markers** from the **Validate** submenu when invoking the contextual menu in the **Project Explorer** view.

 **Tip:**

If a large number of validation errors are detected and the validation process takes too long, you can [limit the maximum number of reported errors in the Document Checking preferences page \(on page 133\)](#).

Related Information:[Automatic Validation \(on page 864\)](#)[Presenting Validation Errors in JSON Documents \(on page 866\)](#)

Presenting Validation Errors in JSON Documents

Validation errors and warnings in JSON documents are presented in various locations within the interface.

Validation Marker Locations

Validation issues are marked in the following locations:

- In the main editing pane, with the issue underlined in a color according to the type of issue.
- In the right-side vertical stripe, with a marker that is colored according to the type of issue.
- In the **Outline** view, with an icon that is colored according to the type of issue.

Validation Marker Colors

The colors for each type of issue are as follows:

- **Validation Errors** [Red] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in red.
- **Validation Warnings** [Yellow] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in yellow.
- **Validation Info** [Blue] - By default, the underline in the editing pane, the marker in the right vertical stripe, and the foreground color of the attribute in the **Attributes** view are colored in blue.

You can configure the colors and how the various types of validation problems are rendered from the Eclipse **Annotations** preferences page (**Window ('Eclipse' on macOSX) > Preferences > General > Editors > Text Editors > Annotations**).

Validation Markers in the Right-Side Stripe

Also, the stripe on the right side of the editor panel is designed to display the issues found during the validation process and to help you locate them in the document. The stripe contains the following:

Upper Part of the Stripe

A success indicator square will turn green if the validation is successful or only info messages are found, red if validation errors are found, or yellow if only validation warnings are found. More details about the issues are displayed in a tooltip when you hover over indicator square. If there are numerous problems, only the first three are presented in the tooltip.

Middle Part of the Stripe

Errors are presented with red markers, warnings with yellow markers, and info message with blue markers. If you want to limit the number of markers that are displayed, [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Document checking**, and specify the desired limit in the **Maximum number of validation highlights** option ([on page 133](#)).

Clicking a marker will highlight the corresponding text area in the editor. The validation message is also displayed both in a tooltip (when hovering over the marker) and in the message area on the bottom of the application.

Bottom Part of the Stripe

Two navigation arrows () can be used to jump to the next or previous issue. The same actions can be triggered from **Document > Automatic validation > Next Error/Highlight (Ctrl + Period (Command + Period on macOS))** and **Document > Automatic validation > Previous Error/Highlight (Ctrl + Comma (Command + Comma on macOS))**.

Hovering Over Validation Issues

Hovering over a validation issue presents a tooltip message with more details about the problem. Also, when hovering over an issue, pressing **F2** will change the focus to the tooltip.

Details About Validation Issues

- Information about the issue is also displayed in the message area on the bottom of the editor panel (clicking the  **Document checking options** button opens the **Document Checking preferences page (on page 133)** where you can configure some validation options. Some validation messages have an icon () and clicking it opens a dialog box with additional information and a link to specifications.
- Status messages from every validation action are logged in the **Console view (on page 304)** (the **Enable Oxygen consoles option (on page 180)** must be selected in the **View preferences page**).
- If you want to see all the validation messages grouped in the **Results view (on page 335)**, use the  **Validate** action from the toolbar or **XML** menu. This action also collects the validation messages and displays them in the **Problems** view if the validated file is in the current workspace or in a custom **Errors** view if the validated file is outside the workspace.

Creating a JSON Validation Scenario

Validation scenarios can be used to [associate one or more JSON Schemas with a JSON document \(on page 873\)](#). Oxygen XML Editor Eclipse plugin also includes a built-in JSON Schematron Validator engine that can be specified in the validation scenario to validate JSON documents against a specified Schematron schema.

Creating a JSON Validation Scenario

To create a validation scenario, follow these steps:

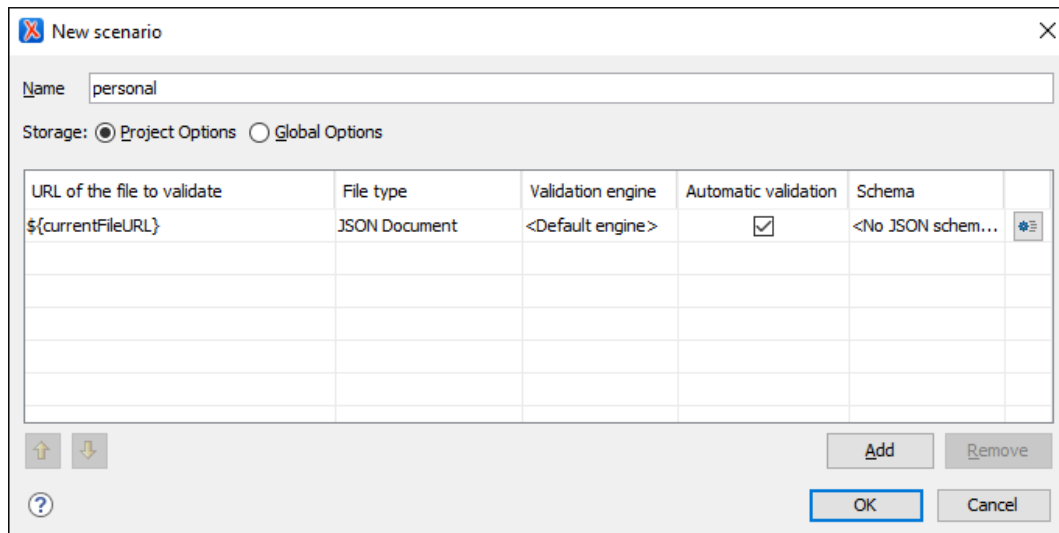

1. Select the  **Configure Validation Scenario(s)** action in one of the following ways:
 - From the toolbar.
 - From the **JSON** menu.
 - From the **Validate** submenu, when invoking the contextual menu on a file in the **Project Explorer view (on page 269)**.

Step Result: The **Configure Validation Scenario(s)** dialog box is displayed.

2. Click the **New** button.

Step Result: A validation scenario configuration dialog box is displayed.

Figure 329. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the **Insert Editor Variable** button to insert an [editor variable \(on page 218\)](#) or a [custom editor variable \(on page 227\)](#).

Figure 330. Insert an Editor Variable

<code>\$\$start-dir</code>	- Start directory of custom validator
<code>\$\$standard-params</code>	- List of standard parameters
<code>\$\$cfn</code>	- The current file name without extension
<code>\$\$currentFileURL</code>	- The path of the currently edited file (URL)
<code>\$\$cfdu</code>	- The path of current file directory (URL)
<code>\$\$frameworks</code>	- Oxygen frameworks directory (URL)
<code>\$\$pdu</code>	- Project directory (URL)
<code>\$\$oxygenHome</code>	- Oxygen installation directory (URL)
<code>\$\$home</code>	- The path to user home directory (URL)
<code>\$\$pn</code>	- Project name
<code>\$\$env(VAR_NAME)</code>	- Value of environment variable VAR_NAME
<code>\$\$system(var.name)</code>	- Value of system variable var.name

File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

You can choose between the following types of validation engines for validating JSON documents:

- **Default engine** - The built-in JSON Validator will be used. For JSON Schema documents, this type should not be chosen unless the document has a schema version specified.
- **JSON Schema Validator** - This type is for JSON Schema documents only. It will use the version specified in the JSON Schema, or if a version is not specified, the [JSON Schema draft-04](#) will be used.
- **JSON Schematron Validator** - The built-in JSON Schematron Validator will be used to validate JSON documents against a specified Schematron schema.

Note:

For proper error localization, the root element of the Schematron schema should include the `@queryBinding` attribute with the value of `xslt2` after the Schematron namespace declaration:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
```

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature. If the **Automatic validation** feature is disabled in the [Document Checking preferences page \(on page 133\)](#), then this option is ignored, as the preference setting has a higher priority.

Schema

Displays the specified schema.

Specify Schema

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating JSON documents.

Move Up

Moves the selected scenario up one spot in the list.

Move Down

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above. You can use the buttons at the bottom of the table to add, remove, or move validation units.
4. Click **OK**.

Result: The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Sharing JSON Validation Scenarios

The validation scenarios and their settings can be shared with other users by [exporting them to a specialized scenarios file \(on page 217\)](#) that can then be imported.

Resolving References with an XML Catalog

If a reference to a remote JSON schema must be used but a local copy of the schema should actually be preferred for performance reasons, the reference can be resolved to the local copy with an [XML Catalog \(on page 2683\)](#).

For example, if the JSON schema contains a reference to a remote schema such as:

```
{ "$ref": "http://json-schema.org/example/geo.json" }
```

the reference can be resolved to a local copy of the schema by inserting the following catalog entry:

```
<uri name="http://json-schema.org/example/geo.json" uri="schemas/geo.json"/>
```

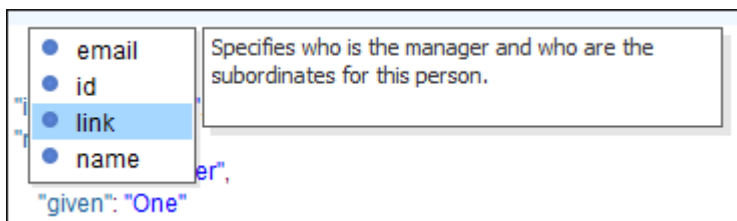

Related information

[Working with XML Catalogs \(on page 594\)](#)

Content Completion Assistant in JSON

Oxygen XML Editor Eclipse plugin includes an intelligent [Content Completion Assistant \(on page 2677\)](#) that offers proposals for inserting JSON structures that are valid at the current editing location.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box [\(on page 70\)](#), go to **Editor > Content Completion**, and deselect the **Enable content completion** option [\(on page 119\)](#).

Figure 331. Content Completion Assistant in JSON

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the [Content Completion Assistant \(on page 2677\)](#) depend on the associated JSON Schema. For information about ways to associate a schema to a JSON document, see the [Associating a Schema to JSON Documents \(on page 872\)](#) section.

If a JSON document does not have a schema associated, Oxygen XML Editor Eclipse plugin automatically learns the document structure as editing events occur and will offer content completion proposals accordingly. Note that this feature is disabled for documents that contain more than one million characters.

Using the Content Completion Assistant in JSON

The feature is activated in **Text** mode for JSON documents by:

- Typing a quote symbol (") to insert a property or value.
- Pressing **Ctrl + Space** or **Alt + ForwardSlash (Command + Option + ForwardSlash on macOS)**.

The feature is activated in **Author** mode by using the **Enter** key.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. In some cases, the *Content Completion Assistant* displays a [documentation window with information about the particular proposal \(on page 872\)](#). You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal, press **Enter** or **Tab**.

Types of Proposals Listed in the Content Completion Assistant for JSON

The proposals that populate the *Content Completion Assistant* for JSON documents depend on the structure defined in the associated JSON Schema. The types of structure proposed in the content completion window include:

- JSON properties
- JSON values
- JSON arrays
- JSON objects

The number and type of proposals displayed by the *Content Completion Assistant* is dependent on the cursor's current position in the JSON document and the child items displayed within a given context are defined by the structure of the specified JSON Schema.

Code Templates in the Content Completion

Oxygen XML Editor Eclipse plugin includes a set of built-in code templates for JSON documents that can be selected from the *Content Completion Assistant*. The code templates are displayed with a  symbol in the content completion list. You can also define your own code templates and share them with others. For more information, see [Code Templates \(on page 323\)](#).

Schema Annotations in JSON Content Completion

A schema annotation is a documentation snippet that appears in the *Content Completion Assistant (on page 2677)* offering more information about the current proposal.

This feature is enabled by default, but you can disable it by deselecting the **Show annotations in Content Completion Assistant (on page 121)** option in the **Annotations** preferences page.

Collecting Annotations from the JSON Schema

In a JSON Schema, the annotations are specified in the value of the `title` and `description` properties like this:

```
"idType": {
  "title": "The 'id' property",
  "description": "Specifies a required ID for this person.",
  "type": "string",
  "maxLength": 20
}
```

Associating a Schema to JSON Documents

To provide as-you-type validation and to compute valid proposals for the *Content Completion Assistant (on page 2677)*, Oxygen XML Editor Eclipse plugin requires a schema to be associated with the JSON document. The schema specifies how the internal structure is defined.

Detecting the Schema(s) for Validation and Content Completion

For validation, Oxygen XML Editor Eclipse plugin tries to detect the JSON Schema by searching in the following order:

1. The schema [referenced in validation stages from the validation scenario\(s\) \(on page 873\)](#) associated with the current JSON document.
2. If a schema is not detected, then it falls back to the [schema associated directly in the JSON document \(on page 876\)](#).

**Tip:**

To quickly open the schema used for validating the current document, select the **Open Associated Schema** action from the toolbar (or **JSON** menu).

Associating a JSON Schema Through a Validation Scenario

Oxygen XML Editor Eclipse plugin uses the rules defined in the detected schema to report errors and warnings during automatic and manual validations that help maintain the structural integrity of your JSON documents. Oxygen XML Editor Eclipse plugin includes built-in validation engines for validating JSON documents against a JSON Schema or Schematron schema. There are several methods that can be used to validate JSON document with a schema.

Configure a Validation Scenario and Specify the Schema

You can specify the schema to be used for validation directly in the [JSON validation scenario \(on page 867\)](#). To associate a schema to a validation scenario to be used whenever the scenario is invoked, follow these steps:

1. Select the **Configure Validation Scenario(s)** from the toolbar, from the **JSON** menu, or from the **Validate** submenu when invoking the contextual menu on a JSON file in the **Project Explorer view (on page 269)**.
2. Click the **New** button to [create a new validation scenario \(on page 867\)](#) or the **Edit** button to modify an existing one.
3. Add or configure validation units according to your needs. For details about all of the configuration options, see [Creating a JSON Validation Scenario \(on page 867\)](#).
4. Click the **Specify Schema** button to select the schema to be associated with the validation unit.
5. Click **OK** on both dialog boxes.

Result: The schema is now associated with that validation scenario whenever it is invoked.

Use the Validate with Action to Specify a Schema for Validating the Current Document

To validate the current document using a specified schema, follow these steps:

1. Select the **Validation with** action from the **Validation** drop-down menu on the toolbar (or **JSON** menu).

Step Result: The **Validate with** dialog box is displayed:

Figure 332. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - You can select one of the following two types (other types of schema will not work with JSON documents):
 - **JSON** - Used for validating JSON documents against a specified JSON Schema.
 - **Schematron** - Used for validating JSON documents against a specified Schematron schema. You can also select a **Schematron phase** that you want to use for the validation.

Note:

For proper error localization, the root element of the Schematron schema should include the `@queryBinding` attribute with the value of **xslt2** after the Schematron namespace declaration:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding
="xslt2">
```

2. Select the schema to be associated with the manual validation.
3. Click **OK**.

Result: The current document is validated using the schema you specified.

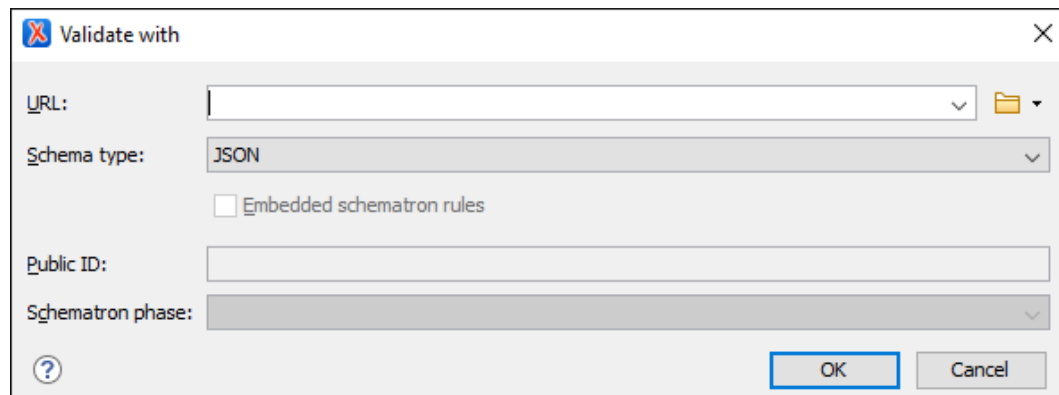

Use the Validate with Schema Action to Specify a Schema for Validating all Selected JSON Documents

To validate multiple JSON documents using a specified schema, follow these steps:

1. Select all the JSON documents you want to validate in the **Project Explorer** view.
2. Invoke the contextual menu (right-click) and select the **Validate with Schema** action from the **Validate** submenu.

Step Result: The **Validate with** dialog box is displayed:

Figure 333. Validate with Dialog Box

This dialog box contains the following options:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S). You can specify the URL by using the text field, the history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list.
- **Schema type** - You can select one of the following two types (other types of schema will not work with JSON documents):
 - **JSON** - Used for validating JSON documents against a specified JSON Schema.
 - **Schematron** - Used for validating JSON documents against a specified Schematron schema. You can also select a **Schematron phase** that you want to use for the validation.

Note:

For proper error localization, the root element of the Schematron schema should include the `@queryBinding` attribute with the value of **xslt2** after the Schematron namespace declaration:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding
="xslt2">
```

3. Select the JSON schema that you want to use to validate all selected JSON documents.
4. Click **OK**.

Result: The selected JSON documents are validated using the JSON schema you specified.

Associating a JSON Schema Directly in JSON Documents

Associate Schema Action

The schema used by the *Content Completion Assistant (on page 2677)* and document validation engine can be associated with the current document by using the  **Associate Schema** action. The association can specify a relative file path or a URL of the schema.

To associate a JSON Schema to the current JSON document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **JSON** menu).

Step Result: The **Associate Schema** dialog box is displayed:

Figure 334. Associate Schema Dialog Box

This dialog box contains the following options for JSON documents:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).
- **Use path relative to file location** - Select this option if the JSON instance document and the associated schema contain relative paths. The location of the schema file is inserted in the JSON instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.

2. Select the JSON Schema that will be associated with the JSON document.
3. Click **OK**.

Result: A `$schema` property is added at the beginning of the document with its value set to the specified URL. If the document already contained a schema association, the old association is replaced with the new one.

Tip:

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **JSON** menu).

Associating a JSON Schema in a Framework (Document Type) Configuration

The JSON schema used to compute valid proposals in the *Content Completion Assistant (on page 2677)* and by the document validation engine to report errors and warnings can be defined in each particular *framework*

([on page 2679](#)) (document type). This schema will be used only if one is not [detected in the current JSON file](#) ([on page 876](#)).

To associate a JSON schema in a particular *framework* (document type), follow these steps:

1. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association**.
2. Select your particular document type and click the **Edit** ([on page 89](#)), **Extend** ([on page 89](#)), or **Duplicate** ([on page 89](#)) button to modify an existing *framework* (or use the **New** button to create a new one).

Step Result: This opens a **Document type** configuration dialog box ([on page 90](#)).

3. Go to the **Schema** tab ([on page 94](#)).
4. Select the schema type and its URI.
5. Click **OK**.

Result: The schema is now associated with the particular document type and will be used by the *Content Completion Assistant* and validation engine if a schema is not detected in the current JSON document.

Learn Document Structure When JSON Schema is not Detected

When there is no JSON schema associated with a JSON document, Oxygen XML Editor Eclipse plugin can learn the document structure by parsing the document internally to provide an initialization source for content completion and validation.

This feature is controlled by the **Learn on open document** option ([on page 119](#)) that is available in the **Editor > Content Completion** preferences page. This feature enabled by default. If you want to disable it, deselect the **Learn on open document** option.

You can choose to create a schema from the learned structure and save it as a file using the **Learn Structure** and **Save Structure** actions.

Creating a JSON Schema from Learned Document Structure

To create a JSON schema from the learned structure of a JSON document, follow these steps:

1. Open the JSON document that will be used to create the schema.
2. Go to **JSON > Learn Structure** (**Ctrl + Shift + L** (**Command + Shift + L on macOS**)). The **Learn Structure** action reads the mark-up structure of the current document. A **Learn completed** message is displayed in the application status bar when the action is finished.
3. Go to **JSON > Save Structure** and enter the file path for the JSON schema.
4. Click the **Save** button.

Syntax Highlighting in JSON Documents

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JSON files, follow these steps:

1. Open the **Preferences** dialog box *(on page 70)*.
2. Go to **Editor > Syntax Highlight** *(on page 176)*.
3. Select and expand the **JSON** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences *\(on page 176\)*](#)

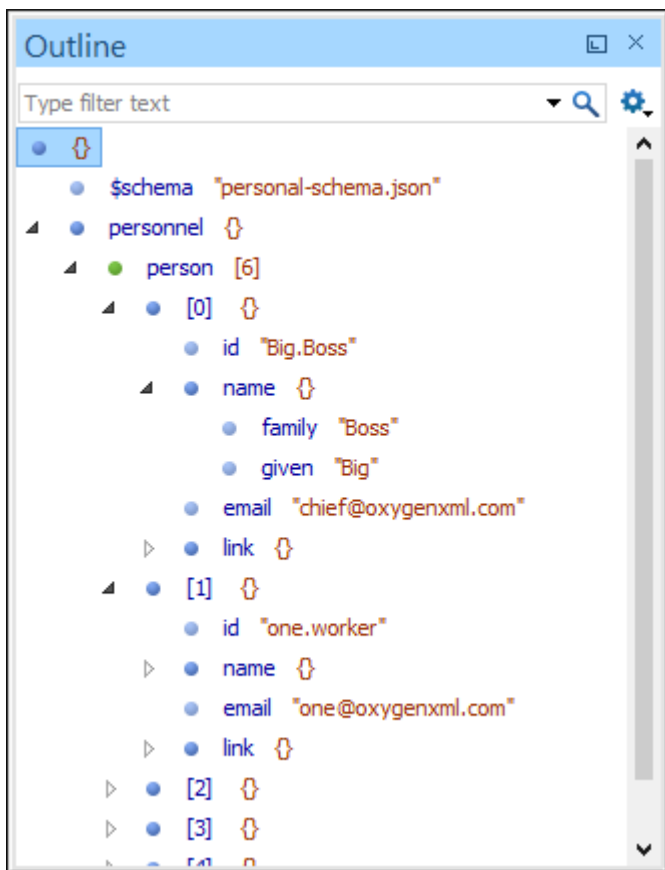

Folding in JSON

In a large JSON document, the data enclosed in the curly bracket characters `{ }` can be collapsed so that only the needed data remains in focus. The folding features available for XML documents are also available in JSON documents.

JSON Outline View

The **Outline** view for JSON documents displays the list of all the components of the JSON document you are editing. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 335. JSON Outline View

Outline View Features

Some of the features provided by the **Outline** view include:

- You can quickly navigate through the document by selecting nodes in the **Outline** tree.
- You can move elements by dragging them to a new position in the tree structure.
- It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.
- Document errors are highlighted in the **Outline** view. A tooltip also provides more information about the nature of the error when you hover over the faulted element.
- Arrays and array elements have the number of their children elements displayed in their label and each child is prefixed with the index in the array.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

It also includes a **View menu** in the top-right corner that presents the following options to help you filter the view even further.

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Drag and Drop Actions in the Outline View

Entire JSON properties, objects, and arrays can be moved or copied in the edited document using only the mouse in the **Outline** view with drag-and-drop operations. Several drag and drop actions are possible:

- If you drag a JSON node within the **Outline** view and drop it on another node, then the dragged node will be moved after the drop target.
- If you hold the mouse pointer over the drop target for a short time before the drop then the drop target node will be expanded first and the dragged node will be moved inside the drop target.
- You can also drop a node before or after another node if you hold the mouse pointer towards the upper or lower part of the target. A marker will indicate whether the drop will be performed before or after the target node.
- If you hold down the **Ctrl (Command on macOS)** key after dragging, a copy operation will be performed instead of a move.

Contextual Menu Actions

The following actions are available in the contextual menu of the JSON **Outline** view:

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Paste

Pastes the copied component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

JSON to XML Converter

Online JSON to XML Converter

Attention:

For a simple **ONLINE** tool for converting a single JSON file to XML, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting JSON to XML in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **XML Tools > JSON Tools** menu.

The **JSON to XML** dialog box is displayed:

Figure 336. JSON to XML Dialog Box

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to an XML document.

Figure 337. Example: XML to JSON Operation Result

Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```
{
  "personnel": {
    "person": [
      {"name": "Boss"},
      {"name": "Worker"}
    ]
  },
  "id": "personnel-id"
}
```

it is converted to:

```
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
    <person>
      <name>Boss</name>
```

```

</person>
<person>
  <name>Worker</name>
</person>
</personnel>
<id>personnel-id</id>
</JSON>

```

- If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```

[
  { "name": "Boss" },
  { "name": "Worker" }
]

```

it is converted to:

```

<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
  <array>
    <name>Worker</name>
  </array>
</array>

```

- If the name of a JSON property contains characters that are not valid in XML element names (for example, \$), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```

{"$id": "personnel-id"}

```

is converted to:

```

<_x24_id>personnel-id</_x24_id>

```

Related Information:

[XML to JSON Converter \(on page 883\)](#)

XML to JSON Converter

Online XML to JSON Converter

Attention:

For a simple **ONLINE** tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting XML to JSON in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting XML files to JSON. The **XML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **XML Tools > JSON Tools** menu.

Step Result: The **XML to JSON** dialog box is displayed:

Figure 338. XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select how you want empty elements to be converted (default is **object**).
5. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
6. Click the **Convert** button.

Result: The original XML document is now converted to a JSON document.

Figure 339. Example: XML to JSON Operation Result

Conversion Details

- Some XML components are ignored (e.g. comments and processing instructions).
- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```
{
  "personnel": {
    "person": [
      {
```

```

    "id": "person.one",
    "name": "Boss"
  },
  {
    "id": "person.two",
    "name": "Worker"
  }
]
}
}

```

- If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `#text` property with its value set as the text content. If there are multiple text nodes, the subsequent `#text` properties will contain a number (e.g. `#text1`, `#text2`). If there are multiple elements with the same name, the first property will have the element name and the subsequent properties will contain a number (e.g. `b`, `b#1`, `b#2`).

```
<p>This <b>is</b> an <b>example</b>!</p>
```

is converted to:

```

{
  "p": {
    "#text": "This ",
    "b": "is",
    "#text1": " an ",
    "b#1": "example",
    "#text2": "!"
  }
}

```

- If the XML document contains element names that contains hexadecimal codes (for example, if they were escaped during a [JSON to XML conversion \(on page 881\)](#)), it will be converted to the normal character value in the converted JSON document.

```
<_x24_id>personnel-id</_x24_id>
```

is converted to:

```
{"$id": "personnel-id"}
```

JSON to YAML Converter

Converting JSON to YAML in Oxygen

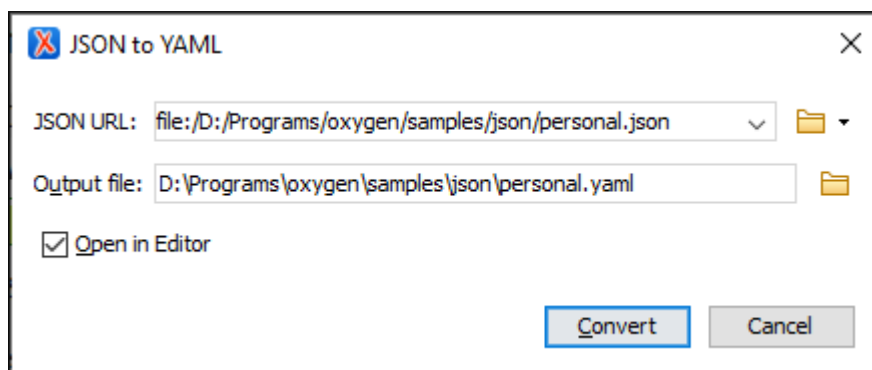

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **XML Tools > JSON Tools** menu.

The **JSON to YAML** dialog box is displayed:

Figure 340. JSON to YAML Dialog Box

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

[YAML to JSON Converter \(on page 887\)](#)

YAML to JSON Converter

Converting YAML to JSON in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

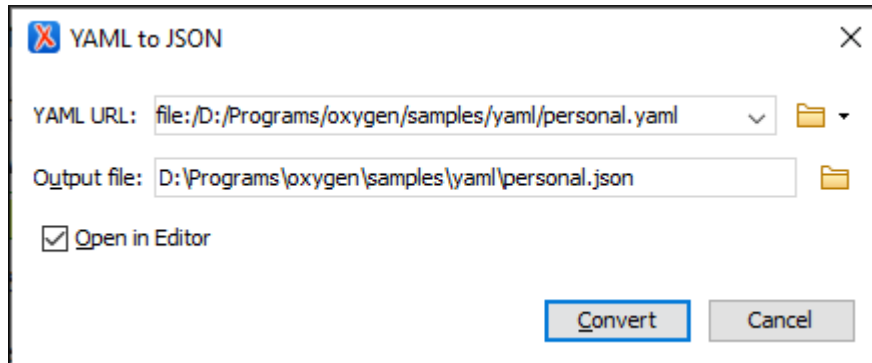

The **YAML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **XML Tools > JSON Tools** menu.

The **YAML to JSON** dialog box is displayed:

Figure 341. YAML to JSON Dialog Box

2. Choose or enter the **YAML URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

[JSON to YAML Converter \(on page 887\)](#)

Contextual Menu Actions in JSON Documents

When editing JSON documents, Oxygen XML Editor Eclipse plugin provides the following actions in the contextual menu:

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

Copy JSON Pointer

Creates a *JSON Pointer* at the current cursor location and copies the expression that denotes the JSON pointer to the system clipboard.

Copy XPath

Copies the XPath expression of the current property from the current editor to the clipboard.

Toggle Line Wrap (**Ctrl + Shift + Y** (**Command + Shift + Y** on macOS))

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

 **Go to Matching Bracket**

Moves the cursor to the end bracket that matches the start bracket, or vice versa.

Flatten Schema

Available only if the JSON document is a JSON schema, it flattens the entire hierarchy of the JSON schema. For more details, see [Flatten JSON Schema \(on page 921\)](#).

Open File at Cursor

Opens the file at the cursor position in a new panel. If the file path represents a directory path, it will be opened in system file browser. If the file at the specified location does not exist, an error dialog box is displayed and it includes a **Create new file** button that starts the **New document** wizard. This allows you to choose the type or the template for the file. If the action succeeds, the file is created with the referenced location and name and is opened in a new editor panel.

Transforming and Querying JSON Documents

Oxygen XML Editor Eclipse plugin provides the ability to transform JSON documents to XML or HTML through XSLT or XQuery processing. You also have access to some powerful tools for querying JSON through XPath expressions or XQuery.

Resources

For more information about transforming and querying in JSON, watch our video demonstration:

<https://www.youtube.com/embed/1LHoMhEFagA>

Transforming JSON Documents with XSLT

There are several methods that can be used to transform JSON documents through XSLT processing.

Transforming a JSON Document Directly with XSLT

1. [Create a new transformation scenario \(on page 1206\)](#) using one of the following types of transformations:
 - [JSON Transformation with XSLT \(on page 1252\)](#) - This scenario is useful if you want to develop a JSON document and the XSLT document is in its final form.
 - [XSLT Transformation on JSON \(on page 1277\)](#) - This scenario is useful if you want to develop an XSLT document and the JSON document is in its final form.
2. Configure the transformation scenario to suit your needs. In the **XSLT** tab, make sure you select the JSON file in the **JSON URL** field and the XSL file in the **XSL URL** field.
3. Run the transformation.

Transforming Multiple JSON Documents at Once

It is also possible to transform multiple JSON documents at once with XSLT processing. To achieve this, select the JSON documents in the **Project** view, right-click, and apply or configure a transformation scenario.

Transforming a JSON Document Using XSLT and XPath Functions

1. Create an XSLT 3.0 stylesheet that has the `xsl:initial-template`. You can use one of the following two templates available in the New Document Wizard.
 - **XSLT Stylesheet for JSON** - Processes a JSON document by using a `json-doc()` function and matches the JSON properties from the JSON map.
 - **XSLT Stylesheet for JSON to XML** - Processes a JSON document by using a `json-to-xml()` function and matches the converted XML content.
2. Create a new **XSLT transformation** scenario for your stylesheet.
3. Reference the JSON document that you want to transform using one of these two methods:
 - In the transformation scenario, click the **Parameters** button in the **XSLT** tab and add a parameter that specifies the URL to your JSON document in its value. For example, if you are transforming one of the built-in templates mentioned above, the `input` parameter is added by default and you could specify the URL in its value.
 - Specify the URL to your JSON document in the stylesheet you created. For example, if you use one of the built-in templates mentioned above, you would specify the URL in the value of the `input` parameter (in the `xsl:param` element).
4. Run the transformation.

**Tip:**

There are some sample files in the `[OXYGEN_INSTALL_DIR]/samples/json/transform` folder that can be used to transform a JSON document to XML or HTML.

Related Information:

[Blog: Transforming JSON](#)

[XSLT Functions on JSON Data](#)

Transforming JSON Documents with XQuery

It is possible to transform JSON documents through XQuery processing. To do so, follow these steps:

1. Create an XQuery file.
2. Create a new **XQuery transformation** scenario for your XQuery file.
3. Reference the JSON document that you want to transform using one of these two methods:
 - In the transformation scenario, click the **Parameters** button in the **XQuery** tab and add a parameter that specifies the URL to your JSON document in its value.
 - Specify the URL to your JSON document in the XQuery file you created.
4. Run the transformation.

**Tip:**

There is a sample XQuery file in the `[OXYGEN_INSTALL_DIR]/samples/json/transform` folder that can be used to transform a JSON document.

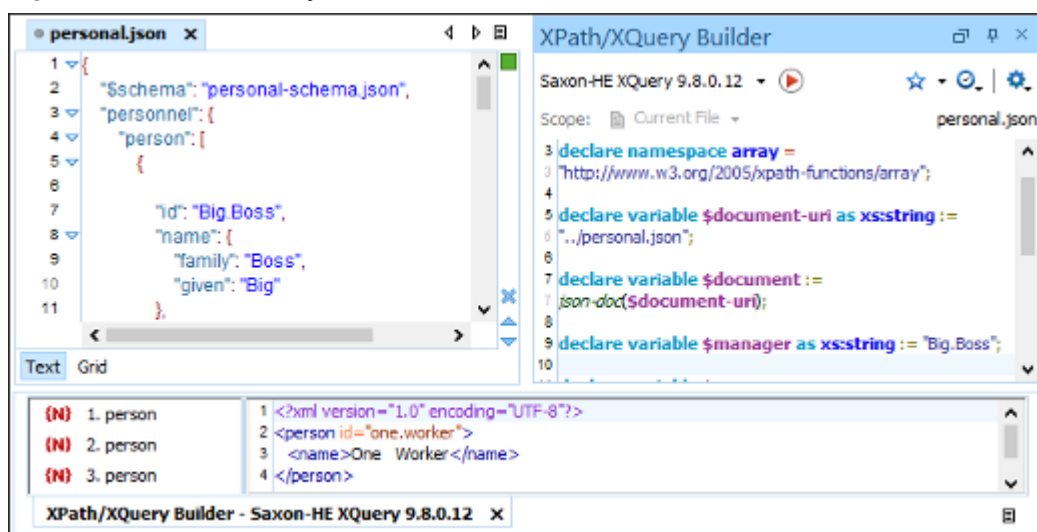

Querying JSON Documents with XPath or XQuery

Oxygen XML Editor Eclipse plugin provides a dedicated **XPath/XQuery Builder** view that allows you to compose complex XPath or XQuery expressions and execute them over JSON documents.

XPath/XQuery Builder View

You can also use the **XPath/XQuery** view to run XPath and XQuery expressions over a JSON document. For XQuery, you need to reference the JSON document in your XQuery content. For more information about this view, see [XPath Builder View \(on page 1817\)](#).

Figure 342. XPath/XQuery Builder View for JSON

Details About Querying JSON Documents Using XPath Expressions

To execute XPath expressions over a JSON document, the document is converted to XML and the XPath is executed over the converted XML document. For this conversion, Oxygen XML Editor Eclipse plugin uses the built-in [JSON to XML Converter tool \(on page 881\)](#). The results are mapped back to the original JSON document.

For example, if you have the following JSON document:

```
{
  "personnel": {
    "person": [
      { "name": "Boss" },
      { "name": "Worker" }
    ]
  },
  "id": "personnel-id"
}
```

and you want to match the name of the second person, the XPath expression would look like this:

```
/JSON/personnel/person[2]/name
```

The reason why the first element is `JSON` is because if the JSON document contains more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`. For more information, see [JSON to XML Conversion Details \(on page 882\)](#).

The `[2]` in the expression represents the index of the `person` in the array and in this case, it matches the second `person` because the index counting starts with 1.

Editing JSON Schema Documents

Oxygen XML Editor Eclipse plugin offers powerful tools that allow you to design, develop, and edit JSON Schemas. These tools include:

- **Text editing mode** ([on page 893](#)) (packed full of editing helpers)
- **Schema Design mode** ([on page 894](#)) (a visual, intuitive schema diagram editor)
- **Author editing mode** ([on page 893](#)) (a visual authoring mode with form controls)
- **Grid mode** ([on page 893](#)) (a compact layout of nested tables)
- **JSON Schema instance generator** ([on page 915](#)) for producing JSON Schema documents from a JSON file

This section describes the features included in Oxygen XML Editor Eclipse plugin for editing JSON Schema documents and how to use them.

Resources

For more information about the JSON support in Oxygen XML Editor Eclipse plugin, see the following resources:

- Video: [Introducing JSON Schema Design Mode](#)
- Video: [JSON Editing](#)
- Video: [JSON Tools in Oxygen](#)
- Video: [JSON Schema Search and Refactoring Actions in Oxygen](#)
- Video: [JSON Schema Version 2020-12 Support in Oxygen](#)
- Webinar: [JSON and JSON Schema Support in Oxygen](#)
- Webinar: [Creating and Designing JSON Schemas](#)

JSON Schema Editor

Oxygen XML Editor Eclipse plugin includes a specialized JSON Schema editor with various editing features for files that have the `jsonschema` file extension, or for files that have `json` file extension and includes a [meta-schema URL \(on page 920\)](#) in the `"$schema"` key. The purpose of the JSON schema is to define the legal properties and values of a JSON document to keep it valid and well-formed.

New Document Templates

Oxygen XML Editor Eclipse plugin includes a new document template to help you get started creating a JSON Schema document. The template is called **JSON Schema** and it can be found in the **New Document** folder in

the **New from templates** wizard (*on page 253*). You can also [customize your own JSON Schema templates](#) (*on page 255*) and specify other versions (Draft 04, 06, 07, 2019-09, or 2020-12).

**Tip:**

You can experiment with a sample of a JSON Schema file available at: `[OXYGEN-INSTALL-DIR]/samples/json/personal-schema.json`.

Text Mode Editor

When editing JSON Schema documents in **Text** editing mode, the usual text editing actions are available, along with various other actions, including:

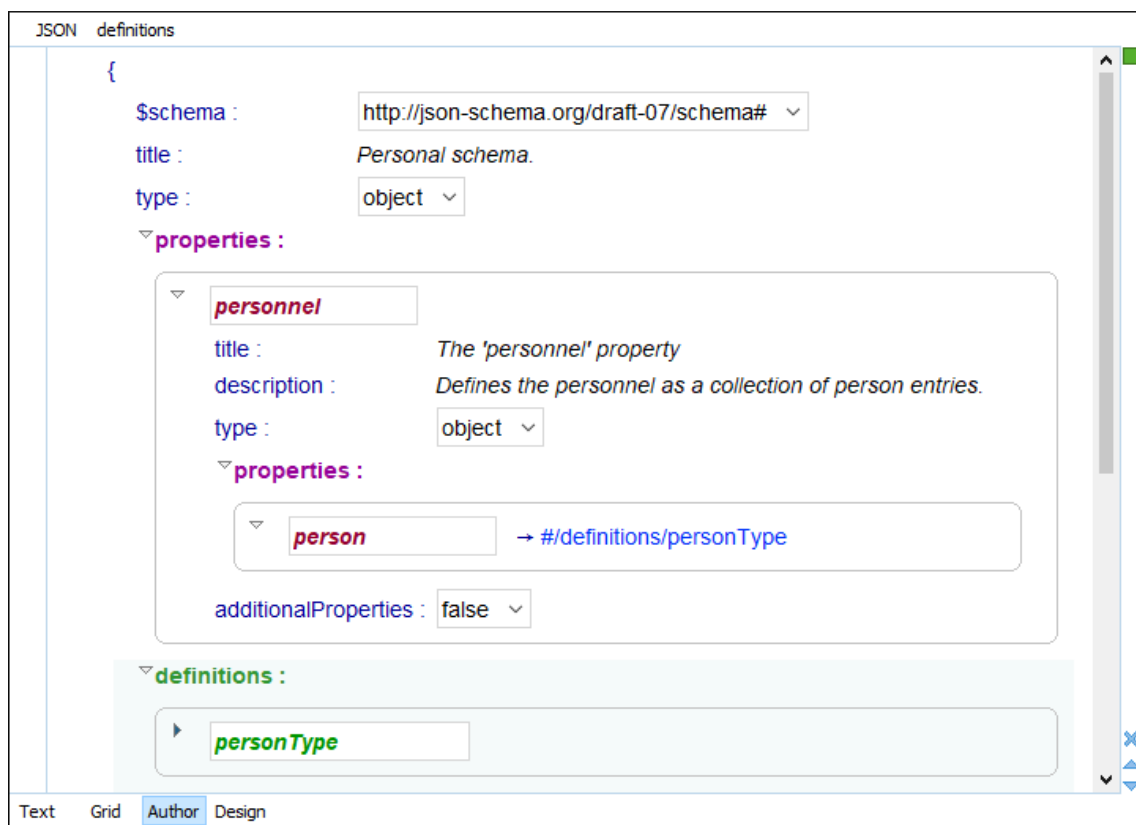

- [JSON Outline View](#) (*on page 878*)
- [JSON-specific Syntax Highlighting](#) (*on page 921*)
- [Search and Find/Replace](#) (*on page 281*)
- Drag and Drop
- [Validation](#) (*on page 863*)
- Format and Indent (Pretty Print)

Grid Mode Editor

Oxygen XML Editor Eclipse plugin allows you to view and edit the JSON Schema documents in the **Grid** mode. The JSON Schema is represented in **Grid** mode as a compound layout of nested tables and the JSON data and structure can be easily manipulated with table-specific operations or drag and drop operations on the grid components. For more details, see [JSON Grid Mode Editor](#) (*on page 858*).

Author Visual Editor

It is also possible to edit JSON Schema files in the visual **Author** editing mode. Oxygen XML Editor Eclipse plugin provides a JSON Schema framework that uses a specific CSS for rendering JSON Schema documents in **Author** mode and you have access to the various features and actions that are available when [editing XML documents in Author mode](#) (*on page 367*).

Figure 343. JSON Schema in Author Mode

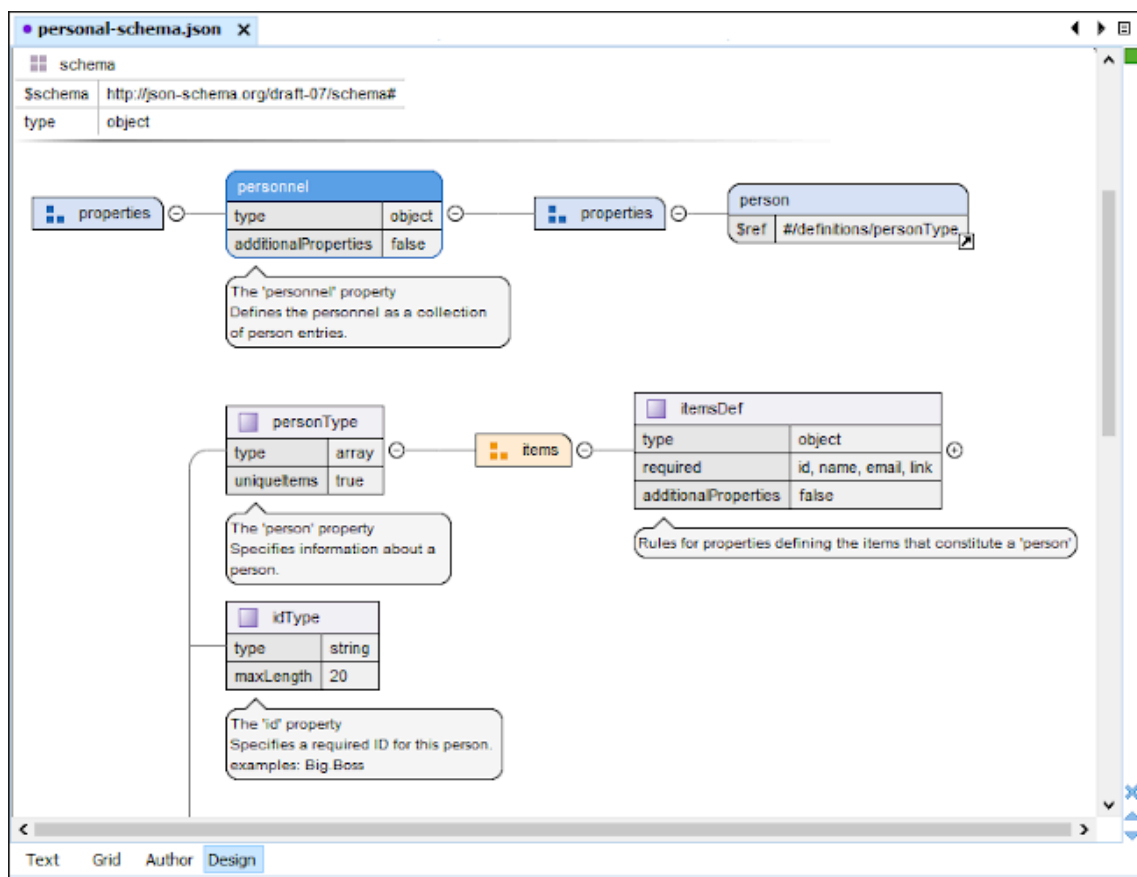

Design Mode Editor

Oxygen XML Editor Eclipse plugin provides a powerful, expressive visual schema diagram editor (**Design** mode) for editing JSON Schemas. It is helpful for both content authors who want to visualize or understand a schema and schema designers who develop complex schemas. For all the details, see [JSON Schema Design Mode \(on page 894\)](#).

JSON Schema Design Mode (JSON Schema Diagram Editor)

Oxygen XML Editor Eclipse plugin provides a powerful, expressive visual schema diagram editor (**Design** mode) for editing JSON Schemas. The structure of the diagram editor is designed to be intuitive and easy to use. The **Design** mode was created to help both content authors who want to visualize or understand a schema and schema designers who develop complex schemas.

The JSON Schema **Design** mode includes various [navigation features \(on page 895\)](#), [contextual menu actions \(on page 899\)](#), [automatic validation \(on page 914\)](#), and you can [move and edit components directly within the diagram \(on page 898\)](#).

Figure 344. JSON Schema Design Mode

To switch to the JSON Schema diagram editing mode, select **Design** at the bottom of the editing area.

Resources

For more information about the JSON Schema Design mode, see the following resources:

- Video: [Introducing JSON Schema Design Mode](#)
- Video: [JSON Schema Search and Refactoring Actions in Oxygen](#)
- Video: [JSON Schema Version 2020-12 Support in Oxygen](#)
- Webinar: [The New JSON Schema Diagram Editor](#)
- Webinar: [Create JSON Schema in Design Mode](#)
- Webinar: [Creating and Designing JSON Schemas](#)

Navigation in the JSON Schema Design Mode

The following editing and navigation features work for all types of schema components in the JSON Schema **Design** mode:

- Select consecutive components on the diagram (components from the same level) using the *Shift* key. You can also make discontinuous selections in the schema diagram using the **Ctrl (Meta on macOS)** key. To deselect one of the components, use **Ctrl + Single-Click (Command + Single-Click on macOS)**.
- Use the arrow keys to navigate the diagram vertically and horizontally.
- To expand a component, click the  widget to the right of the component.
- Use *Home/End* keys to jump to the first/last component from the same level. Use **Ctrl + Home (Command + Home on macOS)** key combination to go to the diagram root and **Ctrl + End (Command + End on macOS)** to go to the last child of the selected component.
- You can easily go back to a previously visited component while moving from left to right. The path will be preserved only if you use the left arrow key or right arrow key. For example, if the current selection is on the second property from a properties parent and you press the left arrow key to jump to the properties parent, when you press the right arrow key, then the selection will be moved to the second property.
- Go back and forward between components viewed or edited in the diagram by using the following toolbar actions:
 -  **Back** (go to previous schema component).
 -  **Forward** (go to next schema component).
 -  **Go to Last Modification** (go to last modified schema component).
- Go to the definition of a property by clicking on the **Go to Definition** widget (). You can then use the  **Back** or  **Forward** toolbar buttons to go back and forth between the properties.
- The dedicated **Outline** view displays all of the properties, pattern properties, and definitions found in the document and you can click on any property/definition to navigate to it within the document.

JSON Schema Palette View (Available in Design Mode)

The **Palette** view is designed to offer quick access to JSON schema components and to improve the usability of the JSON schema diagram builder. You can use the **Palette** to drag and drop components into the **Design** mode. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 345. JSON Palette View (for schema versions draft-04, draft-06, draft-07)

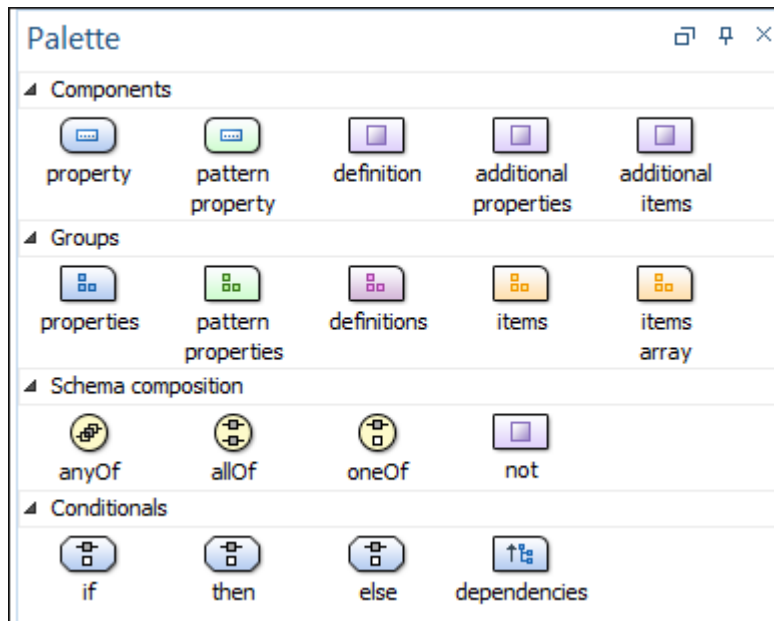

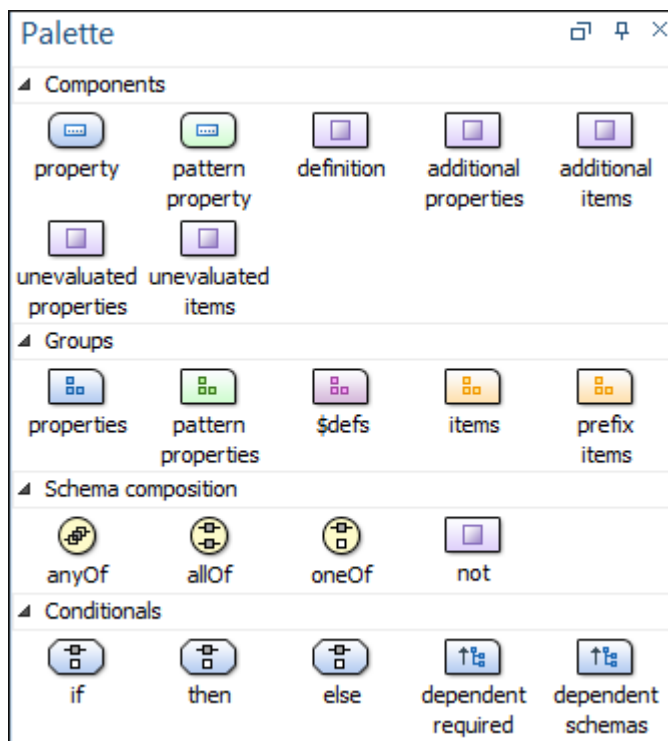

Figure 346. JSON Palette View (for schema versions 2019-09, 2020-12)

Components are organized functionally into 4 collapsible categories:

- **Components:** *property*, *patternProperty*, *definition*, *additionalProperties*, *additionalItems*, *unevaluatedProperties* (for 2019-09 or 2020-12 schemas), *unevaluatedItems* (for 2019-09 or 2020-12 schemas).
- **Groups:** *properties*, *patternProperties*, *definitions/\$defs* (for draft 2019-09 or 2020-12 schemas), *items*, *itemsArray*, *prefixItems* (for 2019-09 or 2020-12 schemas).

**Note:**

Two of the group palette components presented above (*itemsArray* and *patternProperty*), have no match in JSON schema keywords. They were introduced only as a design convenience and their use does not generate code that would affect the validity of the edited schema.

- **Schema composition:** *anyOf*, *allOf*, *oneOf*, *not*.
- **Conditionals:** *if*, *then*, *else*, *dependencies* (for draft-04, draft-06, or draft-07 schemas), *dependentRequired* (for 2019-09 or 2020-12 schemas), *dependentSchemas* (for 2019-09 or 2020-12 schemas).

To add a component to the edited schema:

- Click and hold a graphic symbol from the **Palette** view, then drag the component into the **Design** view.
- A line dynamically connects the component with the XML schema structure.
- Release the component into a valid position.

**Note:**

You cannot drop a component into an invalid position. When you hover the component into an invalid position, the mouse cursor changes its shape into . Also, the connector line changes its color from the usual dark gray to the color defined in the **Validation error highlight color** option (*on page 133*) (default color is red).

**Tip:**

When dragging and dropping a property/definition or pattern property on a component, if it does not have the corresponding group component (*properties*, *definitions*, *patternProperties*), it will automatically be created.

Resources

For more information about the Schema palette, watch our video demonstration:

<https://www.youtube.com/embed/r5SLk3XL0Us>

Editing Actions in JSON Schema Design Mode

The JSON Schema **Design** mode includes various editing features, including:

- You can edit a JSON Schema using various **contextual menu actions** (*on page 899*).
- You can copy/paste or drag/drop to move existing components to other locations in an JSON Schema. You can also use the Move Up/Down actions to change the order of the components in a parent.
- You can edit schema components directly in the diagram. For these components, you can edit the name and the additional properties presented in the diagram by double-clicking the value you want

to edit. If you want to edit the name of a selected component, you can also press **Enter**. The list of properties that can be displayed for each component can be customized [in the JSON Schema Properties preferences page \(on page 161\)](#).

- When switching between editing modes, the cursor position is synchronized. For example, if you switch from **Design** to **Text** mode, the cursor will be in the same position within the document in **Text** mode as it was in **Design** mode, and vice versa.
- The content completion assistant can be used for in-place editing within the JSON schema **Design** mode. For example, when editing properties, you can use **Ctrl+Space** to invoke the content completion window and the proposals are offered based on the defined JSON schema, according to the version used.
- You can drag properties/definitions from the **Outline** view and drop them into appropriate location in the diagram editor.

Contextual Menu Actions in the JSON Schema Design Mode

The contextual menu of the **Design** mode includes the following actions:

Go to Definition [Ctrl + Shift + Enter]

Navigates to the referenced schema component. This action is also available by clicking the arrow displayed in its bottom right corner.

Edit Properties

Allows you to edit the properties of the selected component in a in-place editor.

Properties that have set values are rendered in bold while unset properties are rendered with a gray foreground. You can edit any property (set or unset) by double-clicking or by pressing **Ctrl + Enter (Command + Enter on macOS)**.

You can delete any property already set by pressing **Delete**. This operation does not mean the selected property is deleted from the table. It means the property is *unset* (rendered with gray foreground). The **Edit** and **Remove** actions are also available on the contextual menu in the table.

If the `type` property changes as a result of an editing/removal action, then the list of properties presented in the table is updated according to the new schema type.

Note:

When filling in string values they should not be enclosed in quotation marks, these are added automatically.

Note:

For array values simply fill in the items that will constitute the array, separated by commas.

Edit Annotations

Allows you to edit the annotations for the selected schema component in the **Edit Annotations** dialog box. Annotations are not required, but they are encouraged as a good practice and can make the schema “self-documenting”.

The **title** and **description** must be strings. A **title** is preferably short, whereas a **description** provides a more lengthy explanation about the data described by the schema. The **default** keyword specifies a default schema value that can be anything. The **examples** keyword is meant to provide an array of examples that validate against the schema. Its items must be separated by a comma.

Annotations that have set values are rendered in bold while unset annotations are rendered with a gray foreground. You can unset an annotation by using the **Delete** key or the **Remove** action that is available in the contextual menu of the table.

By default, annotations are rendered under the graphical representation of the component. To edit the annotations, use the **Edit Annotations** action from the contextual menu or simply double-click the annotations area (if any).

Edit Dependencies

Available for `dependencies` and `dependentRequired` components, this action allows you to add, rename, delete, and edit the values for dependencies.

Make Required

Marks the selected property as being required in the parent object. By default, the defined properties are not required in the JSON schema. You can set a list of required properties in the `required` keyword. By invoking the action, the name of the property is added in the parent object's `required` keyword.

Make Optional

Marks the selected property as being optional in the parent object. By default, the defined properties are optional in the JSON schema. You can set a list of required properties in the `required` keyword. By invoking the action, the name of the property is deleted from the parent object's `required` keyword.

Refactoring > Extract definition in another file

Extracts a definition to a new file. If the file does not already exist, the action will create a new file and a document preset will be used to match the current schema specification. If the file does exist, the action will find a corresponding group (or create one) to append the extracted definition. This action can also be used on a selection of multiple definitions.

Refactoring > Extract definition in current file

Extracts a definition as a global definition and references it. It can be used on a property to extract its definition (in case you want to reuse it) or on a local definition to extract it as global one. This action can also be used on a selection of multiple definitions. Note that this action is not available for global definitions.

Refactoring > Convert type to 'any' type

Converts the `type` for the selected property, definition, or conditional into an `any type` with the value `true` or `false`. You can set `true` value to represent a schema that matches anything, or `false` for a schema that matches nothing.

Refactoring > Convert 'any' type to standard type

Converts the `any type` for the selected property, definition, or conditional into a standard `type`.

Append child

Offers a list of valid components, depending on the context, and appends your selection as a child of the currently selected component. You can set a name for a named component after it has been added in the diagram.

Insert before

Offers a list of valid components, depending on the context, and inserts your selection before the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

Insert after

Offers a list of valid components, depending on the context, and inserts your selection after the selected component, as a sibling. You can set a name for a named component after it has been added in the diagram.

 Undo [Ctrl + Z (Command + Z on macOS)]

Reverses the last editing action.

 Redo [Ctrl + Y (Command + Shift + Z on macOS, Ctrl + Shift + Z on Linux/Unix)]

Recreates the last editing action that was reversed by the **Undo** function.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action. These files are identified by searching the references of the selected component in the scope provided.

 Cut [Ctrl + X (Command + X on macOS)]

Cuts the selected component(s).

 Copy [Ctrl + C (Command + C on macOS)]

Copies the selected component(s) to the clipboard.

 Paste [Ctrl + V (Command + V on macOS)]

Pastes the component(s) from the clipboard as children of the selected component.

Remove [Delete key]

Removes the selected component(s).

Move Up [Alt + UpArrow (Option + UpArrow on macOS)]

Moves a component up in its parent.

Move Down [Alt + DownArrow (Option + DownArrow on macOS)]

Moves a component down in its parent.

Search > Search References

Available on components that have a *Definition* type in the diagram, it searches all references of the selected definition in a scope determined by the schemas referenced in the file and the schemas declared in the validation scenarios associated with them. You can also use it on the *Schema* type component (the root of the schema diagram) to search for all references to the schema name.

Search > Search References in

Available on components that have a *Definition* type in the diagram, it is an extension of the **Search References** action, where the search for references is additionally done in the file(s) specified when defining a scope in the resulting dialog box. You can also use it on the *Schema* type component (the root of the schema diagram) to search for references to the schema name.

Search > Search Occurrences in File [Ctrl + Shift + U (Command + Shift + U on macOS)]

Available on all components that have a *Definition* type in the diagram, it searches all occurrences of the currently selected definition in the current file. You can also use it on the *Schema* type component (the root of the schema diagram) to search for all occurrences of the schema name in the current file.

Flatten Schema

Flattens the entire hierarchy of JSON schemas. For more details, see [Flatten JSON Schema \(on page 921\)](#).

 **Expand All**

Recursively expands all sub-components of the selected component.

 **Collapse All**

Recursively collapses all sub-components of the selected component.

Print Selection

Prints the selected component diagram.

Save as Image

Saves the selected component diagram as image, in JPEG, BMP, SVG or PNG format.

 **Options**

Opens the [JSON Schema preferences page \(on page 161\)](#) where you can control which properties to display for JSON Schema components in the JSON Schema **Design** mode.

JSON Schema Design Mode Components and Properties

A schema diagram contains a series of interconnected components. In the JSON Schema **Design** mode, each component is displayed with distinguishable graphics and the thickness of the lines that connect the components identify whether the connected component is required or optional (a thick line denotes a required component while a thin line denotes an optional component).

Figure 347. Example: Required Component

Figure 348. Example: Optional Component

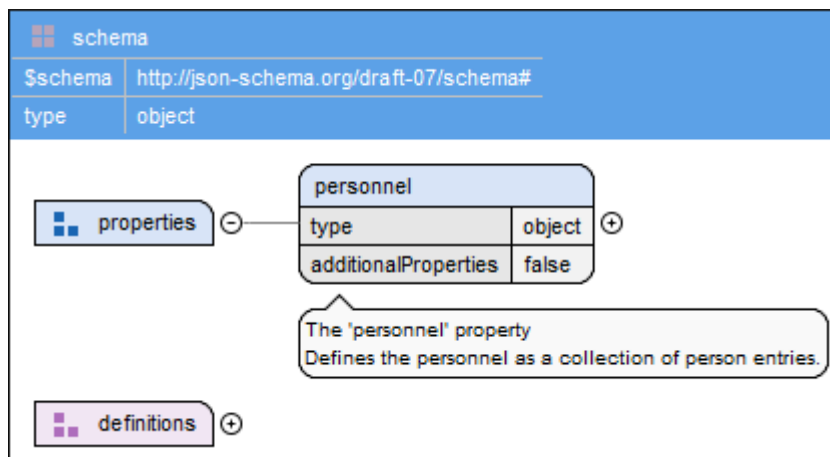

This section provide details about the available components and their corresponding graphics, along with details about component properties.

JSON Schema Components

Schema

Figure 349. The schema Component

Description: Defines the root element of a JSON schema. A JSON schema document contains all the steps that are necessary to be performed to validate JSON documents and it contains a collection of JSON schema components.

Property

Figure 350. Example of a property Component

Description: Each `key:value` pair is known as a **property** of the object. The value can be any JSON data type.

Properties

Figure 351. The properties Component

Description: An object is valid against the **properties** keyword if every property that is present in both the object and the value of this keyword validates against the corresponding schema. The value must be an object, where properties must contain valid JSON schemas (object or boolean). Only the property names that are present in both the object and the keyword value are checked.

Note:

Properties with a boolean value are presented in diagram as components. You can change the boolean value by modifying the `any type` property value. You can also convert a boolean `any type` property into a standard `type` property using the **Convert property to standard type** contextual menu action.

Pattern Property

Figure 352. Example of a patternProperty Component

Description: Maps regular expressions to schemas. If a property name matches the given regular expression, the property value must validate against the corresponding schema.

Pattern Properties

Figure 353. The patternProperties Component

Description: An object is valid against the **patternProperties** keyword if every property where a property name (key) matches a regular expression from the value of this keyword is also valid against the corresponding

schema. The value must be an object where the keys must be valid regular expressions and the corresponding values must be valid JSON schemas (object or boolean).

Unevaluated Properties (for 2019-09 or 2020-12 schemas)

Figure 354. The `unevaluatedProperties` Component

Description: An object is valid against the `unevaluatedProperties` keyword if every unevaluated property is valid against the schema defined by the value of this keyword. Unevaluated properties are the properties that were not evaluated anywhere in the current schema. This keyword can see through adjacent keywords, such as `allOf`.

Definition

Figure 355. Example of a definition Component

Description: The definition of a component of a schema. It can be referenced from a property to define its specification.

Definitions

Figure 356. The definitions Component

or

Description: The optional `definitions` keyword (or `$defs` for *draft 2019-09* or *2020-12* schemas) does not directly validate data, but it contains a map of validation schemas. The value can be anything.

Note:

Definitions with a boolean value are presented in diagram as components. You can change the boolean value by modifying the definition's `any type` property value. You can also convert a definition's boolean `any type` property into a standard `type` property using the **Convert definition to standard type** contextual menu action.

Additional Properties

Figure 357. The additionalProperties Component

Description:

An object is valid against the **additionalProperties** keyword if all *unchecked* properties are valid against the schema defined by the value of this keyword. *Unchecked* properties are the properties not checked by the **properties** and **patternProperties** keywords (if a property name is not present in the **properties** keyword and does not match any regular expression defined by the **patternProperties** keyword, then it is considered *unchecked*). The value must be a valid JSON schema (object or boolean).

To be more concise, if there are *unchecked* properties:

- If the value of the **additionalProperties** keyword is *true*, it is always valid.
- If the value is *false*, it is never valid.
- If the value contains an object (schema), every property must be valid against that schema.

Additional Items

Figure 358. The additionalItems Component

Description: An array is valid against the **additionalItems** keyword if all *unchecked* items are valid against the schema defined by the keyword value. An item is considered *unchecked* if the **items** keyword or **prefixItems** keyword (starting with 2020-12) contains an array of schemas and does not have a corresponding position (index). The value must be a valid JSON schema (object or boolean).

Items

Figure 359. The items Component

Description: An array is valid against the **items** keyword if the items are valid against the corresponding schemas provided by the keyword value. The value can be:

- A valid JSON schema (object or boolean). Every item must be valid against this schema.
- An array of valid JSON schemas. Each item must be valid against the schema defined at the same position (index). Items that do not have a corresponding position (e.g. an array contains 5 items but this keyword only has 3) are considered valid unless the **additionalItems** keyword is present, which will decide the validity.

Prefix Items (for 2020-12 schemas)

Figure 360. The prefixItems Component

Description: An array is valid against the **prefixItems** keyword if items are valid against the corresponding schemas provided by the keyword value. The value of this keyword must be an array of valid JSON schemas and each item must be valid against the schema defined at the same position (index). Items that do not have a corresponding position (an array contains 5 items and this keyword only has 3) will be considered valid, unless the **items** keyword is present (which will decide the validity).

Unevaluated Items (for 2019-09 or 2020-12 schemas)

Figure 361. The unevaluatedItems Component

Description: An object is valid against the **unevaluatedItems** keyword if every unevaluated item is valid against the schema defined by the value of this keyword. Unevaluated items are the items that were not evaluated anywhere in the current schema. This keyword can see through adjacent keywords, such as **allOf**.

AllOf

Figure 362. Example of an allOf Component

Description: An instance is valid against the **allOf** keyword if it is valid against all schemas defined by the value of this keyword. The value of this keyword must be an array of valid JSON schemas (objects or boolean).

AnyOf

Figure 363. Example of an anyOf Component

Description: An instance is valid against the **anyOf** keyword if it is valid against at least one schema defined by the value of this keyword. The value must be an array of valid JSON schemas (objects or boolean).

OneOf

Figure 364. Example of an oneOf Component

Description: An instance is valid against the **oneOf** keyword if it is valid against exactly one schema defined by the value of this keyword. The value must be an array of valid JSON schemas (object or boolean).

Not

Figure 365. Example of a not Component

Description: An instance is valid against the **not** keyword if it is not valid against the schema defined by the value of this keyword. The value must be a valid JSON schema (object or boolean).

If/Then/Else

Figure 366. Examples of an if, then, and else Components

Description: A conditional structure that contains three keywords: **if**, **then**, and **else**. Every keyword value must be a valid JSON schema (object or boolean). When the **if** keyword is not present, the **then** and **else** keywords are ignored. When the **if** keyword is present, at least one of the **then** or **else** keywords should also be present (or both). The instance is valid against this keyword in one of the following cases:

- The **if** keyword validates the instance and the **then** keyword also validates it.
- The **if** keyword does not validate the instance but the **else** keyword validates it.

Dependencies

Figure 367. The dependencies Component

Description: An object is valid against the **dependencies** keyword if it meets all dependencies specified by this keyword value. Only property names (from this keyword value) that are also present in the object are checked. The value of this keyword must be an object, where property values can be:

- Objects representing valid JSON schemas and the whole object must match the entire schema.

Important:

For *draft 2019-09* and *2020-12* schemas, you should use the **dependentSchemas** keyword (on [page 909](#)) instead.

- Arrays of strings representing property names, then the object must contain all property names.

Important:

For *draft 2019-09* and *2020-12* schemas, you should use the **dependentRequired** keyword (on [page 909](#)) instead.

Dependent Required (for 2019-09 or 2020-12 schemas)

Figure 368. The dependentRequired Component

Description: An object is valid against the **dependentRequired** keyword if it meets all dependencies specified by this keyword value. The value of this keyword must be an object where property values must be arrays of strings representing property names, and the object must contain all property names. Only property names (from this keyword value) that are also present in the object are checked.

Dependent Schemas (for 2019-09 or 2020-12 schemas)

Figure 369. The dependentSchemas Component

Description: An object is valid against the **dependentSchemas** keyword if it meets all dependencies specified by this keyword value. The value of this keyword must be an object where property values must be objects

representing valid JSON schemas, and the whole object must match the entire schema. Only property names (from this keyword value) that are also present in the object are checked.

JSON Schema Component Properties

Table 36. JSON Schema Diagram Component Properties

Prop-er-ties Group	Prop-erty Name	Description
Com-mon Prop-er-ties	type	<p>Specifies the type of data that the schema is expecting to validate. This keyword is not mandatory and the value must be a string representing a valid data type, or an array of strings representing a valid list of data types.</p> <p>When specifying multiple types, their order is irrelevant to the validation process, but make sure that a data type is specified only once.</p>
	\$ref	<p>An instance is valid against this keyword if it is valid against the schema that points to the location indicated in its value. The value must be a string representing a URI, URI reference, URI template, or JSON pointer.</p> <div data-bbox="400 1238 1437 1554" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; margin-top: 10px;"> <p> Note: A schema version 2019-09 or 2020-12 that contains a <code>\$ref</code> in conjunction with other type-specific keywords (such as <i>properties</i> or <i>items</i>) is processed as a combined schema, under the <i>allOf</i> criterion. This means that for an instance to be valid, it has to validate against both the referenced schema and the schema defined in-place by those keywords.</p> </div>
	\$id	<p>Specifies a unique ID for a document or a document sub-schema. The value must be a string representing a URI. All sub-schema IDs are resolved relative to the document ID. It is not a required keyword, but it is considered best practice to use it.</p>
	enum	<p>An instance validates against this keyword if its value can be found in the items defined by its value. The value must be an array that contains anything (an empty array is not allowed).</p>
	const	<p>An instance validates against this keyword if its value equals the value of this keyword. The value can be anything.</p>
	\$comment	<p>Contains an observation about the schema. The value must be a string.</p>

Table 36. JSON Schema Diagram Component Properties (continued)

Prop- er- ties Group	Prop- er- ty Name	Description
	readOnly	Used to mark specific properties as <i>read-only</i> .
	writeOnly	Used to mark specific properties as <i>write-only</i> .
	deprecated	Used to indicate that the instance value is deprecated and should not be used since it might be removed in the future.
Ob- ject Prop- er- ties	additional- Properties	<p>An object is valid against this keyword if all <i>unchecked</i> properties are valid against the schema defined by its value. <i>Unchecked</i> properties are the properties not checked by the properties and patternProperties keywords (if a property name is not present in the properties keyword and does not match any regular expression defined by the patternProperties keyword, then it is considered <i>unchecked</i>). The value must be a valid JSON schema (object or boolean).</p> <p>To be more concise, if we have <i>unchecked</i> properties:</p> <ul style="list-style-type: none"> • If the value of this keyword is <i>true</i>, it is always valid. • If the value is <i>false</i>, it is never valid. • If the value contains an object (schema), every property must be valid against that schema.
	unevaluat- edProp- er- ties	Similar to the additionalProperties keyword except that this one can recognize properties that declared in subschemas.
	maxProp- er- ties	An object is valid against this keyword if the number of properties it contains is lower than or equal to its value. The value must be a non-negative integer. Using 0 as a value means that the object must be empty (no properties).
	minProp- er- ties	An object is valid against this keyword if the number of properties it contains is greater than or equal to its value. The value of this keyword must be a non-negative integer. Using 0 as a value has no effect.
	pattern- Properties	An object is valid against this keyword if every property where a property name (key) matches a regular expression from its value and is also valid against the corresponding schema. The value must be an object where the keys must be valid regular expressions and the corresponding values must be valid JSON schemas (object or boolean).

Table 36. JSON Schema Diagram Component Properties (continued)

Prop- er- ties Group	Prop- erty Name	Description
	property-Names	An object is valid against this keyword if every property name (key) is valid against its value. The value must be a valid JSON schema (an object or a boolean).
	required	An object is valid against this keyword if it contains all property names (keys) specified by its value. The value must be a non-empty array of strings that represent property names.
	dependencies	<p>An object is valid against this keyword if it meets all dependencies specified by its value.</p> <div data-bbox="400 797 1437 976" style="border: 1px solid #0070C0; border-radius: 10px; padding: 10px; background-color: #E6F2FF;"> <p> Note: For 2019-09 and 2020-12 schemas, you should use the dependentRequired and dependentSchemas keywords instead.</p> </div>
	dependent-Required	An object is valid against this keyword if it meets all dependencies specified by its value. The value must be an object where property values must be arrays of strings representing property names, and the object must contain all property names.
	dependent-Schemas	An object is valid against this keyword if it meets all dependencies specified by its value. The value must be an object where property values must be objects representing valid JSON schemas, and the whole object must match the entire schema.
Ar- ray Prop- er- ties	additional-Items	An array is valid against this keyword if all <i>unchecked</i> items are valid against the schema defined by its value.
	unevaluatedItems	An array is valid against this keyword if the value is a valid JSON schema that will be applied to all array items that were not evaluated by other keywords for items (<code>prefix-Items</code> , <code>items</code> , <code>contains</code>).
	contains	An array is valid against this keyword if at least one item is valid against the schema defined by its value. The value must be a valid JSON schema (object or boolean).
	maxContains	An array is valid against this keyword if the number of <i>contains</i> is lower than or equal to its value. The value must be a non-negative integer.
	minContains	An array is valid against this keyword if the number of <i>contains</i> is greater than or equal to its value. The value must be a non-negative integer.

Table 36. JSON Schema Diagram Component Properties (continued)

Prop- er- ties Group	Prop- erty Name	Description
	items	<p>An array is valid against this keyword if the items are valid against the corresponding schemas provided by its value. The value of this keyword can be:</p> <ul style="list-style-type: none"> • A valid JSON schema (object or boolean). Every item must be valid against this schema. • An array of valid JSON schemas. Each item must be valid against the schema defined at the same position (index). Items that do not have a corresponding position (e.g. an array contains 5 items but this keyword only has 3) will be considered valid unless the additionalItems keyword is present, which will decide the validity.
	maxItems	An array is valid against this keyword if the number of items it contains is lower than or equal to its value. The value must be a non-negative integer.
	minItems	An array is valid against this keyword if the number of items it contains is greater than or equal to its value. The value must be a non-negative integer.
	prefixItems	An array is valid against this keyword if each item is a schema that corresponds to each index of the document's array (where the first element validates the first element of the input array, the second element validates the second element of the input array, and so on).
	uniqueItems	An array is valid against this keyword if an item cannot be found more than once in the array. The value must be boolean. If set to <i>false</i> , the keyword validation will be ignored.
Num- ber/In- te- ger Prop- er- ties	exclusiveMaximum	A number is valid against this keyword if it is strictly lower than its value. The value must be a number (integer or float) or boolean.
	exclusiveMinimum	A number is valid against this keyword if it is strictly greater than its value. The value must be a number (integer or float) or boolean.
	maximum	A number is valid against this keyword if it is lower than or equal to its value. The value must be a number (integer or float).

Table 36. JSON Schema Diagram Component Properties (continued)

Prop- er- ties Group	Prop- er- ty Name	Description
	minimum	A number is valid against this keyword if it is greater than or equal to its value. The value must be a number (integer or float).
	multipleOf	A number is valid against this keyword if the division between the number and its value results in an integer. The value must be a strictly positive number (zero is not allowed).
String Prop- er- ties	contentEn- coding	A string is valid against this keyword if it is encoded using the method indicated by its value. The value must be a string.
	content- MediaType	A string is valid against this keyword if its content has the media type (MIME type) indicated by its value. If the contentEncoding keyword is also specified, the decoded content must have the indicated media type. The value must be a string.
	format	Performs a semantic validation on data. The value must be a string that represents a format. The keyword behavior depends on the data type, meaning that the same format name for a string behaves differently on a number, or is missing, because not all data types must implement a format and usually differing data types have different formats.
	maxLength	A string is valid against this keyword if its length is lower than or equal to its value. The value must be a non-negative integer.
	minLength	A string is valid against this keyword if its length is greater than or equal to its value. The value must be a non-negative integer.
	pattern	A string is valid against this keyword if it matches the regular expression specified by its value. The value must be a string that represents a valid regular expression.

Related information

[JSON Schema Components \(on page 903\)](#)

JSON Schema Design Mode Validation

Validation for the **Design** mode is seamlessly integrated in the Oxygen XML Editor Eclipse plugin [JSON Schema validation support \(on page 919\)](#). You can ensure that the JSON Schemas you develop comply with JSON standards by using the built-in validation engine. You can also configure a validation scenario to use an external JSON Schema validation engine. A validation scenario can also be configured to define a main module of a complex JSON Schema to validate modules in the context of the larger schema structure.

Figure 370. JSON Schema Design Mode Validation

Visual Error Markers

A schema validation error is presented by highlighting the invalid component in the following locations:

- The component is surrounded with a red or yellow border within the diagram (you can customize these colors in the [Document Validation preferences page \(on page 133\)](#)).

If you validate the entire schema using the **Validate** action from the **Validation** toolbar drop-down menu, all validation errors will be presented in the **Results** pane at the bottom of the application. To resolve an error, just click it and the corresponding schema component will be displayed as the diagram root so that you can easily correct the error.

Generating JSON Schema from a JSON File

Oxygen XML Editor Eclipse plugin includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for generating the JSON Schema.

Figure 371. Generate JSON Schema Dialog Box

The **Generate JSON Schema** dialog box includes the following fields and options:

JSON Document URL

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Output JSON Schema

The path to the folder where the generated JSON Schema will be saved.

Open in Editor

If selected, the generated JSON Schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 4**, **Draft 6**, **Draft 7**, **2019-09**, and **2020-12**.

Extract matching format for strings

If selected, the generator will attempt to find a format that matches the string values from the JSON Document.

Restrict additional content

If selected, *additionalProperties* (for objects) and *additionalItems* (for arrays) will be set to *false* in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

Add default values for simple types

If selected, the *default* values (*0* for number, *""* for string, *false* for boolean) and *examples* for strings will be added.

Make all properties required

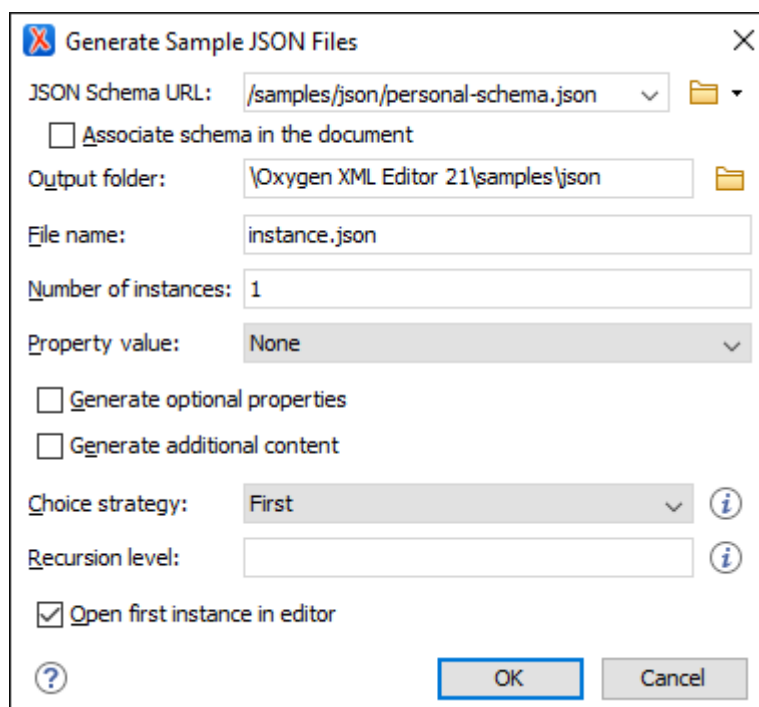

If selected, the generator will mark all the properties as required in the resulting schema.

You can click **Generate** at any point to generate the JSON Schema.

Generating Sample JSON Files from a JSON Schema

Oxygen XML Editor Eclipse plugin includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select **Generate Sample JSON Files** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 372. Generate Sample JSON Files Dialog Box

The **Generate Sample JSON Files** dialog box includes the following fields and options:

Schema URL

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list. The tool supports schemas with versions *Draft 04, 06, 07, 2019-09, and 2020-12*.

Associate schema in the document

If enabled, the specified schema will be associated with the generated files.

Output folder

Path to the folder where the generated JSON instances will be saved.

File name

The name of the instance(s) that will be generated. By default, `instance.json` is used.

Number of instances

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate additional content

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

Choice strategy

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either *oneOf* or *anyOf*). The following options are available:

- *First* - The first defined schema in *oneOf* or *anyOf* will be used.
- *Random* - A random schema defined in *oneOf* or *anyOf* will be used.

Recursion level

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

Open first instance in editor

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

JSON Schema Converter

Oxygen XML Editor Eclipse plugin includes a tool for converting an older version of a JSON schema (Draft 4, 6, or 7) to the latest versions (2019-09 or 2020-12).

To convert a JSON schema, select **Convert JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for converting the JSON Schema.

Figure 373. Convert JSON Schema Dialog Box

The **Convert JSON Schema** dialog box includes the following fields and options:

JSON Schema URL

The URL of the JSON schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list.

Output JSON Schema

The path to the folder where the converted JSON schema will be saved.

Open in Editor

If selected, the converted JSON schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 2019-09** or **2020-12**.

You can click **Convert** at any point to generate the JSON Schema.

Conversion Notes

- The `$schema` declaration is changed according to the selected JSON schema version.
- The `definitions` keyword is converted to `$defs` and all the references are updated.
- The `dependencies` keyword is split into `dependentRequired` and `dependentSchemas`.
- The `items` keyword (tuple array) is converted to `prefixItems` (2020-12).
- The `additionalItems` keyword is converted to `items` (2020-12, only if `prefixItems` is present).
- The `exclusiveMinimum` and `exclusiveMaximum` keywords with boolean values (Draft 4) are removed.
- The `id` keyword (Draft 4) is converted to `$id`.
- The `$ref` keyword wrapped into 1-item `allOf` is unwrapped because the latest versions allow processing `$ref` along with other keywords.

Validating JSON Schema Documents

A *valid* JSON Schema document is a *well-formed* document that also conforms to the JSON meta-schema rules that defines the legal syntax of a JSON Schema document.

If a JSON document includes a meta-schema URL in the document root with the "\$schema" key, the file will be validated as a JSON Schema against the specified meta-schema.

Quick Reference

- If there is a "\$schema": "http://json-schema.org/draft-04/schema" property in the schema root, then [Draft 4](#) will be used.
- If there is a "\$schema": "http://json-schema.org/draft-06/schema" property in the schema root, then [Draft 6](#) will be used.
- If there is a "\$schema": "http://json-schema.org/draft-07/schema" property in the schema root, then [Draft 7](#) will be used.
- If there is a "\$schema": "http://json-schema.org/draft/2019-09/schema" property in the schema root, then [2019-09](#) will be used.
- If there is a "\$schema": "http://json-schema.org/draft/2020-12/schema" property in the schema root, then [2020-12](#) will be used.
- If there is a "\$schema" property in the schema root, but with a different draft value, then an error will be displayed ("*could not determine version*").
- If none of these are found, then it is validated as a simple JSON instance.
- You could also select the **JSON Schema Validator** in a [JSON validation scenario \(on page 867\)](#) and it will use the version specified in the JSON Schema, or if a version is not specified, the [JSON Schema draft-04](#) will be used.

For information about how to associate a JSON Schema for the purposes of validation, see [Associating a JSON Schema Through a Validation Scenario \(on page 873\)](#).

For information about using a JSON Schema to validate documents, see [Validating JSON Documents Against JSON Schema or Schematron \(on page 864\)](#).

2019-09 and 2020-12 Validator Limitations

The JSON Schema Validator handles all the newly introduced keywords in 2019-09 and 2020-12 specifications. However, there are still some limitations:

1. The keywords "\$recursiveRef" and "\$recursiveAnchor" (2019-09) are not supported. This is also indicated by a validation warning.
2. The keyword "\$dynamicRef" has the same functionality as "\$ref", and "\$dynamicAnchor" (2020-12) is not supported. This is also indicated by a validation warning.
3. The keywords "unevaluatedProperties" / "unevaluatedItems" can "see through" the subschemas of adjacent keywords "if", "then", "else", but do not know about successfully validated *properties* / *items*. This means that all the *properties* / *items* defined by those subschemas are considered evaluated.
4. The keywords "unevaluatedProperties" / "unevaluatedItems" can "see through" the nested subschemas of adjacent keywords "oneOf", "anyOf", "allOf", but all the *properties* / *items* defined by those subschemas are considered evaluated, regardless of other nested restrictions.

Syntax Highlighting in JSON Schema Documents

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JSON Schema files, follow these steps:

1. Open the **Preferences** dialog box *(on page 70)*.
2. Go to **Editor > Syntax Highlight** *(on page 176)*.
3. Select and expand the **JSON Schema** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences *\(on page 176\)*](#)

Flatten JSON Schema

Oxygen XML Editor Eclipse plugin includes a **Flatten Schema** action that is available in the contextual menu when editing in **JSON Schema Design mode** *(on page 894)* and in the Text mode. It allows you to flatten an entire hierarchy of JSON schemas. Starting with the main JSON schema, Oxygen XML Editor Eclipse plugin calculates its hierarchy by processing the `$ref` keys and determining all the other referenced schema files. This means that the flattened JSON schema is obtained by recursively adding the components of all referenced schemas into the main one, and by updating all the `$ref` keys to point to the components from the resulting schema.

Resolving schema references is done through **XML Catalogs**. That means that the sub-schemas referenced through URIs and not mapped accordingly cannot not be parsed for integration into the resulting flattened schema, affecting its logic.

The **Flatten Schema** action opens a small dialog box that allows you to configure the operation by choosing the resulting schema name and the directory to save it, and opting whether to open the resulting schema in the editing area after the operation completes.

Editing JSON Lines Documents

Oxygen XML Editor Eclipse plugin includes some basic support for working with **JSON Lines** documents. *JSON Lines* is a convenient format for storing structured data that may be processed one record at a time.

Editing JSON Lines Documents

You can edit JSON Lines documents in the **Text** mode editor in Oxygen XML Editor Eclipse plugin and you have access to its various features and actions that are common for basic text files.

Validation

Validation support is available for JSON Lines documents if you have associated a schema through a configured validation scenario.

Content Completion

Content completion support is also available for JSON Lines documents if you have associated a schema through a configured validation scenario.

Editing JSON5 Documents

Oxygen XML Editor Eclipse plugin includes support for working with **JSON5** documents (files that have the `json5` file extension). The *JSON5* format is a superset of JSON that aims to alleviate some of the limitations of JSON by expanding its syntax to include some productions from *ECMAScript 5.1*.

Editing JSON5 Documents

You can edit JSON5 documents in the **Text** mode editor in Oxygen XML Editor Eclipse plugin and you have access to its usual text editing actions, along with other JSON5 editor-specific actions, including syntax highlighting, validation, formatting and indenting.

**Note:**

The  **Format and Indent** action works for JSON5 documents with limitations being that quotes are removed for keys and values are always double quoted (regardless of the initial quotation).

It also includes a document template to help you get started with JSON5 documents. The template is called **JSON5** and it can be found in the **New Document** folder in the **New from templates wizard** ([on page 253](#)).

Outline View

The **Outline** view for JSON5 documents displays the list of all the components of the document you are editing in a hierarchical (tree-like) representation. It is synchronized with the main editor so you can use the view to navigate to specific parts of the document and move or delete components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Validation

Oxygen XML Editor Eclipse plugin includes built-in validation engine for JSON5 documents to help keep them well-formed. JSON5 documents are validated automatically as you type and the validation engine detects syntax errors, based on the [JSON5 specification](#). One limitation is that hexadecimal values are not supported.

Editing YAML Documents

This section discusses the various features that are included in the Oxygen XML Editor Eclipse plugin YAML Editor and how to use them.

Resources

For more information about the YAML (and JSON) support in Oxygen XML Editor Eclipse plugin, see the following resources:

- [Video: YAML Support in Oxygen](#)
- [Webinar: Exploring Oxygen's YAML Support](#)
- [Webinar: JSON and JSON Schema Support in Oxygen](#)

YAML Editor

Oxygen XML Editor Eclipse plugin includes a specialized YAML editor with various editing features for files that have the `yaml/yml` file extension. It also includes a document template to help you get started with YAML documents. The template is called **YAML** and it can be found in the **New Document** folder in the **New from templates** wizard (*on page 253*).

**Tip:**

You can experiment with a sample of a YAML file available at: `[OXYGEN-INSTALL-DIR]/samples/yaml/personal.yaml`.

Text Mode Editor

When editing YAML documents in the **Text** editing mode, the usual text editing actions are available, along with other YAML editor-specific actions, including:

- [Syntax highlighting \(on page 928\)](#)
- [Automatic validation \(on page 923\)](#)
- [Formatting and indenting \(on page 929\)](#)

Validating YAML Documents

Automatic Validation

Oxygen XML Editor Eclipse plugin includes built-in validation engine for YAML documents to help you keep them well-formed. YAML documents are validated automatically as you type and the validation engine detects syntax errors (such as improper indentation or duplicate keys), based on the [YAML specification](#). The built-in validation also works on files that consist of multiple YAML documents.

Manual Validation Actions

To manually validate the currently edited YAML document, use one of the following actions:

 **Validate**

Available from the  **Validation** drop-down menu on the toolbar, the **YAML** menu, or from the **Validate** submenu when invoking the contextual menu on one or more YAML documents in the **Project Explorer view** ([on page 269](#)). The validation is done based on the [YAML specification](#).

Validate with

Available from the  **Validation** drop-down menu on the toolbar or the **YAML** menu. This action opens a dialog box that allows you to specify a JSON Schema for validating the current YAML document (it also works on files that consist of multiple YAML documents).

 **Check Well-Formedness (Alt + Shift + V, W (Command + Option + V, W on macOS))**

Available from the  **Validation** drop-down menu on the toolbar, the **YAML** menu, or from the **Validate** submenu when invoking the contextual menu in the **Project Explorer view** ([on page 269](#)). This action checks the document for syntax errors to make sure it is well-formed.

Validate with Schema

Available from the **Validate** submenu when invoking the contextual menu on one or more YAML documents in the **Project Explorer view** ([on page 269](#)). This action opens a dialog box that allows you to specify a JSON Schema to be used for the validation.

Batch Validation

The built-in validation engine can also be used to batch validation multiple YAML files at once by selecting multiple files in the **Project Explorer view**, right-click, and select **Validate** >  **Check Well-Formedness** or **Validate** >  **Validate**. This automatically validates the selected files using the built-in YAML validation engine, based on the [YAML specification](#).

Creating a YAML Validation Scenario

The built-in *YAML Validator* engine that can be specified in a validation scenario to validate YAML documents. In this case, the validation is done against a specified JSON Schema.

Creating a YAML Validation Scenario

To create a validation scenario, follow these steps:

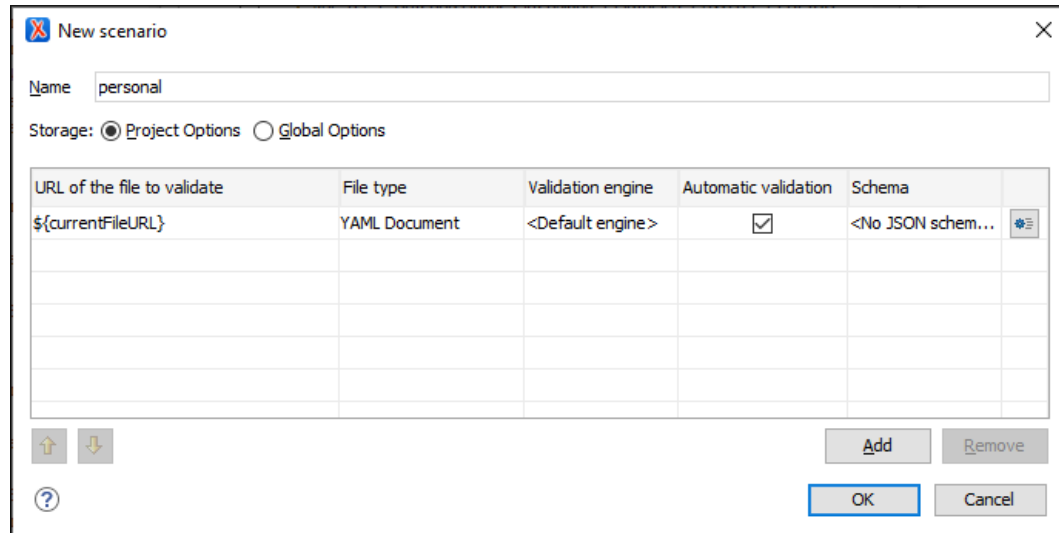

1. Select the  **Configure Validation Scenario(s)** action in one of the following ways:
 - From the toolbar.
 - From the **YAML** menu.
 - From the **Validate** submenu, when invoking the contextual menu on a file in the **Project Explorer view** ([on page 269](#)).

Step Result: The **Configure Validation Scenario(s)** dialog box is displayed.

2. Click the **New** button.

Step Result: A validation scenario configuration dialog box is displayed.

Figure 374. Validation Scenario Configuration Dialog Box

This scenario configuration dialog box allows you to configure the following information and options:

Name

The name of the validation scenario.

URL of the file to validate

The URL of the main module that includes the current module. It is also the entry module of the validation process when the current one is validated. To edit the URL, click its cell and specify the URL of the main module by doing one of the following:

- Enter the URL in the text field or select it from the drop-down list.
- Use the  **Browse** drop-down button to browse for a local, remote, or archived file.
- Use the  **Insert Editor Variable** button to insert an [editor variable \(on page 218\)](#) or a [custom editor variable \(on page 227\)](#).

Figure 375. Insert an Editor Variable

```

 $\{\{start-dir\}$  - Start directory of custom validator
 $\{\{standard-params\}$  - List of standard parameters
 $\{\{cfn\}$  - The current file name without extension
 $\{\{currentFileURL\}$  - The path of the currently edited file (URL)
 $\{\{cfdu\}$  - The path of current file directory (URL)
 $\{\{frameworks\}$  - Oxygen frameworks directory (URL)
 $\{\{pdu\}$  - Project directory (URL)
 $\{\{oxygenHome\}$  - Oxygen installation directory (URL)
 $\{\{home\}$  - The path to user home directory (URL)
 $\{\{pn\}$  - Project name
 $\{\{env(VAR\_NAME)\}$  - Value of environment variable VAR_NAME
 $\{\{system(var.name)\}$  - Value of system variable var.name

```

File type

The type of the document that is validated in the current validation unit. Oxygen XML Editor Eclipse plugin automatically selects the file type depending on the value of the **URL of the file to validate** field.

Validation engine

For YAML documents, the built-in *YAML Validator* engine (**Default engine**) is used.

Automatic validation

If this option is selected, the validation operation defined by this row is also applied by the automatic validation feature. If the **Automatic validation** feature is disabled in the [Document Checking preferences page \(on page 133\)](#), then this option is ignored, as the preference setting has a higher priority.

Schema

Displays the specified schema.

 **Specify Schema**

Opens the **Specify Schema** dialog box that allows you to set a schema to be used for validating YAML documents.

 **Move Up**

Moves the selected scenario up one spot in the list.

 **Move Down**

Moves the selected scenario down one spot in the list.

Add

Adds a new validation unit to the list.

Remove

Removes an existing validation unit from the list.

3. Configure any of the existing validation units according to the information above. You can use the buttons at the bottom of the table to add, remove, or move validation units.
4. Click **OK**.

Result: The newly created validation scenario will now be included in the list of scenarios in the **Configure Validation Scenario(s)** dialog box. You can select the scenario in this dialog box to associate it with the current document and click the **Apply associated** button to run the validation scenario.

Related Information:

[Associating a JSON Schema Directly in YAML Documents \(on page 927\)](#)

Associating a JSON Schema Directly in YAML Documents

Associate Schema Action

The schema used by the validation engine can be associated with the current document by using the  **Associate Schema** action. The association can specify a relative file path or a URL of the schema.

To associate a JSON Schema to the current YAML document, follow these steps:

1. Select the  **Associate Schema** action from the toolbar (or **YAML** menu).

Step Result: The **Associate Schema** dialog box is displayed:

Figure 376. Associate Schema Dialog Box

This dialog box contains the following options for YAML documents:

- **URL** - Allows you to specify or select a URL for the schema. It also keeps a history of the last used schemas. The URL must point to the schema file that can be loaded from the local disk or from a remote server through HTTP(S), FTP(S).
 - **Use path relative to file location** - Select this option if the YAML instance document and the associated schema contain relative paths. The location of the schema file is inserted in the YAML instance document as a relative file path. This practice allows you, for example, to share these documents with other users without running into problems caused by multiple project locations on physical disk.
2. Select the JSON Schema that will be associated with the YAML document.
 3. Click **OK**.

Result: A `$schema` property is added at the beginning of the document with its value set to the specified URL. If the document already contained a schema association, the old association will be replaced with the new one.

Tip:

To quickly open the schema used for validating the current document, select the  **Open Associated Schema** action from the toolbar (or **YAML** menu).

Related Information:

[Creating a YAML Validation Scenario \(on page 924\)](#)

Content Completion Assistant in YAML

Oxygen XML Editor Eclipse plugin includes an intelligent *Content Completion Assistant* (on page 2677) that offers proposals for inserting YAML structures that are valid at the current editing location.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (on page 70), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 119).

Content Completion and the Associated Schema

The *Content Completion Assistant* feature is schema-driven and the list of proposals in the *Content Completion Assistant* (on page 2677) depend on the associated JSON schema. For information about ways to associate a schema to a YAML document, see *Associating a JSON Schema Directly in YAML Documents* (on page 927).

Using the Content Completion Assistant in YAML

The feature is activated in **Text** mode for YAML documents by pressing **Ctrl + Space** or **Alt + ForwardSlash** (**Command + Option + ForwardSlash on macOS**).

The feature is activated in **Author** mode by using the **Enter** key.

You can navigate through the list of proposals by using the **Up** and **Down** keys on your keyboard. You can also change the size of the documentation window by dragging its top, right, and bottom borders.

To insert the selected proposal, press **Enter** or **Tab**.

Content Completion Options for YAML

The content that is inserted by the content completion mechanism in YAML is generated automatically from the associated schema. You can control the inserted content with options available in the **Options > Preferences > Editor > Content Completion > YAML preferences page** (on page 130). You can specify whether or not required content, optional content, and additional content should be generated.

Syntax Highlighting in YAML Documents

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for YAML files, follow these steps:

1. Open the **Preferences** dialog box (on page 70).
2. Go to **Editor > Syntax Highlight** (on page 176).
3. Select and expand the **YAML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences \(on page 176\)](#)

Folding in YAML Documents

In a large YAML document, the data corresponding to complex keys can be collapsed so that only the needed data remains in focus. The usual *folding features available for XML documents* are also available in YAML documents.

Formatting/Indenting YAML Documents

Oxygen XML Editor Eclipse plugin includes support for formatting and indenting YAML documents. You can trigger a format and indent operation for your YAML document using the  **Format and Indent** toolbar button.

Some of the formatting actions that are performed include:

- Indents the document with the indent size specified in the [Editor > Format preferences page \(on page 162\)](#).
- Removes empty lines and extra spaces between keys and values.
- Compacts the string values (for example, *description*) and limits it to 80 characters on a row.

To batch format/indent multiple YAML files, select and right-click the files in the **Project Navigator** view, then select  **Format and Indent Files**.

YAML Outline View

The **Outline** view for YAML documents displays the list of all the components of the document you are editing in a hierarchical (tree-like) representation. It is synchronized with the main editor so you can use the view to navigate to specific parts of the document and move or delete components. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 377. YAML Outline View

Outline View Features

The **Outline** view allows you to:

- Quickly navigate through the document by selecting nodes in the **Outline** tree.
- Move elements by dragging them to a new position in the tree structure.
- Highlight elements in the editor area. It is synchronized with the editor area, so when you make a selection in the editor area, the corresponding nodes are highlighted in the **Outline** view, and vice versa.

Outline View Interface

By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

It also includes a **View menu** in the top-right corner that presents the following options to help you filter the view even further.

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Contextual Menu Actions

The following actions are available in the contextual menu of the YAML **Outline** view:

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Paste

Pastes the copied component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

YAML to JSON Converter

Converting YAML to JSON in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

The **YAML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **XML Tools > JSON Tools** menu.

The **YAML to JSON** dialog box is displayed:

Figure 378. YAML to JSON Dialog Box

2. Choose or enter the **YAML URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

[JSON to YAML Converter \(on page 887\)](#)

JSON to YAML Converter

Converting JSON to YAML in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **XML Tools > JSON Tools** menu.

The **JSON to YAML** dialog box is displayed:

Figure 379. JSON to YAML Dialog Box

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

[YAML to JSON Converter \(on page 887\)](#)

Contextual Menu Actions in YAML Documents

In addition to the usual text editing actions being available in the YAML editor, it also includes some unique editor-specific actions available in the contextual menu:

 **Cut**,  **Copy**,  **Paste**

Executes the typical editing actions on the currently selected content.

Copy JSON Pointer

Creates a *JSON Pointer* at the current cursor location and copies the expression that denotes the JSON pointer to the system clipboard.

Copy XPath

Copies the XPath expression of the current property from the current editor to the clipboard.

Toggle Line Wrap (**Ctrl + Shift + Y (Command + Shift + Y on macOS)**)

Enables or disables line wrapping. When enabled, if text exceeds the width of the displayed editor, content is wrapped so that you do not have to scroll horizontally.

Toggle Line Comment (Ctrl + ForwardSlash (Command + ForwardSlash on macOS))

Allows you to comment (or uncomment) the current selection (or current line if no content is selected) in the YAML document you are editing.

Editing XLIFF Documents

XLIFF (*XML Localization Interchange File Format*) is an XML-based format that was designed to standardize the way multilingual data is passed between tools during a localization process. Oxygen XML Editor Eclipse plugin provides the following support for editing XLIFF documents:

XLIFF Version 1.2, 2.0, and 2.1 Support:

- New document templates for XLIFF documents.
- A default CSS file (`xliff.css`) used for rendering XLIFF content in **Author** mode is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/css/`.

- Validation and content completion support using local catalogs. The default catalog (`catalog.xml`) for version 1.2 is stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/1.2`, for version 2.0 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.0`, and for version 2.1 in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.1`.

XLIFF Version 2.0 and 2.1 Enhanced Support:

Support for validating XLIFF 2.0 and 2.1 documents using modules. For version 2.0, the default modules are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.0/modules` and for version 2.1, they are stored in `[OXYGEN_INSTALL_DIR]/frameworks/xliff/schemas/2.1`.

Editing XLIFF Documents in Author Mode

By default, when you create a new XLIFF document [from a template \(on page 253\)](#), Oxygen XML Editor Eclipse plugin opens it in **Text** mode. Aside from the normal editing features found in **Text** mode, you can also switch to **Author** mode where Oxygen XML Editor Eclipse plugin offers some special form controls specifically for XLIFF documents. These form controls simply allow you to add or edit XLIFF attribute values and content in a visual mode.

For XLIFF version 2.0 and 2.1 documents, you can also change the style of the visual editing mode. The **Styles** drop-down menu on the toolbar offers the following styles that are specifically designed to render XLIFF 2.0 and 2.1 documents in **Author** mode:

- **Default**
- **Classic**
- **Translate**

Editing JavaScript Documents

This section explains the features of the Oxygen XML Editor Eclipse plugin JavaScript Editor and how you can use them.

JavaScript Editing Actions

Oxygen XML Editor Eclipse plugin allows you to create and edit JavaScript files and assists you with useful features such as syntax highlight, content completion, and outline view. To enhance your editing experience, you can select entire blocks (parts of text delimited by brackets) by double-clicking somewhere inside the brackets.

Figure 380. JavaScript Editor Text Mode

```

90 ▾ function change_sides(front) {
91 ▾   switch ($('#version-switch').text()) {
92     case 'Original':
93       $('#holder').html($('#div .original[id]').html());
94       make_clickable();
95       $('#version-switch').text('Translation 1');
96       break;
97     case 'Translation 1':
98       $('#holder').html($('#div .translation[id]').filter(':first').html());
99       $('#version-switch').text('Translation 2');
100      break;
101     case 'Translation 2':
102       $('#holder').html($('#div .translation[id]').filter(':last').html());
103       $('#version-switch').text('Original');
104       break;
105   }
106 }

```

The contextual menu of the **JavaScript** editor offers the following actions:

Cut

Allows you to cut fragments of text from the editing area.

Copy

Allows you to copy fragments of text from the editing area.

Paste

Allows you to paste fragments of text in the editing area.

→! **Toggle Comment**

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a single comment for the entire fragment you want to comment.

→! **Toggle Line Comment**

Allows you to comment a line or a fragment of the JavaScript document you are editing. This option inserts a comment for each line of the fragment you want to comment.

Go to Matching Bracket

Use this option to find the closing, or opening bracket, matching the bracket at the cursor position. When you select this option, Oxygen XML Editor Eclipse plugin moves the cursor to the matching bracket, highlights its row, and decorates the initial bracket with a rectangle.

Note:

A rectangle decorates the opening or closing bracket that matches the current one, at all times.

Source

Allows you to select one of the following actions:

To Lower Case

Converts the selection content to lower case characters.

To Upper Case

Converts the selection content to upper case characters.

Capitalize Lines

Converts to upper case the first character of every selected line.

Join and Normalize Lines

Joins all the rows you select to one row and normalizes the content.

Insert new line after

Inserts a new line after the line at the cursor position.

Modify all matches

Use this option to modify (in-place) all the occurrences of the selected content. When you use this option, a thin rectangle replaces the highlights and allows you to start editing. If matches with different letter cases are found, a dialog box is displayed that allows you select whether you want to modify only matches with the same letter case or all matches.

Open

Allows you to select one of the following actions:

- **Open File at Cursor** - select this action to open the source of the file located at the cursor position
- **Open File at Cursor in System Application** - select this action to open the source of the file located at the cursor position with the application that the system associates with the file

Compare

Select this option to open the **Compare Files** tool to compare the file you are editing with a file you choose in the dialog box.

Validating JavaScript Files

You have the possibility to validate the JavaScript document you are editing. Oxygen XML Editor Eclipse plugin uses the Mozilla Rhino library for validation. For more information about this library, go to <https://github.com/mozilla/rhino>. The JavaScript validation process checks for errors in the syntax. Calling a function that is not defined is not treated as an error by the validation process. The interpreter discovers this error when executing the faulted line. Oxygen XML Editor Eclipse plugin can validate a JavaScript document both on-request and automatically.

Content Completion in JavaScript Documents

When you edit a JavaScript document, the *Content Completion Assistant* (on page 2677) presents you a list of the elements you can insert at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

For an enhanced assistance, JQuery methods are also presented. The following icons decorate the elements in the content completion list of proposals depending on their type:

-  - function
-  - variable
-  - object
-  - property
-  - method

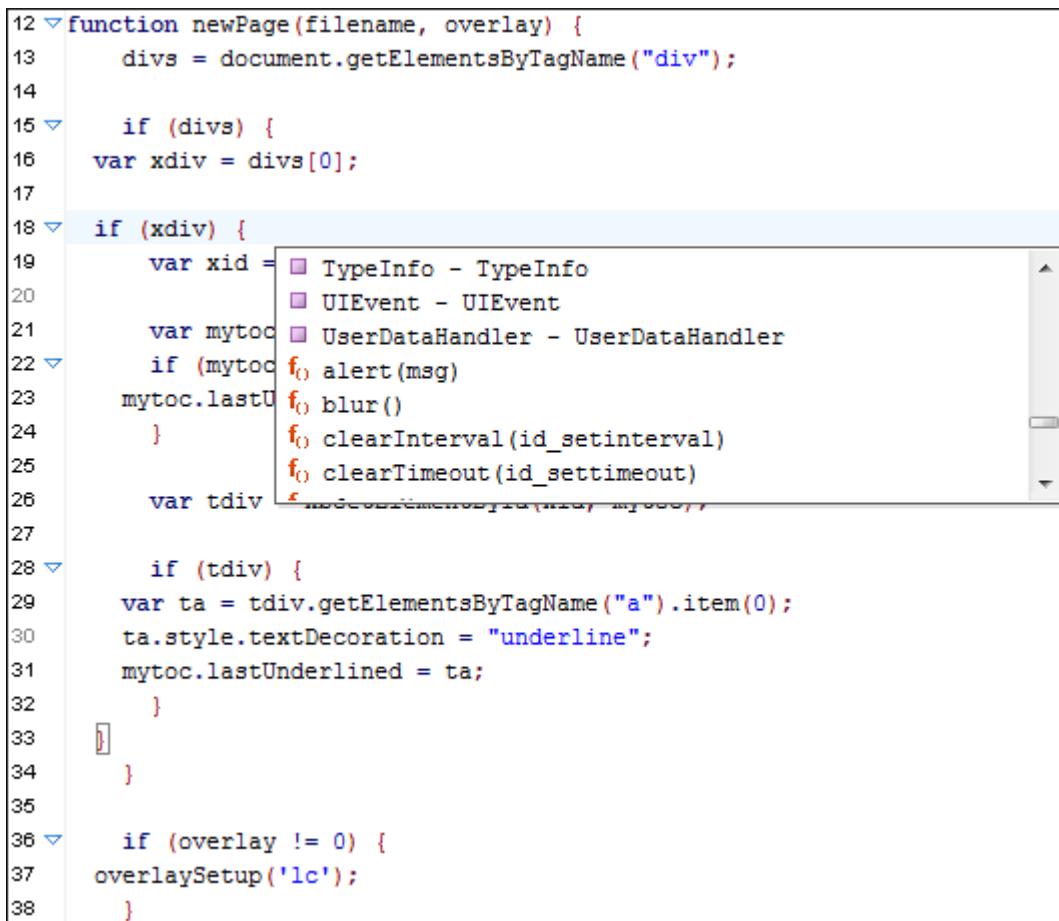

Note:

These icons decorate both the elements from the content completion list of proposals and from the **Outline view** (on page 938).

Figure 381. JavaScript Content Completion Assistant

```

12 ▾ function newPage(filename, overlay) {
13     divs = document.getElementsByTagName("div");
14
15 ▾   if (divs) {
16     var xdiv = divs[0];
17
18 ▾   if (xdiv) {
19     var xid =  TypeInfo - TypeInfo
20              UIEvent - UIEvent
21              UserDataHandler - UserDataHandler
22 ▾   if (mytoc  alert(msg)
23     mytoc.lastU  blur()
24     }  clearInterval(id_setinterval)
25     }  clearTimeout(id_settimeout)
26     var tdiv
27
28 ▾   if (tdiv) {
29     var ta = tdiv.getElementsByTagName("a").item(0);
30     ta.style.textDecoration = "underline";
31     mytoc.lastUnderlined = ta;
32     }
33     ]
34     }
35
36 ▾   if (overlay != 0) {
37     overlaySetup('lc');
38     }

```

The *Content Completion Assistant* collects:

- Method names from the current file and from the library files.
- Functions and variables defined in the current file.

If you edit the content of a function, the content completion list of proposals contains all the local variables defined in the current function, or in the functions that contain the current one.

Syntax Highlighting in JavaScript Documents

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for JavaScript files, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*).
2. Go to **Editor > Syntax Highlight** (*on page 176*).
3. Select and expand the **JavaScript** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences](#) (*on page 176*)

JavaScript Outline View

Oxygen XML Editor Eclipse plugin present a list of all the components of the JavaScript document you are editing in the **Outline** view. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 382. JavaScript Outline View

The following icons decorate the elements in the **Outline** view depending on their type:

- - function
- - variable
- - object
- - property
- - method

The contextual menu of the JavaScript **Outline** view contains the usual **Cut**, **Copy**, **Paste**, and **Delete** actions. From the **Settings** menu, you can select the **Update selection on cursor move** option to synchronize the **Outline** view with the editing area.

Editing XProc Scripts

XProc is an XML pipeline language that can be used to script transformations. An XProc script is edited as an XML document that is validated against a RELAX NG schema, or if the script has an associated validation scenario, then the XProc engine selected in the scenario is used as the validating engine (if the XProc engine supports validation). The default engine for XProc scenarios is a version of the *Calabash* engine that comes bundled with Oxygen XML Editor Eclipse plugin version 26.1. The default engine supports content completion and validation of XProc 1.0 and 3.0 files.

**Note:**

If a custom engine is used, the validation support for XProc version 3.0 depends on whether it is available for the particular custom engine.

XProc Content Completion

Oxygen XML Editor Eclipse plugin helps you edit a XProc scripts through the *Content Completion Assistant (on page 2677)*, offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

The content completion inside the `<input/inline>` element from the XProc namespace `http://www.w3.org/ns/xproc` offers elements from the following schemas depending both on the `@port` attribute and the parent of the `<input>` element. When invoking the content completion inside the `<inline>` XProc element, the list of content completion proposals is populated as follows:

- If the value of the `@port` attribute is `stylesheet` and the `<xslt>` element is the parent of the `<input>` elements, the *Content Completion Assistant* offers XSLT elements.
- If the value of the `@port` attribute is `schema` and the `<validate-with-relax-ng>` element is the parent of the `<input>` element, the *Content Completion Assistant* offers RELAX NG schema elements.
- If the value of the `@port` attribute is `schema` and the `<validate-with-xml-schema>` element is the parent of the `<input>` element, the *Content Completion Assistant* offers XML Schema schema elements.
- If the value of the `@port` attribute is `schema` and the `<validate-with-schematron>` element is the parent of the `<input>` element, the *Content Completion Assistant* offers either ISO Schematron elements or Schematron 1.5 schema elements.
- If the above cases do not apply, then the *Content Completion Assistant* offers elements from all the schemas from the above cases.

Figure 383. XProc Content Completion

```

<p:choose>
  <p:when test="not(contains(//item[1]/title, 'sunny'))">
    <p:xslt>
      <p:input port="source"/>
      <p:input port="stylesheet">
        <p:inline>
          <xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform" version="2.0">
            <xsl:import href=""/>
            <xsl:include href=""/>
          </xsl:stylesheet>
        </p:inline>
      </p:input>
    </p:when>
    <p:otherwise>
      <p:xslt>

```

The `xsl:decimal-format` element is used to indicate a set of localisation parameters. If the `xsl:decimal-format` element has a name attribute, it identifies a named format; if not, it identifies the default format. In practice decimal formats are used only for formatting numbers using the `format-number()` function in XSL expressions. It is an error to declare either the default decimal-format or a decimal-format with a given name more than once (even with different import precedence), unless it is declared every time with the same value for all attributes (taking into account any default values).

XProc Syntax Highlighting

The XProc editor assists you in writing XPath expressions by offering dedicated coloring schemes for syntax highlighting.

To customize the colors or styles used for the syntax highlighting colors for XProc, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*).
2. Go to **Editor > Syntax Highlight** (*on page 176*).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Enabling Extensions in Calabash

If you are using the default Calabash engine, it is possible to configure extensions (for a list of the valid extensions, see <http://xmlcalabash.com/docs/reference/cfg.extension.html>).

To configure an extension:

1. Edit the following file: `OXYGEN_INSTALL_DIR/lib/xproc/calabash/engine.xml`.
2. Add the extension and its value as a `system-property`, as in the following example:

```
<system-property name="com.xmlcalabash.allow-text-results" value="true"/>
```

Editing Schematron Schemas

Schematron is a simple and powerful Structural Schema Language for making assertions about patterns found in XML documents. It relies almost entirely on XPath query patterns for defining rules and checks. Schematron validation rules allow you to specify a meaningful error message. This error message is provided to you if an error is encountered during the validation stage.

There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:

- [Guide to Schema Writing with Schematron](#)
- [Presentation: Schematron Development with Oxygen](#)

Oxygen XML Editor Eclipse plugin assists you in editing Schematron documents with schema-based content completion, syntax highlight, search and refactor actions, and dedicated icons for the **Outline view** (*on page*

961). You can create a new Schematron schema using one of the Schematron templates available in the **New from Templates** wizard (on page 253).

For information about applying and detecting Schematron schemas, see [Associating a Schema to XML Documents](#) (on page 584).

Validating XML Documents Against Schematron

The Skeleton XSLT processor is used for validation and conforms with ISO Schematron or Schematron 1.5. It allows you to [validate XML documents against Schematron schemas](#) (on page 956) or against combined RELAX NG / W3C XML Schema and Schematron.

How to Specify the Query Language Binding

You can specify the query language binding to be used in the Schematron schema by doing the following:

- For embedded ISO Schematron, [open the Preferences dialog box](#) (on page 70), go to **XML > XML Parser > Schematron**, and select it in the **Embedded rules query language binding** option (on page 194).
- For standalone ISO Schematron, specify the version by setting the query language to be used in a `@queryBinding` attribute on the schema root element. For more information, see the [Query Language Binding](#) section of the Schematron specifications.
- For Schematron 1.5 (standalone and embedded), [open the Preferences dialog box](#) (on page 70), go to **XML > XML Parser > Schematron**, and select the version in the **XPath Version** option (on page 195).

Multi-Lingual Support in Schematron Messages

You can specify the desired language for the validation messages in the [Schematron Preferences](#) page (on page 193). The Schematron validation messages can be presented in multiple languages by defining the language for each message using the Schematron `<diagnostics>` element.

For example, you can define a diagnostic for each language and reference the ID of the diagnostics in the `<assert>` element. You can specify the language of the diagnostic message by adding the `xml:lang` attribute on the `sch:diagnostic` element or on its parent:

```
<sch:assert test="bone" diagnostics="d_en d_de">
  A dog should have a bone.
</sch:assert>
...
<sch:diagnostics>
  <sch:diagnostic id="d_en" xml:lang="en">
    A dog should have a bone.
  </sch:diagnostic>
  <sch:diagnostic id="d_de" xml:lang="de">
    Das Hund muss ein Bein haben.
  </sch:diagnostic>
</sch:diagnostics>
```

```
</sch:diagnostic>  
</sch:diagnostics>
```

How to Customize Color Schemes in Schematron

The Schematron editor renders the XPath expressions with dedicated color schemes. To customize the coloring schemes, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Syntax Highlight**.

Schematron Transformation Scenario

When you create a Schematron document, Oxygen XML Editor Eclipse plugin provides a built-in transformation scenario. You can use this scenario to obtain the XSLT style-sheet corresponding to the Schematron schema. You can apply this XSLT stylesheet to XML documents to obtain the Schematron validation results.

Examples of Schematron Rules and Quick Fixes

This topic is meant to provide some basic examples of Schematron Rules and Schematron Quick Fixes (SQF) to help you create and impose your own rules and quick fixes.

Other examples and ideas can also be found at:

- [Public GitHub project with the Schematron file used for Oxygen's User Guide](#)
- [Public GitHub project with sample Schematron Quick Fixes](#)

Schematron Examples

Schematron Use Case 1: Impose a Relax NG Schema Declaration

Description: The following sample rule is useful if, for example, you need to enforce the use of Relax NG schema declarations in all of your documents (i.e. instead of using DTD schemas).

Sample Code:

```

<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2" xmlns:saxon="http://saxon.sf.net/">
  <sch:let name="rngDeclaration"
    value="processing-instruction('xml-model')
    [saxon:get-pseudo-attribute('schematypens')='http://relaxng.org/ns/structure/1.0']"/>
  <sch:pattern>
    <sch:rule context="/element()">
      <sch:assert test="exists($rngDeclaration)">You must define a Relax NG schema
        declaration in the document (DTD schemas are not supported).</sch:assert>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

Result: The engine checks for a Relax NG schema declaration in the document and displays an error if it is missing. The error is reported on the document's root element (`/element()`).

Schematron Use Case 2: Check for Missing IDs

Description: The following sample rule checks for missing or undefined IDs in a TEI document. Specifically, it looks for IDs from the `tei:rs/@ref` attribute defined in the document named `persons.xml` (as `xml:id` of a TEI `person` element).

Sample Code:

```

<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
  <sch:ns uri="http://www.tei-c.org/ns/1.0" prefix="tei"/>
  <sch:let name="personIds"
    value="document('../persons.xml')/tei:TEI//tei:person/@xml:id"/>
  <sch:pattern>
    <sch:rule context="tei:rs">
      <sch:let name="refIds"
        value="for $id in tokenize(@ref, ' ') return substring-after($id, '#')"/>
      <sch:let name="missingIds"
        value="for $id in $refIds return (if($id = $personIds) then '' else $id)"/>
      <sch:report test="$missingIds != ''">
        The following ids "<sch:value-of select="$missingIds"/>"
        are not defined in "<sch:value-of select="$personIds"/>"
      </sch:report>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

where the XML document looks something like this:

```
<tei xmlns="http://www.tei-c.org/ns/1.0">
  <rs ref=" ../SomePerson/persons.xml#EDP ../personography/HAMpersons.xml#SD">text</rs>
  <rs ref=" ../SomePerson/persons.xml#EDP">text</rs>
</tei>
```

Result: The engine displays an error message listing the missing/undefined IDs.

Schematron Use Case 3: Check for Broken Links

Description: The following sample rule detects broken links in DITA `<xref>` or `<link>` elements. The first example only checks links that do not contain an anchor (#).

Sample Code:

```
<rule
  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]
  [@href][not(contains(@href, '#'))][not(@scope = 'external')]
  [not(@type) or @type='dita']">
  <assert test="doc-available(resolve-uri(@href, base-uri().))">
    The document linked by <value-of select="local-name()"/>
    "<value-of select="@href"/>" does not exist!</assert>
</rule>
```

For links that contain an anchor, the Schematron rule must look something like this:

```
<rule
  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]
  [@href][contains(@href, '#')][not(@scope = 'external')]
  [not(@type) or @type='dita']">
  <let name="file" value="substring-before(@href, '#')"/>
  <let name="idPart" value="substring-after(@href, '#')"/>
  <let name="topicId"
    value="if (contains($idPart, '/')) then substring-before($idPart, '/') else $idPart"/>
  <let name="id" value="substring-after($idPart, '/')"/>

  <assert test="document($file, .)//*[ @id=$topicId]">
    Invalid topic id "<value-of select="$topicId"/>" </assert>
  <assert test="$id = '' or document($file, .)//*[ @id=$id]">
    No such id "<value-of select="$id"/>" is defined! </assert>
  <assert test="$id = '' or document($file, .)//*[ @id=$id]
    [ancestor::*[contains(@class, ' topic/topic ')]][1][ @id=$topicId]">
    The id "<value-of select="$id"/>" is not in the scope of the referenced topic id
    "<value-of select="$topicId"/>". </assert>
</rule>
```

Result: The engine displays an error message when a broken link or cross reference is detected.

Schematron Use Case 4: Check for Duplicate IDs

Description: The following sample rule detects if there are two sibling `<step>` elements with the same `@id` value in a DITA Task document.

Sample Code:

```
<sch:rule context="*[contains(@class, ' task/step ')]">
  <sch:let name="id" value="@id"/>
  <sch:report
    test="preceding-sibling::element()[contains(@class, ' task/step ')][@id = $id]">
    Element with duplicate ID "<sch:value-of select="$id"/>" detected.
  </sch:report>
</sch:rule>
```

Result: The engine displays an error message when a duplicate ID is detected in sibling `<step>` elements within a DITA Task document.

Schematron Use Case 5: Check for Duplicate DITA Topic References

Description: The following sample rule checks a DITA map for duplicate `<topicref>` elements with the same `@href` value.

Sample Code:

```
<sch:rule context="*[contains(@class, ' map/topicref ')]">
  <sch:let name="href" value="@href"/>
  <sch:report
    test="preceding::element()[contains(@class, ' map/topicref ')][@href = $href]">
    Duplicate topicref "<sch:value-of select="$href"/>" detected in map.
  </sch:report>
</sch:rule>
```

Result: The engine displays an error message when multiple `<topicref>` elements with the same `@href` value are detected in a DITA map.

Schematron Use Case 6: Restrict Certain Words from the Title

Description: The following sample rule checks for instances of specified words to be restricted from a `<title>` element (in this example, the words *test* and *hello* are restricted).

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2">
  <sch:let name="words" value="'test,hello'"/>
```

```

<sch:let name="wordsToMatch" value="replace($words, ',', '|')"/>
<sch:pattern>
  <sch:rule context="title">
    <sch:report test="matches(text(), $wordsToMatch)" role="warn">
      The following words should not be added in the title:
      <sch:value-of select="$words" />
    </sch:report>
  </sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if one of the specified restricted words appear in a title.

Schematron Use Case 7: Check the Location of a Resource

Description: The following sample rule checks if the path to a resource (in this case, an image) is specified correctly. Specifically, this sample rule reports that the image must be located in the current project (the images location must be relative to the parent folder and no more than one "../" in the path).

Sample Code:

```

<sch:rule context="image">
  <sch:report test="count(tokenize(@href, '\.\/')) > 2">
    The image must be located in the current project. It is currently located
    in: <sch:value-of select="@href" />
  </sch:report>
</sch:rule>

```

Result: The engine displays an error message if an image is detected in a location other than the current project, relative to the parent folder.

Schematron Use Case 8: Check for Extra Spaces at Beginning/End of Elements

Description: The following sample rule checks for spaces at the beginning and end of elements.

Tip:

You could specify a list of elements to check to make the rule context-sensitive.

Sample Code:

```

<rule context="p|ph|codeph|filename|indexterm|xref|user-defined|user-input">
  <let name="firstNodeIsElement" value="node()[1] instance of element()"/>
  <let name="lastNodeIsElement" value="node()[last()] instance of element()"/>
  <report test="(not($firstNodeIsElement) and matches(.,'^\s',';j'))
    or (not($lastNodeIsElement) and matches(.,'\s$',';j'))"
    role="warning">

```

```

        Textual elements should not begin or end with whitespace.</report>
</rule>

```

Result: The engine displays an error message if a whitespace is detected at the beginning or end of a textual element.

Schematron Use Case 9: Impose Capitalizing the First Letter

Description: The following sample rule detects if elements start with a capital letter or a number. The rule is implemented using abstract patterns. The abstract pattern `starts-with-capital` has one argument representing the element to be checked. There are two implementations of the abstract pattern, one that specifies the `<tittle>` element as the element to verify, and one that specifies the `` element.

Sample Code:

```

<sch:pattern abstract="true" id="starts-with-capital">
  <sch:rule context="$element" role="information">
    <sch:let name="firstNodeIsElement" value="node()[1] instance of element()"/>
    <sch:report test="(not($firstNodeIsElement) and (not(matches(., '^[A-Z|0-9'])))">
      Start the element &lt;$element&gt; with a capital letter.</sch:report>
  </sch:rule>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="title"/>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="li"/>
</sch:pattern>

```

Result: The engine displays an error message if a title begins with a word that does not contain a capital letter or number as its first character.

Schematron Use Case 10: Check for Specified Terms in a Paragraph

Description: The following sample rule checks if any DITA `<p>` elements contain certain keywords defined in an external document.

Sample Code:

```

<sch:pattern>
  <sch:let name="keys" value="document('keys-common.ditamap')//keyword"/>
  <sch:rule context="p">
    <sch:let name="text" value="."/>
    <sch:let name="matchedKeys" value="$keys[contains($text, normalize-space(.))]/>
    <sch:report id="now001" test="count($matchedKeys) > 0" role="error">
      The paragraph text contains the keywords: <sch:value-of select="$matchedKeys"/>
    </sch:report>
  </sch:rule>
</sch:pattern>

```

```

</sch:rule>
</sch:pattern>

```

Result: The engine displays an error message if any of the keywords listed in an external document are detected within a DITA `<p>` element.

Schematron Use Case 11: Impose a Minimum Value

Description: The following sample rule determines the `<type>` element value with the minimum version specified by the `@version` attribute and then verifies that they are all equal to the determined value.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
  <sch:let name="typeValue" value="//Node1[not(@version >
    ../Node1/@version)][1]/Type/text()" />

  <sch:pattern>
    <sch:rule context="Type">
      <sch:assert test="text() = $typeValue">
        The Type value must be "<sch:value-of select="$typeValue"/>"
      </sch:assert>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

where the XML file would look something like this:

```

<root>
  <Node1 version="1">
    <Element1>Value1</Element1>
    <Type>123456</Type>
  </Node1>
  <Node1 version="2">
    <Element1>Value1</Element1>
    <Type>123456</Type>
  </Node1>
  <Node1 version="3">
    <Element1>Value1</Element1>
    <Type>1234567</Type>
  </Node1>
</root>

```

Result: The engine displays an error message if a `<type>` element value does not equal the minimum version specified by the `@version` attribute.

SQF (Schematron Quick Fix) Examples

SQF Use Case 1: Impose a DITA Prolog

Description: The following sample Schematron rule checks a DITA topic to make sure it contains `<prolog>`, `<critdates>`, `<revised>` elements and the sample Quick Fix proposes options for inserting the missing elements.

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="*[contains(@class, ' topic/topic ')]">
      <sch:assert sqf:fix="add_prolog" test="prolog" role="warn">Every topic must contain
        prolog/critdates/revised elements where the revised modified date is in
        YYYY-MM-DD format.</sch:assert>
      <sqf:fix id="add_prolog">
        <sqf:description>
          <sqf:title>Add prolog/critdates/revised elements, where the revised element's
            @modified attribute value is the current date in YYYY-MM-DD
            format.</sqf:title>
        </sqf:description>
        <sqf:add match="*[contains(@class, ' topic/body ')]" node-type="element"
          position="before" target="prolog">
          <critdates>
            <revised modified=""> </revised>
          </critdates>
        </sqf:add>
      </sqf:fix>
    </sch:rule>

    <sch:rule context="*[contains(@class, ' topic/prolog ')]">
      <sch:report role="warn" test="not(critdates)" sqf:fix="add_critdates">The prolog
        element must have critdates/revised elements with the @modified attribute value
        in YYYY-MM-DD format.</sch:report>
      <sqf:fix id="add_critdates">
        <sqf:description>
          <sqf:title>Add the critdates element.</sqf:title>
        </sqf:description>
        <sqf:add node-type="element" target="critdates">
          <revised modified=""> </revised>
        </sqf:add>
      </sqf:fix>
    </sch:rule>
```

```

<sch:rule context="*[contains(@class, ' topic/critdates ')]">
  <sch:report role="warn" test="not(revised)" sqf:fix="add_revised">The critdates
    element must have revised @modified in YYYY-MM-DD format. </sch:report>
  <sqf:fix id="add_revised">
    <sqf:description>
      <sqf:title>Add the revised element.</sqf:title>
    </sqf:description>
    <sqf:add node-type="element" target="revised"/>
  </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if the `<prolog>`, `<critdates>`, or `<revised>` elements are missing from a DITA topic and the Quick Fix mechanism proposes options for inserting the missing elements.

SQF Use Case 2: Impose an ID for all DITA Section Elements

Description: The following sample Schematron rule checks if each DITA `<section>` element has a specified ID and the sample Quick Fix proposes options for inserting the missing IDs.

Sample Code:

```

<<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <!-- Add IDs to all sections to impose link targets -->
    <sch:rule context="section">
      <sch:assert test="@id" sqf:fix="addId addIds"> [Bug] All sections should
        have an @id attribute </sch:assert>

      <sqf:fix id="addId">
        <sqf:description>
          <sqf:title>Add @id to the current section</sqf:title>
          <sqf:p>Add an @id attribute to the current section. The ID is
            generated from the section title.</sqf:p>
        </sqf:description>
        <!-- Generate an id based on the section title. If there is no title then
          generate a random id. -->
        <sqf:add target="id" node-type="attribute"
          select="
            concat('section_',
              if (exists(title) and string-length(title) > 0)

```

```

        then
            substring(lower-case(replace(replace(
                normalize-space(string(title)), '\s', '_'),
                '[^a-zA-Z0-9_]', '')), 0, 50)
        else
            generate-id()"/>
</sqf:fix>
<sqf:fix id="addIds">
    <sqf:description>
        <sqf:title>Add @id to all sections</sqf:title>
        <sqf:p>Add an @id attribute to each section from the document. The ID
            is generated from the section title.</sqf:p>
    </sqf:description>
    <!-- Generate an id based on the section title. If there is no title then
        generate a random id. -->
    <sqf:add match="//section[not(@id)]" target="id" node-type="attribute"
        select="
            concat('section_',
                if (exists(title) and string-length(title) > 0)
                then substring(lower-case(replace(replace(
                    normalize-space(string(title)), '\s', '_'),
                    '[^a-zA-Z0-9_]', '')), 0, 50)
                else generate-id()"/>
    </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if an `@id` attribute is missing for any `<section>` element in a DITA topic and the Quick Fix mechanism proposes options for inserting the missing ID.

SQF Use Case 3: Impose a Short Description in an Abstract Element

Description: The following sample Schematron rule checks a DITA topic to make sure it contains a `<shortdesc>` element inside an `<abstract>` element and the sample Quick Fix proposes options for correcting the missing structure.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
    xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
    xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
    <sch:pattern>
        <sch:rule context="shortdesc">
            <sch:assert test="parent::abstract" sqf:fix="moveToAbstract moveToExistingAbstract">

```

The short description must be added in an abstract element

```

</sch:assert>

<!-- Check if there is an abstarct element -->
<sch:let name="abstractElem" value="preceding-sibling::abstract |
    following-sibling::abstract"/>

<!-- Create an abstract element and add the short description -->
<sqf:fix id="moveToAbstract" use-when="not($abstractElem)">
    <sqf:description>
        <sqf:title>Move short description in an abstract element</sqf:title>
    </sqf:description>
    sqf:replace>
        <abstract>
            <xsl:apply-templates mode="copyExceptClass" select="."/>
        </abstract>
    </sqf:replace>
</sqf:fix>

<!-- Move the short description in the abstract element-->
sqf:fix id="moveToExistingAbstract" use-when="$abstractElem">
    <sqf:description>
        <sqf:title>Move short description in the abstract element</sqf:title>
    </sqf:description>
    <sch:let name="shortDesc">
        <xsl:apply-templates mode="copyExceptClass" select="."/>
    </sch:let>
    <sqf:add match="$abstractElem" select="$shortDesc"/>
    <sqf:delete/>
</sqf:fix>
</sch:rule>
</sch:pattern>

<!-- Template used to copy the current node -->
<xsl:template match="node() | @" mode="copyExceptClass">
    <xsl:copy copy-namespaces="no">
        <xsl:apply-templates select="node() | @" mode="copyExceptClass"/>
    </xsl:copy>
</xsl:template>

<!-- Template used to skip the @class attribute from being copied -->
<xsl:template match="@class" mode="copyExceptClass"/>
</sch:schema>

```

Result: The engine displays an error message if an `<abstract>` element does not contain a `<shortdesc>` element and the Quick Fix mechanism proposes options for inserting the missing structure or to move the `<shortdesc>` element inside the `<abstract>` element.

SQF Use Case 4: Impose a Certain Article Type

Description: The following sample Schematron rule checks the `@article-type` attribute to make sure its value is one of the specified allowed values (**abstract, addendum, announcement, article-commentary**) and the sample Quick Fix proposes options for replacing any other detected value with one of the allowed values.

Sample Code:

```
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">

  <sch:let name="articleTypes" value="('abstract', 'addendum', 'announcement',
    'article-commentary')"/>

  <sch:pattern>
    <sch:rule context="article/@article-type">
      <sch:assert test=". = $articleTypes" sqf:fix="setArticleType">
        Should be one of the article types:
        <sch:value-of select="$articleTypes"/></sch:assert>

        <sqf:fix id="setArticleType" use-for-each="$articleTypes">
          <sqf:description>
            <sqf:title>Set article type to '<sch:value-of select="$sqf:current"/>'
            </sqf:title>
          </sqf:description>
          <sqf:replace node-type="attribute" target="article-type" select="$sqf:current"/>
        </sqf:fix>
      </sch:rule>
    </sch:pattern>
  </sch:schema>
```

Result: The engine displays an error message if an `@article-type` attribute has any other value other than **abstract, addendum, announcement, or article-commentary** and the Quick Fix mechanism proposes options for replacing the disallowed value with one of those four allowed values (using the `use-for-each` construct).

SQF Use Case 5: Impose Certain Attributes and Values

Description: The following sample Schematron rule checks the `@rowsep` and `@colsep` attributes are added on the `<colspec>` element and their value is set to 1. The Quick Fix proposes options for adding the attributes in case they are missing or set the correct value .

Sample Code:

```

<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="colspec">
      <sch:assert test="@rowsep = 1" sqf:fix="addRowsep">The @rowsep should be
        set to 1</sch:assert>
      <sch:assert test="@colsep = 1" sqf:fix="addColsep">The @colsep should be
        set to 1</sch:assert>

      <sqf:fix id="addRowsep">
        <sqf:description>
          <sqf:title>Add @rowsep attribute</sqf:title>
        </sqf:description>
        <sqf:add node-type="attribute" target="rowsep" select="'1'"/>
      </sqf:fix>

      <sqf:fix id="addColsep">
        <sqf:description>
          <sqf:title>Add @colsep attribute</sqf:title>
        </sqf:description>
        <sqf:add node-type="attribute" target="colsep" select="'1'"/>
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

Modular Contextual Schematron Editing Using 'Main Files' Support

Smaller interrelated modules that define a complex Schematron cannot be correctly edited or validated individually, due to their interdependency with other modules. For example, a diagnostic defined in a main schema document is not visible when you edit an included module. Oxygen XML Editor Eclipse plugin provides the support for defining the main module (or modules), thus allowing you to edit any of the imported/included schema files in the context of the larger schema structure.

You can set a main Schematron document either using the *main files* support from the **Project Explorer** view (on page 278), or using a validation scenario.

To set a main file using a validation scenario, add validation units that point to the main schemas. Oxygen XML Editor Eclipse plugin warns you if the current module is not part of the dependencies graph computed for the main schema. In this case, it considers the current module as the main schema.

The advantages of editing in the context of main file include:

- Correct validation of a module in the context of a larger schema structure.
- [Content Completion Assistant \(on page 2677\)](#) displays all the referable components valid in the current context. This include components defined in modules other than the currently edited one.

Presenting Schematron Validation Issues

The possible issues that might occur during the validation process when validating XML documents against Schematron are presented with colored underlines in the editing pane, colored markers in the right vertical stripe, and details about the issues are presented in the **Problems** tab at the bottom area of the Oxygen XML Editor Eclipse plugin window. Each error is flagged with a severity level that can be: *warning*, *error*, *fatal* or *info*.

To set a severity level, Oxygen XML Editor Eclipse plugin looks for the following information:

- The **role** attribute, which can have one of the following values:
 - **warn** or **warning** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
 - **error** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **fatal** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **info** or **information** - Sets the severity level to *information*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- The start of the message, after trimming leading white-spaces. Oxygen XML Editor Eclipse plugin looks to match the following exact string of characters (case-sensitive):
 - **Warning:** - Sets the severity level to *warning*. By default, underlined with a yellow squiggly line in the editing pane and a yellow marker in the right vertical stripe.
 - **Error:** - Sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **Fatal:** - Sets the severity level to *fatal*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.
 - **Info:** - Sets the severity level to *info*. By default, underlined with a blue squiggly line in the editing pane and a blue marker in the right vertical stripe.
- If none of the previous rules match, Oxygen XML Editor Eclipse plugin sets the severity level to *error*. By default, underlined with a red squiggly line in the editing pane and a red marker in the right vertical stripe.

Integrating Schematron Rules in a Framework and Sharing Them

Custom **Schematron** rules are a great way to ensure consistency for XML authoring, especially when there is a large team working on the same set of documents. You can use **Schematron** for numerous use cases. For example, to restrict certain elements from being used, to impose restrictions on the amount of text for an element, or to impose restrictions on certain elements based on various attribute values or text content set in other elements. Furthermore, you can [define quick fixes for each Schematron rule \(on page 983\)](#) to offer technical writers proposed solutions for reported problems.

Once you define the **Schematron** rules, they can be shared with the other members of your team by integrating them in a [framework \(on page 2679\)](#) (document type) configuration.

How to Integrate Schematron Rules in a Framework

To integrate a Schematron rule in an existing framework bundled with the application, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, `custom_frameworks/dita-extension`).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).
3. Define the Schematron rules in an existing or new Schematron file and save it in the folder you created in step 2. There are numerous online resources out there to help you get started with writing Schematron rules. Here are just a few that might help you:
 - [Guide to Schema Writing with Schematron](#)
 - [Presentation: Schematron Development with Oxygen](#)
4. Open the **Preferences** dialog box ([on page 70](#)) and go to **Document Type Association > Locations** ([on page 90](#)). In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.
5. Go to the **Document Type Association preferences page** ([on page 88](#)) and select a *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.
6. Give the extension an appropriate name (for example, *DITA - Custom*), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the  **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file). For more details about editing validation scenarios, see [Configuring Validation Scenarios for a Framework \(on page 2029\)](#).
8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association preferences page** ([on page 88](#)).
9. Open an XML document that matches your framework configuration and test the new rule.
10. You can continue to refine the Schematron and develop additional rules as needed.

Sharing Schematron Rules

To share Schematron rules with other members of your team, you simply need to share the framework where you integrated the Schematron rules. There are several methods for sharing frameworks and you can find details here: [Sharing a Framework \(on page 2099\)](#).

Related Information:

[Defining Schematron Quick Fixes \(on page 983\)](#)

[Associating a Schema in Validation Scenarios Defined in the Document Type \(on page 590\)](#)

[Sharing a Framework \(on page 2099\)](#)

Validating Schematron Documents

By default, a Schematron schema is validated as you type. To change this, open the **Preferences** dialog box ([on page 70](#)), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option ([on page 133](#)).

To validate a Schematron document manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. When Oxygen XML Editor Eclipse plugin validates a Schematron schema, it expands all the included modules so the entire schema hierarchy is validated. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Oxygen XML Editor Eclipse plugin offers an error management mechanism capable of pinpointing errors in XPath expressions and in the included schema modules.

Related Information:

[Presenting Schematron Validation Issues \(on page 956\)](#)

Content Completion in Schematron Documents

Oxygen XML Editor Eclipse plugin helps you edit a Schematron schema through the *Content Completion Assistant* ([on page 2677](#)), offering proposals that are valid at the cursor position. It can be manually activated with the **Ctrl + Space** shortcut.

When you edit the value of an attribute that refers a component, the proposed components are collected from the entire schema hierarchy. For example, if the editing context is `phase/active/@pattern`, the *Content Completion Assistant* proposes all the defined patterns.

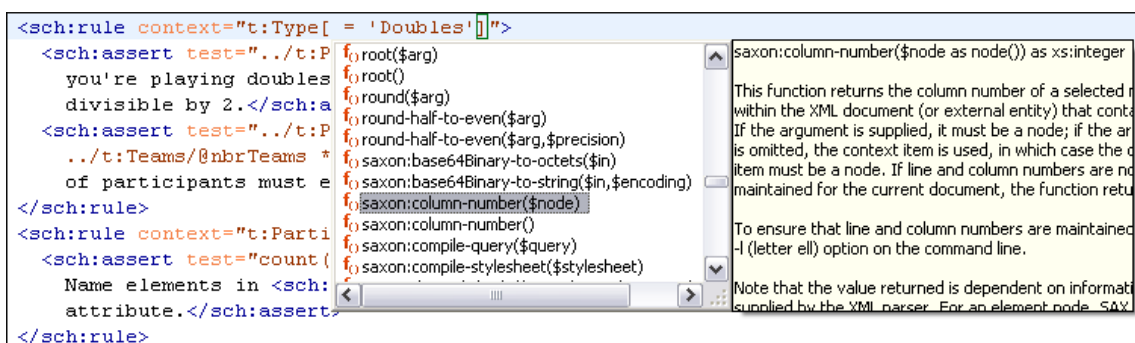

Note:

For Schematron resources, the *Content Completion Assistant* collects its components starting from the *main files* ([on page 2680](#)). The *main files* can be defined in the project or in the associated validation scenario. For further details about the *Main Files* support go to [Defining Main Files at Project Level \(on page 278\)](#).

If the editing context is an attribute value that is an XPath expression (such as `assert/@test` or `report/@test`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables.

The *Content Completion Assistant* displays XSLT 1.0 functions and optionally XSLT 2.0 / 3.0 functions in the attributes *path*, *select*, *context*, *subject*, *test* depending on the *Schematron* options (on page 193) that are set in Preferences pages. If the Saxon 6.5.5 namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon 12.3 namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions as in the following figure:

Figure 384. XSLT Extension Functions in Schematron Schema Content Completion

The *Content Completion Assistant* also includes code templates that can be used to quickly insert code fragments (on page 323) into Schematron documents.

Syntax Highlighting in Schematron

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

To customize the colors or styles used for the syntax highlighting colors for Schematron schemas, follow these steps:

1. Open the **Preferences** dialog box (on page 70).
2. Go to **Editor > Syntax Highlight** (on page 176).
3. Select and expand the **XML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.
5. Select the **XML** tab in the **Preview** pane to see the effects of your changes.

Tip:

Oxygen XML Editor Eclipse plugin also allows you to specify syntax highlighting colors for specific XML elements and attributes with specific namespace prefixes. This can be done in the **Editor > Syntax Highlight > Elements/Attributes by Prefix** preferences page (on page 176).

Related Information:[Syntax Highlight Preferences \(on page 176\)](#)

Embedding Schematron Rules in XML Schema or RELAX NG

Schematron rules can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in any element on any level of a RELAX NG Schema (taking into account that the RELAX NG validator ignores all elements that are not in the RELAX NG namespace).

Oxygen XML Editor Eclipse plugin supports Schematron validation schemas and it is able to extract and use the embedded rules.

Validating XML Documents with XML Schema and Embedded Schematron

To validate an XML document with XML Schema and its embedded Schematron, you can associate the document like this:

```
<?xml-model href="percent.xsd" type="application/xml"
  schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

Validating XML Documents with Relax NG and Embedded Schematron

To validate an XML document with RELAX NG schema and its embedded Schematron rules, you need to associate the document with both schemas like this:

```
<?xml-model href="percent.rng" type="application/xml"
  schematypens="http://relaxng.org/ns/structure/1.0"?>
<?xml-model href="percent.rng" type="application/xml"
  schematypens="http://purl.oclc.org/dsdl/schematron"?>
```

The second association validates your document with Schematron rules extracted from the RELAX NG Schema.

**Note:**

When you work with XML Schema or Relax NG documents that have embedded Schematron rules Oxygen XML Editor Eclipse plugin provides two built-in validation scenarios: **Validate XML Schema with embedded Schematron** for XML schema, and **Validate Relax NG with embedded Schematron** for Relax NG. You can use one of these scenarios to validate the embedded Schematron rules.

Example: Embedded Schematron in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
```

```

</sch:pattern>
</xsd:appinfo>

```

Example: Embedded Schematron in Relax NG Schema

```

<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="...">Message.</sch:assert>
    </sch:rule>
  </sch:pattern>
  <start>
    .....
  </start>
</grammar>

```

[Embedding Schematron Quick Fixes in Relax NG or XML Schema \(on page 997\)](#)

Schematron Outline View

The **Outline** view for Schematron schemas presents a list of components in a tree-like structure and it allows for quick access to a component by name. By default, it is displayed on the left side of the editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

Figure 385. Schematron Outline View

The following actions are available in the **View menu** on the **Outline** view action bar:

Filter returns exact matches

The text filter of the **Outline** view returns only exact matches.

Selection update on cursor move

Controls the synchronization between **Outline** view and source document. The selection in the **Outline** view can be synchronized with the cursor moves or the changes in the editor. Selecting one of the components from the **Outline** view also selects the corresponding item in the source document.

Flat presentation mode of the filtered results

When active, the application flattens the filtered result elements to a single level.

Show comments and processing instructions

Show/hide comments and processing instructions in the **Outline** view.

Show element name

Show/hide element name.

Show text

Show/hide additional text content for the displayed elements.

Show attributes

Show/hide attribute values for the displayed elements. The displayed attribute values can be changed from [the Outline preferences panel \(on page 214\)](#).

Configure displayed attributes

Displays the [XML Structured Outline preferences page \(on page 214\)](#).

The following contextual menu actions are also available in the **Outline** view:

Append Child

Displays a list of elements that you can insert as children of the current element.

Insert Before

Displays a list of elements that you can insert as siblings of the current element, before the current element.

Insert After

Displays a list of elements that you can insert as siblings of the current element, after the current element.

Edit Attributes

Opens a dialog box that allows you to edit the attributes of the currently selected component.

Toggle Comment

Comments/uncomments the currently selected element.

Cut

Cuts the currently selected component.

Copy

Copies the currently selected component.

Delete

Deletes the currently selected component.

Expand All

Expands the structure of a component in the **Outline** view.

Collapse All

Collapses the structure of all the component in the **Outline** view.

The upper part of the **Outline** view contains a filter box that allows you to focus on the relevant components. Type a text fragment in the filter box and only the components that match it are presented. For advanced usage you can use wildcard characters (such as `*` or `?`) and separate multiple patterns with commas.

Schematron Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the hierarchy or dependencies for resources included in a Schematron schema. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

If you want to see the hierarchy of a schema, select the desired schema in the **Project Explorer** view ([on page 269](#)) and choose **Show referenced resources** from the contextual menu.

If you want to see the dependencies of a schema, select the desired schema in the **Project Explorer** view ([on page 269](#)) and choose **Show dependent resources** from the contextual menu.

Figure 386. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the resource structure.

Stop

Stops the computing.

 **Show hierarchy for**

Computes the hierarchical structure of the references for a resource.

 **Show dependencies for**

Computes the structure of the dependencies for a resource.

 **Configure dependencies search scope**

Allows you to configure a scope to compute the dependencies. There is also an option for automatically using the defined scope for future operations.

 **History**

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource within the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Moves the selected resource.

Rename resource

Renames the selected resource.

Show references resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

 **Add to Main Files**

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the hierarchical structure.

Collapse All

Collapses all children of the selected resource from the hierarchical structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

**Note:**

The **Move resource** or **Rename resource** actions give you the option to [update the references to the resource \(on page 965\)](#).

Moving/Renaming Schematron Resources

You can move and rename a resource presented in the **Referenced/Dependent Resources** view, using the **Rename resource** and **Move resource** refactoring actions from the contextual menu.

When you select the **Rename** action in the contextual menu of the **Referenced/Dependent Resources** view, the **Rename resource** dialog box is displayed. The following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - Select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

When you select the **Move** action from the contextual menu of the **Referenced/Dependent Resources** view, the **Move resource** dialog box is displayed. The following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - Select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Highlight Component Occurrences in Schematron Documents

When you position your mouse cursor over a component in a Schematron document, Oxygen XML Editor Eclipse plugin searches for the component declaration and all its references and highlights them automatically.

Customizable colors are used: one for the component definition and another one for component references. Occurrences are displayed until another component is selected.

To change the default behavior of **Highlight Component Occurrences**, [open the Preferences dialog box \(on page 70\)](#) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File Ctrl + Shift + U (Command + Shift + U on macOS)** action from contextual menu. Matches are displayed in separate tabs of the **Results view (on page 335)**.

Searching and Refactoring Operations in Schematron Documents

Search Actions

The following search actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Search** submenu in the contextual menu of the current editor:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on `pattern`, `phase`, or `diagnostic` types and are available from the **Refactoring** submenu in the contextual menu of the current editor:

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 387. Rename Identity Constraint Dialog Box

Searching and Refactoring Operations Scope in Schematron Documents

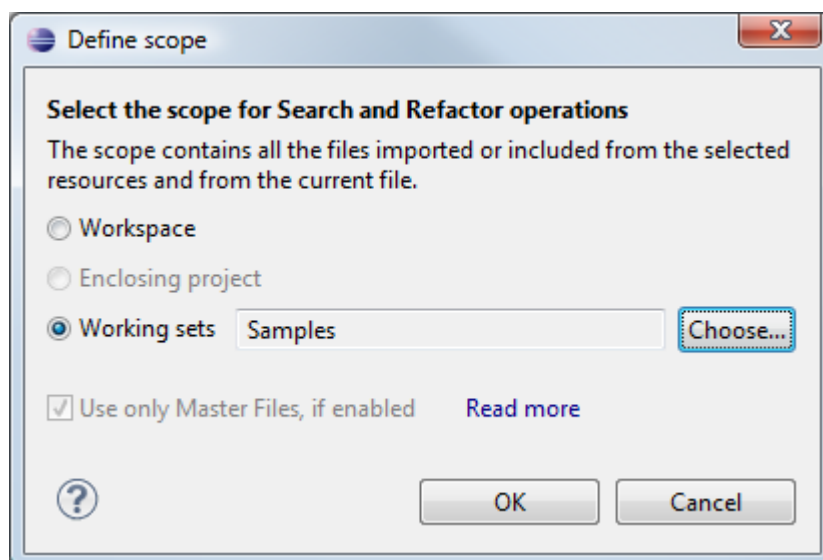

The *scope* is a collection of documents that define the context of a search and refactor operation. To control it you can use the  **Change scope** operation, available in the *Quick Fix* action set or on the **Referenced/Dependent Resources** view's toolbar. You can restrict the scope to the current project or to one or multiple *working sets* ([on page 2683](#)). The **Use only Main Files, if enabled** checkbox allows you to restrict the scope of the search and refactor operations to the resources from the **Main Files** directory. Click **read more** for details about the *Main Files* support ([on page 278](#)).

Figure 388. Define Scope Dialog Box

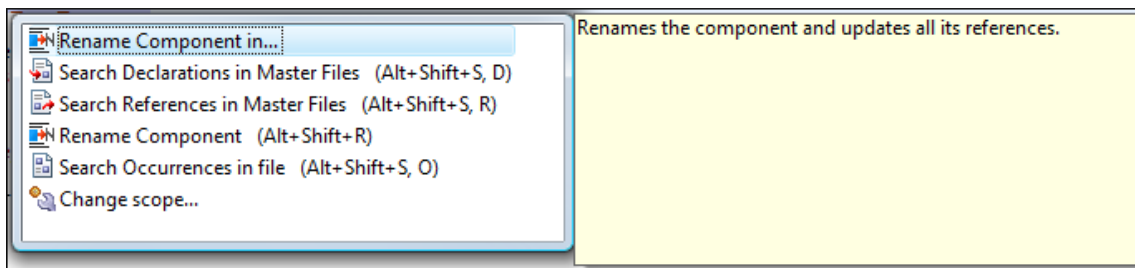

The scope you define is applied to all future search and refactor operations until you modify it. Contextual menu actions allow you to add or delete files, folders, and other resources to the *working set* (on page 2683) structure.

Quick Assist Support in Schematron Documents

The *Quick Assist* support (on page 2681) improves the development work flow, offering fast access to the most commonly used actions when you edit schema documents.

The *Quick Assist* feature (on page 2681) is activated automatically when the cursor is positioned over the name of a component. It is accessible via a yellow bulb icon (💡) placed at the current line in the stripe on the left side of the editor. Also, you can invoke the *quick assist* menu by using the **Ctrl + 1** (**Meta 1** on macOS) keyboard shortcuts.

Figure 389. Schematron Quick Assist Support

The *Quick Assist* support offers direct access to the following actions:

Rename Component in

Renames the component and all its dependencies.

Search Declarations

Searches the declaration of the component in a predefined scope. It is available only when the context represents a component name reference.

Search References

Searches all references of the component in a predefined scope.

Component Dependencies

Searches the component dependencies in a predefined scope.

Change Scope

Configures the scope that will be used for future search or refactor operations.

Rename Component

Allows you to rename the current component in-place.

Search Occurrences

Searches all occurrences of the component within the current file.

Schematron Unit Test (XSpec)

XSpec is a behavior driven development (BDD) *framework* for XSLT, XQuery, and Schematron. XSpec consists of syntax for describing the behavior of your XSLT, XQuery, or Schematron code, and some code that enables you to test your code against those descriptions.

Creating a Schematron Unit Test

To create a Schematron Unit Test, go to **File > New > Schematron Unit Test**. This is simple document template to help you get started.

Running a Schematron Unit Test

To run a Unit Test, open the XSpec file in an editor and click  **Apply Transformation Scenario(s)** on the main toolbar. This will run the built-in **Run XSpec Test** transformation scenario that is defined in the XSpec *framework* (on page 2679).

Testing a Stylesheet

An XSpec file contains one or more test scenarios.

Example

Suppose you have this Schematron rule that says sections should have a title:

```
<sch:pattern>
  <sch:rule context="section">
    <sch:assert test="title" id="a002">
      section should have a title
    </sch:assert>
  </sch:rule>
</sch:pattern>
```

The XSpec test could look like this:

```
<x:description xmlns:x="http://www.jenitennison.com/xslt/xspec" schematron="demo-01.sch">
  <x:scenario label="section should have a title">
    <x:context>
      <article>
        <section>
          <title>Introduction</title>
          <p>This is an example.</p>
        </section>
        <section>
          <p>This is an example.</p>
        </section>
      </article>
```

```

</x:context>

<x:expect-not-assert id="a002" location="/article[1]/section[1]"/>
<x:expect-assert id="a002" location="/article[1]/section[2]"/>

</x:scenario>
</x:description>

```

The `<sch:assert>` with the `id="a002"` is not expected to be triggered on the first section since it includes a title. This requirement is expressed with the `<x:expect-not-assert>` element.

Since the second section does not have a title, you would expect the Schematron rule to be triggered and this requirement is expressed with the `<x:expect-assert>` element.

For more details about how to write Schematron tests and various samples, see <https://github.com/xspec/xspec/wiki/Writing-Scenarios-for-Schematron#writing-tests>.

Adding a Catalog to an XSpec Transformation

If your Schematron needs a catalog, you can add one to the XSpec transformation by doing one of the following:

- If you are using a [project \(on page 268\)](#) in Oxygen XML Editor Eclipse plugin, create a `catalog.xml` file in the project directory. This catalog will then be loaded automatically.
- [Edit \(on page 1297\)](#) the **Run XSpec Test** transformation scenario, go to the **Parameters** tab [\(on page 1250\)](#), and set the value of the `catalog` parameter to the location of your catalog file.

Editing Schematron Quick Fixes

Oxygen XML Editor Eclipse plugin provides support for editing the [Schematron Quick Fixes \(on page 584\)](#) (SQF). They help you resolve issues that appear in XML documents that are validated against Schematron schemas by offering you solution proposals. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron validation messages. Specifically, they are associated with *assert* or *report* messages. You can define a library of *Quick Fixes* by editing them directly in the current Schematron file or in a separate file. Oxygen XML Editor Eclipse plugin assists you in editing Schematron *Quick Fixes* with schema-based content completion, syntax highlighting, and validation as you type.

A typical use case is using Schematron *Quick Fixes* to assist content authors with common editing tasks. For example, you can use Schematron rules to automatically report certain validation warnings (or errors) when performing regular editing tasks, such as inserting specific elements or changing IDs to match specific naming conventions.

For information about applying and detecting the Schematron schemas that include SQF, see [Associating a Schema to XML Documents \(on page 584\)](#).

Displaying the Schematron Quick Fix Proposals

The defined Schematron *Quick Fixes* are displayed on validation errors in **Text** mode and **Author** mode.

Examples of Schematron Rules and Quick Fixes

This topic is meant to provide some basic examples of Schematron Rules and Schematron Quick Fixes (SQF) to help you create and impose your own rules and quick fixes.

Other examples and ideas can also be found at:

- [Public GitHub project with the Schematron file used for Oxygen's User Guide](#)
- [Public GitHub project with sample Schematron Quick Fixes](#)

Schematron Examples

Schematron Use Case 1: Impose a Relax NG Schema Declaration

Description: The following sample rule is useful if, for example, you need to enforce the use of Relax NG schema declarations in all of your documents (i.e. instead of using DTD schemas).

Sample Code:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2" xmlns:saxon="http://saxon.sf.net/">
  <sch:let name="rngDeclaration"
    value="processing-instruction('xml-model')
    [saxon:get-pseudo-attribute('schematypens')='http://relaxng.org/ns/structure/1.0']"/>
  <sch:pattern>
    <sch:rule context="/element()">
      <sch:assert test="exists($rngDeclaration)">You must define a Relax NG schema
        declaration in the document (DTD schemas are not supported).</sch:assert>
    </sch:rule>
```

```
</sch:pattern>
</sch:schema>
```

Result: The engine checks for a Relax NG schema declaration in the document and displays an error if it is missing. The error is reported on the document's root element (`/element()`).

Schematron Use Case 2: Check for Missing IDs

Description: The following sample rule checks for missing or undefined IDs in a TEI document. Specifically, it looks for IDs from the `tei:rs/@ref` attribute defined in the document named `persons.xml` (as `xml:id` of a TEI `person` element).

Sample Code:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
  <sch:ns uri="http://www.tei-c.org/ns/1.0" prefix="tei"/>
  <sch:let name="personIds"
    value="document('../persons.xml')/tei:TEI//tei:person/@xml:id"/>
  <sch:pattern>
    <sch:rule context="tei:rs">
      <sch:let name="refIds"
        value="for $id in tokenize(@ref, ' ') return substring-after($id, '#')"/>
      <sch:let name="missingIds"
        value="for $id in $refIds return (if($id = $personIds) then '' else $id)"/>
      <sch:report test="$missingIds != ''">
        The following ids "<sch:value-of select="$missingIds"/>"
        are not defined in "<sch:value-of select="$personIds"/>"
      </sch:report>
    </sch:rule>
  </sch:pattern>
</sch:schema>
```

where the XML document looks something like this:

```
<tei xmlns="http://www.tei-c.org/ns/1.0">
  <rs ref="../../SomePerson/persons.xml#EDP ../personography/HAMpersons.xml#SD">text</rs>
  <rs ref="../../SomePerson/persons.xml#EDP">text</rs>
</tei>
```

Result: The engine displays an error message listing the missing/undefined IDs.

Schematron Use Case 3: Check for Broken Links

Description: The following sample rule detects broken links in DITA `<xref>` or `<link>` elements. The first example only checks links that do not contain an anchor (`#`).

Sample Code:

```

<rule
  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]
  [@href][not(contains(@href, '#'))][not(@scope = 'external')]
  [not(@type) or @type='dita']">
  <assert test="doc-available(resolve-uri(@href, base-uri()))">
    The document linked by <value-of select="local-name()"/>
    "<value-of select="@href"/>" does not exist!</assert>
</rule>

```

For links that contain an anchor, the Schematron rule must look something like this:

```

<rule
  context="*[contains(@class, ' topic/xref ') or contains(@class, ' topic/link ')]
  [@href][contains(@href, '#')][not(@scope = 'external')]
  [not(@type) or @type='dita']">
  <let name="file" value="substring-before(@href, '#')"/>
  <let name="idPart" value="substring-after(@href, '#')"/>
  <let name="topicId"
    value="if (contains($idPart, '/')) then substring-before($idPart, '/') else $idPart"/>
  <let name="id" value="substring-after($idPart, '/')"/>

  <assert test="document($file, .)//*[ @id=$topicId]">
    Invalid topic id "<value-of select="$topicId"/>" </assert>
  <assert test="$id = '' or document($file, .)//*[ @id=$id]">
    No such id "<value-of select="$id"/>" is defined! </assert>
  <assert test="$id = '' or document($file, .)//*[ @id=$id]
    [ancestor::*[contains(@class, ' topic/topic ')]][1][ @id=$topicId]">
    The id "<value-of select="$id"/>" is not in the scope of the referenced topic id
    "<value-of select="$topicId"/>". </assert>
</rule>

```

Result: The engine displays an error message when a broken link or cross reference is detected.

Schematron Use Case 4: Check for Duplicate IDs

Description: The following sample rule detects if there are two sibling `<step>` elements with the same `@id` value in a DITA Task document.

Sample Code:

```

<sch:rule context="*[contains(@class, ' task/step ')]">
  <sch:let name="id" value="@id"/>
  <sch:report
    test="preceding-sibling::element()[contains(@class, ' task/step ')][@id = $id]">

```

```

    Element with duplicate ID "<sch:value-of select="$id"/>" detected.

</sch:report>
</sch:rule>

```

Result: The engine displays an error message when a duplicate ID is detected in sibling `<step>` elements within a DITA Task document.

Schematron Use Case 5: Check for Duplicate DITA Topic References

Description: The following sample rule checks a DITA map for duplicate `<topicref>` elements with the same `@href` value.

Sample Code:

```

<sch:rule context="*[contains(@class, ' map/topicref ')]">
  <sch:let name="href" value="@href"/>
  <sch:report
    test="preceding::element()[contains(@class, ' map/topicref ')][@href = $href]">
    Duplicate topicref "<sch:value-of select="$href"/>" detected in map.
  </sch:report>
</sch:rule>

```

Result: The engine displays an error message when multiple `<topicref>` elements with the same `@href` value are detected in a DITA map.

Schematron Use Case 6: Restrict Certain Words from the Title

Description: The following sample rule checks for instances of specified words to be restricted from a `<title>` element (in this example, the words *test* and *hello* are restricted).

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2">
  <sch:let name="words" value="'test,hello'"/>
  <sch:let name="wordsToMatch" value="replace($words, ',', '|')"/>
  <sch:pattern>
    <sch:rule context="title">
      <sch:report test="matches(text(), $wordsToMatch)" role="warn">
        The following words should not be added in the title:
        <sch:value-of select="$words" />
      </sch:report>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if one of the specified restricted words appear in a title.

Schematron Use Case 7: Check the Location of a Resource

Description: The following sample rule checks if the path to a resource (in this case, an image) is specified correctly. Specifically, this sample rule reports that the image must be located in the current project (the images location must be relative to the parent folder and no more than one `../` in the path).

Sample Code:

```
<sch:rule context="image">
  <sch:report test="count(tokenize(@href, '\.\/')) > 2">
    The image must be located in the current project. It is currently located
    in: <sch:value-of select="@href" />
  </sch:report>
</sch:rule>
```

Result: The engine displays an error message if an image is detected in a location other than the current project, relative to the parent folder.

Schematron Use Case 8: Check for Extra Spaces at Beginning/End of Elements

Description: The following sample rule checks for spaces at the beginning and end of elements.

Tip:

You could specify a list of elements to check to make the rule context-sensitive.

Sample Code:

```
<rule context="p|ph|codeph|filename|indexterm|xref|user-defined|user-input">
  <let name="firstNodeIsElement" value="node()[1] instance of element()"/>
  <let name="lastNodeIsElement" value="node()[last()] instance of element()"/>
  <report test="(not($firstNodeIsElement) and matches(.,'^\s',';j'))
    or (not($lastNodeIsElement) and matches(.,'\s$',';j'))"
    role="warning">
    Textual elements should not begin or end with whitespace.</report>
</rule>
```

Result: The engine displays an error message if a whitespace is detected at the beginning or end of a textual element.

Schematron Use Case 9: Impose Capitalizing the First Letter

Description: The following sample rule detects if elements start with a capital letter or a number. The rule is implemented using abstract patterns. The abstract pattern `starts-with-capital` has one argument representing the element to be checked. There are two implementations of the abstract pattern, one that specifies the `<title>` element as the element to verify, and one that specifies the `` element.

Sample Code:

```

<sch:pattern abstract="true" id="starts-with-capital">
  <sch:rule context="$element" role="information">
    <sch:let name="firstNodeIsElement" value="node()[1] instance of element()"/>
    <sch:report test="(not($firstNodeIsElement) and (not(matches(., '^[A-Z|0-9]'))))">
      Start the element &lt;$element&gt; with a capital letter.</sch:report>
    </sch:rule>
  </sch:pattern>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="title"/>
</sch:pattern>
<sch:pattern is-a="starts-with-capital">
  <sch:param name="element" value="li"/>
</sch:pattern>

```

Result: The engine displays an error message if a title begins with a word that does not contain a capital letter or number as its first character.

Schematron Use Case 10: Check for Specified Terms in a Paragraph

Description: The following sample rule checks if any DITA `<p>` elements contain certain keywords defined in an external document.

Sample Code:

```

<sch:pattern>
  <sch:let name="keys" value="document('keys-common.ditamap')//keyword"/>
  <sch:rule context="p">
    <sch:let name="text" value="."/>
    <sch:let name="matchedKeys" value="$keys[contains($text, normalize-space(.))]/>
    <sch:report id="now001" test="count($matchedKeys) > 0" role="error">
      The paragraph text contains the keywords: <sch:value-of select="$matchedKeys"/>
    </sch:report>
  </sch:rule>
</sch:pattern>

```

Result: The engine displays an error message if any of the keywords listed in an external document are detected within a DITA `<p>` element.

Schematron Use Case 11: Impose a Minimum Value

Description: The following sample rule determines the `<type>` element value with the minimum version specified by the `@version` attribute and then verifies that they are all equal to the determined value.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2">
  <sch:let name="typeValue" value="//Node1[not(@version >

```

```

    ../Node1/@version)][1]/Type/text()" />

<sch:pattern>
  <sch:rule context="Type">
    <sch:assert test="text() = $typeValue">
      The Type value must be "<sch:value-of select="$typeValue"/>"
    </sch:assert>
  </sch:rule>
</sch:pattern>
</sch:schema>

```

where the XML file would look something like this:

```

<root>
  <Node1 version="1">
    <Element1>Value1</Element1>
    <Type>123456</Type>
  </Node1>
  <Node1 version="2">
    <Element1>Value1</Element1>
    <Type>123456</Type>
  </Node1>
  <Node1 version="3">
    <Element1>Value1</Element1>
    <Type>1234567</Type>
  </Node1>
</root>

```

Result: The engine displays an error message if a `<type>` element value does not equal the minimum version specified by the `@version` attribute.

SQF (Schematron Quick Fix) Examples

SQF Use Case 1: Impose a DITA Prolog

Description: The following sample Schematron rule checks a DITA topic to make sure it contains `<prolog>`, `<critdates>`, `<revised>` elements and the sample Quick Fix proposes options for inserting the missing elements.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="*[contains(@class, ' topic/topic ')]">
      <sch:assert sqf:fix="add_prolog" test="prolog" role="warn">Every topic must contain
        prolog/critdates/revised elements where the revised modified date is in

```

```

        YYYY-MM-DD format.</sch:assert>
    <sqf:fix id="add_prolog">
        <sqf:description>
            <sqf:title>Add prolog/critdates/revised elements, where the revised element's
                @modified attribute value is the current date in YYYY-MM-DD
                format.</sqf:title>
        </sqf:description>
        <sqf:add match="*[contains(@class, ' topic/body ')]" node-type="element"
            position="before" target="prolog">
            <critdates>
                <revised modified=""> </revised>
            </critdates>
        </sqf:add>
    </sqf:fix>
</sch:rule>

<sch:rule context="*[contains(@class, ' topic/prolog ')]">
    <sch:report role="warn" test="not(critdates)" sqf:fix="add_critdates">The prolog
        element must have critdates/revised elements with the @modified attribute value
        in YYYY-MM-DD format.</sch:report>
    <sqf:fix id="add_critdates">
        <sqf:description>
            <sqf:title>Add the critdates element.</sqf:title>
        </sqf:description>
        <sqf:add node-type="element" target="critdates">
            <revised modified=""> </revised>
        </sqf:add>
    </sqf:fix>
</sch:rule>

<sch:rule context="*[contains(@class, ' topic/critdates ')]">
    <sch:report role="warn" test="not(revised)" sqf:fix="add_revised">The critdates
        element must have revised @modified in YYYY-MM-DD format. </sch:report>
    <sqf:fix id="add_revised">
        <sqf:description>
            <sqf:title>Add the revised element.</sqf:title>
        </sqf:description>
        <sqf:add node-type="element" target="revised"/>
    </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if the `<prolog>`, `<critdates>`, or `<revised>` elements are missing from a DITA topic and the Quick Fix mechanism proposes options for inserting the missing elements.

SQF Use Case 2: Impose an ID for all DITA Section Elements

Description: The following sample Schematron rule checks if each DITA `<section>` element has a specified ID and the sample Quick Fix proposes options for inserting the missing IDs.

Sample Code:

```
<<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
  queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <!-- Add IDs to all sections to impose link targets -->
    <sch:rule context="section">
      <sch:assert test="@id" sqf:fix="addId addIds"> [Bug] All sections should
        have an @id attribute </sch:assert>

      <sqf:fix id="addId">
        <sqf:description>
          <sqf:title>Add @id to the current section</sqf:title>
          <sqf:p>Add an @id attribute to the current section. The ID is
            generated from the section title.</sqf:p>
        </sqf:description>
        <!-- Generate an id based on the section title. If there is no title then
          generate a random id. -->
        <sqf:add target="id" node-type="attribute"
          select="
            concat('section_',
              if (exists(title) and string-length(title) > 0)
                then
                  substring(lower-case(replace(replace(
                    normalize-space(string(title)), '\s', '_'),
                    '^[a-zA-Z0-9_]', '')), 0, 50)
                else
                  generate-id()"/>
        </sqf:fix>
      <sqf:fix id="addIds">
        <sqf:description>
          <sqf:title>Add @id to all sections</sqf:title>
          <sqf:p>Add an @id attribute to each section from the document. The ID
            is generated from the section title.</sqf:p>
        </sqf:description>
```

```

<!-- Generate an id based on the section title. If there is no title then
generate a random id. -->
<sqf:add match="//section[not(@id)]" target="id" node-type="attribute"
select="
concat('section_',
if (exists(title) and string-length(title) > 0)
then substring(lower-case(replace(replace(
normalize-space(string(title)), '\s', '_'),
'^a-zA-Z0-9_', '')), 0, 50)
else generate-id())"/>
</sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if an `@id` attribute is missing for any `<section>` element in a DITA topic and the Quick Fix mechanism proposes options for inserting the missing ID.

SQF Use Case 3: Impose a Short Description in an Abstract Element

Description: The following sample Schematron rule checks a DITA topic to make sure it contains a `<shortdesc>` element inside an `<abstract>` element and the sample Quick Fix proposes options for correcting the missing structure.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
xmlns:xsl="http://www.w3.org/1999/XSL/Transform">
<sch:pattern>
<sch:rule context="shortdesc">
<sch:assert test="parent::abstract" sqf:fix="moveToAbstract moveToExistingAbstract">
The short description must be added in an abstract element
</sch:assert>
<!-- Check if there is an abstract element -->
<sch:let name="abstractElem" value="preceding-sibling::abstract |
following-sibling::abstract"/>
<!-- Create an abstract element and add the short description -->
<sqf:fix id="moveToAbstract" use-when="not($abstractElem)">
<sqf:description>
<sqf:title>Move short description in an abstract element</sqf:title>
</sqf:description>
sqf:replace>
<abstract>

```

```

        <xsl:apply-templates mode="copyExceptClass" select="." />
    </abstract>
</sqf:replace>
</sqf:fix>

<!-- Move the short description in the abstract element-->
sqf:fix id="moveToExistingAbstract" use-when="$abstractElem">
    <sqf:description>
        <sqf:title>Move short description in the abstract element</sqf:title>
    </sqf:description>
    <sch:let name="shortDesc">
        <xsl:apply-templates mode="copyExceptClass" select="." />
    </sch:let>
    <sqf:add match="$abstractElem" select="$shortDesc" />
    <sqf:delete/>
</sqf:fix>
</sch:rule>
</sch:pattern>

<!-- Template used to copy the current node -->
<xsl:template match="node() | @" mode="copyExceptClass">
    <xsl:copy copy-namespaces="no">
        <xsl:apply-templates select="node() | @" mode="copyExceptClass" />
    </xsl:copy>
</xsl:template>

<!-- Template used to skip the @class attribute from being copied -->
<xsl:template match="@class" mode="copyExceptClass" />
</sch:schema>

```

Result: The engine displays an error message if an `<abstract>` element does not contain a `<shortdesc>` element and the Quick Fix mechanism proposes options for inserting the missing structure or to move the `<shortdesc>` element inside the `<abstract>` element.

SQF Use Case 4: Impose a Certain Article Type

Description: The following sample Schematron rule checks the `@article-type` attribute to make sure its value is one of the specified allowed values (**abstract**, **addendum**, **announcement**, **article-commentary**) and the sample Quick Fix proposes options for replacing any other detected value with one of the allowed values.

Sample Code:

```

<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">

```

```

<sch:let name="articleTypes" value="( 'abstract', 'addendum', 'announcement',
    'article-commentary' )"/>

<sch:pattern>
  <sch:rule context="article/@article-type">
    <sch:assert test=". = $articleTypes" sqf:fix="setArticleType">
      Should be one of the article types:
      <sch:value-of select="$articleTypes"/></sch:assert>

    <sqf:fix id="setArticleType" use-for-each="$articleTypes">
      <sqf:description>
        <sqf:title>Set article type to '<sch:value-of select="$sqf:current"/>'
        </sqf:title>
      </sqf:description>
      <sqf:replace node-type="attribute" target="article-type" select="$sqf:current"/>
    </sqf:fix>
  </sch:rule>
</sch:pattern>
</sch:schema>

```

Result: The engine displays an error message if an `@article-type` attribute has any other value other than **abstract**, **addendum**, **announcement**, or **article-commentary** and the Quick Fix mechanism proposes options for replacing the disallowed value with one of those four allowed values (using the `use-for-each` construct).

SQF Use Case 5: Impose Certain Attributes and Values

Description: The following sample Schematron rule checks the `@rowsep` and `@colsep` attributes are added on the `<colspec>` element and their value is set to 1. The Quick Fix proposes options for adding the attributes in case they are missing or set the correct value .

Sample Code:

```

<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <sch:pattern>
    <sch:rule context="colspec">
      <sch:assert test="@rowsep = 1" sqf:fix="addRowsep">The @rowsep should be
        set to 1</sch:assert>
      <sch:assert test="@colsep = 1" sqf:fix="addColsep">The @colsep should be
        set to 1</sch:assert>

      <sqf:fix id="addRowsep">
        <sqf:description>
          <sqf:title>Add @rowsep attribute</sqf:title>

```

```

        </sqf:description>
        <sqf:add node-type="attribute" target="rowsep" select="'1'"/>
    </sqf:fix>

    <sqf:fix id="addColsep">
        <sqf:description>
            <sqf:title>Add @colsep attribute</sqf:title>
        </sqf:description>
        <sqf:add node-type="attribute" target="colsep" select="'1'"/>
    </sqf:fix>
</sch:rule>
</sch:pattern>
</sch:schema>

```

Defining Schematron Quick Fixes

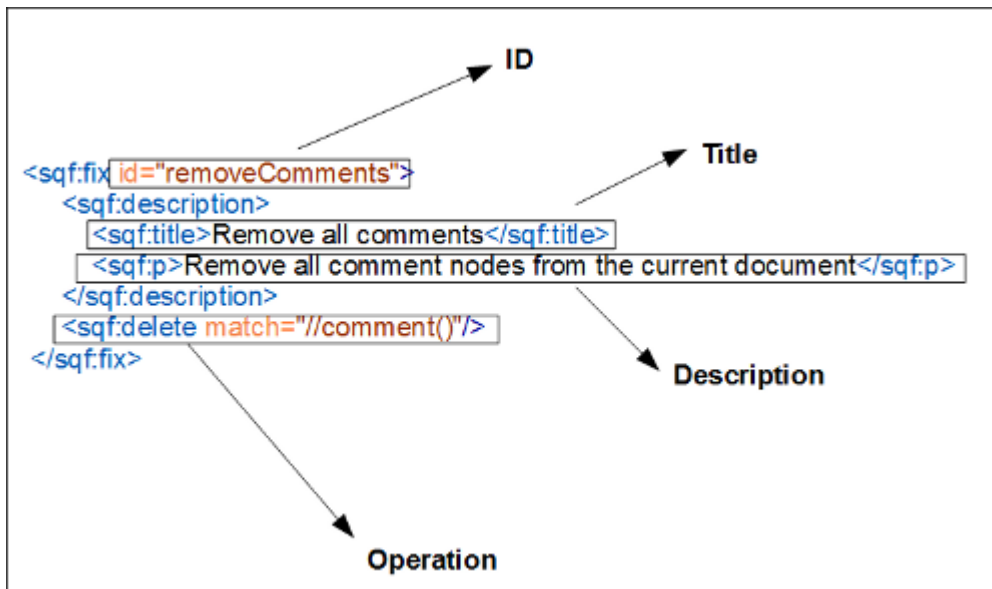

You can define and customize Schematron *Quick Fixes* (on page 2682) directly in the current Schematron file or in a separate Schematron file. The Schematron *Quick Fixes* are an extension of the Schematron language and they allow you to define fixes for Schematron error messages. You can reference the *Quick Fixes* using the `@sqf:fix` attribute inside the `<assert>` or `<report>` elements (for example: `<assert test="title" sqf:fix="removeComments">Remove comments</assert>`).

Defining a Schematron Quick Fix

The basics of a Schematron *Quick Fix* is defined by an ID, name, description, and the operations to be executed.

- **ID** - Defined by the `@id` attribute from the `<sqf:fix>` element and must be unique in the current context. It is used to refer the *Quick Fix* from a `<report>` or `<assert>` element.
- **Name** - The name of the *Quick Fix* is defined by the `<sqf:title>` element.
- **Description** - Defined by the text in the paragraphs (`<sqf:p>`) of the `<sqf:description>` element.
- **Operations** - The following basic types of *operations (elements)* (on page 985) are supported:
 - `<sqf:add>` Element - To add a new node or fragment in the document.
 - `<sqf:delete>` Element - To remove a node from the document.
 - `<sqf:replace>` Element - To replace a node with another node or fragment.
 - `<sqf:stringReplace>` Element - To replace text content with other text or a fragment.

Figure 391. Schematron Quick Fix Components

The assertion message that generates the *Quick Fix* is added as the `<sqf:description>` of the problem to be fixed. The `<sqf:title>` is presented as the name of the *Quick Fix*. The content of the paragraphs (`<sqf:p>`) within the `<sqf:description>` element are presented in the tooltip message when the *Quick Fix* is selected.

Additional Elements Supported in the Schematron Quick Fixes

`<sqf:user-entry>`

This element defines a value that must be set manually by the user. For more information, see [User Entry SQF Operation \(on page 989\)](#).

`<sqf:call-fix>`

This element calls another *Quick Fix* within a *Quick Fix*. The called *Quick Fix* must be defined globally or in the same Schematron rule as the calling *Quick Fix*. A calling *Quick Fix* adopts the activity elements of the called *Quick Fix* and should not include other activity elements. You can also specify which parameters are sent by using the `<sqf:with-param>` child element.

`<sqf:group>`

Allows you to group multiple *Quick Fixes* and refer them from an `<assert>` or `<report>` element.

`<sqf:fixes>`

Is defined globally and contains global fixes and groups of fixes.

`<sqf:copy-of>`

Used to copy the selected nodes that are specified by the `@select` attribute. The element with its attribute is treated as an `xsl:copy-of` with a `@select` attribute, as defined in the XSLT specification.

`<sqf:param>`

Defines a parameter for a *Quick Fix*. If the parameter is defined as `abstract` then the `type` and default value should not be specified and the fix can be called from an abstract pattern that defines this parameter.

Other SQF Notes

Note:

The `sqf:default-fix` attribute is ignored in Oxygen XML Editor Eclipse plugin.

For more details on editing Schematron *Quick Fixes*, go to: [Schematron Quick Fix Specifications](#)

Basic Schematron Quick Fix Operations

There are four basic operations that can be executed in a Schematron *Quick Fix* (on page 2682): **Add**, **Delete**, **Replace**, and **String Replace**.

Add

The `<sqf:add>` element allows you to add a node to the instance. An *anchor* node is required to select the position for the new node. The *anchor* node can be selected by the `@match` attribute. Otherwise, it is selected by the `@context` attribute of the rule.

The `@target` attribute defines the name of the node to be added. It is required if the value of the `@node-type` attribute is set to anything other than "comment".

The `<sqf:add>` element has a `@position` attribute and it determines the position relative to the *anchor* node. The new node could be specified as the first child of the *anchor* node, the last child of the *anchor* node, before the *anchor* node, or after the *anchor* node (`first-child` is the default value). If you want to add an attribute to the *anchor* node, do not use the `@position` attribute.

Note:

If you insert an element and its content is empty, Oxygen XML Editor Eclipse plugin will insert the required element content.

An Example of the `<sqf:add>` Element:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern>
    <rule context="head">
      <assert test="title" sqf:fix="addTitle">title element missing.</assert>
      <sqf:fix id="addTitle">
        <sqf:description>
          <sqf:title>Insert title element.</sqf:title>
        </sqf:description>
      </sqf:fix>
    </rule>
  </pattern>
</schema>
```

```

        </sqf:description>
        <sqf:add target="title" node-type="element">Title text</sqf:add>
    </sqf:fix>
</rule>
</pattern>
</schema>

```

Specific Add Operations:

- **Insert Element** - To insert an element, use the `<sqf:add>` element, set the value of the `@node-type` attribute as "element", and specify the element *QName (on page 2681)* with the `@target` attribute. If the element has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix" />`).
- **Insert Attribute** - To insert an attribute, use the `<sqf:add>` element, set the value of the `@node-type` attribute as "attribute", and specify the attribute *QName (on page 2681)* with the `@target` attribute. If the attribute has a prefix, it must be defined in the Schematron using a namespace declaration (`<ns uri="namespace" prefix="prefix" />`).
- **Insert Fragment** - If the `@node-type` attribute is not specified, the `<sqf:add>` element will insert an XML fragment. The XML fragment must be well-formed. You can specify the fragment in the `<sqf:add>` element or by using the `@select` attribute.
- **Insert Comment** - To insert a comment, use the `<sqf:add>` element and set the value of the `@node-type` attribute as "comment".
- **Insert Processing Instruction** - To insert a processing instruction, use the `<sqf:add>` element, set the value of the `@node-type` attribute as "pi" or "processing-instruction", and specify the name of the processing instruction in the `@target` attribute.

Delete

The `<sqf:delete>` element allows you to remove any type of node (such as elements, attributes, text, comments, or processing instructions). To specify nodes for deletion, the `<sqf:delete>` element can include a `@match` attribute that is an XPath expression (the default value is `.`). If the `@match` attribute is not included, it deletes the context node of the Schematron rule.

An Example of the `<sqf:delete>` Element:

```

<schema xmlns="http://purl.oclc.org/dsdl/schematron" queryBinding="xslt2"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process">
  <pattern>
    <rule context="*[@xml:lang]">
      <report test="@xml:lang" sqf:fix="remove_lang">
        The attribute "xml:lang" is forbidden.</report>
      <sqf:fix id="remove_lang">
        <sqf:description>
          <sqf:title>Remove "xml:lang" attribute</sqf:title>
        </sqf:description>
      </sqf:fix>
    </rule>
  </pattern>
</schema>

```

```

        <sqf:delete match="@xml:lang" />
    </sqf:fix>
</rule>
</pattern>
</schema>

```

Replace

The `<sqf:replace>` element allows you to replace nodes. Similar to the `<sqf:delete>` element, it can include a `@match` attribute. Otherwise, it replaces the context node of the rule. The `<sqf:replace>` element has three tasks. It identifies the nodes to be replaced, defines the replacing nodes, and defines their content.

An Example of the `<sqf:replace>` Element:

```

<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern>
    <rule context="title">
      <report test="exists(ph)" sqf:fix="resolvePh" role="warn">
        ph element is not allowed in title.</report>
      <sqf:fix id="resolvePh">
        <sqf:description>
          <sqf:title>Change the ph element into text</sqf:title>
        </sqf:description>
        <sqf:replace match="ph">
          <value-of select="." />
        </sqf:replace>
      </sqf:fix>
    </rule>
  </pattern>
</schema>

```

Other Attributes for Replace Operations:

- **node-type** - Determines the type of the replacing node. The permitted values include:
 - **keep** - Keeps the node type of the node to be replaced.
 - **element** - Replaces the node with an element.
 - **attribute** - Replaces the node with an attribute.
 - **pi** - Replaces the node with a processing instruction.
 - **comment** - Replaces the node with a comment.

- **target** - By using a *QName (on page 2681)* it gives the replacing node a name. This is necessary when the value of the `@node-type` attribute is anything other than "comment".
- **select** - Allows you to choose the content of the replacing nodes. You can use XPath expressions with the `@select` attribute. If the `@select` attribute is not specified then the content of the `<sqf:replace>` element is used instead.

String Replace

The `<sqf:stringReplace>` element is different from the others. It can be used to find a sub-string of text content and replace it with nodes or other strings.

Attributes for the String Replace Operation:

- **match** - Allows you to select text nodes that contain the sub-strings you want to replace.
- **select** - Allows you to select the replacing fragment, in case you do not want to set it in the content of the `<stringReplace>` element.
- **regex** - Matches the sub-strings using a regular expression.

Note:

Consider the following information about using regular expressions in the `<stringReplace>` element:

- The regular expressions from this operation are compiled as Java regular expressions. For more information, see <https://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>.
- The ***j flag*** allows you to use the standard Java regular expression engine, which allows native Java regular expression syntax. This allows, for example, the use of `\b` in a regular expression to match word boundaries. For more information, see <https://www.saxonica.com/html/documentation/functions/fn/matches.html>.
- Regular expressions in the `<sqf:stringReplace>` element always have the *dot matches all* flag set to "true". Therefore, the line terminator will also be matched by the regular expression.

- **flags** - Specifies flags to control the interpretation of the regular expression (given in the `@regex` attribute).

Attention:

The context of the content within the `<sqf:stringReplace>` element is set to the whole text node, rather than the current sub-string.

An Example of the `<sqf:stringReplace>` Element:

```
<?xml version="1.0" encoding="UTF-8"?>
<sch:schema xmlns:sch="http://purl.oclc.org/dsdl/schematron"
```

```

xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
queryBinding="xslt2">
  <sch:pattern>
    <sch:rule context="text()">
      <sch:report test="matches(., 'Oxygen', 'i')">
sqf:fix="changeWord">The oYgen word is not allowed</sch:report>
      <sqf:fix id="changeWord">
        <sqf:description>
          <sqf:title>Replace word with product</sqf:title>
        </sqf:description>
        <sqf:stringReplace regex="Oxygen" flags="i"><ph keyref="product"/>
        </sqf:stringReplace>
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
</sch:schema>

```

Related Information:[User Entry SQF Operation \(on page 989\)](#)[Restricting Quick Fix Operations \(on page 990\)](#)[Examples of Schematron Rules and Quick Fixes \(on page 943\)](#)

User Entry SQF Operation

The `<sqf:user-entry>` element defines a value that must be set manually by the user. If multiple `<user-entry>` elements are defined, Oxygen XML Editor Eclipse plugin will display a dialog box for each one where the user can specify values. Also, the `<user-entry>` element can be used as an XPath variable where the XPath variable is the name of the `<user-entry>`. Note that the `@default` attribute defines a default value for the operation by using an XPath expression (as in the example below) and its value will be presented in the user entry dialog box.

An Example of the `<sqf:user-entry>` Element:

```

<sqf:fix id="editTitle">
  <sqf:description>
    <sqf:title>Edit the journal title</sqf:title>
  </sqf:description>
  <sqf:user-entry name="newTitle" default="@title">
    <sqf:description>
      <sqf:title>Edit the title:</sqf:title>
    </sqf:description>
  </sqf:user-entry>
  <sqf:replace match="@title" target="title" node-type="keep" select="$newTitle"/>
</sqf:fix>

```

Related Information:[Basic Schematron Quick Fix Operations \(on page 985\)](#)[Examples of Schematron Rules and Quick Fixes \(on page 943\)](#)

Restricting Quick Fix Operations

To restrict a *Quick Fix* (on page 2682) or a specific operation to only be available if certain conditions are met, the `@use-when` attribute can be included in the `<sqf:fix>` element or any of the SQF operation elements. The condition of the `@use-when` attribute is an XPath expression and the fix or operation will be performed only if the condition is satisfied. In the following example, the `use-when` condition is applied to the `<sqf:fix>` element:

```
<sqf:fix id="last" use-when="$colWidthSummarized - 100 lt $lastWidth"
role="replace">
  <sqf:description>
    <sqf:title>Subtract excessive width from the last element.</sqf:title>
  </sqf:description>
  <let name="delta" value="$colWidthSummarized - 100"/>
  <sqf:add match="html:col[last()]" target="width" node-type="attribute">
    <let name="newWidth" value="number(substring-before(@width,'%')) - $delta"/>
    <value-of select="concat($newWidth,'%')"/>
  </sqf:add>
</sqf:fix>
```

Related Information:[Basic Schematron Quick Fix Operations \(on page 985\)](#)

Formatting/Indenting Content Inserted by SQF Operations

Content that is inserted by the **Add**, **Replace**, or **String Replace** Schematron *Quick Fix* (on page 2682) operations is automatically indented unless you set the value of the `@xml:space` attribute to `preserve` on the operation element. There are several methods available to format the content that is inserted:

- **xsl:text** - You can use an `<xsl:text>` element to format the inserted content and keep the automatic indentation, as in the following example:

```
<sqf:add position="last-child">
  <row><xsl:text>
  </xsl:text>
  <entry>First column</entry><xsl:text>
  </xsl:text>
  <entry>Second column</entry><xsl:text>
  </xsl:text>
</row><xsl:text>
```

```
</xsl:text>
</sqf:add>
```

- **xml:space** - Use the `@xml:space` attribute and set its value to `preserve` to format the content and specify the spacing between elements, as in the following example:

```
<sqf:add node-type="element" target="codeblock" xml:space="preserve">
  /* a long sample program */
  Do forever
  Say "Hello, World"
End</sqf:add>
```

Related Information:

[Basic Schematron Quick Fix Operations \(on page 985\)](#)

Executing Schematron Quick Fixes in Other Documents

You can apply Schematron *Quick Fixes (on page 2682)* over nodes from referenced documents (using XInclude or external entities), and you can access them as nodes in your current document.

Also, you can apply the *Quick Fixes* over other documents using the `doc()` function in the value of the `@match` attribute. For example, you can add a new `<Key>` element with the value of `newVal` as the last child in the `<KeyList>` element from the `keylist.xml` file using the following operation:

```
<sqf:add match="doc('keylist.xml')/KeyList" target="Key" node-type="element"
  select="'newVal' " position="last-child"/>
```

The `keylist.xml` file can have a structure similar to this:

```
<KeyList>
  <Key>one</Key>
  <Key>two</Key>
</KeyList>
```

Generate Multiple Similar Quick Fixes

You can generate the same Schematron *Quick Fix (on page 2682)* for multiple matches. To do this, you can add the `@use-for-each` attribute inside the `<sqf:fix>` element and for each match of the XPath expression in the value of the `@use-for-each` attribute, a Quick Fix will be presented to the user. The XPath expression does not change the context of the Quick Fix. If you want to access the current match from the XPath expression, you can use the `$sqf:current` variable.

Example:

Suppose you want to restrict the user from entering more than 4 list items in a list. The following example presents an error on any list that has more than 4 list items and offers a Quick Fix with multiple proposals where the user would specify which list item to remove.

```

<sch:rule context="ul">
  <sch:report test="count(li) gt 4" sqf:fix="removeAnyItem">
    The list cannot contain more than 4 entries.
  </sch:report>
  <sqf:fix id="removeAnyItem" use-for-each="1 to count(li)">
    <sqf:description>
      <sqf:title>Remove item #<sch:value-of select="$sqf:current" /></sqf:title>
    </sqf:description>
    <sqf:delete match="li[$sqf:current]" />
  </sqf:fix>
</sch:rule>

```

Localizing SQF Messages

Oxygen XML Editor Eclipse plugin provides support for presenting Schematron Quick Fix messages in multiple languages. The language used for the SQF messages is the language specified in the **'Message Language** option in the **Schematron preferences page** (*on page 194*). If you want to provide an alternative message for a specific language, you can reference IDs or key values for the specific alternate text phrase. In Oxygen XML Editor Eclipse plugin, the alternate text phrase is defined in a `<sch:diagnostic>` element and it can be used in conjunction with `<sch:assert>` or `<sch:report>` elements.

Example:

The following example presents a quick fix with a different message depending on whether the user's language is English or German.

```

<sch:rule context="dog">
  <sch:assert test="bone" diagnostics="d_en d_de" sqf:fix="addBone" >
    A dog should have a bone.</sch:assert>

  <sqf:fix id="addBone">
    <sqf:description>
      <sqf:title ref="fix_en fix_de" xml:lang="en">Add a bone</sqf:title>
      <sqf:p ref="fix_desc_en fix_desc_de" xml:lang="en">Add bone element as child</sqf:p>
    </sqf:description>
    <sqf:add node-type="element" target="bone" />
  </sqf:fix>
</sch:rule>

...

<sch:diagnostics xml:lang="en">
  <sch:diagnostic id="d_en"> A dog should have a bone. </sch:diagnostic>
  <sch:diagnostic id="fix_en"> Add a bone </sch:diagnostic>
  <sch:diagnostic id="fix_desc_en">Add a bone element as child</sch:diagnostic>
</sch:diagnostics>

```

```
<sch:diagnostics xml:lang="de">
  <sch:diagnostic id="d_de"> Ein Hund sollte ein Bein haben. </sch:diagnostic>
  <sch:diagnostic id="fix_de"> Fügen Sie einen Knochen hinzu </sch:diagnostic>
  <sch:diagnostic id="fix_desc_de"> Fügen Sie ein Knochenelement als
    untergeordnetes Element hinzu </sch:diagnostic>
</sch:diagnostics>
```

Integrating SQF in a Framework and Sharing Them

You can use Schematron *Quick Fixes (on page 2682)* to assist your content authors by imposing rules for an entire *framework (on page 2679)* (document type) and offering fixes when a rule violation is detected.

For example, if you are using DITA, you may want your contributors to avoid inserting a figure (`<fig>` element) inside a paragraph (`<p>` element) that contains other content since it may result in undesirable placement or spacing in the output. The Schematron rule and its *Quick Fix* for this particular use-case could look like this:

```
<schema xmlns="http://purl.oclc.org/dsdl/schematron"
  xmlns:sqf="http://www.schematron-quickfix.com/validator/process"
  queryBinding="xslt2">
  <pattern id="check.figure.location">
    <rule context="p/fig">
      <report test="true()" role="warn" sqf:fix="moveAfter">
        A figure inside a paragraph doesn't transform well into PDF. </report>
      <sqf:fix id="moveAfter">
        <sqf:description>
          <sqf:title>Move after the paragraph.</sqf:title>
        </sqf:description>
        <let name="figToMove" value="."/ >
          <sqf:add match="parent::p" select="$figToMove" position="after" />
          <sqf:delete match="." />
        </sqf:fix>
      </rule>
    </pattern>
  </schema>
```

The result of this example would be that the user will see a warning if they insert a `<fig>` element inside a `<p>` element and they are presented with the option of selecting the *Quick Fix* that would move the figure outside the paragraph.

How to Integrate SQF in a Framework

To integrate a Schematron *Quick Fix* in a *framework (on page 2679)*, follow these steps:

1. Create a folder structure for an extended framework and save it somewhere on disk where you have full write access (for example, `custom_frameworks/dita-extension`).
2. In that new folder structure, create another folder that will contain all of your custom Schematron files (for example, `custom_frameworks/dita-extension/rules`).
3. Define the Schematron *Quick Fix* for a rule (on page 983) in an existing or new Schematron file and save it in the folder you created in step 2.
4. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association > Locations** (on page 90). In this preferences page, add the path to your `custom_frameworks` folder in the **Additional frameworks directories** list, then click **OK** or **Apply** to save your changes.
5. Go to the **Document Type Association preferences page** (on page 88) and select a *framework* configuration (for example, **DITA**) and use the **Extend** button to create an extension for it.
6. Give the extension an appropriate name (for example, *DITA - Custom*), select **External** for the **Storage** option, and specify an appropriate path to your framework configuration file (for example, `path/to/.../custom_frameworks/dita-extension/dita-extension.framework`).
7. Make whatever changes you desire to the extension, then go to the **Validation** tab, edit the default validation scenario (select the scenario and click the  **Edit** button), and add an extra validation unit to it (one that uses your custom Schematron file that includes the SQF). For more details about editing validation scenarios, see [Configuring Validation Scenarios for a Framework](#) (on page 2029).
8. Click **OK** to close the dialog box and then **OK** or **Apply** to save the changes to the **Document Type Association preferences page** (on page 88).
9. Add a reference to the Schematron file that includes the SQF in your *framework* by following the procedure in [Associating a Schema in Validation Scenarios Defined in the Document Type](#) (on page 590).
10. Open a document in your *framework* and test the new rule and *Quick Fix*.
11. You can continue to refine the Schematron and develop additional rules as needed.

Sharing Schematron Quick Fixes

To share Schematron Quick Fixes with other members of your team, you simply need to share the framework where you integrated the SQF. There are several methods for sharing frameworks and you can find details here: [Sharing a Framework](#) (on page 2099).

Related Information:

[Defining Schematron Quick Fixes](#) (on page 983)

[Basic Schematron Quick Fix Operations](#) (on page 985)

[Associating a Schema in Validation Scenarios Defined in the Document Type](#) (on page 590)

[Sharing a Framework](#) (on page 2099)

Validating Schematron Quick Fixes

By default, Schematron *Quick Fixes* (on page 2682) are validated as you edit them within the Schematron file or while editing them in a separate file. To change this, open the **Preferences** dialog box (on page 70), go to **Editor > Document Checking**, and deselect the **Enable automatic validation** option (on page 133).

To validate Schematron *Quick Fixes* manually, select the  **Validate** action from the  **Validation** toolbar drop-down menu or the **XML** menu. The validation problems are highlighted directly in the editor, making it easy to locate and fix any issues.

Related Information:

[Validating XML Documents Against a Schema \(on page 546\)](#)

[Validation Scenario \(on page 557\)](#)

[Presenting Validation Errors in Author Mode \(on page 551\)](#)

[Presenting Validation Errors in Text Mode \(on page 549\)](#)

Content Completion in SQF

Oxygen XML Editor Eclipse plugin helps you edit Schematron *Quick Fixes* (on page 2682) embedded in a Schematron document by offering proposals that are valid at the cursor position in a *Content Completion Assistant* (on page 2677). It can be manually activated with the **Ctrl + Space** shortcut.

When you edit the value of an attribute that references a *Quick Fix ID*, the ids are collected from the entire definition scope. For example, if the editing context is `assert/@sqf:fix`, the *Content Completion Assistant* proposes all fixes defined locally and globally.

If the editing context is an attribute value that is an XPath expression (such as `sqf:add/@match` OR `replace/@select`), the *Content Completion Assistant* offers the names of XPath functions, the XPath axes, and user-defined variables and parameters.

The *Content Completion Assistant* displays XSLT 1.0 functions (and optionally XSLT 2.0 / 3.0 functions) in the `@path`, `@select`, `@context`, `@subject`, and `@test` attributes, depending on the [Schematron options \(on page 193\)](#) that are set in Preferences pages. If the Saxon namespace (`xmlns:saxon="http://icl.com/saxon"`) or the Saxon namespace is declared in the Schematron schema (`xmlns:saxon="http://saxon.sf.net/"`) the content completion also displays the XSLT Saxon extension functions.

Highlight Quick Fix Occurrences in SQF

When you position your mouse cursor over a *Quick Fix* (on page 2682) ID in a Schematron document, Oxygen XML Editor Eclipse plugin searches for the *Quick Fix* declaration and all its references and highlights them automatically.

Customizable colors are used: one for the *Quick Fix* definition and another one for its references. Occurrences are displayed until another *Quick Fix* is selected.

To change the default behavior of **Highlight Component Occurrences**, open the **Preferences** dialog box (on page 70) and go to **Editor > Mark Occurrences**. You can also trigger a search using the **Search > Search Occurrences in File (Ctrl + Shift + U (Command + Shift + U on macOS))** action from contextual menu. Matches are displayed in separate tabs of the **Results** view (on page 335).

Searching and Refactoring Operations in SQF

Search Actions

The following search actions can be applied on *Quick Fix (on page 2682)* IDs and are available from the **Search** submenu in the contextual menu of the current editor:

Search References

Searches all references of the item found at current cursor position in the defined scope, if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box is displayed and you have the possibility to define another search scope.

Search References in

Searches all references of the item found at current cursor position in the file or files that you specify when define a scope in the **Search References** dialog box.

Search Declarations

Searches all declarations of the item found at current cursor position in the defined scope if any. If a scope is defined, but the currently edited resource is not part of the range of resources determined by this, a warning dialog box will be displayed and you have the possibility to define another search scope.

Search Declarations in

Searches all declarations of the item found at current cursor position in the file or files that you specify when you define a scope for the search operation.

Search Occurrences in File

Searches all occurrences of the item at the cursor position in the currently edited file.

Refactoring Actions

The following refactoring actions can be applied on *Quick Fix* IDs and are available from the **Refactoring** submenu in the contextual menu of the current editor:

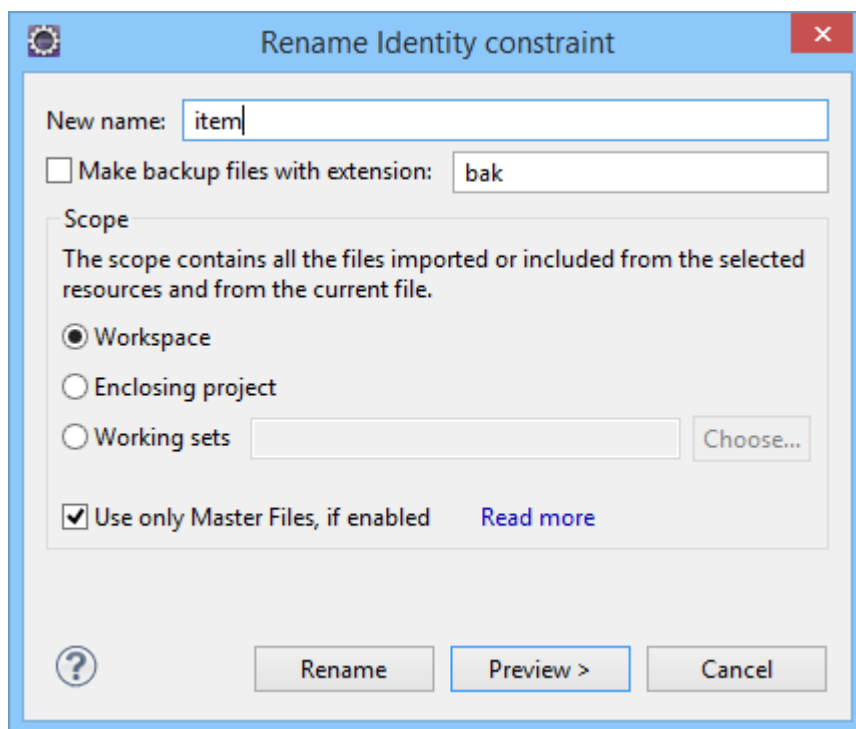

Rename Component

Allows you to rename the current component (in-place). The component and all its references in the document are highlighted with a thin border and the changes you make to the component at the cursor position are updated in real time to all occurrences of the component. To exit the in-place editing, press the **Esc** or **Enter** key on your keyboard.

Rename Component in

Opens a dialog box that allows you to rename the selected component by specifying the new component name and the files to be affected by the modification. If you click the **Preview** button, you can view the files to be affected by the action.

Figure 392. Rename Identity Constraint Dialog Box

Embedding Schematron Quick Fixes in Relax NG or XML Schema

Schematron *Quick Fixes* (on page 2682) can be embedded into an XML Schema through annotations (using the `<appinfo>` element), or in a Schematron rule embedded in the RELAX NG Schema. For more information about embedding Schematron in XML Schema or Relax NG, see [Embedding Schematron Rules in XML Schema or RELAX NG](#) (on page 960).

Oxygen XML Editor Eclipse plugin is able to extract and use the embedded Schematron *Quick Fixes*. To make the embedded Schematron *Quick Fixes* available, follow these steps:

1. Define a [validation against a schema](#) (on page 546).
2. For the **Schema type**, choose XML Schema OR Relax NG.
3. Select the **Embedded Schematron rules** option.

Example: Embedded Schematron Quick Fix in XML Schema

```
<xsd:appinfo>
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
      <sqf:fix id="fixId">
        .....
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
</xsd:appinfo>
```

Example: Embedded Schematron Quick Fix in Relax NG

```

<grammar
  xmlns="http://relaxng.org/ns/structure/1.0"
  xmlns:sch="http://purl.oclc.org/dsdl/schematron" >
  <sch:pattern>
    <sch:rule context="...">
      <sch:assert test="..." sqf:fix="fixId">Message.</sch:assert>
      <sqf:fix id="fixId">
        .....
      </sqf:fix>
    </sch:rule>
  </sch:pattern>
  <start>
    .....
  </start>
</grammar>

```

**Tip:**

For more extensive examples, see the samples in the `[OXYGEN_INSTALL_DIR]/samples/schematron` folder.

Related Information:

[Embedding Schematron Rules in XML Schema or RELAX NG \(on page 960\)](#)

[Defining Schematron Quick Fixes \(on page 983\)](#)

Editing HTML Documents

Oxygen XML Editor Eclipse plugin provides a special framework for editing HTML files (*html* or *htm* file extensions) with a variety of specialized editing features, including validation, content completion, syntax highlighting, HTML-specific actions, and more. You can edit HTML documents in **Text** or **Author** mode.

Oxygen XML Editor Eclipse plugin also includes a [built-in XHTML framework \(on page 1112\)](#) (files with the `http://www.w3.org/1999/xhtml` namespace or with the *xhtml* or *xht* file extension) that has a full set of features (full editing support, document templates, enhanced CSS rendering, specific actions, validation, content completion, transformation scenarios, and more). Oxygen XML Editor Eclipse plugin also includes support for [importing HTML files as an XML document \(on page 1909\)](#).

Resources

For more information about the HTML support in Oxygen XML Editor Eclipse plugin, see the following resources:

- Webinar: [HTML5 Support in Oxygen](#).
- Video: [HTML Support in Oxygen](#).

Related information

[XHTML Document Type \(Framework\) \(on page 1112\)](#)

HTML Editor

Oxygen XML Editor Eclipse plugin includes a specialized HTML editor and various editing features for files that have the `html` or `htm` file extensions. The encoding is detected automatically based on the value specified in the `@charset` attribute of the `<meta>` element.

Note:

If an HTML document has an XHTML namespace, or there is an XSD schema declared, or there is a PUBLIC ID specified in a DOCTYPE, or there is a SYSTEM ID with a value other than *"about:legacy-compat"*, then the document will be opened as an XHTML file.

New Document Template

Oxygen XML Editor Eclipse plugin includes a new document template to help you get started creating HTML content. It is available when creating [new documents from templates \(on page 253\)](#) and can be found in the **New Document** folder or by typing `html` in the search field.

Text Mode Editor

You can edit HTML files in the **Text** editing mode using all of its useful features. It includes content completion based on a special HTML schema, [syntax highlighting \(on page 1003\)](#), a specialized [Outline view \(on page 1004\)](#) that presents the structure, [folding support \(on page 1003\)](#), and more.

HTML documents support formatting and indenting single or multiple documents to make them more readable. The formatting works even if the document is not XML well-formed and it also works on embedded CSS or JavaScript code. The HTML formatting details are similar to those for XML documents. For details, see [Formatting and Indenting XML Documents \(on page 338\)](#).

Author Mode Editor

You can edit HTML files in the visual **Author** editing mode [\(on page 367\)](#), but when opening an HTML document in **Author** mode, if it is not considered well-formed according to XML standards, you will see a warning message at the top of the editor explaining that once you make a modification, the document will be automatically converted to proper XML structure. For more details, see [XML Well-Formedness Details for HTML Documents \(on page 1000\)](#).

When editing HTML documents in **Author** mode, you have access to many of the same [authoring features and actions as you have with XHTML documents \(on page 1113\)](#). You also have the benefit of CSS rendering and you can [specify a CSS file to be associated with an HTML document \(on page 1005\)](#).

HTML-Specific Contextual Menu Actions

There are some specialized actions (available in the contextual menu when you right-click anywhere in the current HTML document) that invoke features unique to HTML documents. These contextual menu actions include:

View in Browser/System Application

Opens the HTML document in your default browser.

Minify HTML

Compresses the HTML document by removing unnecessary white spaces, without affecting the functionality of the document, but significantly reducing the loading time in Web browsers.

HTML to XML Well-formed (Available in both Text and Author modes)

Converts the currently edited HTML document to be XML well-formed. This means that unclosed tags will be properly closed, unquoted attribute values will be quoted, and more. This is helpful if, for example, you use XSLT stylesheets while applying transformations on HTML documents (since the transformation will require the HTML document to be XML well-formed).

XML Well-Formedness Details for HTML Documents

When opening an HTML document in **Author** mode, if it is not XML well-formed, you will see a warning message at the top of the editor explaining that once you make a modification, the document will be automatically converted to proper XML structure. Examples of things that are automatically converted include:

- Missing end tags are added to applicable elements.
- Empty tags are closed.
- Missing quote characters are added to applicable attributes.
- Entity references that are allowed in the [HTML5 specification](#) are converted to the corresponding character.

Tip:

It is also possible to manually convert HTML documents to be XML well-formed. There are two ways to do this, depending on whether you want to convert a single document or batch convert multiple documents at once:

- **Single Document** - To convert a single HTML document, right-click anywhere in the currently open HTML document (in the main editor) and select **HTML to XML Well-formed**.
- **Multiple Documents** - To batch convert multiple HTML documents at once, go to the **Project Explorer** view, select the documents you want to convert, then right-click and select **HTML to XML Well-formed**.

**Notes:**

- All selected HTML files are backed up before being processed (same path/name but with the ".bak" extension added at the end).
- Any detected conversion errors are grouped and listed in a dedicated tab in the **Results** pane at the bottom of the application.
- A brief report is displayed at the end of the operation.

HTML Validation

Oxygen XML Editor Eclipse plugin includes a built-in default validator used for validating HTML documents. It is based upon the W3C HTML Validator and the HTML documents are validated against the [W3C HTML5 specification](#). The validator in Oxygen XML Editor Eclipse plugin only supports HTML5 structure. It presents the errors in the editor similar to XML documents. It also checks the embedded CSS content and the warnings and errors are presented similar to the [CSS editor \(on page 826\)](#).

Validating HTML Against a Schematron

It is also possible to validate HTML documents against a Schematron schema. Besides the default HTML validator, Oxygen XML Editor Eclipse plugin also includes a built-in *HTML Schematron Validator* engine. There are several ways to validate an HTML document against a Schematron:

- **Configure a Validation Scenario** - You can create or edit a validation scenario, change the **File type** column to *HTML Document*, change the **Validation engine** column to *HTML Schematron Validator*, and specify the Schematron document in the **Schema** column.
- **Manually Validate a Single Document** - You can use the **Validate with** action from the  **Validation** drop-down menu on the toolbar. This opens a dialog box where you can specify the Schematron document to validate the current document against.
- **Batch Validate Multiple Documents** - You can select multiple HTML documents in the **Project Explorer** view, right-click, and use the **Validate with schema** action from the **Validate** submenu. This opens a dialog box where you can specify the Schematron document to validate the selected documents against.

**Notes:**

- The Schematron must use the HTML5 namespace to reference the elements from the instance.
- Implicit HTML elements (i.e. `<html>`, `<body>`, `<tbody>`) must be included in an XPath expression in the Schematron document, even if they are missing from the HTML document.

**Tip:**

The Oxygen XML Editor Eclipse plugin installation directory includes a `samples` folder that contains numerous sample files to help you learn about features, certain file types, and XML technologies. For example, inside the `samples` folder, there is an `html` folder with a `schematron` subfolder where you can find some samples that illustrate HTML validation against a Schematron schema.

Validating HTML Against Other Types of Schema

If your HTML document is XML well-formed, you could also configure a validation scenario to validate it as an XML document against other types of schemas. You would create or edit a validation scenario, make sure the **File type** column is set to *XML Document*, select the appropriate **Validation engine**, and specify the schema document in the **Schema** column.

HTML Content Completion Assistant

Oxygen XML Editor Eclipse plugin includes an intelligent *Content Completion Assistant* (on page 2677) that offers proposals for inserting HTML structures that are valid at the current editing location. Content completion is even available for CSS and JavaScript code that is embedded in an HTML document.

The *Content Completion Assistant* is enabled by default. To disable it, open the **Preferences** dialog box (on page 70), go to **Editor > Content Completion**, and deselect the **Enable content completion** option (on page 119).

Figure 393. Content Completion Assistant in HTML

Using the Content Completion in HTML

For HTML documents, the *Content Completion Assistant* uses a built-in schema and the list of proposals depend on the RELAX NG schema specified in the HTML framework. Using the content completion feature is the same as with any other XML document. For more details, see:

- [Using the Content Completion Assistant in Text Mode](#) (on page 319)
- [Using the Content Completion Assistant in Author Mode](#) (on page 393)

Code Templates in the Content Completion

Oxygen XML Editor Eclipse plugin includes a set of built-in code templates for HTML documents that can be selected from the *Content Completion Assistant*. The code templates are displayed with a  symbol in the

content completion list. You can also define your own code templates and share them with others. For more information, see [Code Templates \(on page 323\)](#).

Content Completion for XPath Expressions

When entering XPath expressions in the **XPath Builder** view, the *Content Completion Assistant* is available as you type to help you compose query patterns.

Syntax Highlighting in HTML Documents

Oxygen XML Editor Eclipse plugin supports syntax highlighting in **Text** mode to make it easier to read the semantics of the structured content by displaying each type of code in different colors and fonts.

For HTML documents, it handles attributes without quotes, unclosed or void elements, and it also offers highlighting for embedded CSS or JavaScript content.

To customize the colors or styles used for the syntax highlighting colors for HTML files, follow these steps:

1. Open the **Preferences** dialog box [\(on page 70\)](#).
2. Go to **Editor > Syntax Highlight** [\(on page 176\)](#).
3. Select and expand the **XHTML** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences \(on page 176\)](#)

Folding in HTML

In a large HTML document, elements can be collapsed so that only the needed data remains in focus. The [folding features available for XML documents \(on page 316\)](#) are also available in HTML documents, but it also provides folding for nested elements that are not closed.

Minifying HTML Documents

Minification (or compression) of an HTML document is the practice of removing unnecessary white spaces, without affecting the functionality of the document, but significantly reducing the loading time in Web browsers. While a minified HTML document gains in terms of execution performance, it is more difficult to read.

To minify an HTML document, right-click anywhere in the editor for an HTML document that is open in **Text** mode (or right-click an HTML document in the **Project Explorer** view and select the **Minify HTML** action. This opens a dialog box with the following options:

Output file

Use this option to set the name and location of the resulting compressed/minified HTML document.

Remove comments

If selected (default), all the HTML comments and also the comments from embedded CSS or JavaScript code blocks will be removed from the resulting output file.

Compress on a single line

If selected (default), the resulting output file will consist of a single line, as all the *'new line'* characters from the source document are removed.

Open output file in editor

If selected (default), the resulting output file will be opened in Oxygen XML Editor Eclipse plugin.

When you click **OK**, the resulting HTML document is a compressed version of the original file for the purpose of enhanced performance, while losing some readability. The source HTML document is not affected.

HTML Outline View

The **Outline** view for HTML documents displays the structure of the HTML document you are editing. By default, it is displayed on the left side of the editor. In addition to the normal features available in the **Outline** view for XML documents, the HTML **Outline** view also handles void elements, elements that are not closed, or attributes without quotes, and presents the tree structure of the HTML document correctly.

Figure 394. HTML Outline View

Querying HTML Documents with XPath

Oxygen XML Editor Eclipse plugin provides a dedicated **XPath Builder view** (*on page 1817*) that allows you to compose complex XPath expressions and execute them over HTML documents (even if they are not well-formed according to XML standards). The **XPath Builder** view offers content completion as you type to help you compose expressions.

Associating a CSS with an HTML Document

The rendering of an HTML document in the **Author** mode is driven by a CSS stylesheet that conforms to the [version 2.1 of the CSS specification](#) from the W3C consortium.

To associate a CSS with an HTML document:

1. Use the  **Associate XSLT/CSS Stylesheet** action that is available on the toolbar or in the **XML** menu.
2. In the resulting dialog box, specify the URL for the CSS file and optionally a title, and click **OK**.

Result: A CSS association is added in the HTML document in a `<link>` element, as specified in the [W3C stylesheet specification](#).

Editing Markdown Documents

Markdown was created as a lightweight markup language with plain text formatting syntax designed to provide syntax that is very easy to read and write, and to convert it to HTML and other formats. It is often used by content contributors who want a quick and easy way to write content without having to take their fingers off the keyboard and without having to learn numerous codes or shortcuts, and it can easily be shared interchangeably between virtually any types of contributor and system.

Oxygen XML Editor Eclipse plugin provides a built-in Markdown editor that allows you to convert Markdown syntax to HTML or DITA and it includes a preview panel to help you visualize the final output. Aside from the plain text syntax that is common among most Markdown applications, the editor in Oxygen XML Editor Eclipse plugin also integrates many other powerful features that content authors are accustomed to using for other types of documents. Some of these additional unique features include:

- Additional toolbar and contextual menu actions.
- Automatic validation to help keep the syntax valid.
- Dedicated syntax highlighting to make Markdown documents even easier to read and write.
- Unique features for creating Markdown documents directly in *DITA maps* (*on page 2678*) and converting Markdown documents to DITA topics.
- Specialized syntax rules to combine popular syntax features from several specifications.

Resources

For more information about editing Markdown documents in Oxygen XML Editor Eclipse plugin, see our webinar: [Oxygen Markdown Support](#).

Markdown Editor

Oxygen XML Editor Eclipse plugin provides an intuitive, dynamic, and easy-to-use Markdown editor. It is a split-screen editor with two panels that are synchronized in real time. The left side is a simple text editor that is specially designed for writing Markdown syntax. The right side is a WYSIWYG style preview of how changes will look in the output.

Markdown Text Editor Pane (Left Side)

The left pane is a simple text editor that is refined to accept Markdown syntax. At the same time, you still have many of the actions, options, and features that you are used to when editing any other type of document in Oxygen XML Editor Eclipse plugin.

The features of this special editor that are unique for Markdown documents include:

- **Unique Markdown Syntax Rules** - The Markdown editor in Oxygen XML Editor Eclipse plugin uses [an integration of rules \(on page 1016\)](#) that combine rules from common default Markdown syntax along with many of the rules used in the GitHub Flavored Markdown syntax.
- **Syntax Highlighting** - The Oxygen XML Editor Eclipse plugin syntax highlighting feature is integrated into the Markdown text editor to make it easier to read and write Markdown syntax. You can even [customize the colors and styles for the syntax highlighting \(on page 1011\)](#).
- **Automatic Spell Checking** - The Markdown editor supports the Oxygen XML Editor Eclipse plugin [automatic spell checking feature \(on page 293\)](#) that reports possible misspelled words as you type. You simply need to select the **Automatic spell check** option in the **Spell Check** preferences page [\(on page 172\)](#), then click the **Select editors** button and select **Markdown Editor**.
- **Helpful Toolbar and Contextual Menu Actions** - A [variety of unique actions \(on page 1008\)](#) are available from the toolbar to help you insert proper Markdown syntax. The contextual menu also includes some common editing actions, as well as unique actions to export (convert) Markdown documents to HTML or DITA.

WYSIWYG Preview Pane (Right Side)

The right pane is a WYSIWYG *Preview* pane that shows a visual representation of how changes made in the left-side text editor will be converted to **HTML**, **XDITA** (Lightweight DITA XML), or **DITA** output. The changes you make in the text editor are parsed continually and they are immediately visible in the *Preview* pane. There are two tabs available in the *Preview* pane, one for visualizing DITA output and one for visualizing HTML output. You can switch between the two tabs at the bottom of the pane.

The *Preview* pane includes the following features:

- **WYSIWYG Visualization** - This pane presents the Markdown syntax from the left-side text editor in a visual WYSIWYG style interface that is automatically synchronized as you type.
- **Synchronous caret and scroll synchronization** - Moving the cursor in the editor area will display the corresponding move in the *Preview* area.

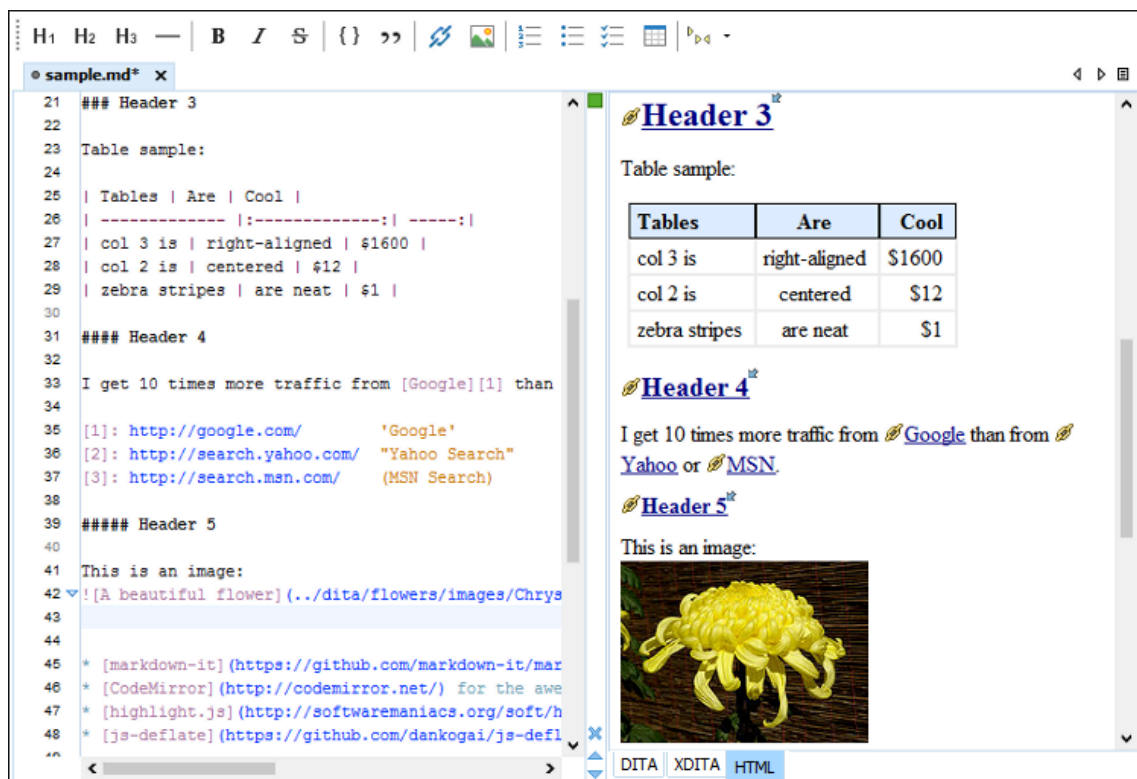

- **Export Options** - The **DITA** tab includes a contextual menu action to **export (convert)** the current Markdown document to a DITA topic (*on page 1011*). The **XDITA** tab includes a contextual menu action to **export (convert)** the current Markdown document to a Lightweight DITA topic (*on page 1011*). Similarly, the **HTML** tab includes a contextual menu action to **export (convert)** it to an XHTML document (*on page 1011*).
- **Automatic Validation** - As you edit Markdown documents, they are **validated automatically** (*on page 1012*). The conversion engine constantly tries to parse your changes and if a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the *Preview* pane or **Results view** (*on page 335*) at the bottom of the editor.
- **Print Feature** - The Markdown editor includes a **Print** action that is available in the contextual menu and it allows you to configure options for printing the current document as you see it in the *Preview* pane.
- **Preview Markup** - The Markdown editor includes a  **Tags Display Mode** drop-down menu (*on page 1010*) that is available on the toolbar and it allows you to control the amount of markup that is displayed in the *Preview* pane.
- **Specialized DITA Features** - The Markdown editor includes some unique, **specialized features to integrate it with the powerful DITA support** (*on page 2467*) in Oxygen XML Editor Eclipse plugin.

Figure 395. Markdown Editor

Related information

[Markdown Editor Syntax Rules and Specifications](#) (*on page 1016*)

[Actions Available in the Markdown Editor](#) (*on page 1008*)

[Working with Markdown Documents in DITA](#) (*on page 2467*)

[Creating New Markdown Documents](#) (*on page 1008*)

Creating New Markdown Documents

To create a new Markdown document in Oxygen XML Editor Eclipse plugin, follow these steps:

1. Click the  **New** button on the toolbar or select **File > New**.
2. Select the  **Markdown** document template.
3. Click **Next**.
4. Choose the storage path and file name for the new document.
5. Click the **Finish** button.

Result: A new Markdown document is created and it is opened in the specialized [Markdown Editor \(on page 1006\)](#).

Actions Available in the Markdown Editor

Aside from the actions that are available in Oxygen XML Editor Eclipse plugin for any type of document (such as the actions in the various menus and the common sections of the toolbar), a variety of unique actions are also available in the Markdown editor, from the toolbar and contextual menu.

Toolbar Actions

The following default actions are available on the Markdown toolbar when editing Markdown documents:

H₁ Header (1st Level)

Inserts an *atx-style first-level header* ([on page 1016](#)) at the cursor position.

H₂ Header (2st Level)

Inserts an *atx-style second-level header* ([on page 1016](#)) at the cursor position.

H₃ Header (3rd Level)

Inserts an *atx-style third-level header* ([on page 1016](#)) at the cursor position.

— Horizontal Rule

Inserts a *horizontal rule* ([on page 1017](#)) at the cursor position.

B Bold (Strong)

Marks the selected text with *bold* ([on page 1018](#)).

I Italic (Emphasis)

Marks the selected text with *italics* ([on page 1018](#)).

ⓧ Strikethrough

Marks the selected text with a *strikethrough* ([on page 1018](#)).

Code Block

Inserts (or surrounds selected text in) a *codeblock* (on page 1022).

Blockquote

Inserts a *blockquote* (on page 1021) at the cursor position.

Insert Link

Opens the **Insert Link** dialog box that allows you to define a *link* (on page 1018) to insert at the cursor position.

Figure 396. Insert Link Dialog Box

Insert Image

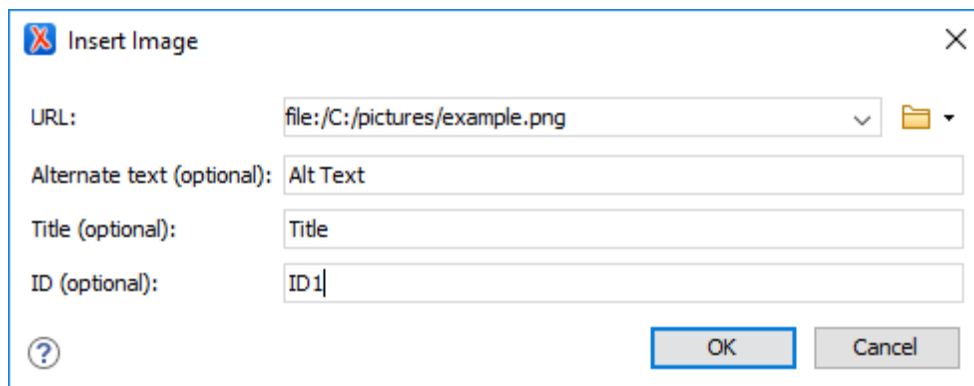

Opens the **Insert Image** dialog box that allows you to define an *image* (on page 1020) to insert at the cursor position. You can type the URL of the image you want to insert or use browsing actions in the  **Browse** drop-down menu.

Figure 397. Insert Image Dialog Box

Insert Ordered List

Inserts an *ordered list* (on page 1024) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an ordered list.

Insert Unordered List

Inserts an [unordered list \(on page 1023\)](#) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to an unordered list.

Insert Task List

Inserts a [task list \(on page 1025\)](#) at the cursor position. Three child list items are also automatically inserted by default. You can also use this action to convert selected content to a task list.

Insert Table

Inserts a [table \(on page 1026\)](#) at the cursor position.

Tags Display Mode drop-down menu

Allows you to control the amount of markup that is displayed in the *Preview* pane and offers the following choices:

Full Tags with Attributes

Displays full tag names with attributes for both [block \(on page 2676\)](#) and [inline elements \(on page 2679\)](#). Oxygen XML Editor Eclipse plugin

Full Tags

Displays full tag names without attributes for both *block elements* and *inline elements*.

Block Tags

Displays full tag names for *block elements* and simple tags without names for *inline elements*.

Block Tags without Element Names

Displays tags for *block elements* but without element names for a more compact version of **Block Tags** mode. You can still see the element names by hovering over the tags.

Inline Tags

Displays full tag names for *inline elements*, while *block elements* are not displayed.

Partial Tags

Displays simple tags without names for *inline elements*, while *block elements* are not displayed.

No Tags

No tags are displayed. This is the most compact mode and is as close as possible to a word-processor view.

Configure Tags Display Mode

Use this option to go to the **Author** preferences page where you can configure the **Tags Display Mode** options.

Contextual Menu Actions

The following default actions are available in the contextual menu when editing Markdown documents:

 **Cut**,  **Copy**,  **Paste**

Use these actions to execute the typical editing actions on the currently selected content.

Show/Hide Preview

A toggle action that shows or hides the *Preview* pane.

Export as DITA Topic

Converts the current Markdown document into a DITA topic.

Export as XDITA Topic

Converts the current Markdown document into a Lightweight DITA XML topic.

Export as HTML

Converts the current Markdown document into an XHTML document.

Print (Available in the *Preview* pane)

Opens a page setup dialog box that allows you to configure printing options for the current document.

[Markdown Editor Syntax Rules and Specifications \(on page 1016\)](#)

Syntax Highlighting in the Markdown Editor

Oxygen XML Editor Eclipse plugin supports syntax highlighting in the Markdown editor to make it easier to read the semantics of the structured content by displaying each type of XML code in different colors and fonts.

Note:

For Markdown documents that contain code from other languages, those blocks are rendered with proper syntax highlights to make them more distinguishable. The languages that are rendered with syntax highlights within Markdown documents include JavaScript, JSON, YAML, XML, Java, Python, and CSS.

To customize the colors or styles used for the syntax highlighting colors for Markdown documents, follow these steps:

1. Open the **Preferences** dialog box (*on page 70*).
2. Go to **Editor > Syntax Highlight** (*on page 176*).
3. Select and expand the **Markdown** section in the top pane.
4. Select the component you want to change and customize the colors or styles using the selectors to the right of the pane.

You can see the effects of your changes in the **Preview** pane.

Related Information:

[Syntax Highlight Preferences](#) (*on page 176*)

[Markdown Editor](#) (*on page 1006*)

Automatic Validation in Markdown Documents

Markdown documents are validated automatically as you type. The conversion engine constantly tries to parse your changes to display the results in the *Preview* pane. If a change results in an error that prevents the parser from converting the syntax, an error message will be displayed in the **DITA** tab or in the **Results view** (*on page 335*) at the bottom of the editor.

Examples of the type of errors that will be reported include headers being in the wrong order or the syntax of a document begins with something other than a 1st level header.

Validating Markdown Documents with Schematron

It is possible to validate Markdown documents with Schematron rules. There are two ways to create an association between Markdown documents and Schematron files:

- You can configure an association using the [Markdown preferences page](#) (*on page 177*). You can specify a Schematron file to validate converted HTML content, as well as one to validate converted DITA content.
- You can create a Schematron association for Markdown documents by adding a [catalog mapping](#) (*on page 594*) for one of the following URIs:
 - <http://www.oxygenxml.com/schematron/validation/markdown-as-html> - The obtained Schematron will be applied over HTML conversions.
 - <http://www.oxygenxml.com/schematron/validation/markdown-as-dita> - The obtained Schematron will be applied over DITA conversions.

The catalog mapping is a fallback in case the Schematron validation is disabled in the [Markdown preferences page](#) (*on page 177*) or the path to the Schematron file is empty.

**Warning:**

If you are using a [custom version of DITA-OT](#) (*on page 81*), the mapping information might not be generated properly, causing issues with the Schematron validation. For example, error locations may not be accurate or synchronization may fail.

**Tip:**

Inside the samples folder, there is a `schematron-validation` folder with some files you can use to see how Schematron validation can be done with Markdown files. The path of the folder is: `[OXYGEN_INSTALL_DIR]/samples/markdown/schematron-validation/`.

[Markdown Editor \(on page 1006\)](#)

Working with Markdown Documents in DITA

The Oxygen XML Editor Eclipse plugin has special features that make it easy to incorporate Markdown documents into a DITA project. This is particularly useful for teams with members who are familiar with Markdown syntax but want to generate their output from DITA projects. The integration between the Markdown editor and DITA includes options to export or convert Markdown documents into DITA topics, as well as a live preview of the edited Markdown content.

Preview

The changes made to the Markdown content can be previewed live in three separate tabs: **DITA**, **XDITA**, and **HTML**.

The **DITA** tab in the *Preview* pane shows how an equivalent DITA topic will look after conversion. Similarly, the **XDITA** tab shows how a Lightweight DITA topic will look after conversion. The **HTML** tab shows a preview of the HTML equivalent.

Keys that are defined in the root map are also resolved in the *Preview* pane in the **XDITA** and **DITA** tabs.

**Note:**

To make the content generated for preview in the **DITA** and **XDITA** preview tabs more readable and to improve the conversion of Markdown to DITA in the editor, you can add an XML catalog to the [XML catalogs \(on page 594\)](#) list. This XML catalog will help with post-processing before the content is displayed. Here is an example of an XML catalog that you can use:

```
<catalog
  xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri
    name="http://www.oxygenxml.com/ns/preview/postprocess/dita" uri="postProcessDITA.xsl" />
  <uri
    name="http://www.oxygenxml.com/ns/preview/postprocess/lwdita" uri="postProcessLWDITA.xsl" />
</catalog>
```

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor Eclipse plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager** (on page 2337). The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (`topicref` element) with the `format` attribute set to `markdown`.
- **Validate Markdown Documents in DITA Maps** - When you use the  **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, Markdown documents that are referenced in the *DITA map* will be converted to DITA topics in the background and validated the same as any other DITA topic.
- **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

Figure 398. Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

Destination

The destination path for the new DITA topic.

File Name

Presents the current name and allows you to change it.

Update references

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

Delete Markdown file

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview

Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.

Convert

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a [LightWeight DITA topic](#).

Tip:

Oxygen XML Editor Eclipse plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the [Project Explorer view \(on page 269\)](#), open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

DITA-Related Markdown Syntax

For a list of Markdown rules and syntax examples that are specific to DITA, see the [Markdown DITA Syntax Reference](#).

[Markdown DITA Syntax Reference](#)

Markdown Editor Syntax Rules and Specifications

The Markdown editor in Oxygen XML Editor Eclipse plugin uses rules that were integrated from the most common set of [default Markdown syntax rules](#) along with many of the [GitHub Flavored Markdown rules](#).

This topic lists the Oxygen XML Editor Eclipse plugin implementation of the most commonly used syntax rules.

Headers

The Markdown editor supports two styles of headers, *Setext* and *Atx*.

- **Setext Style**

Setext-style headers are underlined using equal signs (for first-level headers) and dashes (for second-level headers). Any number of equal signs or dashes will result in the same output.

Example: Setext Style Headers

```
First-Level Header (H1)
=====

Second-Level Header (H2)
-----
```

- **Atx Style**

Atx-style headers use 1-6 hash characters at the start of the line, corresponding to header levels 1-6. Optionally, you may close atx-style headers. This is purely cosmetic and the closing hashes do not need to match the number of hashes used to open the header. It is the number of opening hashes that determines the header level.

Example: Atx Style Headers

```
# H1 text #
## H2 text
```

```
### H3 text #####
#### H4 text
##### H5 text ###
##### H6 text
```

Horizontal Rules (for HTML output only)

You can produce a horizontal rule tag (`<hr>`) by placing three or more hyphens, asterisks, or underscores on a line by themselves (they also need to be preceded and followed by a blank line). Optionally, they can be separated by spaces.

Example: Horizontal Rules

```
* * *
```

```
*****
```

```
-----
```

```
-----
```

Paragraphs and Line Breaks

A paragraph is simply one or more consecutive lines of text, separated by one or more blank lines. The text at the beginning of a paragraph should not be indented with spaces or tabs. To create a new paragraph, simply insert a blank line in between them.

Important:

When converting to HTML, if you break a paragraph on multiple lines (without a blank line in between them), it will create a break tag (`
`). When converting to DITA, the text is kept in a single paragraph in this case and a blank line is required to break a paragraph. This behavior differs slightly from the default Markdown rules.

Example: Paragraphs

```
This is a paragraph that contains
two lines of text. (In HTML, a break tag is created in between the two lines)

This is a new paragraph.
```

Styling Text

The Markdown editor supports some syntax rules for styling text (such as bold, italic, or strikethrough).

- **Italic (Emphasis)**

Text wrapped with one asterisk or underscore produces an italic (emphasis) tag.

```
*italic*
_italic_
```

- **Bold (Strong)**

Text wrapped with two asterisks or underscores produces a bold (strong) tag.

```
**bold**
__bold__
```

- **Strikethrough**

In HTML only, text wrapped with two tildes (~~) produces a strikethrough tag.

```
~~strikethrough~~
```

- **Underline**

Text wrapped with two plus signs (++) produces an underline tag.

```
++underline++
```

Tip:

You can also combine these styling rules. For example, `**BoldText _ItalicText_ BoldText**` would produce italicized text within bold text. Also, if you surround an asterisk or underscore with spaces, it will be treated as a literal asterisk or underscore. To produce a literal asterisk or underscore at a position where it would otherwise be used as a styling delimiter, you can escape it with a backslash (for example, `*literal asterisks*`).

Links

The Markdown editor supports two types of links, *inline* and *reference*. In both cases, it begins with link text that is delimited by [square brackets].

- **Inline Links**

To create an inline link, use a set of regular parentheses immediately after the closing square bracket for the link text. Inside the parentheses, put the URL where you want the link to point, and optionally a title surrounded in quotes. Also, if you reference a local resource on the same server, you can use relative paths.

Examples: Inline Link

With a title:

```
Text with [example link text](http://www.example.com/path "Title") inline link and title.
```

Without a title:

```
Text with [example link text](http://www.example.com/path) inline link without a title.
```

Relative path:

```
Text with [example link text](/relative_path/) inline link with relative path.
```

• **Reference Links**

Reference-type links use a second set of square brackets that include a label (link identifier) to reference the target for the link (link identifier may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (link identifiers) are only used for creating the links and do not appear in the output.

```
Text with [link text1][id 1] a reference-type link and [link text2][id_2] another one.
```

Then, somewhere in the document, you need to define your link label on a line by itself. The link identifier must be within square brackets followed by a colon, then after one or more spaces the URL for the link. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses. Also, the link may optionally be enclosed in angle brackets (< >).

```
[id 1]: http://example1.com/ "Optional Title"
[id_2]: <http://example2.com/> "Optional Title2"
```

Other notes about Reference Links:

- You can put the title on a second line and use extra spaces or tabs for padding. This is useful for aesthetics when the URL is long.

```
[id]: http://example.com/long/path/to/resource/here
    "Optional Title Here"
```

- The label (link identifier) can be missing, in which case the link text (in square brackets) is used as the name.

```
[My Link][]
```

and then defined as:

```
[My Link]: http://example.com/
```

Automatic Links

The Markdown editor supports a shortcut style for creating automatic links for URLs and email addresses. You simply surround the URL or email address with angle brackets.

Note:

These automatic links only work properly in HTML conversions. The *Preview* pane may display them properly in the DITA tab, but the DITA output will not properly recognize the format.

- **URLs**

By surrounding a URL with angle brackets, you can show the actual text of the URL while also making it clickable in the output.

```
<http://example.com/>
```

For example, in HTML it is converted to:

```
<a href="http://example.com/">http://example.com/</a>
```

- **Email Addresses**

Automatic links for email addresses work similarly, except that Markdown will also perform a bit of randomized decimal and hex entity-encoding to help obscure your address from address-harvesting *spambots*.

```
<address@example.com>
```

In HTML, it is converted to something like:

```
<a href="&#x6D;&#x61;i&#x6C;&#x74;&#x6F;:&#x61;&#x64;&#x64;&#x72;&#x65;
&#115;&#115;&#64;&#101;&#120;&#x61;&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;
&#109;">&#x61;&#x64;&#x64;&#x72;&#x65;&#115;&#115;&#64;&#101;&#120;&#x61;
&#109;&#x70;&#x6C;e&#x2E;&#99;&#111;&#109;</a>
```

Images

The Markdown editor uses an image syntax that is intended to resemble the syntax for two types of links (*inline* and *reference*). In both cases, the syntax for images begins with an exclamation mark, followed by `Alt` attribute text surrounded by square brackets, and then followed by a set of parentheses that contain the URL or path to the image.

- **Inline Images**

For inline images, use a set of regular parentheses immediately after the closing square bracket for the `Alt` attribute text. Inside the parentheses, put the URL or path of the image, and optionally a title surrounded in quotes.

Examples: Inline Images

With a title:

```
Text with ![Alt text](/path/to/img.jpg "Optional title") inline image and a title.
```

Without a title:

```
Text with ![Alt text](/path/to/img.jpg) inline link without a title.
```

- **Reference Images**

For reference-type images, use a second set of square brackets that include a label (image identifier) to identify the image (it may consist of letters, numbers, spaces, and punctuation and it is not case-sensitive). You can optionally use a space to separate the sets of brackets. The labels (image identifiers) do not appear in the output.

```
Text with ![Alt text][id] a reference-type image.
```

Then, somewhere in the document, you need to define your image label on a line by itself. The image identifier must be within square brackets followed by a colon, then after one or more spaces the URL or path of the image. Optionally this can be followed by a title enclosed in single quotes, double quotes, or parentheses.

```
[id]: url/to/image "Optional Title"
```

Blockquotes

The Markdown editor uses email-style greater than characters (>) for *blockquotes*. You only need to put the > before the first line of a hard-wrapped paragraph, but it looks better (and is clearer) if you put a > before every line.

- **Example: Blockquotes**

```
> This is a blockquote with two paragraphs. Lorem ipsum dolor sit amet,
> consectetur adipiscing elit. Aliquam hendrerit mi posuere lectus.
> Vestibulum enim wisi, viverra nec, fringilla in, laoreet vitae, risus.
>
> Donec sit amet nisl. Aliquam semper ipsum sit amet velit. Suspendisse
> id sem consectetur libero luctus adipiscing.
```

- **Example: Nested Blockquotes**

Blockquotes can be nested by adding additional levels of > characters.

```
> This is the first level of quoting.
>
> > This is nested blockquote.
>
> Back to the first level.
```

- **Example: Blockquotes with Other Markdown Elements**

Blockquotes can also contain other Markdown elements (such as headers, lists, and code blocks).

```
> ## This is a header.
>
> 1. This is the first list item.
> 2. This is the second list item.
>
```

```
> Here's some example code:
>
>     return shell_exec("echo $input | $markdown_script")
```

Quoting Code (Inline and Code Blocks)

The Markdown editor supports quoting code or commands inline within a sentence or in distinct blocks.

- **Inline**

You can quote or emphasize code within a sentence (inline) with single backticks (`). The text within the backticks will not be formatted.

Example: Inline Code Emphasis

```
This is a normal sentence with a `code` in the middle.
```

- **Code Blocks**

You can format code or text into its own distinct block by inserting a blank line before and after the content and using at least 4 spaces (or 1 tab), or by using opening and closing triple backticks (```) on separate lines.

Example: Code Block

```
This is a normal paragraph:

    This is a code block

This is a normal paragraph:

```
This is a code block
```
```

One level of indentation is removed from each line of a codeblock and it continues until it reaches a line that is not indented (or until the closing backticks).

Example: Code Block with Indentation

```
    tell application "something"
        beep
    end tell
```

For example, in HTML the result would look like this:

```
<pre><code>tell application "Foo"
    beep
```

```
end tell
</code></pre>
```

You can also add an optional language identifier to enable syntax highlighting in your code blocks. The Oxygen XML Editor Eclipse plugin Markdown editor syntax highlight supports the following languages: *Java*, *JavaScript*, *CSS*, and *Python*. When publishing Markdown content as part of a DITA project, more language values are supported and produce syntax highlights in the published WebHelp or PDF outputs: [How to Add Syntax Highlights for Codeblocks in the Output \(on page 1414\)](#).

Example: Syntax Highlighting in Code Block

```
```css
input[type="submit"] {
 color: white;
 font-weight: bold;
}
```
```

Inline XHTML (for HTML output only)

The Markdown editor supports writing inline XHTML. Since Markdown is just a writing format, it requires a conversion for publishing purposes. If you are using the HTML conversion, for any markup that is not covered by Markdown syntax, you can simply use XHTML syntax.

Example: Inline XHTML

```
This is a regular paragraph.

<table>
  <tr>
    <td>Col 1</td>
    <td>Col 2</td>
  </tr>
</table>

This is another regular paragraph.
```

Lists

The Markdown editor supports ordered and unordered lists. You can also insert *blockquotes (on page 1021)* and *code blocks (on page 1022)* inside list items. List markers typically start at the left margin, but may be indented by up to three spaces.

• Unordered Lists

For unordered lists, you can use asterisks (*), plus signs (+), and hyphens (-) interchangeably.

```
* List item 1
+ List item 2
- List item 3
```

• **Ordered Lists**

For ordered lists, use numbers followed by periods. The actual numbers you use have no effect on the output. It simply converts them to list items within an ordered list and the actual number of list items will determine the numbers in the output.

```
1. List item 1
8. List item 2
5. List item 3
```

• **Nested Lists**

You can create nested lists by indenting lines by three spaces.

```
1. Ordered list item 1
  1. Nested ordered list item 1
  2. Nested ordered list item 2
    * 2nd level nested unordered list item 1
    * 2nd level nested unordered list item 2
      * 3rd level nested unordered list item 1
  2. Ordered list item 2
```

• **Paragraphs Inside Lists**

If list items are separated by blank lines, Markdown will wrap the items in a paragraph in the output.

```
* List item 1

* List item 2
```

For both DITA and HTML output, this would result in:

```
<ul>
<li><p>List item 1</p></li>
<li><p>List item 2</p></li>
</ul>
```

• **Multiple Paragraphs Inside Lists**

List items may consist of multiple paragraphs. Each subsequent paragraph in a list item must be indented by either 4 spaces or one tab. Optionally, you can also indent each line of a paragraph to make it look nicer.

```
1. This is a list item with two paragraphs. Lorem ipsum dolor
   sit amet, consectetur adipiscing elit. Aliquam hendrerit
```

```
mi posuere lectus.
```

```
Vestibulum enim wisi, viverra nec, fringilla in, laoreet
vitae, risus. Donec sit amet nisl. Aliquam semper ipsum
sit amet velit.
```

```
2. Suspendisse id sem consectetuer libero luctus adipiscing.
```

• **Blockquotes Inside Lists**

To put a *blockquote* within a list item, the blockquote delimiters (>) need to be indented so that they are under the first letter of the text after the list item marker.

```
* A list item with a blockquote:
  > This is a blockquote
  > inside a list item.
```

• **Code Blocks Inside Lists**

To put a code block within a list item, insert an empty line in between the list item and the code block, and the code block needs to be indented twice (with 8 spaces or 2 tabs), or if you are using the triple backticks method, the opening triple backtick needs to be indented with 4 spaces or 1 tab.

```
* A list item with a code block:

    This is a code block inside a list item

    ...

    This is a code block inside a list item using the backticks method
    ...
```

Task Lists

You can create task lists by prefacing list items with a hyphen followed by a space followed by square brackets (- []). To mark a task as complete, use - [x].

Example: Task Lists

```
- [ ] Unfinished task 1
- [x] Finished task 2
```

Definition Lists

You can create definition lists by using a colon plus a space for each list item.

Example: Definition Lists

```
Term 1
: Definition A
: Definition B
```

Tables

You can create tables in the Markdown editor by using pipes (|) and hyphens (-).

• Creating a Table

Pipes are used to separate each column, while hyphens are used to create column headers. The pipes on either end of the table are optional. Cells can vary in width and do not need to be perfectly aligned within columns, but there must be at least three hyphens in each column of the header row.

```
| First Header | Second Header |
| ----- | ----- |
| Column 1 Row 1 Cell | Column 2 Row 1 Cell |
| Column 1 Row 2 Cell | Column 2 Row 2 Cell |
```

• Formatting Rules in Table Cells

You can use formatting rules inside the cells of the table (such as links, inline code blocks, and text styling).

```
| First Header | Second Header |
| --- | --- |
| `inline code` | Content with bold text inside cell |
```

• Aligning Text in Tables

You can align text to the left, right, or center of a column by including colons (:) to the left, right, or on both sides of the hyphens within the header row.

```
| Left-aligned | Center-aligned | Right-aligned |
| :--- | :---: | ---: |
| Content Cell | Content Cell | Content Cell |
```

• Joining Cells (Span a Cell Over Multiple Columns)

You can join cells horizontally (span a cell over multiple columns) by using multiple consecutive pipe characters (|) to the right of the particular cell. The number of consecutive pipes indicate the number of columns the cell will span (|| for two, ||| for three, and so on).

```
| First Header | Second Header | Third Header | Fourth Header |
| ----- | ----- | ----- | ----- |
| Content Cell | *Cell Span Over 3 Columns* |||
```

Emoji

You can add *emoji* in the Markdown editor by surrounding the EMOJICODE with colons (:EMOJICODE:).

Example: Emoji

```
:smile:
:laughing:
```

The resulting emoticons will appear in the output, but they are not displayed in the *Preview* pane.

For a full list of available emoji codes, see [Emoji Cheat Sheet](#).

Backslash Escapes

You can ignore Markdown formatting by using backslash escapes (\) to generate literal characters that would otherwise have special meaning in the Markdown syntax. For example, if you want to surround a word with literal asterisks (instead of an italic or emphasis tag), you can use backslashes to escape the asterisks.

```
\*literal asterisks\*
```

The Markdown editor provides backslash escapes for the following characters:

```
\  backslash
`  backtick
*  asterisk
_  underscore
{} curly braces
[] square brackets
() parentheses
#  hash mark
+  plus sign
-  minus sign (hyphen)
.  dot
!  exclamation mark
```

Automatic Escaping for Special Characters

The Markdown editor includes support for automatically escaping special characters such as angle brackets (< >) and ampersands (&). If you want to use them as literal characters, you must escape them as entities, as in the table below. The exception to this is in HTML output, if the special characters for a valid tag (for example,), they are treated as literal characters and escaping is not necessary.

Literal Character	Escaping Code
<	<
>	>

Literal Character	Escaping Code
&	&

Footnotes

The Markdown editor in Oxygen XML Editor Eclipse plugin supports normal and inline footnotes. The following examples show the required syntax.

- **Example: Normal Footnote**

```
Here is a footnote reference, [^1]
```

```
[^1]: Here is the footnote.
```

- **Example: Normal Footnote with Multiple Blocks**

```
Here is a footnote reference, [^longnote]
```

```
[^longnote]: Here is the footnote with multiple blocks.
```

```
    Subsequent paragraphs are indented with 4 spaces or 1 tab to show that they
    belong to the previous footnote.
```

- **Example: Inline Footnote**

```
Here is an inline note.^[Inlines notes are easier to write, since
you don't have to pick an identifier and move down to type the
note.]
```

DITA-Related Markdown Syntax

For information about unique Markdown features for DITA projects, see [Working with Markdown Documents in DITA \(on page 2467\)](#). Also, for a list of Markdown rules and examples for DITA, see the [Markdown DITA Syntax Reference](#).

Other Supported Document Types

Along with the [fully supported built-in frameworks \(document types\) \(on page 1030\)](#), Oxygen XML Editor Eclipse plugin also provides limited support (including document templates) for editing a variety of other document types. All the specialized views, editors, actions, and options are dynamic according to the type of

file that is opened or created. Other document types that are supported in Oxygen XML Editor Eclipse plugin include:

- **EPUB (NCX, OCF, OPF 2.0, 3.0, & 3.1)** ([on page 1163](#)) - A standard for e-book files.
- **OOXML** ([on page 1827](#)) - An XML-based file format for representing spreadsheets, charts, presentations, and word processing documents.
- **ODF** ([on page 1827](#)) - An free and open-source XML-based file format for electronic office documents, such as spreadsheets, charts, presentations, and word processing documents.
- **DocBook Targetset** ([on page 1075](#)) - For resolving cross-references when using *olinks*.
- **MathML** ([on page 521](#)) - Mathematical Markup Language (2.0 and 3.0) is an application of XML for describing mathematical notations.
- **XMLSpec** - A markup language for W3C specifications and other technical reports.
- **DITAVAL** - DITA conditional processing profile to identify the values you want to conditionally process for a particular output, build, or other purpose.
- **Daisy XML** - A technical standard for digital audio books, periodicals, and computerized text. It is designed to be an audio substitute for print material.
- **Maven Project & Settings** - Project or settings file for Maven build automation tool that is primarily used for Java projects.
- **Oasis XML Catalog** - An *XML Catalog* ([on page 2683](#)) document that describes a mapping between external entity references and locally-cached equivalents.
- **Other Non-XML Files** ([on page 267](#)) - Oxygen XML Editor Eclipse plugin also includes a simple text editor and a variety of helpful features for creating and editing non-XML files.

External Document Types

Some document types are available to be manually installed from GitHub:

- **StratML (Part 1 & 2)** - Part 1 and 2 of the Strategy Markup Language specification. Available to be installed from [GitHub](#).
- **EAD** - Encoded Archival Description is an XML standard for encoding archival finding aids. Available to be installed from [GitHub](#).
- **KML** - Keyhole Markup Language is an XML notation for expressing geographic visualization in maps and browsers. Available to be installed from [GitHub](#).

9.

Built-in Frameworks (Document Types)

Oxygen XML Editor Eclipse plugin includes a variety of specialized editors, views, and features that are dynamic according to the type of document that you open or create. Oxygen XML Editor Eclipse plugin includes fully supported built-in *frameworks* (on page 2679) for popular XML document types (e.g. DITA, DocBook, TEI, XHTML, JATS), as well as other document types (e.g. JSON, YAML, OpenAPI, Markdown, HTML, CSS), each with a specialized set of *editing features for the particular document type* (on page 306).

The built-in *frameworks* (on page 2679) are defined according to a set of rules and a variety of settings that improve editing capabilities for its particular file type. These settings include:

- A default grammar used for validation and content completion in both **Author** mode and **Text** mode.
- CSS stylesheets for rendering XML documents in **Author** mode.
- User actions invoked from toolbars or menus in **Author** mode.
- Built-in transformation scenarios used for publishing XML documents.
- *XML Catalogs* (on page 2683) used for mapping resources.
- New document templates to make it easy to create XML documents.
- User-defined extensions for customizing the interaction with the content author in **Author** mode.

It is also possible to create and configure your own custom *frameworks* (document types). For more information, see the *Creating and Configuring Custom Frameworks* (on page 1941) section.

For extensive details about the DITA editing features included in Oxygen XML Editor Eclipse plugin, see the *DITA Authoring chapter* (on page 2327).

DocBook 4 Document Type (Framework)

DocBook is a very popular set of tags for describing books, articles, and other prose documents, particularly technical documentation. DocBook provides a vast number of semantic element tags, divided into three broad categories: structural, *block-level*, and *inline*. DocBook content can then be published in a variety of formats, including HTML, PDF, WebHelp, and EPUB.

File Definition

A file is considered to be a *DocBook 4* document when one of the following conditions are true:

- The root element name is `<book>` or `<article>`.
- The PUBLIC ID of the document contains the string `-//OASIS//DTD DocBook XML`.

Default Document Templates

There are a variety of default *DocBook 4* templates available when creating [new documents from templates \(on page 253\)](#) and they can be found in: **Framework Templates > DocBook 4**.

The default templates for DocBook 4 documents are located in the `[OXYGEN_INSTALL_DIR]/frameworks/docbook/templates/Docbook 4` folder.

Default Schema for Validation and Content Completion

The default schema that is used if one is not detected in the DocBook 4 file is `docbookxi.dtd` and it is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/4.5/dtd/`.

Default CSS

The default CSS files used for rendering DocBook content in **Author** mode are stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/css/`.

By default, these default CSS files are merged with any that are specified in the document. For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Default XML Catalog

The default *XML Catalog (on page 2683)*, `catalog.xml`, is stored in `[OXYGEN_INSTALL_DIR]/frameworks/docbook/`.

Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes numerous built-in DocBook transformation scenarios that allow you to transform DocBook 4 documents to a variety of outputs, such as WebHelp, PDF, HTML, HTML Chunk, XHTML, XHTML Chunk, and EPUB. All of them are listed in the **DocBook 4** section in the **Configure Transformation Scenario(s)** dialog box [\(on page 1300\)](#).

For more information, see the [DocBook Transformation Scenarios \(on page 1200\)](#) section.

DocBook 4 Author Mode Actions

A variety of actions are available for DocBook 4 documents in the **DocBook4** menu, toolbar, contextual menu, and the *Content Completion Assistant (on page 2677)*.

DocBook 4 Toolbar Actions

The following default actions are available on the DocBook toolbar when editing in **Author** mode (by default, most of them are also available in the **DocBook4** menu and in various submenus of the contextual menu):

B Bold

Emphasizes the selected text by surrounding it with a *bold* tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an *italic* tag. You can use this action on multiple non-contiguous selections.

U Underline

Emphasizes the selected text by surrounding it with an *underline* tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

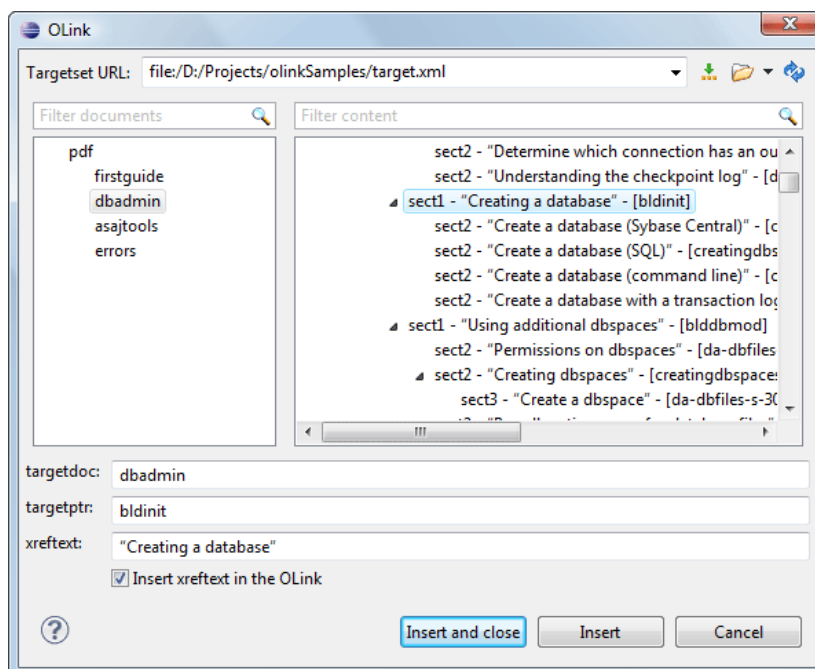

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the values of the `@targetdoc` and `@targetptr` attributes that are present in a **Targetset (on page 1075)** file.

Figure 399. Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed allowing you to easily identify the `@targetptr` for the `<olink>` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `<olink>` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `<olink>`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Edit OLink

Opens a dialog box that allows you edit an existing *OLink*. See the **Insert OLink** action for more information.

Insert Image

Opens a dialog box that allows you to select the path of an **image to insert at the cursor position** (*on page 491*). Depending on the current location, an image-type element is inserted. If the action is invoked between two block elements (such as paragraphs), the dialog box also allows you to provide a title.

Insert Media Resource

Opens a **Choose Media dialog box** ([on page 519](#)) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

§ ▾ **Section Drop-Down Menu**

The following actions are available from this menu:

§ **Insert Section**

Inserts a new section or subsection in the document, depending on the current context. For example, if the current context is `<sect1>`, then a `<sect2>` is inserted. By default, this action also inserts a `<para>` element as a child node. The `<para>` element can be deleted if it is not needed.

← **Promote Section (Ctrl + Alt + LeftArrow (Command + Option + LeftArrow on macOS))**

Promotes the current node as a sibling of the parent node.

→ **Demote Section (Ctrl + Alt + RightArrow (Command + Option + RightArrow on macOS))**

Demotes the current node a child of the previous node.

Insert Paragraph

Insert a new paragraph element at current cursor position.

Σ **Insert Equation**

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations \(on page 521\)](#).

Insert List Item

Inserts a list item in the current list type.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Insert Itemized List

Inserts an itemized list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an itemized list.

Insert Variable List

Inserts a DocBook variable list. A child list item is also inserted automatically by default. You can also use this action to convert selected paragraphs or other types of lists to a variable list.

Insert Procedure List

Inserts a DocBook `<procedure>` element. A `<step>` child element is also inserted automatically. You can also use this action to convert selected paragraphs or other types of lists to a procedure list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Row

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Column

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DocBook4 Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DocBook4** menu at the top of the interface):

Edit Attributes

Displays an *in-place attributes editor* (*on page 407*) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the *profiling attributes* (*on page 442*) defined on all selected elements.

Cut (**Ctrl + X** (**Command + X** on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (**Ctrl + C** (**Command + C** on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (**Ctrl + V** (**Command + V** on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions:

Paste As XInclude

Allows you to create an `<xi:include>` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as link

Allows you to create a `<link>` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Paste as xref

Allows you to create an `<xref>` element that references a DocBook element copied from **Author** mode. The operation fails if the copied element does not have a declared ID.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image**

Map Editor dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Insert submenu

This submenu includes the following insert actions that are specific to the DocBook *framework*.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Image

Inserts an *image reference (on page 491)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Media Resource

Opens a **Choose Media** dialog box (*on page 519*) that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Σ Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and *edit MathML notations (on page 521)*.

Insert Paragraph

Inserts a new *paragraph* element at current cursor position.

§ Insert Section

Inserts a new *section* element in the document, depending on the current context.

Insert XInclude

Opens a dialog box that allows you to browse and select content to be included and automatically generates the corresponding XInclude instruction.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- #<decimal value> - e.g. #65
- &#<decimal value> - e.g. A
- #x<hexadecimal value> - e.g. #x41
- &#x<hexadecimal value> - e.g. A

§ Section submenu

The following actions are available in this submenu:

← Promote Section (**Ctrl + Alt + LeftArrow (Command + Option + LeftArrow on macOS)**)

Promotes the current node as a sibling of the parent node.

→ Demote Section (**Ctrl + Alt + RightArrow (Command + Option + RightArrow on macOS)**)

Demotes the current node a child of the previous node.

🔗 Link submenu

The following actions are available in this submenu:

Cross reference (link)

Opens a dialog box that allows you to select a target to insert as a hypertext link.

Cross reference (xref)

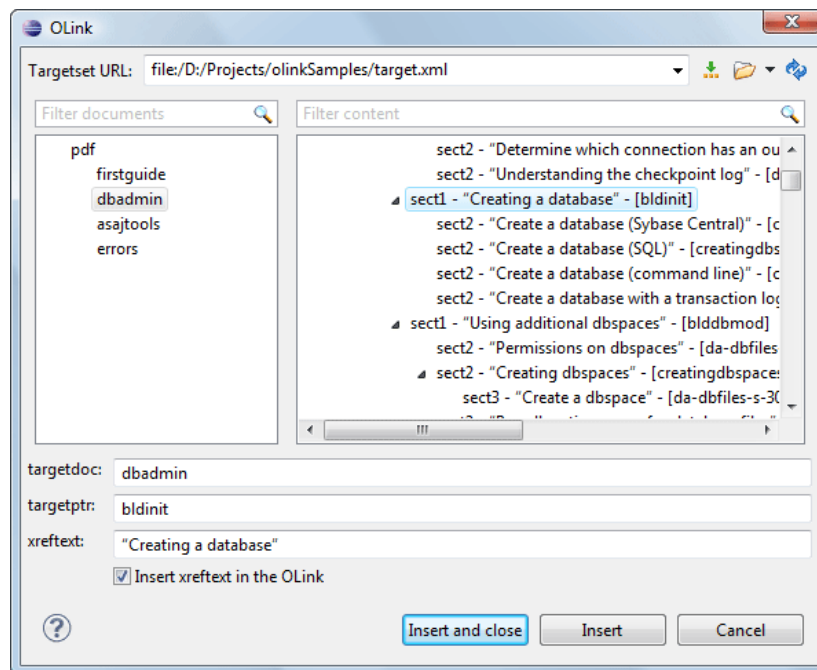

Inserts a cross reference to other parts of the document.

Web Link (ulink)

Inserts a link that addresses its target with a URL (Universal Resource Locator).

Insert OLink

Opens an **OLink** dialog box that allows you to insert a link that addresses its target indirectly, using the values of the `@targetdoc` and `@targetptr` attributes that are present in a **Targetset** (on page 1075) file.

Figure 400. Insert OLink Dialog Box

After you choose the **Targetset URL**, the structure of the target documents is presented. For each target document (`@targetdoc`), its content is displayed allowing you to easily identify the `@targetptr` for the `<olink>` element that will be inserted. You can also use the search fields to quickly identify a target. If you already know the values for **targetdoc** and **targetptr**, you can insert them directly in the corresponding fields. You can also edit an `<olink>` using the **Edit OLink** action that is available on the contextual menu. The last used **Targetset** URL will be used to identify the edited target.

To insert XREF text into the `<olink>`, enter the text in the **xreftext** field and make sure the **Insert xreftext in the OLink** option is selected.

Insert URI

Inserts a URI element. The URI identifies a Uniform Resource Identifier (URI) in content.

Edit OLink

Opens a dialog box that allows you edit an existing *OLink*. See the **Insert OLink** action for more information.

Table actions

The following table editing actions are available in the contextual menu when it is invoked on a table:

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

 **Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

 **Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

 **Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

 **Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

 **Sort**

Sorts cells or list items in a table.

 **Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

**Note:**

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

**Note:**

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to `␣`
- 0x0125 to `ñ`
- 265 to `␣`
- 2190 to `␣`

**Note:**

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements (on page 2676)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 120*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 120*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

 **Show/Edit Comment**

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

 **Remove Comment**

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

 **Manage Reviews**

Opens the **Review** view (*on page 438*).

Folding submenu

This submenu includes the following actions:

 **Toggle Fold**

Toggles the state of the current fold.

 **Collapse Other Folds**

Folds all the elements except the current element.

 **Collapse Child Folds**

Folds the elements indented with one level inside the current element.

 **Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))**

Unfolds all child elements of the currently selected element.

 **Expand All**

Unfolds all elements in the current document.

About Element >  Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the **CSS Inspector** view (*on page 414*) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the **Author mode preferences** page (*on page 136*) where you can configure various options with regard to the **Author** editing mode.

Floating Contextual Toolbar for DocBook

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 401. DocBook Floating Contextual Toolbar

The *floating contextual toolbar* is automatically displayed when editing DocBook documents in the following situations:

- When a `<para>` or `<listitem>` element has a selection inside, the floating toolbar includes actions such as **B Bold**, **I Italic**, **U Underline**, **T₂ Subscript**, and **T² Superscript**.
- When an `<imagedata>` or `<videodata>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When an `<olink>` element is selected, the floating toolbar includes an **Edit OLink** action.
- When a `<link>` or `<include>` element is selected, the floating toolbar includes a URL chooser where you can select the appropriate target.
- When a `<programlisting>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@language` attribute.
- When an `<itemizedlist>`, `<orderlist>`, `<variablelist>`, or `<procedure>` element is selected, the floating toolbar includes actions for converting it to a different type of list or sorting the list.
- When a `<listitem>`, `<varlistentry>`, or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<tr>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
- When an `<entry>` or `<td>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
- When a `<table>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

DocBook 4 Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project Explorer view** (on page 269) or **DITA Maps Manager view** (on page 2337) and dropping it into a DocBook 4 document that is edited in **Author** mode, creates a link to the dragged file (the `<ulink>` DocBook element) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project Explorer view** (on page 269) and drop them into a DocBook 4 document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the `<inlinegraphic>` DocBook element with a `@fileref` attribute).

**Tip:**

For information about customizing **Author** mode actions for a particular *framework (on page 2679)* (document type), see the *Customizing the Author Mode Editing Experience for a Framework (on page 1955)* section.

Inserting an Olink in DocBook Documents

The `<olink>` element is used for linking to resources outside the current DocBook document. The `@targetdoc` attribute is used for the document ID that contains the target element and the `@targetptr` attribute for the ID of the target element (the value of an `@id` or `@xml:id` attribute). The combination of those two attributes provides a unique identifier to locate cross references.

For example, a *Mail Administrator Guide* with the document ID `MailAdminGuide` might contain a chapter about user accounts, like this:

```
<chapter id="user_accounts">
<title>Administering User Accounts</title>
<para>blah blah</para>
```

You can form a cross reference to that chapter by adding an `<olink>`, as in the following example:

```
You may need to update your
<olink targetdoc="MailAdminGuide" targetptr="user_accounts">user accounts
</olink>
when you get a new machine.
```

To use an `<olink>` to create links between documents, follow these steps:

1. Decide which documents are to be included in the domain for cross referencing.

A unique ID must be assigned to each document that will be referenced with an `<olink>`. It is usually added as an `@id` (or `@xml:id` for DocBook5) attribute to the root element of the document.

2. Decide on your output hierarchy.

For creating links between documents, the relative locations of the output documents must be known. Before going further you must decide the names and locations of the output directories for all the documents from the domain. Each directory will be represented by an element: `<dir name="directory_name">`, in the target database document.

3. Create the target database document.

Each collection of documents has a main target database document that is used to resolve all *olinks* from that collection. The target database document is an XML file that is created once. It provides a means for pulling in the target data for each document. The database document is static and all the document data is pulled in dynamically.

**Tip:**

Oxygen XML Editor Eclipse plugin includes a built-in new document template called **DocBook Targetset Map** available in the **New from templates wizard** (*on page 253*) that will help you get started.
