If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in [Oxygen XML Editor Eclipse plugin operations](#) ([on page 1962](#)). If the class is not found in this package, then it will be loaded using the specified name.

- **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed). The argument value supports [editor variables](#) ([on page 218](#)).
- **ID** - (optional) - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.

Example: oxy action function inside an oxy_button form control ([on page 2189](#)):

```
oxy_button(
  action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation,
```

```

    'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'),
    showIcon, true)

```

Example: `oxy_action` Function

You can also create a button form control directly from an `oxy_action` function:

```

oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After')

```

Tip:

A code template is available to make it easy to add the `oxy_action` function with the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_action` code template.

Related information

[Button Form Control \(on page 2189\)](#)

Action Lists: `oxy_action_list()` Function

This function allows you to define a sequential list of actions directly in the CSS, rather than referencing them from the associated framework.

The `oxy_action_list()` function is used from the [`oxy_buttonGroup\(\)` function \(on page 2192\)](#) that provides a graphical group of buttons with multiple custom actions. These actions are normally defined in the associated Document Type (*framework* configuration) but the `oxy_action_list()` function allows you to define the actions directly in the CSS instead of the *framework* configuration.

The arguments received by the `oxy_action_list()` function are a list of actions (executed sequentially) that are defined with the [`oxy_action\(\)` function \(on page 2165\)](#). The following properties are supported in the `oxy_action()` function:

- **name** - The name of the action. The name of the first defined action will be displayed as the label for the button or menu item.
- **description** (optional) - A short description with details about the result of the action. The description of the first defined action will be displayed in a tooltip.

- **icon** (optional) - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed using an *editor variable* (on page 218).
- **operation** - The name of the Java class implementing the `ro.sync.ecss.extensions.api.AuthorOperation` interface. There is also a variety of *predefined operations* (on page 1962) that can be used.

**Note:**

If the name of the operation specified in the CSS is not qualified (has no Java package name), then it is considered to be one of the built-in [Oxygen XML Editor Eclipse plugin operations](#) (on page 1962). If the class is not found in this package, then it will be loaded using the specified name.

- **arg-<string>** - All arguments with the `arg-` prefix are passed to the operation (the string that follows the `arg-` prefix is passed). The argument value supports *editor variables* (on page 218).
- **ID** - (optional) - The ID of the action from the *framework*. If this is specified, all others parameters are disregarded.

Example: `oxy action list` Function

```
p:after {
    content: oxy_buttonGroup(
        label, 'A group of actions',
        icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
        actions,
        oxy_action_list(
            oxy_action(
                name, 'Insert a new paragraph',
                description, 'Insert an element after the current one',
                operation, 'InsertFragmentOperation',
                arg-fragment, '<p></p>',
                arg-insertLocation, '.',
                arg-insertPosition, 'After'
            ),
            oxy_action(
                name, 'Delete',
                description, 'Deletes the current element',
                operation, 'DeleteElementOperation'
            )
        )
    )
}
```

**Tip:**

A code template is available to make it easy to add the `oxy_action_list` function with the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_action_list` code template.

Related information

[Actions: oxy_action\(\) Function \(on page 2165\)](#)

[Button Group Form Control \(on page 2192\)](#)

Attributes Concatenation: oxy_attributes() Function

This function concatenates the attributes for an element and returns the serialization.

Syntax:

```
oxy_attributes ( )
```

Example: oxy_attributes Function

```
element{
  content:oxy_attributes();
}
```

For instance, if you have the following XML fragment: `<element att1="x" xmlns:a="2" x="""/>`, the CSS function will display:

```
att1="x" xmlns:a="2" x=""
```

Base URL: oxy_base-uri() Function

This function evaluates the base URL in the context of the current node.

It does not have any arguments and takes into account the `xml:base` context of the current node. See the [XML Base specification](#) for more details.

Example: oxy_base-uri Function

Suppose you have some image references but you want to see other thumbnail images that reside in the same folder (in **Author** mode):

```
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

Capitalization: oxy_capitalize() Function

This function capitalizes the first letter of the text received as argument.

Syntax:

```
oxy_capitalize ( text )
```

text

The text in which the first letter will be capitalized.

Example: *oxy_capitalize* Function

```
*:before{
  content: oxy_capitalize(oxy_name()) ": ";
}
```

This would insert the capitalized qualified name as static text content before the element.

Compound Actions: *oxy_compound_action()* Function

This function allows you to define multiple actions that will be executed sequentially.

The `oxy_compound_action()` function is used from the `oxy_button()` form control function ([on page 2189](#)) or the `oxy_buttonGroup()` form control function ([on page 2192](#)).

The arguments received by the `oxy_compound_action()` function are a list of actions (executed sequentially) that are defined with the `oxy_action()` function ([on page 2165](#)).

You can use three optional properties (`name`, `description`, `icon`) in the `oxy_compound_action()` function to provide labels for the compound action. If you do not specify these three properties, those same properties defined in the first `oxy_action` function will be used for the labels.

- **name** - The name of the action. It will be displayed as the label for the action. If you want to reuse the name of an action already defined in your framework, you can use the `oxy_getActionName` function.
- **description** - A short description with details about the result of the action. It will be displayed in a tooltip when hovering over the button linked to this action. If you want to reuse the description of an action already defined in your framework, you can use the `oxy_getActionDescription` function.
- **icon** - A path relative to the CSS pointing to an image (the icon for the action). The path can point to resources that are packed in Oxygen XML Editor Eclipse plugin (`oxygen.jar`) by starting its value with `/` (for example, `/images/Remove16.png`). It can also be expressed as an [editor variable](#) ([on page 218](#)). If you want to reuse the icon of an action already defined in your framework, you can use the `oxy_getActionIcon` function.

The `oxy_getActionName`, `oxy_getActionDescription`, and `oxy_getActionIcon` functions accept the following 2 parameters:

- **framework.defined.action.id** (required) - The ID of an action defined in the current framework that gets the name, description, or icon for that action.
- **fallback** (optional) - A fallback value in case the ID value provided in the `framework.defined.action.id` parameter is not found.

Example: `oxy_compound_action` Function

```
oxy_button(
  action,
    oxy_compound_action(
      name, oxy_getActionName('framework.id', 'Fallback'),
      description, 'Inserts a paragraph and uses form controls to edit its @audience attribute',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      oxy_action(
        name, 'Insert',
        description, 'Insert an element after the current one',
        operation, 'ro.sync.ecss.extensions.commons.operations.InsertFragmentOperation',
        icon, url('insert.png'),
        arg-fragment, "<p audience=''></p>",
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
      ),
      oxy_action(
        name, 'Activate edit mode',
        description, 'Sets a pseudo class that will activate a CSS rule that will present a
text field form control for the @audience attribute',
        operation, 'SetPseudoClassOperation',
        arg-name, 'edit-mode-on',
        arg-elementLocation, '.'
      )
    )
  ), showIcon, true)
```

Tip:

A code template is available to make it easy to add the `oxy_compound_action` function with the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_action_list` code template.

Related information

Actions: `oxy_action()` Function (on page 2165)

Button Form Control (on page 2189)

Concatenation: `oxy_concat()` Function

This function concatenates the received string arguments.

Syntax:

```
oxy_concat ( str_1 , str_2 )
```

str_1 ... str_n

The string arguments to be concatenated.

Example: `oxy_concat` Function

If an XML element has a `@padding-left` attribute:

```
<p padding-left="20">...
```

and you want to add a padding before it with that specific amount specified in the attribute value:

```
*[padding-left]{
  padding-left:oxy_concat(attr(padding-left), "px");
}
```

Get Text: `oxy_getSomeText(text, length)` Function

This function allows you to truncate a long string and to set a maximum number of displayed characters.

Syntax:

```
oxy_getSomeText ( text , length , endsWithPoints )
```

text

Displays the actual text.

length

Sets the maximum number of characters that are displayed.

endsWithPoints

Specifies if the truncated text ends with ellipsis.

Example: `oxy_getSomeText` Function

If an attribute value is very large, you can trim its content before it is displayed as static content:

```
*[longdesc]:before{
  content: oxy_getSomeText(attr(longdesc), 200);
}
```

Indexing: `oxy_indexof()` Function

This function is used to define searches.

The `oxy_indexof()` function has two signatures:

Syntax 1:

```
oxy_indexof ( text , toFind )
```

Returns the index within **text** string of the first occurrence of the **toFind** substring.

text

Text to search in.

toFind

The searched substring.

Syntax 2:

```
oxy_indexof ( text , toFind , fromOffset )
```

Returns the index within **text** string of the first occurrence of the **toFind** substring. The search starts from **fromOffset** index.

text

Text to search in.

toFind

The searched substring.

fromOffset

The index to start the search from.

Example: `oxy_indexof` Function

`oxy_indexof('abcd', 'bc')` returns 1.

`oxy_indexof('abcdbc', 'bc', 2)` returns 4.

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
    oxy_indexof(attr(longdesc), "Appendix"));
}
```

Label: `oxy_label()` Function

This function can be used in conjunction with the CSS `content` property to change the style of generated text.

The arguments of the function are *property name - property value* pairs. The following properties are supported:

- **text** - This property specifies the built-in form control you are using.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **background-color** - Specifies the background color of the form control. If the value of the `background-color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **styles** - Specifies styles for the form control. The values of this property are a set of CSS properties:
 - **font-weight, font-size, font-style, font**
 - **text-align, text-decoration**
 - **width**
 - **color, background-color**
 - **link** - For more information about this property, see the [link property section \(on page 2160\)](#).

```
element{
  content: oxy_label(text, "Label Text", styles,
    "font-size:2em;color:red;link:attr(href);");
}
```

Instead of using the values of the `styles` property individually, you can define them in a CSS file as in the following example:

```
* {
  width: 40%;
  text-align:center;
}
```

Then refer that file with an `@import` directive, as follows:

```
elem {
  content: oxy_label(text, 'my_label', styles, "@import 'labels.css';")
}
```

CAUTION:

Extensive use of the `styles` property may lead to performance issues.

If the text from an `oxy_label()` function contains new lines, for example `oxy_label(text, 'LINE1\A LINE2', width, 100px)`, the text is split in two. Each of the two new lines has the specified width of 100 pixels.

**Note:**

The text is split after `\A`, which represents a new line character.

You can use the `oxy_label()` function together with a [built-in form control \(on page 2184\)](#) function to create a form control based layouts.

Example: oxy_label Function

An example of a use case is if you have multiple attributes on a single element and you want use form controls on separate lines and style them differently. Consider the following CSS rule:

```
person:before {
  content: "Name:*" oxy_textfield(edit, '@name', columns, 20)
  "\A Address:" oxy_textfield(edit, '@address', columns, 20)
}
```

Suppose you only want the **Name** label to be set to **bold**, while you want both labels aligned to look like a table (the first column with labels and the second with a text field). To achieve this, you can use the `oxy_label()` to style each label differently.

```
person:before {
  content: oxy_label(text, "Name:*", styles, "font-weight:bold;width:200px")
  oxy_textfield(edit, '@name', columns, 20) "\A "
  oxy_label(text, "Address:", styles, "width:200px")
  oxy_textfield(edit, '@address', columns, 20)
}
```

**Tip:**

A code template is available to make it easy to add the `oxy_label` function with the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_label` code template.

Last Occurrence: oxy_lastindexof() Function

This function is used to define last occurrence searches.

The `oxy_lastindexof()` function has two signatures:

Syntax 1:

```
oxy_lastindexof ( text , toFind )
```

Returns the index within **text** string of the rightmost occurrence of the **toFind** substring.

text

Text to search in.

toFind

The searched substring.

Syntax 2:

```
oxy_lastindexof ( text , toFind , fromOffset )
```

The search starts from **fromOffset** index. Returns the index within **text** string of the last occurrence of the **toFind** substring, searching backwards starting from the **fromOffset** index.

text

Text to search in.

toFind

The searched substring.

fromOffset

The index to start the search backwards from.

Example: *oxy_lastindexof* Function

`oxy_lastindexof('abcdbc', 'bc')` returns 4.

`oxy_lastindexof('abcdbccdbc', 'bc', 2)` returns 1.

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
    oxy_lastindexof(attr(longdesc), "Appendix"));
}
```

Link Text: *oxy_link-text()* Function

You can use this function on the CSS `content` property to obtain a text description from the source of a reference.

By default, the `oxy_link-text()` function resolves DITA and DocBook references. For further details about how you can also extend this functionality to other *frameworks (on page 2679)*, go to [Configuring an Extensions Bundle \(on page 2042\)](#).

DITA Support

For DITA, the `oxy_link-text()` function resolves the `<xref>` element and the elements that have a `@keyref` attribute. The text description is the same as the one presented in the final output for those elements. If you

use this function for a `<topicref>` element that has the `@navtitle` and `@locktitle` attributes set, the function returns the value of the `@navtitle` attribute.

DocBook Support

For DocBook, the `oxy_link-text()` function resolves the `<xref>` element that defines a link in the same document. The text description is the same as the one presented in the final output for those elements.

Example: `oxy_link-text` Function

For the following XML and associated CSS fragments the `oxy_link-text()` function is resolved to the value of the `@xreflabel` attribute.

```
<para><code id="para.id" xreflabel="The reference label">my code</code>
  </para>
<para><xref linkend="para.id"/></para>

xref {
  content: oxy_link-text();
}
```

If the text from the target cannot be extracted (for instance, if the `@href` is not valid), you can use an optional argument to display fallback text.

```
*[class~="map/topicref"]:before{
  content: oxy_link-text("Cannot find the topic reference");
  link:attr(href);
}
```

Local Name: `oxy_local-name()` Function

This function evaluates the local name of the current node.

It does not have any arguments.

Example: `oxy_local-name` Function

To insert the local name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_local-name() " : ";
}
```

Lowercase: `oxy_lowercase()` Function

This function transforms the text received as argument to lower case.

Syntax:

```
oxy_lowercase ( text )
```

text

The text to be lower cased.

Example: oxy_lowercase Function

To insert a lower-cased qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_lowercase(oxy_name()) ": ";
}
```

Name: oxy_name() Function

This function evaluates the qualified name of the current node.

It does not have any arguments.

Example: oxy_name Function

To insert a qualified name as static text content before the element, use this CSS selector:

```
*:before{
  content: oxy_name() ": ";
}
```

Parent URL: oxy_parent-url() Function

This function evaluates the parent URL of a URL received as string.

Syntax:

```
oxy_parent-url ( URL )
```

URL

The URL as string.

Replace: oxy_replace() Function

This function is used to replace a string of text.

The `oxy_replace()` function has two signatures:

Syntax 1:

```
oxy_replace ( text , target , replacement )
```

This function replaces each substring of the text that matches the literal target string with the specified literal replacement string.

text

The text in which the replace will occur.

target

The target string to be replaced.

replacement

The string replacement.

Example: Suppose that you have image references but you want to see other thumbnail images that reside in the same folder in the visual **Author** editing mode:

```
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

Syntax 2:

```
oxy_replace ( text , target , replacement , isRegExp )
```

This function replaces each substring of the text that matches the target string with the specified replacement string.

text

The text in which the replace will occur.

target

The target string to be replaced.

replacement

The string replacement.

isRegExp

If *true* the target and replacement arguments are considered regular expressions, if *false* they are considered literal strings.

Example: Suppose that you want to use a regular expression to replace all space sequences with an underscore:

```
image[title]{
  content:oxy_replace(attr(title), "\\s+", "_", true)
}
```

Substring of Text: oxy_substring() Function

This function is used to return a string of text.

The `oxy_substring()` function has two signatures:

Syntax 1:

```
oxy_substring ( text , startOffset )
```

Returns a new string that is a substring of the original **text** string. It begins with the character at the specified index and extends to the end of **text** string.

text

The original string.

startOffset

The beginning index, inclusive

Syntax 2:

```
substring ( text , startOffset , endOffset )
```

Returns a new string that is a substring of the original **text** string. The substring begins at the specified **startOffset** and extends to the character at index **endOffset** - 1.

text

The original string.

startOffset

The beginning index, inclusive.

endOffset

The ending index, exclusive.

Example: *oxy_substring* Function

`oxy_substring('abcd', 1)` returns the string 'bcd'.

`oxy_substring('abcd', 4)` returns an empty string.

`oxy_substring('abcd', 1, 3)` returns the string 'bc'.

If you only want to display part of an attribute value, for instance the part that comes before an **Appendix** string:

```
image[longdesc]{
  content: oxy_substring(attr(longdesc), 0,
    oxy_indexof(attr(longdesc), "Appendix"));
}
```

Unescape URL Value: `oxy_unescapeURLValue(string)` Function

This function returns the unescaped value of a URL-like string given as a parameter.

For example, if the value contains `%20` it will be converted to a simple space character.

Example: `oxy_unescapeURLValue` Function

`oxy_unescapeURLValue("http://www.example.com/a%20simple%20example.html")` returns the following value:

```
http://www.example.com/a simple example.html
```

Unparsed Entity URI: `oxy_unparsed-entity-uri()` Function

This function returns the URI value of an unparsed entity name.

Syntax:

```
oxy_unparsed-entity-uri ( unparsedEntityName )
```

unparsedEntityName

The name of an unparsed entity defined in the DTD.

This function can be useful to display images that are referenced with unparsed entity names.

Example: `oxy_unparsed-entity-uri` Function

CSS for displaying the image in Author for an *imagedata* with *entityref* to an unparsed entity:

```
imagedata[entityref]{
  content: oxy_url(oxy_unparsed-entity-uri(attr(entityref)));
}
```

Uppercase: `oxy_uppercase()` Function

This function transforms the text received as argument to upper case.

Syntax:

```
oxy_uppercase ( text )
```

text

The text to be capitalized.

Example: `oxy_uppercase` Function

To insert the upper-cased qualified name as static text content before the element, use this CSS selector:

```

*:before{
  content: oxy_uppercase(oxy_name()) ": ";
}

```

URL: oxy_url() Function

This function extends the standard CSS `url()` function by allowing you to specify additional relative path components (parameters `loc_1` to `loc_n`).

Oxygen XML Editor Eclipse plugin uses all these parameters to construct an absolute location. Note that any of the parameters that are passed to the function can be either relative or absolute locations. These locations can be expressed as String objects, functions, or [editor variables \(on page 218\)](#) (built-in or custom).

Syntax:

```
oxy_url ( base_location , loc_1 , loc_2 )
```

base_location

String representing the base location. If not absolute, will be solved relative to the CSS file URL.

loc_1 ... loc_n (optional)

Strings representing relative location path components.

Examples: oxy_url Function

The following function receives String objects as input parameters:

```
oxy_url('http://www.oxygenxml.com/css/test.css', '../dir1/',
       'dir2/dir3/', '../..../dir4/dir5/test.xml')
```

and returns:

```
'http://www.oxygenxml.com/dir1/dir4/dir5/test.xml'
```

The following function receives the result of the evaluation of two other functions as parameters (for instance, this is useful if you have image references and you want to see thumbnail images stored in the same folder):

```
image[href]{
  content:oxy_url(oxy_base-uri(), oxy_replace(attr(href),
    '.jpeg', 'Thumbnail.jpeg'));
}
```

The following function uses an [editor variable \(on page 218\)](#) as the first parameter to point to the Oxygen XML Editor Eclipse plugin installation location:

```
image[href] {
    content: oxy_url('${oxygenHome}', 'logo.png');
}
```

Related information

[Editor Variables \(on page 218\)](#)

XPath: oxy_xpath() Function

This function is used to evaluate XPath expressions.

Syntax:

```
oxy_xpath ( XPathExpression [ , processChangeMarkers , value ] [ , evaluate , value ] )
```

It evaluates the given XPath 3.1 expression using the latest Saxon XSLT processor bundled with the application and returns the result. XPath expressions that depend on the cursor location can be successfully evaluated only when the cursor is located in the actual XML content.

The parameters of the function are as follows:

- A required `expression` parameter, which is the XPath expression to be evaluated.
- An optional `processChangeMarkers` parameter, followed by its value, which can be either `true` or `false` (default value). When you set the parameter to `true`, the function returns the resulting text with all the change markers accepted (*delete* changes are removed and *insert* changes are preserved).
- An optional `evaluate` parameter, followed by its value, which can be one of the following:
 - **dynamic** - Evaluates the XPath each time there is a change in the document. This is the default evaluation value.

Important:

If the edited XML document is large, using dynamic XPath evaluation may induce performance issues while editing the content.

- **dynamic-once** - Separately evaluates the XPath for each node that matches the CSS selector. It will not re-evaluate the expression when changes are made to other nodes in the document. This will lead to improved performance, but the displayed content may not be updated to reflect the actual document content.
- **static** - If the same XPath is evaluated on several nodes, the result for the first evaluation will be used for all other matches. Use this only if the XPath does not contain a relationship with the node on which the CSS property is evaluated. This will lead to improved performance, but the static displayed content may not be updated to reflect the actual document content.

When XPath expressions are evaluated, the entities and `<xi:include>` elements are replaced with the actual content that is referenced. For example, consider the following code snippet:

```
<article>
  <xi:include href="section1.xml" xmlns:xi="http://www.w3.org/2001/XInclude"/>
</article>
```

where `section1.xml` contains the following content:

```
<section>
  <p>Referenced content</p>
</section>
```

The XPath expression will be executed over the actual content in the `section1.xml` file.

Example: `oxy_xpath` Function

The following example counts the number of words from a paragraph (including *tracked changes (on page 2683)*) and displays the result in front of it:

```
para:before{
  content:
    concat(" |Number of words:",
    oxy_xpath(
      "count(tokenize(normalize-space(string-join(text(), '')), ' '))",
      processChangeMarkers,
      true),
    " | ");
}
```

The `oxy_xpath()` function supports *editor variables (on page 218)*, as in the following example:

```
* {
  content:
    oxy_concat("Result: ",
    oxy_xpath('count(collection("${cfdu}/?select=*.xml"))')
    );
}
```

You can split the XPath expression on multiple lines by adding a backslash before each new line:

```
* {
  content: oxy_xpath('count(\
    collection(\
      "${cfdu}/?select=*.xml"))')
}
```

Form Controls

Oxygen XML Editor Eclipse plugin provides a variety of built-in form controls that allow users to interact with documents with familiar user interface objects. These form controls are defined in CSS stylesheets that are used to render **Author** mode. For customization purposes, Oxygen XML Editor Eclipse plugin also supports [custom form controls in Java \(on page 2215\)](#).

How to Add a Built-in Form Control in Author Mode

Form controls can be added by defining them in the CSS associated with the XML document.

1. Create a custom CSS file.
2. Define the form control in the CSS using its dedicated CSS function. For example, to add a [date picker form control \(on page 2200\)](#), its dedicated function is `oxy_datePicker`.
3. Associate the CSS file with the XML document in one of the following ways:
 - If you have a framework (document type) already created for this XML vocabulary, create a CSS in the framework directory and [associate the CSS with the framework \(on page 1955\)](#). This approach is recommended if you intend on sharing the customization with others.
 - If you do not have a framework, you can [associate the CSS to the XML document through a Processing Instruction \(on page 2117\)](#).

Resources

For more information about form controls, watch our video demonstration:

<https://www.youtube.com/embed/-WY3wzkMSLM>

Audio File Player Form Control

The `oxy_audio` built-in form control is used for providing a mechanism to play audio clips.

The `oxy_audio` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_audio(href, oxy_url(oxy_base-uri(), 'ex.mp3'), width, 400px)
```
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units.

Example: `oxy_audio` Form Control

```
object {
  content:
    oxy_audio(
      href, 'resources/audio.mp3',
```

```
width, 200px),
}
```

**Tip:**

To insert a sample of the `oxy_audio` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_audio` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

[Custom CSS Functions \(on page 2164\)](#)

[URL: oxy_url\(\) Function \(on page 2181\)](#)

Browser Form Control

The `oxy_browser` built-in form control is used for providing a mechanism to integrate HTML frames or interact with SVG documents directly in the **Author** mode editor. It can also be used to load HTML that executes JavaScript and from that JavaScript you can access the Oxygen XML Editor Eclipse plugin workspace.

The `oxy_browser` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_browser(href, oxy_url(oxy_base-uri(), 'ex.svg')), width, 50%, height, 50%)
```

- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units.
- **height** - Specifies the height of the form control area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units.

Example: oxy_browser Form Control

```
object {
  content:
    oxy_browser(
      href, 'http://example.page',
```

```
width, 600px,
height, 400px);
}
```

**Tip:**

To insert a sample of the `oxy_browser` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_browser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

Interacting with the Oxygen XML Editor Eclipse plugin Workspace

The `oxy_browser` form control also provides the possibility of creating custom form control without having to use the Java-based API. You can use the `oxy_browser` form control to load HTML that executes JavaScript. In the JavaScript, you can use some predefined global variables that provide a gateway between the JavaScript and the Oxygen XML Editor Eclipse plugin Java API. This allows you to perform changes in the document, open resources, and more, solely from the JavaScript.

**Important:**

This will only work if the loaded HTML is located inside a [framework or plugin directory \(on page 90\)](#), such as: `[OXYGEN_INSTALL_DIR]/frameworks/` or `[OXYGEN_INSTALL_DIR]/plugins/`.

The following global variables can be used:

- **authorAccess** - This object is an instance of `ro.sync.ecss.extensions.api.AuthorAccess`.
- **contextElement** - An instance of `ro.sync.ecss.extensions.api.node.AuthorNode`. The form control is added over this node.
- **pluginWorkspace** - An instance of `ro.sync.xml.workspace.api.standalone.StandalonePluginWorkspace`.
- **fcArguments** - A `java.util.Map` implementation with the properties (name and value pairs) passed on the form control function.
- **apiHelper** - A helper object for creating Java objects. It allows you to create Java objects from within the JavaScript code. These objects can then be passed to the Java methods as in the following example:

```
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```

You can also specify the constructor signature:

```
var newAttrValue = apiHelper.newInstance(
    "ro.sync.ecss.extensions.api.node.AttrValue
    (java.lang.String, java.lang.String, boolean)",
    ["normalizedValue", "rawValue", true]);
authorAccess.getDocumentController().setAttribute(
    "counter", newAttrValue, contextElement);
...
```

For more information, open the `form-controls.xml` file in the `[OXYGEN_INSTALL_DIR]/samples/form-controls` directory and go to section **11.1 - Interacting with the Oxygen Workspace**.

Warning:

On macOS, you need to use asynchronous calls to the API, due to the following JDK bug: <https://bugs.openjdk.java.net/browse/JDK-8087465>. By default, the API is called synchronously, but you can change this behavior for each API object by calling two methods: `sync()` and `async()`.

```
// By default, the methods are invoke synchronously.
var ctrl = authorAccess.getDocumentController();
try {
    // On Mac, methods that change the document must be executed asynchronously.
    ctrl.async();
    ctrl.setAttribute("counter", newAttrValue, contextElement);
} finally {
    ctrl.sync();
}
```

Listening for Changes in the Document

If the form control presents some information from the document (for example, the value of an attribute), then it needs to be notified on changes in the document so that it can update that information. To do this, follow these steps:

1. In the JavaScript, the `bridgeReady()` method is invoked as soon as the form control is loaded and the API bridge is installed. This is where you can add a listener:

```
function bridgeReady () {
    // We declare a member function for each method of the
    // ro.sync.ecss.extensions.api.AuthorListener interface (same function signature)
    var handler = {
        attributeChanged : function(event) {
            var node = event.getOwnerAuthorNode();
            var attrName = event.getAttributeName();
```

```

    if (node.equals(contextElement) && attrName === "counter") {
        init();
    }
},
contentDeleted : function(event) {},
contentInserted : function(event) {}
};

// We create a proxy over an ro.sync.ecss.extensions.api.AuthorListener that will
// delegate its methods to the JS object's functions.
// We assign the listener to a global variable so that we can remove it later on,
// on the dispose() method.
authorDocumentListener = apiHelper.createProxyListener(
    "ro.sync.ecss.extensions.api.AuthorListener", handler);

var ctrl = authorAccess.getDocumentController();

// Add the proxy listener.
ctrl.addAuthorListener(authorDocumentListener);
}

```

2. Since a listener was added on the document, it is important to remove it once the form control is not used anymore. When a form control is discarded, the `dispose()` JavaScript function is invoked, so if you have any cleanup to do, make sure you define a function with this name and remove any previously created listeners in it.

```

/**
 * The form control will not be used anymore. Clean up.
 */
function dispose() {
    // Dispose all added listeners.
    var ctrl = authorAccess.getDocumentController();
    ctrl.removeAuthorListener(authorDocumentListener);
}

```

Debugging JavaScript Used for Custom Form Controls

If you encounter unexpected results when using the [method described above \(on page 2186\)](#), you can debug the script by using the following guidelines:

- Calls to `alert("message.to.present")` or `console.log("message.to.present")` will be presented in the [Results panel \(on page 335\)](#).
- You can install the [Firebug extension](#) by executing the following script:

```

{code:javascript}
function installFB() {
  if (!document.getElementById('FirebugLite')) {
    E = document['createElement' + 'NS'] && document.documentElement.namespaceURI;
    E = E ? document['createElement' + 'NS'](E, 'script')
      : document['createElement']('script');
    E['setAttribute']('id', 'FirebugLite');
    E['setAttribute']('src',
      'https://getfirebug.com/' + 'firebug-lite.js' + '#startOpened');
    E['setAttribute']('FirebugLite', '4');
    (document['getElementsByTagName']('head')[0]
      || document['getElementsByTagName']('body')[0]).appendChild(E);
    E = new Image;
    E['setAttribute']('src', 'https://getfirebug.com/' + '#startOpened');
  }
}
{code}

```

**Note:**

To force the *Browser Form Control* to reload after making changes to the JavaScript file, you need to use the **Reload page** action from the form control's contextual menu.

[URL: oxy_url\(\) Function \(on page 2181\)](#)

Button Form Control

The `oxy_button` built-in form control is used for graphical user interface objects that invoke a custom **Author** mode action (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_button` form control supports the following properties:

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **transparent** - Flattens the aspect of the button form control, removing its border and background. The values of this property can be `true` or `false` (default value).
- **showText** - Specifies if the action text should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```
element {
  content: oxy_button(actionID, 'remove.attribute', showText, true);
}
```

- **showIcon** - Specifies if the action icon should be displayed on the button form control. If this property is missing then the button displays the icon only if it is available, or the text if the icon is not available. The values of this property can be `true` or `false`.

```
element {
  content: oxy_button(actionID, 'remove.attribute', showIcon, true);
}
```

- **enableInReadOnlyContext** - To enable [button form controls \(on page 2189\)](#) or [groups of buttons form controls \(on page 2192\)](#), this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_button(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

- **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

- **actionID** - The ID of the action, specified in the *document type association (on page 98)*, that is invoked when you click the button.

**Note:**

The element that contains the form control represents the context where the action is invoked.

- **action** - Defines an action directly, rather than using the `actionID` parameter to reference an action from the *document type association (on page 98)*. This property is defined using the *oxy_action function (on page 2165)*.

**Tip:**

You can also create a button form control [directly from an oxy_action function \(on page 2166\)](#).

```
oxy_button(action, oxy_action(
    name, 'Insert',
    description, 'Insert an element after the current one',
    icon, url('insert.png'),
    operation, 'InsertFragmentOperation',
    arg-fragment, '<element>${caret}</element>',
    arg-insertLocation, '.',
    arg-insertPosition, 'After'
))
```

**Tip:**

To execute multiple actions sequentially, you can use the [oxy_compound_action function \(on page 2169\)](#).

Example: oxy_button Form Control

```
button:before {
    content: "Label:"
    oxy_button(
        /* This action is declared in the document type
           associated with the XML document. */
        actionID, "insert.popupWithMultipleSelection");
}
```

**Tip:**

To insert a sample of the `oxy_button` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_button` code template. Also, an `oxy_button_in_place_action` code template is available that inserts an `oxy_button` function that includes an `action` parameter.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

[Actions: oxy_action\(\) Function \(on page 2165\)](#)

Button Group Form Control

The `oxy_buttonGroup` built-in form control is used for a graphical user interface group of buttons that invokes one of several custom **Author** mode actions (defined in the associated Document Type) referencing it by its ID, or directly in the CSS.

The `oxy_buttonGroup` form control supports the following properties:

- **label** - Specifies the label to be displayed on the button. This label can be translated using the `$(i18n())` editor variable (on page 225).
- **icon** - The path to the icon to be displayed on the button.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **transparent** - Makes the button transparent without any borders or background colors. The values of this property can be `true` or `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **enableInReadOnlyContext** - To enable [button form controls \(on page 2189\)](#) or [groups of buttons form controls \(on page 2192\)](#), this property needs to be set to `true`. This property can be used to specify areas as *read-only* (by setting the `-oxy-editable` property to `false`). This is useful when you want to use an action that does not modify the context.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_buttonGroup(hoverPseudoclassName, 'showBorder')
}
```

```
p:showBorder {
  border: 1px solid red;
}
```

- **actionIDs** - The IDs of the actions that will be presented in the group of buttons.
- **actionID** - The ID of the action, specified in the *document type association (on page 98)*, that is invoked when you click the button.

**Note:**

The element that contains the form control represents the context where the action is invoked.

- **actions** - Defines a sequential list of actions directly, rather than using the `actionID` parameter to reference actions from the *document type association (on page 98)*. This property is defined using the *oxy_action_list function (on page 2166)*.

```
oxy_buttonGroup(
  label, 'A group of actions',
  icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
  actions,
  oxy_action_list(
    oxy_action(
      name, 'Insert',
      description, 'Insert an element after the current one',
      operation, 'InsertFragmentOperation',
      arg-fragment, '<element></element>',
      arg-insertLocation, '.',
      arg-insertPosition, 'After'
    ),
    oxy_action(
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
    )
  )
)
```

**Tip:**

To execute multiple actions sequentially, you can use the *oxy_compound_action function (on page 2169)* in the *oxy_action_list function (on page 2166)*.

```
p:before {
  content:
  oxy_buttonGroup(
    label, 'A group of actions',
```

```

icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
actions,
  oxy_action_list(
    oxy_compound_action(
      name, oxy_getActionName('framework.id', 'Fallback'),
      description, 'Inserts a paragraph and uses form controls to edit its
@audience attribute',
      icon, url('http://www.oxygenxml.com/img/icn_oxy20.png'),
      oxy_action(
        name, 'Insert',
        description, 'Insert an element after the current one',

operation, 'ro.sync.ecss.extensions.common.operations.InsertFragmentOperation',
        icon, url('insert.png'),
        arg-fragment, "<p audience=''></p>",
        arg-insertLocation, '.',
        arg-insertPosition, 'After'
      ),
      oxy_action(
        name, 'Activate edit mode',
        description, 'Sets a pseudo class that will activate a CSS rule
that will present a text field form control for the @audience attribute',
        operation, 'SetPseudoClassOperation',
        arg-name, 'edit-mode-on',
        arg-elementLocation, '.'
      )
    ),
    oxy_action(
      name, 'Delete',
      description, 'Deletes the current element',
      operation, 'DeleteElementOperation'
    )
  )
}

```

- **actionContext** - Specifies the context that the action associated with the form control is executed. Its possible values are `element` (default value) and `caret`. If you select the `element` value, the context is the element that holds the form control. If you select the `caret` value, the action is invoked at the cursor

location. If the cursor is not inside the element that holds the form control, the `element` value is selected automatically.

- **actionStyle** - Specifies what to display for an action in the form control. The values of this property can be `text` (default value), `icon`, or `both`.

Example: `oxy_buttonGroup` Form Control

```
buttongroup:before {
  content:
    oxy_label(text, "Button Group:", width, 150px, text-align, left)
    oxy_buttonGroup(
      label, 'A group of actions',
      /* The action IDs are declared in the document type
         associated with the XML document. */
      actionIDs,
      "insert.popupWithMultipleSelection,insert.popupWithSingleSelection",
      actionStyle, "both");
}
```

Tip:

To insert a sample of the `oxy_buttonGroup` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_buttonGroup` code template. Also, an `oxy_buttonGroup_in_place_action` code template is available that inserts an `oxy_buttonGroup` function that includes an `oxy_action_list` function.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

Checkbox Form Control

The `oxy_checkbox` built-in form control is used for a graphical user interface box that you can click to enable or disable an option. A single checkbox or multiple checkboxes can be used to present and edit the value on an attribute or element.

The `oxy_checkbox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (on page 2681)* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

Note:

You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2155) to render the text only in the form control that the `oxy_editor` function specifies.

- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the *space* character is used.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `${comma}` variable (on page 224).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that are committed when the check-boxes are selected. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note:

Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **uncheckedValues** - Specifies the values that are committed when check-boxes are not selected.
- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `#{18n()}` editor variable (on page 225). If this property is not specified, the `values` property is used as the label.

- **columns** - Controls the layout of the form control. The check boxes will be grouped in a number of columns equal to the given value.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_checkbox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: Single *oxy_checkbox* Form Control

```
checkbox[attribute]:before {
  content: "A check box editor that edits a two valued attribute (On/Off)
          The values are specified in the CSS:"
  oxy_checkbox(
    edit, "@attribute",
    values, "On",
    uncheckedValues, "Off",
    labels, "On/Off");
}
```

Example: Multiple *oxy_checkbox* Form Controls

```
multipleCheckBox[attribute]:before {
  content: "Multiple checkboxes editor that edits an attribute value.
          Depending whether the check-box is selected,
          a different value is committed:"
  oxy_checkbox(
    edit, "@attribute",
    values, "true, yes, on",
    uncheckedValues, "false, no, off",
    resultSeparator, ",",
    labels, "Present, Working, Started");
}
```

Tip:

To insert a sample of the `oxy_checkbox` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_checkbox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

[Collapse Text: -oxy-collapse-text Property Value \(on page 2155\)](#)

Combo Box Form Control

The `oxy_combobox` built-in form control is used for providing a graphical user interface object that is a drop-down menu of proposed values. This form control can also be used for a combination of a drop-down menu and an editable single-line text field.

The `oxy_combobox` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a [QName \(on page 2681\)](#) and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

Note:

You can set the value of the [visibility property to -oxy-collapse-text \(on page 2155\)](#) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the **w** character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **editable** - This property accepts the **true** and **false** values. In addition to a drop-down menu, the **true** value also generates an editable text field box that allows you to insert other values than the proposed ones. The **false** value generates a drop-down menu that only accepts the proposed values.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `#{comma}` variable (on page 224).
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema..

**Note:**

Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\', '2\\', 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **labels** - This property must have the same number of items as the `values` property. Each item provides a literal description of the items listed in the `values` property. These labels can be translated using the `#{18n()}` editor variable (on page 225).

**Note:**

This property is only available for read-only combo boxes (the `editable` property is set to `false`).

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_combobox(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

- **canRemoveValue** - If the value is set to `true` and the combo box is not editable, then a new `<Empty>` value is added in that combo box. This clears or removes the value being edited, depending on if it edits an element or attribute.
- **onChange** - Can be used to invoke an action when the value of the combo box changes. The action can be created in the CSS using the `oxy_action()` function (on page 2165) or referenced from the `framework` (on page 2679) by its ID. After the action is executed, the cursor remains in the combo box. Note that this property does not support actions defined by JavaScript code.

Example: `oxy_combobox` Form Control

This example uses a combo box form control to edit an attribute value. Each time the value changes, it triggers an action that inserts an element into the attribute's parent element.

```

comboBox:before {
    content: "A combo box that edits an attribute value.
            The possible values are provided from CSS:"
    oxy_combobox(
        edit, "@attribute",
        editable, false,
        values, "value1, value2, value3",
        labels, "Value no1, Value no2, Value no3",
        onChange, oxy_action(
            name, 'Insert',
            operation, 'XQueryUpdateOperation',
            arg-script, 'insert node <product>{xs:string(@attribute)}</product>
                        as last into .');
    }
}

```

Tip:

To insert a sample of the `oxy_combobox` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the  `oxy_combobox` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

[\[OXYGEN_INSTALL_DIR\]/samples/form-controls.](#)

Date Picker Form Control

The `oxy_datePicker` built-in form control is used for offering a text field with a calendar browser that allows the user to choose a certain date in a specified format.

The `oxy_datePicker` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (on page 2681)* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:**

You can set the value of the `visibility` property to `-oxy-collapse-text` (on page 2155) to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the `w` character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **format** - This property specifies the format of the inserted date, if a specific format is not detected from the associated document schema. The pattern value must be a valid Java date (or date-time) format. If this property is missing, the format of the date is determined from the associated schema.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **validateInput** - Specifies if the form control is validated. If you introduce a date that does not respect the format, the `datePicker` form control is rendered with a red foreground. By default, the input is validated. To disable the validation, set this property to `false`.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_datePicker(edit, "@attribute", hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: oxy_datePicker Form Control

```
date {
  content:
    oxy_label(text, "Date time attribute with
```

```

        format defined in CSS: ", width, 300px)

oxy_datePicker(
    columns, 16,
    edit, "@attribute",
    format, "yyyy-MM-dd");
}

```

**Tip:**

To insert a sample of the `oxy_datePicker` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the  `oxy_datePicker` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

[Label: oxy_label\(\) Function \(on page 2173\)](#)

HTML Content Form Control

The `oxy_htmlContent` built-in form control is used for rendering HTML content. This HTML content is displayed as a graphical element shaped as a box. The shape of the box is determined by a given width and the height is computed based upon the length of the text.

The `oxy_htmlContent` form control supports the following properties:

- **href** - The absolute or relative location of a resource. The resource needs to be a well-formed HTML file.
- **id** - The unique identifier of an item. This is a `<div>` element that has a unique `@id` and is a child of the `<body>` element. The `<div>` element is the container of the HTML content to be rendered by the form control.
- **content** - An alternative to the `@href` and `@id` pair of elements. It provides the HTML content that will be displayed in the form control.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_htmlContent(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

You can customize the style of the content using CSS that is either referenced by the file identified by the `href` property or is defined inline. If you change the HTML content or CSS and you want your changes to be reflected in the XML that renders the form control, then you need to refresh the XML file. If the HTML does not have an associated style, then a default text and background color will be applied.

Example: `oxy_htmlContent` Form Control

In the following example, the form control collects the content from the `p_description` `<div>` element found in the `descriptions.html` file. The box is 400 pixels wide and is displayed before a paragraph identified by the `@intro_id` attribute value.

```
p#intro_id:before {
  content:
    oxy_htmlContent(
      href, "descriptions.html",
      id, "p_description",
      width, 400px);
}
```

An alternative example, using the `content` property:

```
p#intro_id:before {
  content:
    oxy_htmlContent(
      content, "<div style='font-weight:bold;'>My content</div>",
      width, 400px);
}
```

Note:

Anchor HTML elements are displayed but the links are inactive.

Tip:

To insert a sample of the `oxy_htmlContent` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the  `oxy_htmlContent` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

Pop-up Form Control

The `oxy_popup` built-in form control is used to offer a contextual menu that provides quick access to various actions. A pop-up form control can display single or multiple selections.

The `oxy_popup` form control supports the following properties:

- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

Note:

This property is used for rendering in the **Author** mode.

- **columns** - Controls the width of the form control. The unit size is the width of the **w** character. This property is used for the visual representation of the form control.
- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (on page 2681)* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

Note:

You can set the value of the `visibility` property to `-oxy-collapse-text (on page 2155)` to render the text only in the form control that the `oxy_editor` function specifies.

- **editorSort** - Specifies the sorting of the values displayed after clicking the popup control (for example, clicking a drop-down arrow button). The possible values of this property are `ascending` and `descending`.

- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_popup(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

- **labels** - Specifies the label associated with each entry used for presentation. If this property is not specified, the **values** property is used instead.
- **rendererSeparator** - Defines a separator used when multiple values are rendered. If not specified, the value of the `resultSeparator` property is used.
- **rendererSort** - Specifies the sorting of the values (labels) displayed on the form control before clicking the popup control. The possible values of this property are `ascending` and `descending`.
- **resultSeparator** - If multiple check-boxes are used, the separator is used to compose the final result. If not specified, the `space` character is used.

**Note:**

The value of the `resultSeparator` property cannot exceed one character.

- **rows** - This property specifies the number of rows that the form control presents.

**Note:**

If the value of the **rows** property is not specified, the default value of **12** is used.

- **selectionMode** - Specifies whether the form control allows the selection of a single value or multiple values. The predefined values of this property are `single` (default value) and `multiple`.
- **sort** - Specifies the default sorting of the form control values (the values displayed before and after clicking the popup control). However, the `editorSort` and `rendererSort` properties have a higher priority. The possible values of this property are `ascending` and `descending`.
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the ``${comma}`` variable (on page 224).

Example:

```
link:before{
  content: oxy_popup(
    edit, '@href',
    values, "Spring, Summer, Autumn, Winter",
    tooltips, "Iris${comma}Snowdrop, Gardenia${comma}Lilicac,
              Chrysanthemum${comma}Salvia, Gerbera",
    selectionMode, single);
}
```

- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

Note:

Typically, when you use a comma in the values of a form control, the content that follows a comma is considered a new value. If you want to include a comma in the values, precede the comma with two backslashes. For example, `(values, '1\\, 2\\, 3, 4, edit, false)` will display a form control that has **1, 2, 3** for the first value and **4** for the second value.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).

Example: oxy_popup Form Control

```
popupWithMultipleSelection:before {
  content: " This editor edits an attribute value.
           The possible values are specified
           inside the CSS: "
  oxy_popup(
    edit, "@attribute",
    values, "value1, value2, value3, value4, value5",
    labels, "Value no1, Value no2, Value no3, Value no4, Value no5",
    resultSeparator, "|",
    columns, 10,
    selectionMode, "multiple",
    color, "blue",
    fontInherit, true);
  font-size: 30px;
}
```

**Tip:**

To insert a sample of the `oxy_popup` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_popup` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

[Custom CSS Functions \(on page 2164\)](#)

[Collapse Text: -oxy-collapse-text Property Value \(on page 2155\)](#)

Text Area Form Control

The `oxy_textArea` built-in form control is used for entering multiple lines of text in a graphical user interface box. A text area may include optional syntax highlight capabilities to present the form control.

The `oxy_textArea` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (on page 2681)* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:**

You can set the value of the `visibility` property to `-oxy-collapse-text (on page 2155)` to render the text only in the form control that the `oxy_editor` function specifies.

- **#content** - This parameter is useful when an element has mixed or element-only content and you want to edit its content inside a text area form control.

For example, if you have the following XML content:

```
<codeblock outputclass="language-xml">START_TEXT<ph>phase</ph>
  <apiname><text>API</text></apiname></codeblock>
```

and your CSS includes the following snippet:

```
codeblock:before{
  content:
    oxy_textArea(
      edit, '#content',
      contentType, 'text/xml');
}
```

then the text area form control will edit the following fragment:

```
START_TEXT<ph>phase</ph><apiname><text>API</text></apiname>
```

Note:

When the value of the `edit` property is `#content`, the text area form control will also offer content completion proposals

- **columns** - Controls the width of the form control. The unit size is the width of the **w** character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **rows** - This property specifies the number of rows that the form control presents. If the form control has more lines, you can scroll and see them all.
- **contentType** - Specifies the type of content that the form control will format with syntax highlighting. The following values are supported: `text/batch`; `text/c`; `text/cc`; `text/css`; `text/dtd`; `text/html`; `text/java`; `text/javascript`; `text/json`; `text/markdown`; `text/nvdl`; `text/perl`; `text/plain`; `text/php`; `text/properties`; `text/python`; `text/rnc`; `text/rng`; `text/sch`; `text/shell`; `text/sql`; `text/wSDL`; `text/xml`; `text/xpath`; `text/xproc`; `text/xquery`; `text/xsd`; `text/xsl`; `text/yaml`.
- **indentOnTab** - Specifies the behavior of the **Tab** key. If the value of this property is set to `true` (default value), the **Tab** key inserts characters. If it is set to `false`, **Tab** is used for navigation, jumping to the next editable position in the document.
- **white-space** - CSS property that influences the value that you edit, as well as the form control size:
 - **pre** - The whitespaces and new lines of the value are preserved and edited. If the `rows` and `columns` properties are not specified, the form control calculates its size on its own so that all the text is visible.
 - **pre-wrap** - The long lines are wrapped to avoid horizontal scrolling.

**Note:**

The `rows` and `columns` properties must be specified. If these are not specified, the form control considers the value to be `pre`.

- **normal** - The white spaces and new lines are normalized.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
  content: oxy_textArea(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
  border: 1px solid red;
}
```

Example: oxy_textArea Form Control

The following example presents a text area with CSS syntax highlighting that calculates its own dimension, and a second one with XML syntax highlighting with defined dimension.

```
textArea {
  visibility: -oxy-collapse-text;
  white-space: pre;
}

textArea[language="CSS"]:before {
  content: oxy_textArea(
    edit, '#text',
    contentType, 'text/css');
}

textArea[language="XML"]:before {
  content: oxy_textArea(
    edit, '#text',
    contentType, 'text/xml',
    rows, 10,
    columns, 30);
}
```

**Tip:**

To insert a sample of the `oxy_textArea` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the  `oxy_textArea` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

[Collapse Text: -oxy-collapse-text Property Value \(on page 2155\)](#)

Text Field Form Control

The `oxy_textfield` built-in form control is used for entering a single line of text in a graphical user interface box. A text field may include optional content completion capabilities, used to present and edit the value of an attribute or an element.

The `oxy_textfield` form control supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (on page 2681)* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

Note:

You can set the value of the `visibility` property to `-oxy-collapse-text (on page 2155)` to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the **w** character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **values** - Specifies the values that populate the list of proposals. If these values are not specified in the CSS, they are collected from the associated XML Schema.

- **tooltips** - Associates tooltips to each value in the `values` property. The value of this property is a list of tooltip messages separated by commas. If you want the tooltip to display a comma, use the `#{comma}` variable (on page 224).
- **tooltip** - Specifies a tooltip to be displayed when you hover over the form control.
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.
- **hasMultipleValues** - Specifies if the text field allows multiple values separated by spaces or just a single value.

**Note:**

If the value is `false`, the *Content Completion Assistant* (on page 2677) considers the entire text as the prefix for its proposals. If the value is `true` (the default value), the space is the delimiter for the values and thus it is not included in the prefix (the prefix will be whatever comes after the space).

For example, suppose the possible values for your text field are: `value a`, `value b`, and `other values`. If the `hasMultipleValues` property is set to `true` and the user enters `"value "` (notice the space character after 'value') in the text field, the *Content Completion Assistant* will suggest all three values because the prefix is whatever comes after the space, and in this case the user did not enter anything after the space. If the `hasMultipleValues` property was set to `false`, the *Content Completion Assistant* would only suggest `value a` and `value b` because the space is considered part of the prefix.

- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_textfield(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Example: oxy_textfield Form Control

```
element {
    content: "Label: "
    oxy_textfield(
        edit, "@my_attr",
        values, "value1, value2",
        color, "red",
        columns, 40);
}
```

**Tip:**

To insert a sample of the `oxy_textfield` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the `oxy_textfield` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

[Custom CSS Functions \(on page 2164\)](#)

[Collapse Text: -oxy-collapse-text Property Value \(on page 2155\)](#)

URL Chooser Form Control

The `oxy_urlChooser` built-in form control is used for a dialog box that allows you to select the location of local or remote resources. The inserted reference is made relative to the URL of the currently open editor.

The `oxy_urlChooser` editor supports the following properties:

- **edit** - Lets you edit the value of an attribute, the text content of an element, or Processing Instructions (PI). This property can have the following values:
 - **@attribute_name** - The name of the attribute whose value is being edited. If the attribute is in a namespace, the value of the property must be a *QName (on page 2681)* and the CSS must have a namespace declaration for the prefix.
 - **#text** - Specifies that the presented/edited value is the simple text value of an element.

**Note:**

You can set the value of the `visibility` property to `-oxy-collapse-text (on page 2155)` to render the text only in the form control that the `oxy_editor` function specifies.

- **columns** - Controls the width of the form control. The unit size is the width of the **w** character.
- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units. The `width` property takes precedence over the `columns` property (if the two are used together).
- **color** - Specifies the foreground color of the form control. If the value of the `color` property is `inherit`, the form control has the same color as the element that was used to insert it.

- **visible** - Specifies whether or not the form control is visible. The possible values of this property are `true` (default value) and `false`.
- **fontInherit** - This value specifies whether or not the form control inherits its font from its parent element. The values of this property can be `true` or `false` (default value). To make the form control inherit its font from its parent element, set the `fontInherit` property to `true`.
- **fileFilter** - string value that holds comma-separated file extensions. The URL chooser uses these extensions to filter the displayed files. A value such as `"jpg,png,gif"` is mapped to three filters that will display all `jpg`, `png`, and `gif` files respectively.
- **hoverPseudoclassName** - Allows you to change the way an element is rendered when you hover over a form control. The value is the name of a CSS pseudo-class. When you hover over the form control, the specified pseudo-class will be set on the element that contains the form control.

```
p:before {
    content: oxy_urlChooser(hoverPseudoclassName, 'showBorder')
}
p:showBorder {
    border: 1px solid red;
}
```

Example: `oxy_urlChooser` Form Control

```
urlChooser[file]:before {
    content: "A URL chooser editor that allows browsing for a URL.
            The selected URL is made relative to the currently edited file:"
    oxy_urlChooser(
        edit, "@file",
        columns 25);
}
```

Tip:

To insert a sample of the `oxy_urlChooser` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the  `oxy_urlChooser` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls.`

Video Player Form Control

The `oxy_video` built-in form control is used for providing a mechanism to play videos.

The `oxy_video` form control supports the following properties:

- **href** - The absolute or relative location of a resource. This property is mandatory. Relative values are resolved relative to the CSS. If you have media resources relative to the XML document, you can specify their paths like this:

```
oxy_video(href, oxy_url(oxy_base-uri(), 'ex.mp4'), width, 400px, height, 300px)
```

- **width** - Specifies the width of the content area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units.
- **height** - Specifies the height of the form control area using relative (`em`, `ex`), absolute (`in`, `cm`, `mm`, `pt`, `pc`, `px`), and percentage (followed by the `%` character) length units.

Example: `oxy_video` Form Control

```
object {
  content:
    oxy_video(
      href, 'resources/video.mp4',
      width, 400px,
      height, 300px),
}
```

**Tip:**

To insert a sample of the `oxy_video` form control in a CSS file, invoke the [Content Completion Assistant \(on page 2677\)](#) by pressing **Ctrl + Space** and select the  `oxy_video` code template.

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

Implementing Custom Form Controls

If the built-in form controls are not sufficient for your needs, you can implement custom form controls in Java.

Custom Form Controls Implementation

You can specify custom form controls using the following properties:

- **rendererClassName** - The name of the class that draws the edited value. It must be an implementation of *ro.sync.ecss.extensions.api.editor.InplaceRenderer*. The renderer has to be a **SWING** implementation and can be used both in the standalone and Eclipse distributions.
- **swingEditorClassName** - You can use this property for the standalone (**Swing**-based) distribution to specify the name of the class used for editing. It is a **Swing** implementation of *ro.sync.ecss.extensions.api.editor.InplaceEditor*.
- **swtEditorClassName** - You can use this property for the Eclipse plugin distribution to specify the name of the class used for editing. It is a **SWT** implementation of the *ro.sync.ecss.extensions.api.editor.InplaceEditor*.

**Note:**

If the custom form control is intended to work in the Oxygen XML Editor Eclipse plugin standalone distribution, the declaration of **swtEditorClassName** is not required. The **renderer** (the class that draws the value) has different properties from the **editor** (the class that edits the value) because you can present a value in one way and edit it in another.

- **classpath** - You can use this property to specify the location of the classes used for a custom form control. The value of the **classpath** property is an enumeration of URLs separated by comma.
- **edit** - If your form control edits the value of an attribute or the text value of an element, you can use the `@attribute_name` and `#text` predefined values and Oxygen XML Editor Eclipse plugin will perform the commit logic by itself. You can use the `custom` value to perform the commit logic yourself.
- **ecHeavyFormControlClassName** - This type of form control is effectively present at all times at its allocated bounds. This is useful if you need a form control that renders dynamic or interactive SVG documents (for example, if you have an SVG document that displays tooltips when hovering over certain areas).

The value of this property is a class name that must implement the *ro.sync.ecss.extensions.api.editor.InplaceHeavyEditor* method. The *JAR (on page 2679)* that contains this implementation can either be added in the **Classpath tab in the Document Type Configuration dialog box (on page 95)** for your particular *framework (on page 2679)* or specified with the `classpath` property (on page 2215).

Example: Java Code

The following is a sample Java code for implementing a custom combo box form control that inserts an XML element in the content when the editing stops:

```
public class ComboBoxEditor extends AbstractInplaceEditor {
    /**
     * @see ro.sync.ecss.extensions.api.editor.InplaceEditor#stopEditing()
     */
    @Override
    public void stopEditing() {
        Runnable customCommit = new Runnable() {
            @Override
            public void run() {
                AuthorDocumentController documentController =
                    context.getAuthorAccess().getDocumentController();
                documentController.insertXMLFragment( "<custom/>", offset);
            }
        };
        EditingEvent event = new EditingEvent(customCommit, true);
        fireEditingStopped(event);
    }
}
```

The custom form controls can use any of the predefined properties of the [built-in form controls \(on page 2184\)](#), as well as specified custom properties.

Example: CSS

The following is an example of how to specify a custom form control in the CSS:

```
myElement {
    content: oxy_editor(
        rendererClassName, "com.custom.editors.CustomRenderer",
        swingEditorClassName, "com.custom.editors.SwingCustomEditor",
        swtEditorClassName, "com.custom.editors.SwtCustomEditor",
        edit, "@my_attr",
        customProperty1, "customValue1",
        customProperty2, "customValue2"
    )
}
```

How to Implement Custom Form Controls

To implement a custom form control, follow these steps:

1. Download the Oxygen XML Editor Eclipse plugin SDK at: https://www.oxygenxml.com/oxygen_sdk.html.
2. Implement the custom form control by extending `ro.sync.ecss.extensions.api.editor.InplaceEditorRendererAdapter`. You could also use `ro.sync.ecss.extensions.api.editor.AbstractInplaceEditor`, which offers some default implementations and listeners management.
3. Pack the previous implementation in a Java *JAR* (on page 2679) library.
4. Copy the *JAR* library to the `[OXYGEN_INSTALL_DIR]/frameworks/[FRAMEWORK_DIR]` directory.
5. In Oxygen XML Editor Eclipse plugin, open the **Preferences** dialog box (on page 70), go to **Document Type Association**, edit the appropriate *framework*, and add the *JAR* library in the **Classpath** tab.
6. Specify the custom form control in your CSS, as described above.

**Tip:**

To see more detailed examples and more information about how form controls work in Oxygen XML Editor Eclipse plugin, see the sample files in the following directory:

`[OXYGEN_INSTALL_DIR]/samples/form-controls`.

Resources

For more information about form controls, watch our video demonstration:

<https://www.youtube.com/embed/-WY3wzkMSLM>

Editing Processing Instructions Using a Form Control

Oxygen XML Editor Eclipse plugin allows you to edit *processing instructions*, *comments*, and *CDATA* by using CSS extensions.

**Note:**

You can edit both the content and the attribute value from a *processing instruction*.

Example: Editing an Attribute from a Processing Instruction

PI content:

```
<?pi_target attr="val"?>
```

CSS:

```
@namespace oxy "http://www.oxygenxml.com/extensions/author";

oxy|processing-instruction:before {
    display:inline;
    content:
        "EDIT attribute: " oxy_textfield(edit, '@attr', columns, 15);
    visibility:visible;
```

```

}
oxy|processing-instruction{
  visibility:-oxy-collapse-text;
}

```

Related information

[Text Field Form Control \(on page 2210\)](#)

[Collapse Text: -oxy-collapse-text Property Value \(on page 2155\)](#)

[Displaying Processing Instructions from Other XML Editors \(on page 2119\)](#)

Custom CSS Pseudo-classes

You can set your custom CSS pseudo-classes on the nodes from the *AuthorDocument* model. These are similar to the normal XML attributes, with the important difference that they are not serialized, and by changing them, the document does not create undo and redo edits (the document is considered unmodified). You can use custom pseudo-classes for changing the style of an element (and its children) without altering the document.

In Oxygen XML Editor Eclipse plugin they are used to hide/show the `colspec` elements from CALS tables. To take a look at the implementation, see:

1. [\[OXYGEN_INSTALL_DIR\]/frameworks/docbook/css/cals_table.css](#) (Search for `-oxy-visible-colspecs`)
2. The definition of action `table.toggle.colspec` from the DocBook *framework (on page 2679)* makes use of the pre-defined *TogglePseudoClassOperation Author* mode operation.

Here are some examples:

Example: Controlling the visibility of a section using a pseudo-class

You can use a non standard (custom) pseudo-class to impose a style change on a specific element. For instance, you can have CSS styles matching the custom pseudo-class `access-control-user`, like the one below:

```

section {
  display:none;
}

section:access-control-user {
  display:block;
}

```

By setting the pseudo-class `access-control-user`, the element `section` will become visible by matching the second CSS selector.

Example: Coloring the elements at the current cursor location

You could create an *AuthorCaretListener* that sets the `caret-visited` pseudo-class to the element at the cursor location. The effect will be that all the elements traversed by the cursor become red.

```
*:caret-visited {
  color:red;
}
```

The API that you can use from the *CaretListener*:

ro.sync.ecss.extensions.api.AuthorDocumentController#setPseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)

ro.sync.ecss.extensions.api.AuthorDocumentController#removePseudoClass(java.lang.String, ro.sync.ecss.extensions.api.node.AuthorElement)

Predefined Pseudo-Class Author Mode Operations

Pre-defined **Author mode operations** can be used directly in your *framework* to work with custom pseudo-classes:

1. *TogglePseudoClassOperation*
2. *SetPseudoClassOperation*
3. *RemovePseudoClassOperation*

Using the :before(n) and :after(n) CSS Pseudo-Elements

Although not standard, this extension may be useful if you want to style sections by adding multiple levels of static content. To add static content to an element, you would normally use a `:before` or `:after` pseudo-element.

This example adds static text before the title ("Chapter 1", "Chapter 2", etc.):

```
h1:before {
  content: "Chapter " counter(chapter) ".";
  color: blue;
}
```

All of this is styled with the same color (blue in this example). Using standard CSS, it is impossible to style specific aspects of it (for example, just the chapter number with a larger font and with red). However, you can do it using multiple `before(n)` or `after(n)` pseudo-elements:

```
h1:before(3) {
  content: "Chapter ";
  color: blue;
}
h1:before(2) {
  content: counter(chapter);
  color: red;
}
```

```

font-size: large;
}
h1:before(1) {
  content: ".";
  color: blue;
}

```

Notes:

- The bigger the level, the more distant the pseudo-element is.
- Level 1 corresponds to normal `:before` or `:after` pseudo-elements.

Debugging CSS Stylesheets

To assist you with debugging and customizing CSS stylesheets the **Author** mode includes a **CSS Inspector view** ([on page 414](#)) to examine the CSS rules that match the currently selected element.

This tool is similar to the Inspect Element development tool that is found in most browsers. The **CSS Inspector** view allows you to see how the CSS rules are applied and the properties defined. Each rule that is displayed in this view includes a link to the line in the CSS file that defines the styles for the element that matches the rule. You can use the link to open the appropriate CSS file and edit the style rules. Once you have found the rule you want to edit, you can click the link in the top-right corner of that rule to open the CSS file in the editor.

Figure 541. CSS Inspector View

There are two ways to open the CSS Inspector view:

1. Select **CSS Inspector** from the **Window > Show View** menu.
2. Select the **Inspect Styles** action from the contextual menu in **Author** mode.

Related Information:

[CSS Inspector View \(on page 414\)](#)

18.

Extension Points for the Oxygen Eclipse Plugin

The Oxygen XML Editor Eclipse plugin includes a number of *extension* (on page 2681) points, which can be implemented by other Eclipse *plugins* (on page 2681) that depend on it. All of them are listed in the `plugin.xml` file, along with samples of usage code. The following is a list with short descriptions for some of the most useful extension points:

Extension point: *ditaKeyDefinitionManager*

It can be used to provide an external keys manager, responsible of providing DITA keys that are then used for editing and resolving referenced content. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/ditaKeyDefinitionManager.exsd`.

Extension point: *actionBarContributorCustomizer*

A very useful extension point that can add or remove actions from various menus, contextual menus, and toolbars that are contributed by the Oxygen XML Editor Eclipse plugin. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/actionBarContributorCustomizer.exsd`.

Extension point: *customEditorInputCreator*

Use this extension point to create your custom editor input for a certain resource that will be opened by the Oxygen XML Editor Eclipse plugin when clicking links. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/customEditorInputCreator.exsd`.

Extension point: *editorAdapterContributor*

When an adapter is requested to the open XML editor you can provide your custom adapter from your external *plugin*. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/editorAdapterContributor.exsd`.

Extension point: *extensionsBundleContributor*

Use this extension point to provide your own *ExtensionsBundle* implementation for a certain open XML resource. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/extensionsBundleContributor.exsd`.

Extension point: *stylesFilterContributor*

Use this extension point to provide your own *StylesFilter* implementation for special visual rendering when an XML resource is opened in the **Author** editing mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/stylesFilterContributor.exsd`.

Extension point: *XMLRefactoringContributor*

Contributes a folder that contains the additional XML Refactoring operation descriptor files and XQuery scripts that can be used by the batch XML refactoring actions. Its EXSD schema can be found in:

`OXYGEN_PLUGIN_DIR/exsd-schema/xmlRefactoringContributor.exsd`.

Extension point: *workspaceAccessPlugin*

Use this extension point to be notified when Oxygen XML Editor Eclipse plugin has started.

Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/exsd-schema/workspaceAccessExtension.exsd`.

Extension point: *AuthorStylesheet*

Use this extension point to provide a stylesheet layer that will be used when rendering any XML

document in **Author** mode. Its EXSD schema can be found in: `OXYGEN_PLUGIN_DIR/exsd-schema/authorStylesheetContributor.exsd`.

How to Use a Custom View with the Oxygen XML Editor Eclipse plugin Distribution

Question

Is it possible to create a custom view in Eclipse that can insert certain XML fragments in the documents opened with the Oxygen XML Editor Eclipse plugin?

Answer

Here you can find more information about the Eclipse part of the *Oxygen SDK*:

https://www.oxygenxml.com/oxygen_sdk.html#oxygen_eclipse_plugin

Use the provided Oxygen XML Editor Eclipse plugin sample project as a starting point.

From any custom view/component you can have singleton access to the using the

`ro.sync.exml.workspace.api.PluginWorkspaceProvider.getPluginWorkspace()` API.

The Java code for inserting a certain XML fragment in the currently open editor (either in the **Text** or **Author** editing modes) would look like this:

```

WSEditor currentEditorAccess = PluginWorkspaceProvider.getPluginWorkspace().
getCurrentEditorAccess(PluginWorkspace.MAIN_EDITING_AREA);

if(currentEditorAccess.getCurrentPage() instanceof WSXMLTextEditorPage) {
    //Editor opened in Text page
    WSXMLTextEditorPage tp =
(WSXMLTextEditorPage) currentEditorAccess.getCurrentPage();

    //You can access an API to insert text in the XML content
    // tp.getDocument().insertString(tp.getCaretOffset(), "<testTag/>", null);

```

```
//This is the internal StyledText implementation
//    tp.getTextComponent()
//    //You can use this XPath API to find the range of an XML element.
//    tp.findElementsByXPath(xpathExpression)
} else if(currentEditorAccess.getCurrentPage() instanceof WSAuthorEditorPage) {
    //Editor opened in Author page
//    try {
        WSAuthorEditorPage authPage = (WSAuthorEditorPage)
currentEditorAccess.getCurrentPage();

        //Then you can do stuff like this to insert XML at the cursor position
//        authPage.getDocumentController().insertXMLFragment("<testTag/>",
authPage.getCaretOffset());
//    } catch (AuthorOperationException e) {
//        // TODO Auto-generated catch block
//        e.printStackTrace();
//    }
}
```

19.

Tools

Oxygen XML Editor Eclipse plugin includes a variety of helpful tools to help you accomplish XML-related tasks. This section presents many of those tools. These tools are available in the **Tools** menu and some of them can be launched through keyboard shortcuts or command-line scripts.

Refactoring XML Documents

In the life cycle of XML documents there are instances when the XML structure needs to be changed to accommodate various needs. For example, when an associated schema is updated, an attribute may have been removed, or a new element added to the structure.

These types of situations cannot be resolved with a traditional *Find/Replace* tool, even if the tool accepts regular expressions. The problem becomes even more complicated if an XML document is computed or referenced from multiple modules, since multiple resources need to be changed.

To assist you with these types of refactoring tasks, Oxygen XML Editor Eclipse plugin includes a specialized **XML Refactoring** tool that helps you manage the structure of your XML documents.

XML Refactoring Tool

The **XML Refactoring** tool is presented in the form of an easy to use wizard that is designed to reduce the time and effort required to perform various structure management tasks. For example, you can insert, delete, or rename an attribute in all instances of a particular element that is found in all documents within your project.

To access the tool, select the  **XML Refactoring** action from one of the following locations:

- The **XML Tools** menu.
- The **Refactoring** submenu from the contextual menu in the **Project Explorer** view (*on page 269*).
- The **Refactoring** submenu from the contextual menu in the **DITA Maps Manager** view (*on page 2337*).

Note:

The built-in refactoring operations are also available from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. This is useful because by selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to skip directly to the wizard page of the appropriate operation and to help you by preconfiguring some of the parameter values. For your convenience, the last 5 operations that were *finished* (*on page 2227*) or *previewed* (*on page 2227*) also appear in the **Refactoring** submenu of the contextual menu in the **DITA Maps Manager**.

XML Refactoring Wizard

The XML Refactoring tool includes the following wizard pages:

Refactoring operations

The first wizard page presents the available operations, grouped by category. To search for an operation, you can use the filter text box at the top of the page.

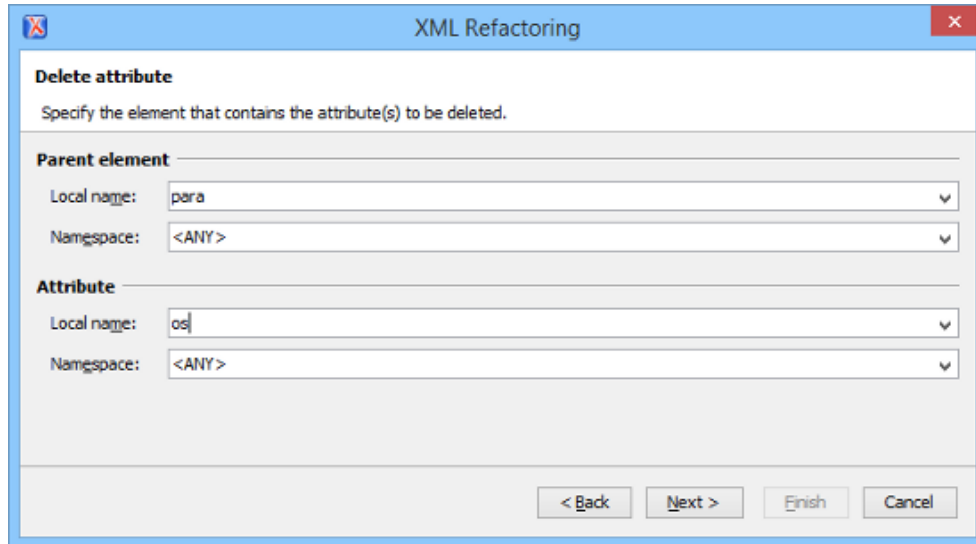

Figure 542. XML Refactoring Wizard

Configure Operation Parameters

The next wizard page allows you to specify the parameters for the refactoring operation. The parameters are specific to the type of refactoring operation that is being performed. For example, to delete an attribute you need to specify the parent element and the qualified name of the attribute to be removed.

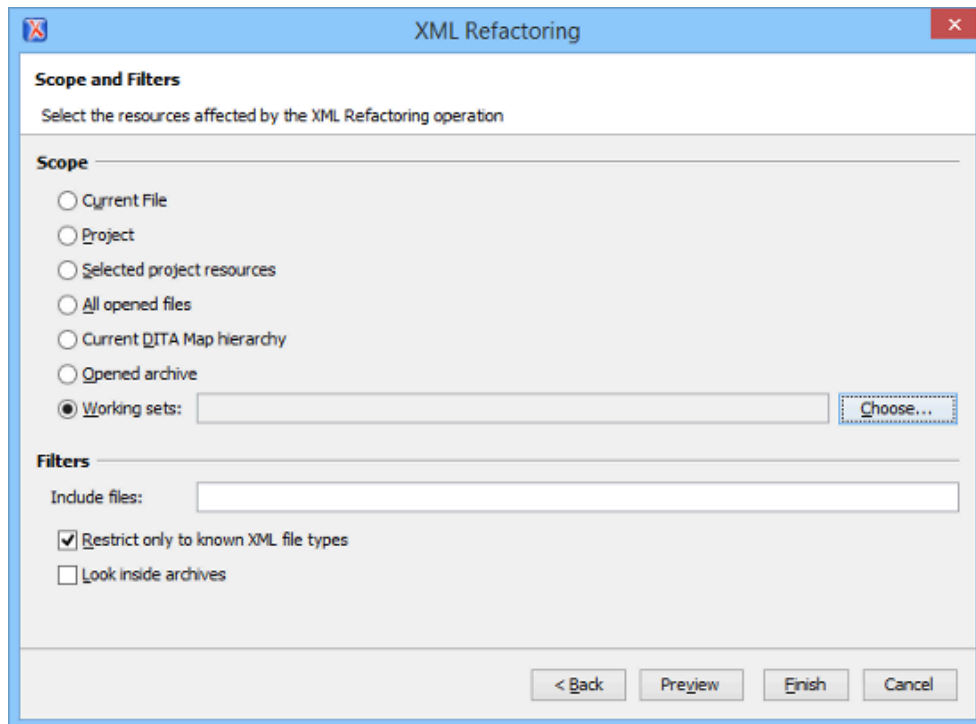

Figure 543. XML Refactoring 2nd Wizard Page (Delete Attribute Operation)

Scope and Filters

The last wizard page allows you to select the set of files that represent the input of the operation.

Figure 544. XML Refactoring - Scope and Filters Wizard Page

Scope section

You can specify the scope for the operation by selecting from predefined resource sets or you can define your own set of resources by creating a *working set* (on page 2683) (select **Working sets** and click the **Choose** button to the right). If you select **Project**, all files attached to the current project will be used for the scope of the operation. If you select **Current DITA Map hierarchy**, the current DITA map

that is open in the DITA Maps Manager along with all of its referenced topics and submaps (and topics referenced in those submaps) are used for the scope.

Filters

The **Filters** section includes the following options:

- **Include files** - Allows you to filter the selected resources by using a file pattern. For example, to restrict the operation to only analyze build files you could use `build*.xml` for the file pattern.
- **Restrict only to known XML file types** - When selected, only resources with a known XML file type will be affected by the operation.

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Finish

After clicking the **Finish** button, the operation will be processed and Oxygen XML Editor Eclipse plugin provides no automatic means for reverting the operations. Any **Undo** action will only revert changes on the current document.

Troubleshooting:

If an operation fails, a notification will be displayed in the **Results** panel with some information about the error. For example, if the operation was invoked on a read-only resource, the error will indicate that a read-only file cannot be converted.

Tip:

If an operation takes longer than expected you can use the  **Stop** button in the progress bar to cancel the operation.

Restriction:

XML refactoring operations cannot preserve CDATA sections. If your document contains XML CDATA sections, the refactoring operations will convert them to plain text nodes.

Built-in Refactoring Operations

The XML Refactoring tool includes a variety of built-in operations that can be used for common refactoring tasks. They are grouped by category in the **Refactoring operations** wizard page. You can also access the operations from the **Refactoring** submenu in the contextual menu of **Author** or **Text** mode. The operations are also grouped by category in this submenu. When selecting the operations from the contextual menu, Oxygen XML Editor Eclipse plugin considers the editing context to get the names and namespaces of the current

element or attribute, and uses this information to preconfigure some of the parameter values for the selected refactoring operation.

Tip:

Each operation includes a link in the lower part of the wizard that opens the **XML / XSLT-XQuery / XPath** preferences page where you can configure XPath options and declare namespace prefixes.

The following built-in operations are available:

Refactoring Operations for *Attributes*

Add/Change attribute

Use this operation to change the value of an attribute or insert a new one. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be changed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

Value

The value for the affected attribute.

Options section

You can choose between one of the following options for the **Operation mode**:

Add the attribute in the parent elements where it is missing

Adds the attribute to all instances of the specified parent element.

Change the value in the parent elements where the attribute already exists

Replaces the value of the already existing attribute in all instance of the specified parent element.

Both

Adds the attributes to the instances where it is missing and replaces the value in instances where the attribute already exists.

Convert attribute to element

Use this operation to convert a specified attribute to an element. This operation allows you to specify the following parameters:

Parent element section

Element

The parent element of the attribute to be converted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute section

Local name

The local name of the affected attribute.

Namespace

The namespace of the affected attribute.

New element section

Local name

The local name of the new element.

Namespace

The namespace of the new element.

Delete attribute

Use this operation to remove one or more attributes. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be deleted.

Rename attribute

Use this operation to rename an attribute. This operation requires you to specify the following parameters:

Element

The parent element of the attribute to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be renamed.

New local name

The new local name of the attribute.

Replace in attribute value

Use this operation to search for a text fragment inside an attribute value and change the fragment to a new value. This operation allows you to specify the following parameters:

Target attribute section

Element

The parent element of the attribute to be modified, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Attribute

The name of the attribute to be modified.

Find / Replace section

Find

The text fragments to find. You can use Perl-like regular expressions.

Replace with

The text fragment to replace the target with. This parameter can bind regular expression capturing groups ($\$1$, $\$2$, etc.) from the find pattern.

Refactoring Operations for *Comments*

Delete comments

Use this operation to delete comments from one or more elements. This operation requires you specify the following parameter:

Element

The target element (or elements) that will have comments deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Note:

Comments that are outside the root element will not be deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *DITA* Topics

Change topic ID to file name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS tables to simple tables

Use this operation to convert DITA CALS tables to simple tables.

Convert DITA 1.3 Maps and Topics to DITA 2.0

Use this operation to convert topics and maps that adhere to the DITA 1.3 standard to the DITA 2.0 standard.

- Changes DOCTYPE declarations and XML Schema/Relax NG schema references.
- DITA Map changes:
 - Removes the `@lockmeta` attribute.
 - Removes the `<topicset>` and `<topicsetref>` elements.
 - Removes the `<anchor>` and `<anchorref>` elements and the `@anchorref` attribute.
 - Migrates the `@navtitle` attribute as a `<navtitle>` element.
 - Migrates the `@title` attribute as a `<title>` element.
 - Converts the `@copy-to` attribute to a `<resourceid>` element.
 - Replaces the `@print` attribute with an `@deliveryTarget` attribute.
 - Convert topicmeta `<linktext>` to `<linktitle>`.
 - Removed `<hasInstance>`, `<hasKind>`, `<hasNarrower>`, `<hasPart>`, `<hasRelated>`, and `<relatedSubjects>` from subject scheme relationship tables in subject scheme, including `<subjectRelTable>`, `<subjectRelHeader>`, `<subjectRel>`, and `<subjectRole>`.
- DITA task changes:
 - Converts the `<substep>` element to a `<step>` element.
 - Converts the `<substeps>` element to a `<steps>` element.
- DITA topic changes:
 - Removes the `@type` attribute with the value `fastpath`.
 - Converts the `@alt` attribute to an `<alt>` element.
 - Replaces the `<index-sort-as>` element with a `<sort-as>` element.
 - Removes the `<itemgroup>` element.
 - Moves the contents of the `<titlealts>` element inside the `<prolog>`.
 - Removes the `@domains` attribute.
 - Renames `<sectiondiv>` to `<div>`.
 - Remove `@query` attribute from `<link>` element.
 - Remove `@specentry` attribute from `<stentry>` element.
 - Remove the `@spectitle` attribute.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes. For more information and instructions for using this operation, see [Converting Conrefs to Conkeyrefs \(on page 2486\)](#).

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2337))

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2337))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert simple tables to CALS tables

Use this operation to convert DITA simple tables to CALS tables.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting). For more information, see [Converting DITA Topics to Another Type \(on page 2411\)](#).

Rename Key

Use this operation to rename a key. It also updates all references to it.

Note:

It does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for *DITA* Maps

Convert DITA Bookmap to Map

Convert a DITA bookmap to a DITA map.

Convert DITA Map to Bookmap

Convert a DITA map to a DITA bookmap.

Change or remove profiling attribute value

Change or remove a value from a DITA profiling attribute. A profiling attribute can have multiple values, separated by spaces (e.g. for `platform="windows redhat"`, you can change the current `redhat` value to `linux`). Select the name of the profiling attribute, the current value to replace, and the new value. If the new value is left empty, the current value is removed from the profiling attribute. The new value is modified and reflected in DITA maps, DITA topics, and DITAVAL files.

Define keys for all topic references

This refactoring action is useful for converting links inside a DITA project from direct to indirect key-based addressing. When applied on DITA resources from your project (DITA maps and

topics), this refactoring action defines keys for all of a DITA map's topic references based on the referenced file name and converts each direct reference to a key reference in each DITA topic. If a topic references already has keys defined, the action does not define new ones. Inside the DITA topics, whenever there is a link element (`<xref>` or `<link>`) with a direct reference to another DITA topic or an element with a `@conref`, the action attempts to convert them to indirect key-based addressing. The refactoring action may introduce linking errors or create duplicate keys so it is advised to run the **Validate and check for completeness** action from the **DITA Maps Manager** toolbar to manually fix those problems. You can enable the **Report duplicate keys** checkbox to also report any keys that are defined more than once.

Scope and Filters:

All of the DITA refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project, All opened files, Current DITA map hierarchy**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for *Elements*

Delete element

Use this operation to delete elements. This operation requires you to specify the following parameter:

Element

The target element to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Delete element content

Use this operation to delete the content of elements. This operation requires you to specify the following parameter:

Element

The target element whose content is to be deleted, in the form of a local name from any namespace, a local name with a namespace prefix, or an XPath expression.

Insert element

Use this operation to insert new elements. This operation allows you to specify the following parameters:

Element section

Local name

The local name of the element to be inserted.

Namespace

The namespace of the element to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the new element is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the new element will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Rename element

Use this operation to rename elements. This operation requires you to specify the following parameters:

Target elements (XPath)

The target elements to be renamed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

New local name

The new local name of the element.

Unwrap element

Use this operation to remove the surrounding tags of elements, while keeping the content unchanged. This operation requires you to specify the following parameter:

Target elements (XPath)

The target elements whose surrounding tags will be removed, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrap element

Use this operation to surround elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element*.

Namespace

The namespace of the *Wrapper element*.

Wrap element content

Use this operation to surround the content of elements with element tags. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be surrounded with tags, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Wrapper element section

Local name

The local name of the *Wrapper element* that will surround the content of the target.

Namespace

The namespace of the *Wrapper element* that will surround the content of the target.

Refactoring Operations for *Fragments*

Insert XML fragment

Use this operation to insert an XML fragment. This operation allows you to specify the following:

XML Fragment

The XML fragment to be inserted.

Location section

XPath

An XPath expression that identifies an existing element to which the inserted fragment is relative, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

Position

The position where the fragment will be inserted, in relation to the specified existing element. The possible selections in the drop-down menu are: **After**, **Before**, **First child**, or **Last child**.

Replace element content with XML fragment

Use this operation to replace the content of elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements whose content will be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the content of the target element.

Replace element with XML fragment

Use this operation to replace elements with an XML fragment. This operation allows you to specify the following parameters:

Target elements (XPath)

The target elements to be replaced, in the form of a local name from any namespace, a local name with a namespace prefix, or other XPath expressions.

XML Fragment

The XML fragment with which to replace the target element.

Refactoring Operations for *JATSKit*

Add BITS DOCTYPE - NLM/NCBI Book Interchange 2.0

Use this operation to add an NLM 'BITS' 2.0 DOCTYPE declaration.

Add Blue DOCTYPE - NISO JATS Publishing 1.1

Use this operation to add a JATS 'Blue' 1.1 DOCTYPE declaration.

Normalize IDs

Use this operation to normalize assigned IDs and assigned IDs to elements that are missing them.

All of these *JATSKit* refactoring actions allow you to choose a scope for the operation and some filters:

Scope

Select from a variety of options to define the scope for the resources that will be affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, or just the **Current file**.

Filters section

Include files

Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).

Restrict to known XML file types only

Excludes non-XML file types from the operation.

Refactoring Operations for *Processing Instructions*

Accept all tracked changes, remove all Oxygen-specific comments and highlights

Use this operation to accept all application-specific tracked changes (from elements and attributes) or remove all application-specific comments or highlights. There are several options to choose from:

Accept all tracked changes

Accepts all application-specific tracked changes (from elements and attributes).

Remove comments

Removes all application-specific comments.

Remove highlights

Removes all application-specific highlights.

Delete processing instructions

Use this operation to delete all processing instructions that have a certain target name from the processed documents. This operation requires you to specify the following parameter:

Processing instruction target

The target name of the processing instructions to delete.

**Note:**

Processing instructions that are outside the root element are not deleted because the *serializer* preserves the content before and after the root.

Refactoring Operations for *Publishing Template*

These operations are for those who use *Oxygen Publishing Templates* for WebHelp Responsive output customization.

Migrate HTML Page Layout Files to v21

Use this operation to convert custom [HTML page layout files \(on page 1375\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin version 20.0 or 20.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 21.0.

Migrate HTML Page Layout Files to v22

Use this operation to convert custom [HTML page layout files \(on page 1375\)](#) that are included in a custom Publishing Template that was created in Oxygen XML Editor Eclipse plugin versions 20.0 - 21.1 so that they will be compatible with Oxygen XML Editor Eclipse plugin version 22.0.

Update HTML Pages

**Attention:**

This operation is only used by Oxygen XML Editor Eclipse plugin and should not be used manually.

**Additional Notes:**

- There are some operations that allow `<ANY>` for the **local name** and **namespace** parameters. This value can be used to select an element or attribute regardless of its local name or namespace. Also, the `<NO_NAMESPACE>` value can be used to select nodes that do not belong to a namespace.
- Some operations have parameters that accept XPath expressions to match elements or attributes. In these XPath expressions you can only use the prefixes declared in the [Options > Preferences > XML > XSLT-XQUERY > XPath \(on page 203\)](#) page. This preferences page can be easily opened by clicking the link in the note (**Each prefix used in an XPath expression must be declared in the Default prefix-namespace mappings section**) at the bottom of the **Configure Operation Parameters** wizard page.

Custom Refactoring Operations

While Oxygen XML Editor Eclipse plugin includes a variety of built-in XML refactoring operations to help you accomplish particular tasks, you can also create custom operations according to your specific needs. For

example, you could create a custom refactoring operation to convert an attribute to an element and insert the element as the first child of the parent element.

An XML Refactoring operation is defined as a pair of resources:

- An *XQuery Update script* or *XSLT stylesheet* that Oxygen XML Editor Eclipse plugin will run to refactor the XML files.
- An *XML Operation Descriptor* file that contains information about the operation (such as the name, description, and parameters).

Figure 545. Diagram of an XML Refactoring Operation

All the defined custom operations are loaded by the **XML Refactoring Tool** and presented in the **Refactoring Operations wizard page** (on page 609), along with the built-in operations.

After the user chooses an operation and specifies its parameters, Oxygen XML Editor Eclipse plugin processes an XQuery Update or XSLT transformation over the input file. This transformation is executed in a **safe mode**, which implies the following:

- When loading the document:
 - The **XInclude** mechanism is disabled. This means that the resources included by using XInclude will not be visible in the transformation.
 - The DTD entities will be processed without being expanded.
 - The associated DTD will be not loaded, so the default attributes declared in the DTD will not be visible in the transformation.

- When saving the updated XML document:
 - The `DOCTYPE` will be preserved.

**Note:**

This can be changed using [Saxon extension functions in XSLT \(on page 641\)](#).

- The DTD entities will be preserved as they are in the original document when the document is saved.
- The attribute values will be kept in their original form without being normalized.
- The spaces between attributes are preserved. Basically, the spaces are lost by a regular XML serialization since they are not considered important.

The result of this transformation overrides the initial input file.

**Note:**

To achieve some of the previous goals, the XML Refactoring mechanism adds several attributes that are interpreted internally. The attributes belong to the http://www.oxygenxml.com/ns/xmlRefactoring/additional_attributes namespace. These attributes should not be taken into account when processing the input XML document since they are discarded when the transformed document is serialized.

**Restriction:**

Comments or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation. In other words, XML Refactoring operations can only be applied on the root element and the nodes inside it. However, as a work around to this limitation, you can use [Saxon extension functions and the XSLT stylesheet method \(on page 641\)](#) to implement the new custom XML refactoring operation.

Creating a Custom Refactoring Operation

To create a custom refactoring operation, follow these steps:

1. Create an [XQuery Update script \(on page 631\)](#) or [XSLT stylesheet file \(on page 636\)](#).
2. Create an XML refactoring operation descriptor file, that references the above script, as explained in these sections: [Example descriptor file for an XQuery Update script \(on page 634\)](#) or [Example descriptor file for an XSLT stylesheet \(on page 639\)](#).
3. Store both files in [one of the locations that Oxygen XML Editor Eclipse plugin \(on page 643\)](#) scans when loading the custom operations.

Result: Once you run the **XML Refactoring** tool again, the custom operation appears in [the Refactoring Operations wizard page \(on page 609\)](#).

Related information[Storing and Sharing Refactoring Operations \(on page 643\)](#)

Custom Refactoring Script

The first step in creating a custom refactoring operation is to create an [XQuery Update script \(on page 631\)](#) or [XSLT stylesheet \(on page 636\)](#) that is needed to process the refactoring operations. The easiest way to create this script file is to use the **New** document wizard to create a new **XQuery** or **XSLT** file and you can use the [XQuery method example \(on page 631\)](#) or [XSLT method example \(on page 636\)](#) to help you with the content.

There are cases when it is necessary to add parameters in the [XQuery script \(on page 631\)](#) or [XSLT stylesheet \(on page 636\)](#). For instance, if you want to rename an element, you may want to declare an external parameter associated with the name of the element to be renamed. To allow you to specify the value for these parameters, they need to be declared in the *refactoring operation descriptor file* that is associated with this operation.

**Note:**

The XQuery Update processing is disabled by default in Oxygen XML Editor Eclipse plugin. Thus, if you want to create or edit an XQuery Update script you have to enable this mechanism by creating an [XQuery transformation scenario \(on page 1288\)](#) and choose **Saxon EE** as the transformation engine. Also, you need to make sure the **Enable XQuery update** option is selected in the [Saxon processor advanced options \(on page 1228\)](#).

**Note:**

If you are using an XSLT file, XPath expressions that are passed as parameters will automatically be rewritten to conform with the mapping of the namespace prefixes declared in the [XML /XSLT-XQuery / XPath preferences page \(on page 203\)](#).

The next step in creating a custom refactoring operation is to create an **XML Refactoring Operation Descriptor** file contains the path to the [XQuery Update script \(on page 634\)](#) or [XSLT stylesheet \(on page 639\)](#).

Related Information:[XQuery Update Script for Creating a Custom Operation \(on page 631\)](#)[XSLT Stylesheet for Creating a Custom Operation \(on page 636\)](#)

Custom Refactoring Operation Descriptor File

The second step in creating a custom refactoring operation is to create an operation descriptor file. The easiest way to do this is to use the **New** document wizard and choose the **XML Refactoring Operation Descriptor** template.

Introduction to the Descriptor File

This descriptor file root element specifies required attributes to define the operation `@name`, `@description`, and `@id` which are necessarily when loading an XML Refactoring operation. It also contains the path to the [XQuery Update script \(on page 631\)](#) or [XSLT stylesheet \(on page 636\)](#) that is associated with the particular operation through the `<script>` element.

The optional `@filesFilter` attribute can be specified to filter the resources by using a file pattern or list of file patterns separated by a comma (for example: `filesFilter="*.dita, *.xml"`). When set, its value is automatically populated in the **Include files** field within the **Scope and Filters** wizard page [\(on page 611\)](#) as a default value.

You can specify a *category* for your custom operations to logically group certain operations. The `<category>` element is optional and if it is not included in the descriptor file, the default name of the category for the custom operations is *Other operations*.

The descriptor file is edited and validated against the following schema: `frameworks/xml_refactoring/operation_descriptor.xsd`.

Declaring Parameters in the Descriptor File

If the XQuery Update script or XSLT stylesheet includes parameters, they should be declared in the **parameters** section of the descriptor file. All the parameters specified in this section of the descriptor file will be displayed in the **XML Refactoring** tool within the **Configure Operation Parameters** wizard page [\(on page 609\)](#) for that particular operation.

The value of the first `<description>` element in the `<parameters>` section will be displayed at the top of the **Configure Operation Parameters** wizard page [\(on page 609\)](#).

To declare a parameter, specify the following information:

- **label** - This value is displayed in the user interface for the parameter.
- **name** - The parameter name used in the XQuery Update script or XSLT stylesheet and it should be the same as the one declared in the script.
- **type** - Defines the type of the parameter and how it will be rendered. There are several types available:
 - **TEXT** - Generic type used to specify a simple text fragment.
 - **XPATH** - Type of parameter whose value is an XPATH expression. For this type of parameter, Oxygen XML Editor Eclipse plugin will use a text input with corresponding content completion and syntax highlighting.

Note:

The value of this parameter is transferred as plain text to the XQuery Update or XSLT transformation without being evaluated. You should evaluate the XPath expression inside the XQuery Update script or XSLT stylesheet. For example, you could use the `saxon:evaluate` Saxon extension function.

**Note:**

A relative XPath expression is converted to an absolute XPath expression by adding `//` before it (`//XPathExp`). This conversion is done before transferring the XPath expression to the XML refactoring engine.

**Note:**

When writing XPath expressions, you can only use prefixes declared in the [Options > Preferences > XML > XSLT-XQuery > XPath \(on page 203\)](#) options page.

- **NAMESPACE** - Used for editing namespace values.
- **REG_EXP_FIND** - Used when you want to match a certain text by using Perl-like regular expressions.
- **REG_EXP_REPLACE** - Used along with `REG_EXP_FIND` to specify the replacement string.
- **XML_FRAGMENT** - This type is used when you want to specify an XML fragment. For this type, Oxygen XML Editor Eclipse plugin will display a text area specialized for inserting XML documents.
- **NC_NAME** - The parameter for `NC_NAME` values. It is useful when you want to specify the local part of a *QName (on page 2681)* for an element or attribute.
- **BOOLEAN** - Used to edit boolean parameters.
- **TEXT_CHOICE** - It is useful for parameters whose value should be from a list of possible values. Oxygen XML Editor Eclipse plugin renders each possible value as a radio button option.
- **optional** - Specifies whether the parameter is optional or required. For optional parameters, the end user is not required to fill in a value in the XML refactoring wizard.
- **description** - The description of the parameter. It is used by the application to display a tooltip when you hover over the parameter.
- **possibleValues** - Contains the list with possible values for the parameter and you can specify the default value, as in the following example:

```
<possibleValues onlyPossibleValuesAllowed="true">
  <value name="before">Before</value>
  <value name="after" default="true">After</value>
  <value name="firstChild">First child</value>
  <value name="lastChild">Last child</value>
</possibleValues>
```

On a `<value>`, you can specify the `@default` attribute with the value `true` to mark it as the default presented value in the XML refactoring wizard. The text specified inside the `<value>` element is displayed as placeholder default text in the text entry box. If the dialog box is accepted with the placeholder text in place, the `@name` attribute value is passed to the refactoring script. Example:

```
<value name="my-actual-default-value" default="true">[default displayed]</value>
```

Specialized Parameters to Match Elements or Attributes

If you want to match elements or attributes, you can use some specialized parameters, in which case Oxygen XML Editor Eclipse plugin will propose all declared elements or attributes based on the schema associated with the currently edited file. The following specialized parameters are supported:

elementLocation

This parameter is used to match elements. For this type of parameter, the application displays a text field where you can enter the element name or an XPath expression. The text from the `@label` attribute is displayed in the application as the label of the text field. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If the value of the `@useCurrentContext` attribute is set to **true**, the element name from the cursor position is used as proposed values for this parameter.

Example of an `<elementLocation>`:

```
<elementLocation name="elem_loc" useCurrentContext="false">
  <element label="Element location">
    <description>Element location description.</description>
  </element>
</elementLocation>
```

attributeLocation

This parameter is used to match attributes. For this type of parameter, the application displays two text fields where you can enter the parent element name and the attribute name (both text fields accept XPath expressions for a finer match). The text from the `@label` attributes is displayed in the application as the label of the associated text fields. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. The value of this parameter is an XPath expression that is computed by using the values of the expression from the *element* and *attribute* text fields. For example, if `section` is entered for the element and a `title` is entered for the attribute, the XPath expression would be computed as `//section/@title`. If the value of the `useCurrentContext` attribute is set to **true**, the element and attribute name from the cursor position is used as proposed values for the operation parameters.

Example of an `<attributeLocation>`:

```
<attributeLocation name="attr_xpath" useCurrentContext="true">
  <element label="Element path">
    <description>Element path description.</description>
  </element>
  <attribute label="Attribute" >
    <description>Attribute path description.</description>
  </attribute>
</attributeLocation>
```

elementParameter

This parameter is used to specify elements by local name and namespace. For this type of parameter, the application displays two combo boxes with elements and namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as label of the associated combo. The `@name` attribute is used to specify the name of the parameter from the XQuery Update script or XSLT stylesheet. If you specify the `@allowsAny` attribute, the application will propose `<ANY>` as a possible value for the **Name** and **Namespace** combo boxes. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the element name and namespace from the cursor position is used as proposed values for the operation parameters.

Example of an `<elementParameter>`:

```
<elementParameter id="elemID" useCurrentContext="true">
  <localName label="Name" name="element_localName" allowsAny="true">
    <description>Local name of the parent element.</description>
  </localName>
  <namespace label="Namespace" name="element_namespace" allowsAny="true">
    <description>Local name of the parent element</description>
  </namespace>
</elementParameter>
```

attributeParameter

This parameter is used to specify attributes by local name and namespace. For this type of parameter, the application displays two combo boxes with attributes and their namespaces collected from the associated schema of the currently edited file. The text from the `@label` attribute is displayed in the application as the label of the associated combo box. You can also use the `@useCurrentContext` attribute and if its value is set to `true`, the attribute name and namespace from the cursor position is used as proposed values for the operation parameters.

Note:

An `<attributeParameter>` is dependant upon an `<elementParameter>`. The list of attributes and namespaces are computed based on the selection in the `elementParameter` combo boxes.

Example of an `<attributeParameter>`:

```
<attributeParameter dependsOn="elemID" useCurrentContext="true">
  <localName label="Name" name="attribute_localName">
    <description>The name of the attribute to be converted.</description>
  </localName>
  <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
    <description>Namespace of the attribute to be converted.</description>
  </namespace>
</attributeParameter>
```

```

</namespace>
</attributeParameter>

```

Grouping Parameters in the Descriptor File

You can use `<section>` elements to group related parameters in the descriptor file:

```

<section label="Parent element">
  <elementParameter id="elemID">
    <localName label="Name" name="element_localName" allowsAny="true">
      <description>Local name of the parent element.</description>
    </localName>
    <namespace label="Namespace" name="element_namespace" allowsAny="true">
      <description>Local name of the parent element</description>
    </namespace>
  </elementParameter>
</section>

```

Note:

All built-in operations are loaded from the `[OXYGEN_INSTALL_DIR]/refactoring` folder.

[Example of an Operation Descriptor File with an XQuery Update script \(on page 634\)](#)

XSLT Stylesheet for Creating a Custom Operation

To demonstrate creating a custom operation, suppose that you have a task where you need to convert an attribute into an element and insert it inside another element. A specific example would be if you have a project with a variety of `<image>` elements where a deprecated `@alt` attribute was used for the description and you want to convert all instances of that attribute into an element with the same name and insert it as the first child of the `<image>` element.

Thus, the task is to convert this attribute into an element with the same name and insert it as the first child of the image element.

Figure 546. Example: Custom XML Refactoring Operation

An XSLT stylesheet can be used to implement the new custom XML refactoring operation. The second requirement is an XML Refactoring operation descriptor file ([on page 2250](#)) that contains the path to the XSLT stylesheet.

Example of an XSLT Script for Creating a Custom Operation to *Convert an Attribute to an Element*

The XSLT stylesheet does the following:

- Iterates over all elements from the document that have the specified local name and namespace.
- Finds the attribute that will be converted to an element.
- Adds the new element as the first child of the parent element.

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema"
  exclude-result-prefixes="xs"
  xmlns:xr="http://www.oxygenxml.com/ns/xmlRefactoring"
  version="2.0">

  <xsl:import
href="http://www.oxygenxml.com/ns/xmlRefactoring/resources/commons.xsl"/>

  <xsl:param name="element_localName" as="xs:string" required="yes"/>
  <xsl:param name="element_namespace" as="xs:string" required="yes"/>
  <xsl:param name="attribute_localName" as="xs:string" required="yes"/>
  <xsl:param name="attribute_namespace" as="xs:string" required="yes"/>
  <xsl:param name="new_element_localName" as="xs:string" required="yes"/>
```

```

<xsl:param name="new_element_namespace" as="xs:string" required="yes" />

<xsl:template match="node() | @">
  <xsl:copy>
    <xsl:apply-templates select="node() | @" />
  </xsl:copy>
</xsl:template>

<xsl:template match="//*[xr:check-local-name($element_localName, ., true())
and
xr:check-namespace-uri($element_namespace, .)]">

  <xsl:variable name="attributeToConvert"
    select="@*[xr:check-local-name($attribute_localName, ., true())
and
xr:check-namespace-uri($attribute_namespace, .)]"/>

  <xsl:choose>
    <xsl:when test="empty($attributeToConvert)">
      <xsl:copy>
        <xsl:apply-templates select="node() | @" />
      </xsl:copy>
    </xsl:when>
    <xsl:otherwise>
      <xsl:copy>
        <xsl:for-each select="@*[empty(. intersect $attributeToConvert)]">
          <xsl:copy-of select="."/>
        </xsl:for-each>
        <!-- The new element namespace -->
        <xsl:variable name="nsURI" as="xs:string">
          <xsl:choose>
            <xsl:when test="$new_element_namespace eq $xr:NO-NAMESPACE">
              <xsl:value-of select="'" />
            </xsl:when>
            <xsl:otherwise>
              <xsl:value-of select="$new_element_namespace" />
            </xsl:otherwise>
          </xsl:choose>
        </xsl:variable>
        <xsl:element name="{ $new_element_localName }" namespace="{ $nsURI }">
          <xsl:value-of select="$attributeToConvert" />
        </xsl:element>
      <xsl:apply-templates select="node()" />
    </xsl:otherwise>
  </xsl:choose>

```

```

</xsl:copy>
</xsl:otherwise>
</xsl:choose>
</xsl:template>
</xsl:stylesheet>

```

**Note:**

The XSLT stylesheet imports a module library that contains utility functions and variables. The location of this module is resolved via an [XML Catalog \(on page 2683\)](#) set in the XML Refactoring framework (on page 2679).

Example of an Operation Descriptor File That References the XSLT Stylesheet for Creating a Custom Operation to *Convert an Attribute to an Element*

After you have developed the XSLT stylesheet (for example, named `convert-attribute-to-element.xsl`), you have to create an XML Refactoring operation descriptor (for example, named `convert-attribute-to-element.xml`) that references the stylesheet and provides descriptions and possible values for its parameters. This descriptor is used by the application to load the operation details such as name, description, or parameters.

```

<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring"
  id="convert-attribute-to-element"
  name="Convert attribute to element">
  <description>Converts the specified attribute to an element.
    The new element will be inserted as first child of the attribute's
    parent element.</description>
  <script type="XSLT" href="convert-attribute-to-element.xsl"/>
  <parameters>
    <description>Specify the attribute to be converted to element.</description>
    <section label="Parent element">
      <elementParameter id="elemID">
        <localName label="Name" name="element_localName" allowsAny="true">
          <description>Local name of the parent element.</description>
        </localName>
        <namespace label="Namespace" name="element_namespace" allowsAny="true">
          <description>Local name of the parent element</description>
        </namespace>
      </elementParameter>
    </section>

```

```

<section label="Attribute">
  <attributeParameter dependsOn="elemID">
    <localName label="Name" name="attribute_localName">
      <description>Name of the attribute to be converted.</description>
    </localName>
    <namespace label="Namespace" name="attribute_namespace" allowsAny="true">
      <description>Namespace of the attribute to be converted.</description>
    </namespace>
  </attributeParameter>
</section>
<section label="New element">
  <elementParameter>
    <localName label="Name" name="new_element_localName">
      <description>The name of the new element.</description>
    </localName>
    <namespace label="Namespace" name="new_element_namespace">
      <description>The namespace of the new element.</description>
    </namespace>
  </elementParameter>
</section>
</parameters>
</refactoringOperationDescriptor>

```

**Note:**

If you are using an XSLT file, the line with the `<script>` element would look like this:

```
<script type="XSLT" href="convert-attribute-to-element.xsl"/>
```

The code exemplified above and other refactoring examples can be found on the [DITA Refactoring GitHub sample project](#).

Results

After you have created these files, copy them into a folder scanned by Oxygen XML Editor Eclipse plugin when it loads the custom operation (*on page 643*). When the XML Refactoring tool is started again, you will see the created operation.

Since various parameters can be specified, this custom operation can also be used for other similar tasks. The following image shows the parameters that can be specified in the example of the custom operation to convert an attribute to an element:

Figure 547. Example: XML Refactoring Wizard for a Custom Operation

Using Saxon Extension Functions to Allow Custom Refactoring Operations to Read and Modify Content Outside the Root Node

One advantage to using an XSLT stylesheet is that there is limitation when using an [XQuery Update script \(on page 631\)](#) in that refactoring operations can only be performed on *comments* or *processing instructions* that are inside the root element. Thus, using the XQuery method, *comments* or *processing instructions* that are in any node before or after the root element cannot be modified by an XML Refactoring operation.

The XSLT stylesheet method offers a work-around to this limitation through the use of some Saxon extension functions.

To illustrate the use of these functions, consider the following sample XML file:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

The following Saxon extension functions can be used to read and modify content outside the root node:

Note:

They belong to the <http://www.oxygenxml.com/ns/xmlRefactoring/functions> namespace.

- **get-content-after-root()** - Returns the content after root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<!-- comment after root -->
<?pi after root ?>
```

- **set-content-after-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-after-root('<!-- Inserted comment -->')` will result in replacing the nodes after the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
<root>
  <child></child>
</root><!-- Inserted comment -->
```

- **get-content-before-root()** - Returns the content before root as `xs:string`.

For the XML above, the call of this function will return the following string value:

```
<?xml version="1.0" encoding="UTF-8"?>
<!-- comment before root -->
<?pi before root ?>
```

- **set-content-before-root(xs:string)** - Updates the content that will be serialized in the refactored document after the root node.

The function call `set-content-before-root('<!-- Inserted comment -->')` will result in replacing the nodes before the root element with the comment passed as string argument. The XML document will be modified as follows:

```
<!-- Inserted comment --><root>
  <child></child>
</root>
<!-- comment after root -->
<?pi after root ?>
```

XSLT Example:

To process content after the root node, the XSLT would look like this:

```
<?xml version="1.0" encoding="UTF-8"?>
<xsl:stylesheet xmlns:xsl="http://www.w3.org/1999/XSL/Transform"
  xmlns:xs="http://www.w3.org/2001/XMLSchema" exclude-result-prefixes="xs"
```

```

xmlns:xrf="http://www.oxygenxml.com/ns/xmlRefactoring/functions" version="3.0">
<xsl:template match="/">
  <!-- The comment content that will be inserted after the root element -->
  <xsl:variable name="commentAsText"><!-- COMMENT ADDED FROM XR OPERATION-->
</xsl:variable>
  <!-- Retrieve the content after the root element as is -->
  <xsl:variable name="after-root-content" as="xs:string"
    select="xrf:get-content-after-root()"/>

  <xsl:variable name="processedContent"
    select="concat($after-root-content, $commentAsText)"/>

  <!-- Update the content after the root element -->
  <xsl:value-of select="xrf:set-content-after-root($processedContent)"/>

  <xsl:apply-templates/>
</xsl:template>

<xsl:template match="node() | @">
  <xsl:copy>
    <xsl:apply-templates select="node() | @"/>
  </xsl:copy>
</xsl:template>
</xsl:stylesheet>

```

**Note:**

The above XSLT retrieves the nodes after the root element as string, appends a new comment, and then sets back the updated content into the XML document.

Storing and Sharing Refactoring Operations

Oxygen XML Editor Eclipse plugin scans the following locations when looking for XML Refactoring operations to provide flexibility:

- A folder named `refactoring`, created inside the folder of the *framework* you are customizing. In the **Classpath** tab of the **Document type** configuration dialog box (*on page 95*), you need to add a reference to the `refactoring` folder specific for the framework.
- A folder that you specify in the **Load additional refactoring operations from text box** (*on page 196*) in the **XML Refactoring** preferences page (*on page 196*).
- The `refactoring` folder from the Oxygen XML Editor Eclipse plugin installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/`).

Sharing Custom Refactoring Operations

The purpose of Oxygen XML Editor Eclipse plugin scanning multiple locations for the XML Refactoring operations is to provide more flexibility for developers who want to share the refactoring operations with the other team members. Depending on your particular use case, you can attach the custom refactoring operations to other resources, such as *framework (on page 2679)* or projects.

After storing custom operations, you can share them with other users by sharing the resources.

Localizing XML Refactoring Operations

Oxygen XML Editor Eclipse plugin includes localization support for the XML refactoring operations.

The translation keys for the built-in refactoring operations are located in `[OXYGEN_INSTALL_DIR]/refactoring/i18n/translation.xml`.

The localization support is also available for custom refactoring operations. The following information can be translated:

- The operation `name`, `description`, and `category`.
- The `<description>` of the `<parameters>` element.
- The `label`, `description`, and `possibleValues` for each `parameter`.

Translated refactoring information uses the following form:

```
${i18n(translation_key)}
```

Oxygen XML Editor Eclipse plugin scans the following locations to find the `translation.xml` files that are used to load the translation keys:

- A `refactoring/i18n` folder, created inside a directory that is associated to a customized *framework*.
- A `i18n` folder, created inside a directory that is associated to a customized *framework*.
- An `i18n` folder inside any specified folder. In this case, you need to [open the Preferences dialog box \(on page 70\)](#), go to **XML > XML Refactoring**, and specify the folder in the **Load additional refactoring operations from** text box.
- The `refactoring/i18n` folder from the Oxygen XML Editor Eclipse plugin installation directory (`[OXYGEN_INSTALL_DIR]/refactoring/i18n`).

Example: Refactoring Operation Descriptor File with *i18n* Support

```
<?xml version="1.0" encoding="UTF-8"?>

<refactoringOperationDescriptor
  xmlns="http://www.oxygenxml.com/ns/xmlRefactoring" id="remove_text_content"
  name="${i18n(Remove_text_content)}">
  <description>${i18n(Remove_text_content_description)}</description>
  <script type="XQUERY_UPDATE" href="remove_text_content.xq"/>
</refactoringOperationDescriptor>
```

```

<parameters>
  <description>${i18n(parameters_description)}</description>
  <parameter label="${i18n(Element_name)}" name="element_localName"
            type="NC_NAME">
    <description>${i18n(Element_name_descriptor)}</description>
    <possibleValues>
      <value default="true" name="value1">${i18n(value_1)}</value>
      <value name="value2">${i18n(value_2)}</value>
    </possibleValues>
  </parameter>
</parameters>
</refactoringOperationDescriptor>

```

Generating Sample XML Files

Oxygen XML Editor Eclipse plugin offers support to generate sample XML files both from XML schema 1.0 and XML schema 1.1, depending on the XML schema version set in [XML Schema preferences page \(on page 195\)](#).

To generate sample XML files from an XML Schema, use the  **Generate Sample XML Files** action from the **XML Tools** menu. This action is also available in the contextual menu of the schema [Design mode \(on page 705\)](#). The action opens the **Generate Sample XML Files** dialog box that allows you to configure a variety of options for generating the files.

The **Generate Sample XML Files** dialog box contains three tabs with various configurable options. Default values for these options can be set in the [Sample XML Files Generator preferences page \(on page 187\)](#).

Schema Tab

The first set of options for the  **Generate Sample XML Files** tool are found in the **Schema** tab.

Figure 548. Generate Sample XML Files Dialog Box (Schema Tab)

The dialog box is titled "Generate Sample XML Files Dialog Box (Schema Tab)". It has three tabs: "Schema", "Options", and "Advanced". The "Schema" tab is selected. The "W3C XML Schema" section includes a "URL:" field with the value "http://www.w3.org/2004/10/inkml/inkml.xsd", a "Namespace:" field with "http://www.w3.org/2003/InkML", a "Root Element:" dropdown menu with "ink" selected, an "Output folder:" field with "D:\projects\userguide-private\DITA\topics\out", a "Filename prefix:" field with "instance" and an "Extension:" field with "xml". Below these is a "Number of instances:" field with "1" and a checked checkbox "Open first instance in editor". The "Namespaces" section has a "Default Namespace:" dropdown with "<NO_NAMESPACE>" selected. Below this is a table:

Prefix	Namespace
mml	http://www.w3.org/1998/Math/MathML
inkml	http://www.w3.org/2003/InkML

At the bottom of the dialog are buttons for "?", "Export settings", "Import settings", "OK", and "Cancel".

This tab includes the following options:

URL

Specifies the URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the ▾ **Browse** drop-down list.

Namespace

Displays the namespace of the selected schema.

Root Element

After the schema is selected, this drop-down menu is populated with all root candidates gathered from the schema. Choose the root of the output XML documents.

Output folder

Path to the folder where the generated XML instances will be saved.

Filename prefix and Extension

You can specify the prefix and extension for the file name that will be generated. Generated file names have the following format: `prefixN.extension`, where `N` represents an incremental number from 0 up to the specified **Number of instances**.

Number of instances

The number of XML files to be generated.

Open first instance in editor

When selected, the first generated XML file is opened in the editor.

Namespaces section

You can specify the **Default Namespace**, as well as the prefixes for the namespaces.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Options Tab

The **Options** tab allows you to set specific options for namespaces and elements.

Figure 549. Generate Sample XML Files Dialog Box (Options Tab)

This tab includes the following options:

Namespace / Element table

Allows you to set a namespace for each element name that appears in an XML document instance. The following prefix-to-namespace associations are available:

- All elements from all namespaces (<ANY> - <ANY>). This is the default setting.
- All elements from a specific namespace.
- A specific element from a specific namespace.

Settings subtab

Namespace

Displays the namespace specified in the table at the top of the dialog box.

Element

Displays the element specified in the table at the top of the dialog box.

Generate optional elements

When selected, all elements are generated, including the optional ones (having the `minOccurs` attribute set to 0 in the schema).

Generate optional attributes

When selected, all attributes are generated, including the optional ones (having the `use` attribute set to `optional` in the schema).

Values of elements and attributes

Controls the content of generated attribute and element values. The following choices are available:

- **None** - No content is inserted.
- **Default** - Inserts a default value depending on the data type descriptor of the particular element or attribute. The default value can be either the data type name or an incremental name of the attribute or element (according to the global option from the **Sample XML Files Generator** preferences page). Note that type restrictions are ignored when this option is selected. For example, if an element is of a type that restricts an `xs:string` with the `xs:maxLength` facet to allow strings with a maximum length of 3, the XML instance generator tool may generate string element values longer than 3 characters.
- **Random** - Inserts a random value depending on the data type descriptor of the particular element or attribute.

Important:

If all of the following are true, the **Generate Sample XML Files** tool outputs invalid values:

- At least one of the restrictions is a `regexp`.
- The value generated after applying the `regexp` does not match the restrictions imposed by one of the facets.

Preferred number of repetitions

Allows you to set the preferred number of repeating elements related to `minOccurs` and `maxOccurs` facets defined in the XML Schema.

- If the value set here is between `minOccurs` and `maxOccurs`, then that value is used.
- If the value set here is less than `minOccurs`, then the `minOccurs` value is used.
- If the value set here is greater than `maxOccurs`, then `maxOccurs` is used.

Maximum recursion level

If a recursion is found, this option controls the maximum allowed depth of the same element.

Type alternative strategy

Used for the `<xsd:alternative>` element from XML Schema 1.1. The possible strategies are:

- **First** - The first valid alternative type is always used.
- **Random** - A random alternative type is used.

Choice strategy

Used for `<xsd:choice>` or `<substitutionGroup>` elements. The possible strategies are:

- **First** - The first branch of `<xsd:choice>` or the head element of `<substitutionGroup>` is always used.
- **Random** - A random branch of `<xsd:choice>` or a substitute element or the head element of a `<substitutionGroup>` is used.

Generate the other options as comments

If selected, generates the other possible choices or substitutions (for `<xsd:choice>` and `<substitutionGroup>`). These alternatives are generated inside comments groups so you can uncomment and use them later. Use this option with care (for example, on a restricted namespace and element) as it may generate large result files.

Element values subtab

Allows you to add values that are used to generate the content of elements. If there are multiple values, then the values are used in a random order.

Attribute values subtab

Allows you to add values that are used to generate the content of attributes. If there are multiple values, then the values are used in a random order.

Export settings

Use this button to save the current settings for future use.

Import settings

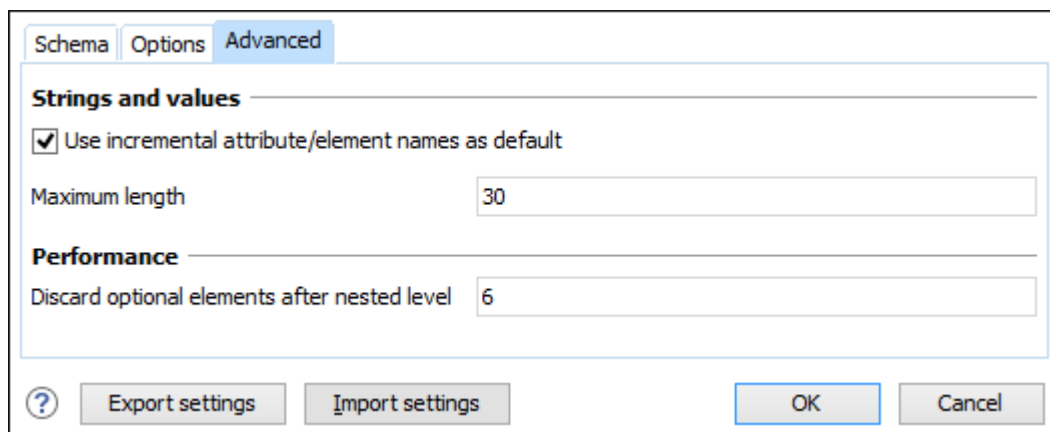

Use this button to load previously exported settings.

You can click **OK** at any point to generate the sample XML files.

Advanced Tab

The **Advanced** tab allows you to set some options regarding output values and performance.

Figure 550. Generate Sample XML Files Dialog Box (Advanced Tab)

This tab includes the following options:

Use incremental attribute / element names as default

If selected, the value of an element or attribute starts with the name of that element or attribute. For example, for an `<a>` element the generated values are: `a1`, `a2`, `a3`, and so on. If not selected, the value is the name of the type of that element / attribute (for example: `string`, `decimal`, etc.)

Maximum length

The maximum length of string values generated for elements and attributes.

Discard optional elements after nested level

The optional elements that exceed the specified nested level are discarded. This option is useful for limiting deeply nested element definitions that can quickly result in very large XML documents.

Export settings

Use this button to save the current settings for future use.

Import settings

Use this button to load previously exported settings.

**Tip:**

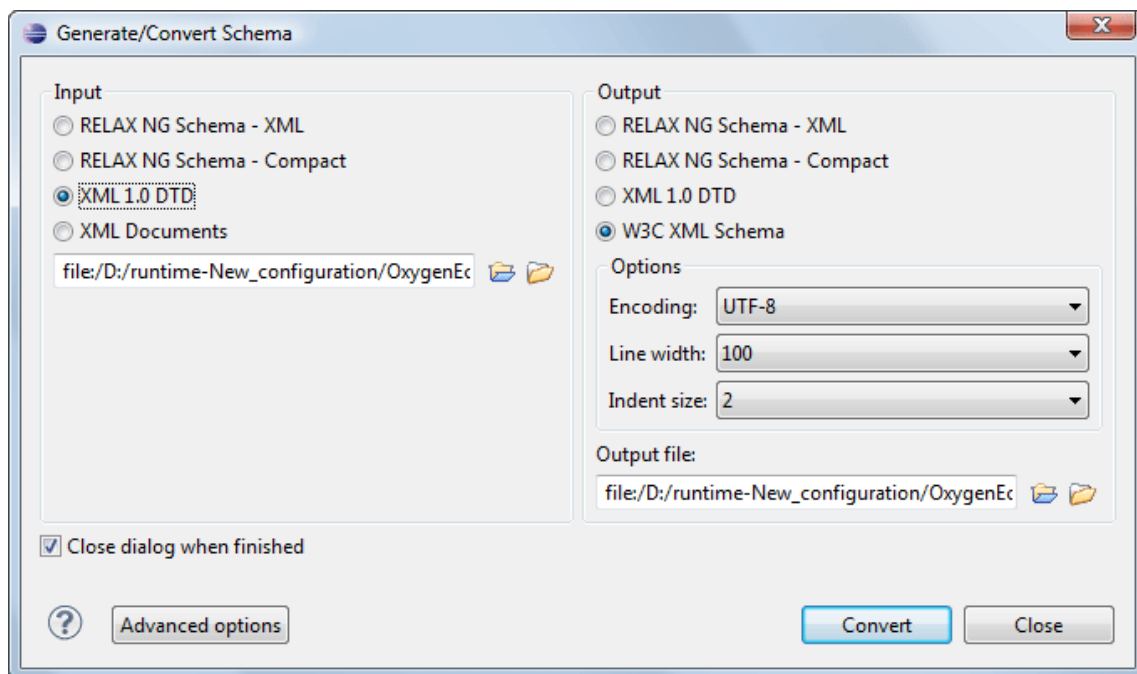

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Converting Schema to Another Schema Language

The **Generate/Convert Schema** tool allows you to convert a DTD or Relax NG (full or compact syntax) schema or a set of XML files to an equivalent XML Schema, DTD or Relax NG (full or compact syntax) schema. Where perfect equivalence is not possible due to limitations of the target language, Oxygen XML Editor Eclipse plugin generates an approximation of the source schema. Oxygen XML Editor Eclipse plugin uses the *Trang multiple format converter* to perform the actual schema conversions.

To use this tool, select the **Generate/Convert Schema (Ctrl + Shift + BackSlash (Command + Shift + BackSlash on macOS))** action from the **XML Tools** menu. This action opens the **Generate/Convert Schema** dialog box that allows you to configure various options for conversion.

Figure 551. Generate/Convert Schema Dialog Box

The **Generate/Convert Schema** dialog box includes the following options:

Input section

Allows you to select the language of the source schema. If the conversion is based on a set of XML files, rather than just a single XML file, select the **XML Documents** option and use the file selector to add the XML files involved in the conversion.

Output section

Allows you to select the language of the target schema.

Options

You can choose the **Encoding**, the maximum **Line width**, and the **Indent size** (in number of spaces) for one level of indentation.

Output file

Specifies the path for the output file that will be generated.

Close dialog when finished

If you deselect this option, the dialog box will remain open after the conversion so that you can easily continue to convert more files.

Advanced options

If you select **XML 1.0 DTD** for the input, you can click this button to access more advanced options to further fine-tune the conversion. The following advanced options are available:

XML 1.0 DTD Input section

These options apply to the source DTD:

- **xmlns** - Specifies the default namespace, that is the namespace used for unqualified element names.
- **attlist-define** - Specifies how to construct the name of the definition representing an attribute list declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **colon-replacement** - Replaces colons in element names with the specified chars when constructing the names of definitions used to represent the element declarations and attribute list declarations in the DTD.
- **any-name** - Specifies the name of the definition generated for the content of elements declared in the DTD as having a content model of ANY.
- **element-define** - Specifies how to construct the name of the definition representing an element declaration from the name of the element. The specified value must contain exactly one percent character. This percent character is replaced by the name of element (after colon replacement) and the result is used as the name of the definition.
- **annotation-prefix** - Default values are represented using a `@prefix:defaultValue` annotation attribute where prefix is the specified value and is bound to `http://relaxng.org/ns/compatibility/annotations/1.0` as defined by the RELAX NG DTD Compatibility Committee Specification. By default, the conversion engine will use a for prefix unless that conflicts with a prefix used in the DTD.
- **inline-attlist** - Instructs the application not to generate definitions for attribute list declarations, but instead move attributes declared in attribute

list declarations into the definitions generated for element declarations. This is the default behavior when the output language is XSD.

- **strict-any** - Preserves the exact semantics of *ANY* content models by using an explicit choice of references to all declared elements. By default, the conversion engine uses a wildcard that allows any element
- **generate-start** - Specifies whether or not the conversion engine should generate a start element. DTD's do not indicate what elements are allowed as document elements. The conversion engine assumes that all elements that are defined but never referenced are allowed as document elements.
- **xmlns mappings table** - Each row specifies the prefix used for a namespace in the input schema.

W3C XML Schema Output section

This section is available if you select **W3C XML Schema** for the output.

- **disable-abstract-elements** - Disables the use of abstract elements and substitution groups in the generated XML Schema. This can also be controlled using an annotation attribute.
- **any-process-contents** - One of the values: strict, lax, skip. Specifies the value for the `@processContents` attribute of any elements. The default is skip (corresponding to RELAX NG semantics) unless the input format is DTD, in which case the default is strict (corresponding to DTD semantics).
- **any-attribute-process-contents** - Specifies the value for the `@processContents` attribute of `<anyAttribute>` elements. The default is skip (corresponding to RELAX NG semantics).

Converting Database to XML Schema

Oxygen XML Editor Eclipse plugin includes a tool that allows you to create an XML Schema from the structure of a database.

To convert a database structure to an XML Schema, use the following procedure:

1. Select the **Convert DB Structure to XML Schema** action from the **Tools** menu.

Result: The **Convert DB Structure to XML Schema** dialog box is opened and your current database connections are displayed in the **Connections** section.

2. If the database source is not listed, click the **Configure Database Sources** button to open the **Data Sources preferences page (on page 74)** where you can configure data sources and connections.
3. In the **Format for generated schema** section, select one of the following formats:

- **Flat schema** - A flat structure that resembles a tree-like view of the database without references to elements.
- **Hierarchical schema** - Display the table dependencies visually, in a type of tree view where dependent tables are shown as indented child elements in the content model. Select this option if you want to configure the database columns of the tables to be converted.

4. Click **Connect**.

Result: The database structure is listed in the **Select database tables** section according to the format you chose.

5. Select the database tables that you want to be included in the XML Schema.

6. If you selected **Hierarchical schema** for the format, you can configure the database columns.

- a. Select the database column you want to configure.
- b. In the **Criterion** section you can choose to convert the selected database column as an **Element**, **Attribute**, or to be **Skipped** in the resulting XML Schema.
- c. You can also change the name of the selected database column by changing it in the **Name** text field.

7. Click **Generate XML Schema**.

Result: The database structure is converted to an XML Schema and it is opened for viewing and editing.

Compiling an XSL Stylesheet for Saxon

As of Saxon 12.3, it is possible to export a compiled form of a stylesheet as a JSON or XML file (called a *stylesheet export file* or SEF). Oxygen XML Editor Eclipse plugin includes a simple tool called **Compile XSL Stylesheet for Saxon** (found in the **XML Tools** menu) that does this for you.

Use-Cases for a Stylesheet Export File (SEF)

- **Use Saxon-JS to run transformations in a browser** - A *stylesheet export file* (SEF) is needed if you want to use the [Saxon-JS product](#) to run transformations in a browser, as in the following example:

```
<script type="text/javascript" src="SaxonJS/SaxonJS.min.js"></script>
<script>
  window.onload = function() {
    SaxonJS.transform({
      stylesheetLocation: "books.sef",
      sourceLocation: "books.xml"
    });
  }
</script>
```

- **Use SEF to run transformations in Oxygen XML Editor Eclipse plugin** - You can also use a *stylesheet export file* (SEF) in Oxygen XML Editor Eclipse plugin to apply an XSLT transformation over an XML file.

This requires **Saxon-EE** or **Saxon-PE** versions of the Saxon product and you must select one of those two versions for the **Target** when you configure the SEF file (*on page 2267*). When configuring the XSLT transformation, you will specify the SEF file in the **XSL URL** field (*on page 1207*).

Compiling an SEF File

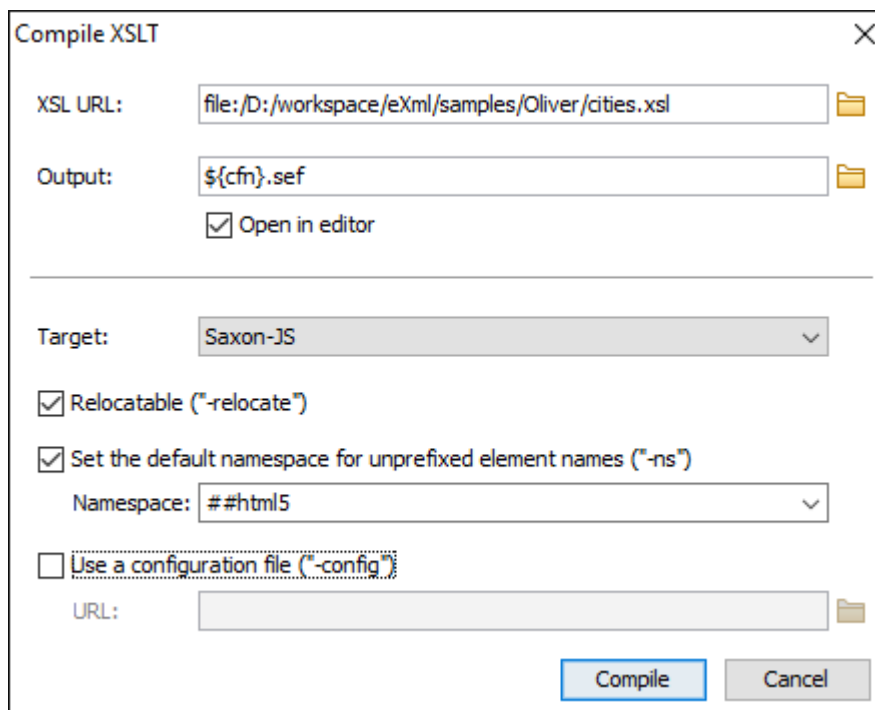

The **Compile XSL Stylesheet for Saxon** tool can be found in the **XML Tools** menu and it compiles a specified stylesheet as a JSON or an XML file (*stylesheet export file*).

If you choose **Saxon-JS** as the **Target** (the type of Saxon product that the export file will be used with), then the compiled stylesheet will be a JSON file with a file extension of `.sef` by default.

If you choose **Saxon-EE**, **Saxon-PE**, or **Saxon-HE** for the **Target**, then the compiled stylesheet will be an XML file with a file extension of `.xsef` by default.

Selecting this tool opens the **Compile XSL Stylesheet for Saxon** dialog box that allows you to configure some options for conversion.

Figure 552. Compile XSLT Stylesheet for Saxon Dialog Box

This dialog box includes the following options:

XSL URL

Allows you to select URL of the source XSL stylesheet. You can specify the URL by using the text field, the history drop-down, or the browsing actions in the **Browse** drop-down list.

Output file

You can specify the path where the output file will be saved by entering it in the text field, using the **Insert Editor Variables** button, or using the browsing actions in the **Browse** drop-down list.

Open in Editor

Select this option to open the resulting *stylesheet export file* in the main Oxygen XML Editor Eclipse plugin editing pane.

Target

Allows you to select the type of Saxon product that the export file will be used with. You can choose **Saxon-JS**, **Saxon-EE**, **Saxon-PE**, or **Saxon-HE**.

Relocatable

Can be used to control the Saxon `-relocate` parameter. You can select this option to produce a *relocatable* export package (SEF) that can be deployed to a different location, with a different base URI.

Set the default namespace for unprefix element names ("-ns")

Can be used to control the `-ns:(uri|##any|##html5)` Saxon parameter that defines the handling of unprefix element names that appear as name tests in path expressions and match patterns in the stylesheet:

- The **##any** value declares that unprefix names are treated as a test on the local name of the element only. They will match regardless of namespace.
- The **##html5** value declares that an unprefix element name will match either a name in the XHTML namespace or a name in no namespace. This option is primarily intended for use when generating stylesheets to run under Saxon-JS in the browser since the resulting behavior is close to that defined by the special rules in the HTML5 specification for XSLT and XPath running against an HTML5 DOM.
- You can also specify a valid URI by editing the value in the combo box. Specifying a URI sets the default namespace for elements and types (effectively a default value for `xpath-default-namespace`). Note that an explicit value for this attribute takes precedence.

Use a configuration file ("-config")

Select this option if you want to use a Saxon 12.3 configuration file that will be executed for the XSLT transformation and validation processes. You can specify the path to the configuration file by entering it in the **URL** field, or by using the  **Insert Editor Variables** button, or using the browsing actions in the  **Browse** drop-down list.

Compile

Use this button to generate the *stylesheet export file* according the options selected in this dialog box.

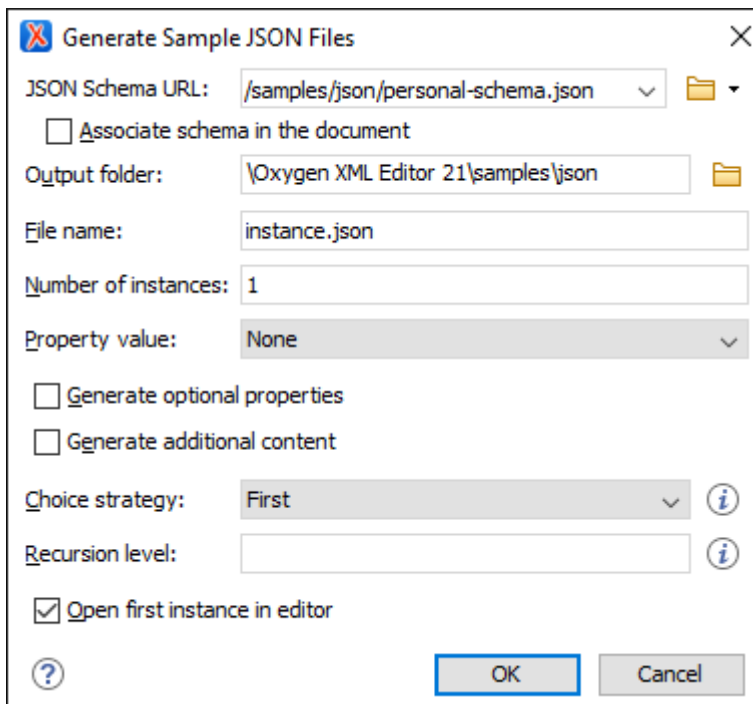

JSON Tools

Oxygen XML Editor Eclipse plugin includes some useful tools for converting between JSON, XML and YAML, converting XSD to JSON Schema, generating JSON instances or a JSON Schema, and OpenAPI (JSON and YAML) testing.

Generating Sample JSON Files from a JSON Schema

Oxygen XML Editor Eclipse plugin includes a tool for generating sample JSON files. To generate sample JSON files from a JSON Schema, select **Generate Sample JSON Files** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure a variety of options for generating the files.

Figure 553. Generate Sample JSON Files Dialog Box

The **Generate Sample JSON Files** dialog box includes the following fields and options:

Schema URL

The URL of the Schema location. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the **Browse** drop-down list. The tool supports schemas with versions *Draft 04, 06, 07, 2019-09, and 2020-12*.

Associate schema in the document

If enabled, the specified schema will be associated with the generated files.

Output folder

Path to the folder where the generated JSON instances will be saved.

File name

The name of the instance(s) that will be generated. By default, `instance.json` is used.

Number of instances

The desired number of JSON instances to be generated. When more than one instance is generated, the index of the instance will be added to its file name.

Property value

You can specify the way the values of the properties are generated. The following options are available:

- *None* - Assigns empty values for properties (a template file will be generated). This is the default value.
- *Default* - Assigns the name of the property as the value (for strings) or assigns the specified minimum value (for numbers).
- *Random* - Assigns random values according to schema restrictions.

Generate optional properties

If selected, the JSON instance will be generated with optional properties that are defined in the JSON schema. Otherwise, only the required properties will be generated.

Generate additional content

If selected, the JSON instance will be generated with additional properties that are defined in the JSON schema as `additionalProperties` and additional items that are defined as `additionalItems` (in the case of an Array).

Choice strategy

You can specify the way an instance will be generated from a schema that contains a `CombinedSchema` (with either *oneOf* or *anyOf*). The following options are available:

- *First* - The first defined schema in *oneOf* or *anyOf* will be used.
- *Random* - A random schema defined in *oneOf* or *anyOf* will be used.

Recursion level

This option controls the maximum allowed depth (must be a number), in case the selected schema contains recursive calls of `$ref` schemas referencing one another. By default, it is set to 1, meaning that the generation for the recursive calls will stop after the first iteration.

Open first instance in editor

If selected, the first generated instance is opened in the editor.

You can click **OK** at any point to generate the sample JSON files.

Generating JSON Schema from a JSON File

Oxygen XML Editor Eclipse plugin includes a tool for generating a sample JSON Schema from a JSON file. To generate a sample JSON Schema, select **Generate JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for generating the JSON Schema.

Figure 554. Generate JSON Schema Dialog Box

The **Generate JSON Schema** dialog box includes the following fields and options:

JSON Document URL

The URL of the JSON file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Output JSON Schema

The path to the folder where the generated JSON Schema will be saved.

Open in Editor

If selected, the generated JSON Schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 4**, **Draft 6**, **Draft 7**, **2019-09**, and **2020-12**.

Extract matching format for strings

If selected, the generator will attempt to find a format that matches the string values from the JSON Document.

Restrict additional content

If selected, *additionalProperties* (for objects) and *additionalItems* (for arrays) will be set to *false* in the resulting schema. By default, these keys are not in the schema, meaning that providing additional content (according to the schema) is allowed.

Add default values for simple types

If selected, the *default* values (*0* for number, *""* for string, *false* for boolean) and *examples* for strings will be added.

Make all properties required

If selected, the generator will mark all the properties as required in the resulting schema.

You can click **Generate** at any point to generate the JSON Schema.

JSON to YAML Converter

Converting JSON to YAML in Oxygen

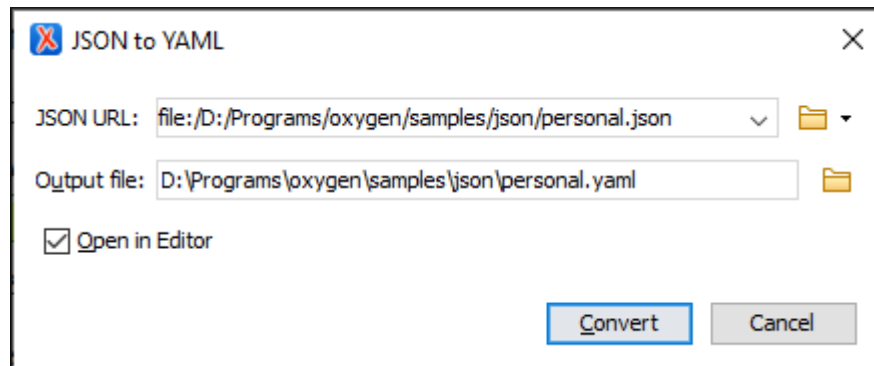

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to YAML. The **JSON to YAML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to YAML, follow these steps:

1. Select the **JSON to YAML** action from the **XML Tools > JSON Tools** menu.

The **JSON to YAML** dialog box is displayed:

Figure 555. JSON to YAML Dialog Box

2. Choose or enter the **JSON URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting YAML document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting YAML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to a YAML document.

Related Information:

[YAML to JSON Converter \(on page 887\)](#)

YAML to JSON Converter

Converting YAML to JSON in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting YAML files to JSON. It even works on files that consist of multiple YAML documents, each separated by three dashes (---), in which case the conversion creates multiple JSON files with a number in the name.

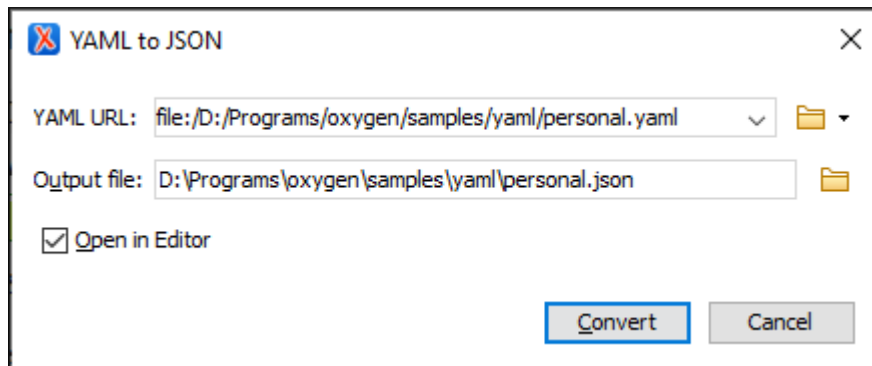

The **YAML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a YAML document to JSON, follow these steps:

1. Select the **YAML to JSON** action from the **XML Tools > JSON Tools** menu.

The **YAML to JSON** dialog box is displayed:

Figure 556. YAML to JSON Dialog Box

2. Choose or enter the **YAML URL** for the document you want to convert.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. **[Optional]** Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
5. Click the **Convert** button.

Result: The original YAML document is now converted to a JSON document.

Related Information:

JSON to XML Converter

Online JSON to XML Converter

Attention:

For a simple **ONLINE** tool for converting a single JSON file to XML, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting JSON to XML in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting JSON files to XML. The **JSON to XML** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert a JSON document to XML, follow these steps:

1. Select the **JSON to XML** action from the **XML Tools > JSON Tools** menu.

The **JSON to XML** dialog box is displayed:

Figure 557. JSON to XML Dialog Box

2. Choose or enter the **Input URL** of the JSON document.
3. Choose the path of the **Output file** that will contain the resulting XML document.
4. Select the **Open in Editor** option to open the resulting XML document in the main editing pane.
5. Click the **Convert** button.

Result: The original JSON document is now converted to an XML document.

Figure 558. Example: XML to JSON Operation Result

Conversion Details

- If the JSON document has more than one property on the first level, the converted XML document will have an additional root element called `<JSON>`.

For example, the following JSON document:

```
{
  "personnel": {
    "person": [
      { "name": "Boss" },
      { "name": "Worker" }
    ]
  },
  "id": "personnel-id"
}
```

it is converted to:

```
<?xml version="1.0" encoding="UTF-8"?>
<JSON>
  <personnel>
    <person>
      <name>Boss</name>
    </person>
    <person>
      <name>Worker</name>
    </person>
  </personnel>
  <id>personnel-id</id>
</JSON>
```

- If the JSON document is an array, the converted XML document will have a root element called `<array>` and for each item within the array, another `<array>` is created.

```
[
  { "name": "Boss" },
  { "name": "Worker" }
]
```

it is converted to:

```
<?xml version="1.0" encoding="UTF-8"?>
<array>
  <array>
    <name>Boss</name>
  </array>
</array>
```

```
<array>
  <name>Worker</name>
</array>
</array>
```

- If the name of a JSON property contains characters that are not valid in XML element names (for example, \$), then the invalid characters will be escaped as its hexadecimal equivalent in the converted XML.

```
{"$id": "personnel-id"}
```

is converted to:

```
<_x24_id>personnel-id</_x24_id>
```

Related Information:

[XML to JSON Converter \(on page 883\)](#)

XML to JSON Converter

Online XML to JSON Converter

Attention:

For a simple **ONLINE** tool for converting a single XML file to JSON, or vice versa, go to: https://www.oxygenxml.com/xml_json_converter.html.

Converting XML to JSON in Oxygen

Oxygen XML Editor Eclipse plugin includes a useful and simple tool for converting XML files to JSON. The **XML to JSON** action for invoking the tool can be found in the **XML Tools > JSON Tools** menu.

To convert an XML document to JSON, follow these steps:

1. Select the **XML to JSON** action from the **XML Tools > JSON Tools** menu.

Step Result: The **XML to JSON** dialog box is displayed:

Figure 559. XML to JSON Dialog Box

2. Choose or enter the **Input URL** of the XML document.
3. Choose the path of the **Output file** that will contain the resulting JSON document.
4. Select how you want empty elements to be converted (default is **object**).
5. Select the **Open in Editor** option to open the resulting JSON document in the main editing pane.
6. Click the **Convert** button.

Result: The original XML document is now converted to a JSON document.

Figure 560. Example: XML to JSON Operation Result

Conversion Details

- Some XML components are ignored (e.g. comments and processing instructions).
- If any elements contain attributes in the XML document, the attributes are converted to properties in the converted JSON document. If the XML document contains more than one element with the same name, they will be converted into an array of object in the converted JSON document.

For example, the following XML document:

```
<personnel>
  <person id="person.one">
    <name>Boss</name>
  </person>
  <person id="person.two">
    <name>Worker</name>
  </person>
</personnel>
```

it is converted to:

```
{
  "personnel": {
    "person": [
      {
        "id": "person.one",
        "name": "Boss"
      },
      {
        "id": "person.two",
        "name": "Worker"
      }
    ]
  }
}
```

- If the XML document contains elements with mixed content (text plus elements), the converted JSON document will contain a `#text` property with its value set as the text content. If there are multiple text nodes, the subsequent `#text` properties will contain a number (e.g. `#text1`, `#text2`). If there are multiple elements with the same name, the first property will have the element name and the subsequent properties will contain a number (e.g. `b`, `b#1`, `b#2`).

```
<p>This <b>is</b> an <b>example</b>!</p>
```

is converted to:

```
{
  "p": {
    "#text": "This ",
    "b": "is",
    "#text1": " an ",
    "b#1": "example",
    "#text2": "!"
  }
}
```

- If the XML document contains element names that contains hexadecimal codes (for example, if they were escaped during a [JSON to XML conversion \(on page 881\)](#)), it will be converted to the normal character value in the converted JSON document.

```
<_x24_id>personnel-id</_x24_id>
```

is converted to:

```
{"$id": "personnel-id"}
```

Related Information:

[JSON to XML Converter \(on page 881\)](#)

JSON Schema Converter

Oxygen XML Editor Eclipse plugin includes a tool for converting an older version of a JSON schema (Draft 4, 6, or 7) to the latest versions (2019-09 or 2020-12).

To convert a JSON schema, select **Convert JSON Schema** from the **XML Tools > JSON Tools** menu. The action opens a dialog box where you can configure some options for converting the JSON Schema.

Figure 561. Convert JSON Schema Dialog Box

The **Convert JSON Schema** dialog box includes the following fields and options:

JSON Schema URL

The URL of the JSON schema file. You can specify the path by using the text field, the history drop-down menu, or the browsing actions in the  **Browse** drop-down list.

Output JSON Schema

The path to the folder where the converted JSON schema will be saved.

Open in Editor

If selected, the converted JSON schema is opened in the editor.

JSON Schema version

The version of the resulting JSON schema. The possible choices are: **Draft 2019-09** or **2020-12**.

You can click **Convert** at any point to generate the JSON Schema.

Conversion Notes

- The `$schema` declaration is changed according to the selected JSON schema version.
- The `definitions` keyword is converted to `$defs` and all the references are updated.
- The `dependencies` keyword is split into `dependentRequired` and `dependentSchemas`.
- The `items` keyword (tuple array) is converted to `prefixItems` (2020-12).
- The `additionalItems` keyword is converted to `items` (2020-12, only if `prefixItems` is present).
- The `exclusiveMinimum` and `exclusiveMaximum` keywords with boolean values (Draft 4) are removed.
- The `id` keyword (Draft 4) is converted to `$id`.
- The `$ref` keyword wrapped into 1-item `allOf` is unwrapped because the latest versions allow processing `$ref` along with other keywords.

Generate Documentation

Oxygen XML Editor Eclipse plugin includes a tool for generating documentation for XSLT, XML Schema, XQuery, WSDL, JSON schema, and OpenAPI documents.

Generating Documentation for an XML Schema

Oxygen XML Editor Eclipse plugin can generate detailed documentation for the components of an XML Schema in HTML, PDF, DocBook, or other custom formats. You can select the components and the level of detail. The components are hyperlinked in both HTML and DocBook documents.

Note:

You can generate documentation for both XML Schema version 1.0 and 1.1.

To generate documentation for an XML Schema document, select **XML Schema Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate XML Schema Documentation** action from the contextual menu of the **Project Explorer** view (*on page 269*).

Figure 562. XML Schema Documentation Dialog Box

The **Schema URL** field of the dialog box must contain the full path to the XML Schema (XSD) file that will have documentation generated. The schema may be a local or a remote file. You can specify the path to the schema by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 769\)](#).
 - **PDF** - The documentation is generated in [PDF output format \(on page 772\)](#).
 - **DocBook** - The documentation is generated in [DocBook output format \(on page 772\)](#).
 - **DITA** - The documentation is generated in [DITA output format \(on page 772\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 772\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional

Resources that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type. For DITA and DocBook documents, this option appears as **Open in Editor** and the result will be opened in Oxygen XML Editor Eclipse plugin (in the current editor).

**Note:**

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, **en** for English), this includes all its possible variations (**en-us**, **en-uk**, etc.).

Settings Tab

When you generate documentation for an XML schema you can choose what components to include in the output and the details to be included in the documentation.

Figure 563. Settings Tab of the XML Schema Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Global elements**, **Global attributes**, **Local elements**, **Local attributes**, **Simple Types**, **Complex Types**, **Groups**, **Attribute Groups**, **Redefines**, **Referenced schemas**, **Include notations**.

You can choose whether or not to include the following other details:

- **Diagram** - Displays the diagram for each component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section. The generated diagrams are dependent on the options from the [Schema Design Properties \(on page 160\)](#) page.
- **Diagram annotations** - This option controls whether or not the annotations of the components presented in the diagram sections are included.
- **Namespace** - Displays the namespace for each component.
- **Location** - Displays the schema location for each component.
- **Type** - Displays the component type if it is not an anonymous one.
- **Type hierarchy** - Displays the types hierarchy.
- **Model** - Displays the model (sequence, choice, all) presented in BNF form. The separator characters that are used depend upon the information item used:

- **xs:all** - Its children will be separated by space characters.
- **xs:sequence** - Its children will be separated by comma characters.
- **xs:choice** - Its children will be separated by / characters.
- **Children** - Displays the list of component's children.
- **Instance** - Displays an XML instance generated based on each schema element.
- **Used by** - Displays the list of all the components that reference the current one. The list is sorted by component type and name.
- **Properties** - Displays some of the component's properties.
- **Facets** - Displays the facets for each simple type.
- **Identity constraints** - Displays the identity constraints for each element. For each constraint there are presented the name, type (unique, key, keyref), reference attribute, selector and field(s).
- **Attributes** - Displays the attributes for the component. For each attribute there are presented the name, type, fixed or default value, usage and annotation.
- **Asserts** - Displays the **assert** elements defined in a complex type. The test, XPath default namespace, and annotation are presented for each assert.
- **Annotations** - Displays the annotations for the component. If you choose **Escape XML Content**, the XML tags are present in the annotations.
- **Source** - Displays the text schema source for each component.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XML Schema documentation.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Related Information:

[Customizing PDF or DocBook Output of Generated XML Schema Documentation \(on page 773\)](#)

Generating Documentation for an XSLT Stylesheet

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation in HTML format for the elements (top-level elements whose names are in the XSLT namespace) of an XSLT stylesheet. You can select what XSLT elements to include in the generated documentation and also the level of details to present for

each of them. The elements are hyperlinked. To generate documentation in a [custom output format \(on page 697\)](#), you can edit the XSLT stylesheet used to generate the documentation, or create your own stylesheet.

To open the **XSLT Stylesheet Documentation** dialog box, select **XSLT Stylesheet Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate Stylesheet Documentation** action from the contextual menu of the **Project Explorer** view ([on page 269](#)).

Figure 564. XSLT Stylesheet Documentation Dialog Box

The **XSL URL** field of the dialog box must contain the full path to the XSL Stylesheet file you want to generate documentation for. The stylesheet may be a local or a remote file. You can specify the path to the stylesheet by entering it in the text field, or by using the **Insert Editor Variables** button or the options in the **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 695\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 697\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box ([on page 698](#)) where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.

- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large XSLT stylesheets, choosing another split criterion may generate smaller output files, providing faster documentation browsing. You can choose to split them by namespace, location, or component name.
- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

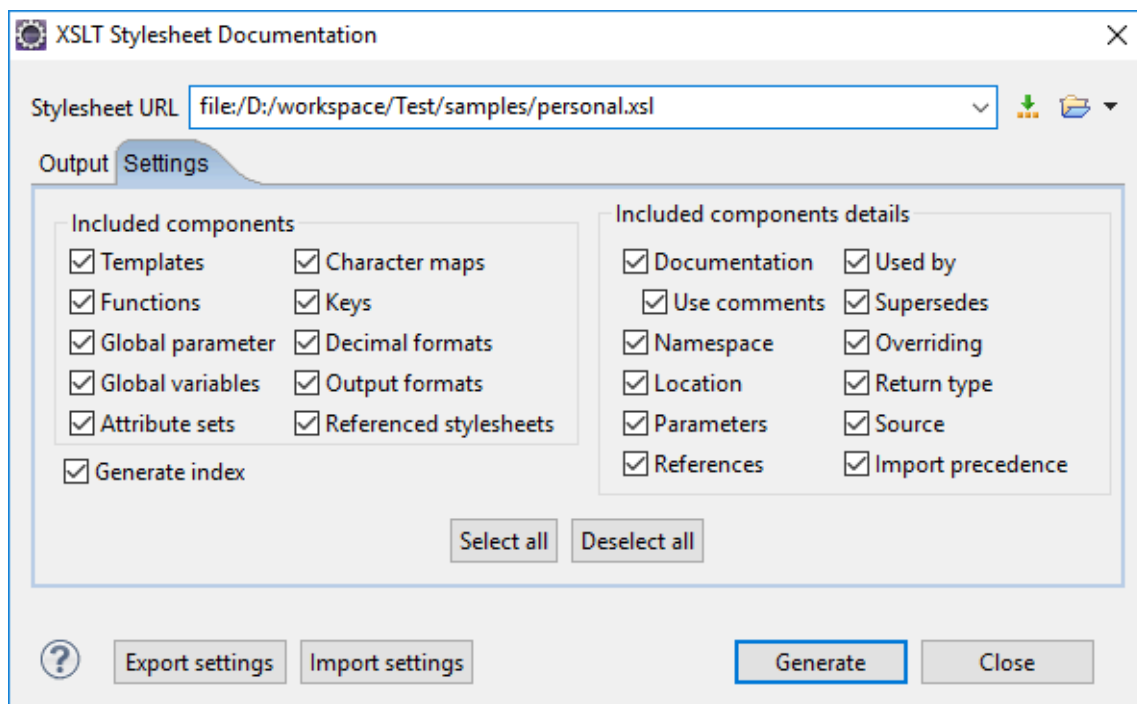

Note:

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

Settings Tab

When you generate documentation for an XSLT stylesheet you can choose what XSLT elements to include in the output (templates, functions, global parameters, global variables, attribute sets, character maps, keys, decimal formats, output formats, XSLT elements from referenced stylesheets) and the details to include in the documentation.

Figure 565. Settings Tab of the XSLT Stylesheet Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following components: **Templates, Functions, Global parameters, Global variables, Attribute sets, Character maps, Keys, Decimal formats, Output formats, Referenced stylesheets.**

You can choose whether or not to include the following other details:

- **Documentation** - Shows the documentation for each XSLT element. For HTML format, the user-defined data elements that are recognized and transformed in documentation blocks of the XSLT elements they precede, are the ones from the following schemas:
 - Oxygen XML Editor Eclipse plugin built-in XSLT documentation schema.
 - A subset of DocBook 5 elements. The recognized elements are: *section, sect1 to sect5, emphasis, title, ulink, programlisting, para, orderedlist, itemizedlist*.
 - A subset of DITA elements. The recognized elements are: *concept, topic, task, codeblock, p, b, i, ul, ol, pre, sl, sli, step, steps, li, title, xref*.
 - Full XHTML 1.0 support.
 - XSLStyle documentation environment. XSLStyle uses DocBook or DITA languages inside its own user-defined data elements. The supported DocBook and DITA elements are the ones mentioned above.
 - DOXSL documentation [framework \(on page 2679\)](#). Supported elements are: *codefrag, description, para, docContent, documentation, parameter, function, docSchema, link, list, listitem, module, parameter, template, attribute-set*.

Other XSLT documentation blocks that are not recognized will just be serialized inside an HTML *pre* element. You can change this behavior by using a [custom format \(on page 697\)](#) instead of the built-in [HTML format \(on page 695\)](#) and providing your own XSLT stylesheets.

- **Use comments** - Controls whether or not the comments that precede an XSLT element is treated as documentation for the element they precede. Comments that precede or succeed the *xsl:stylesheet* element, are treated as documentation for the whole stylesheet. Note that comments that precede an import or include directive are not collected as documentation for the imported/included module. Also, comments from within the body of the XSLT elements are not collected at all.
- **Namespace** - Shows the namespace for named XSLT elements.
- **Location** - Shows the stylesheet location for each XSLT element.
- **Parameters** - Shows parameters of templates and functions.
- **References** - Shows the named XSLT elements that are referenced from within an element.
- **Used by** - Shows the list of all the XSLT elements that reference the current named element.
- **Supersedes** - Shows the list of all the XSLT elements that are superseded the current element.
- **Overriding** - Shows the list of all the XSLT elements that override the current element.
- **Return type** - Shows the return type of the function.
- **Source** - Shows the text stylesheet source for each XSLT element.
- **Import precedence** - Shows the computed import precedence as declared in the XSL transformation specifications.
- **Generate index** - Creates an index with all the XSLT elements included in the documentation.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the XSLT documentation.

**Tip:**

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Related Information:

[XSLT Stylesheet Component Documentation Support \(on page 679\)](#)

Generating HTML Documentation for an XQuery Document

To generate HTML documentation for an XQuery document, use the **XQuery Documentation** dialog box. It is opened with the **XQuery Documentation** action that is available from the **XML Tools > Generate Documentation** menu or from the **Generate XQuery Documentation** action from the contextual menu of the **Project Explorer** view (on page 269).

The dialog box allows you to configure a set of parameters for the process of generating the HTML documentation.

Figure 566. XQuery Documentation Dialog Box

The following options are available:

- **Input** - The full path to the XQuery file must be specified in one of the two fields in this section:
 - **URLFile** - The URL of the file to be used for generating the documentation.
 - **Folder** - The directory that contains the files to be used for generating the documentation. You can also specify the XQuery file extensions to be searched for in the specified directory.
- **Default function namespace** - Optional URI for the default namespace for the submitted XQuery.
- **Predefined function namespaces** - Optional, engine-dependent, predefined namespaces that the submitted XQuery refers to. They allow the conversion to generate annotation information to support the presentation component hypertext linking (only if the predefined modules have been loaded into the local xqDoc XML repository).
- **Open in Browser/System Application** - Select this option if you want the result to be opened in the system application associated with that file type.

**Note:**

To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Output** - Allows you to specify where the generated documentation is saved on disk.

Generating Documentation for WSDL Documents (Deprecated)

You can use Oxygen XML Editor Eclipse plugin to generate detailed documentation for the components of a WSDL document in HTML format. You can select the WSDL components to include in your output and the level of details to present for each of them. Also, the components are hyperlinked. You can also generate the documentation in a *custom output format* ([on page 823](#)) by using a custom stylesheet.

**Note:**

The WSDL documentation includes the XML Schema components that belong to the internal or imported XML schemas.

To generate documentation for a WSDL document, select **WSDL Documentation** from the **XML Tools > Generate Documentation** menu or from the **Generate WSDL Documentation** action from the contextual menu of the **Project Explorer** view ([on page 269](#)).

Figure 567. WSDL Documentation Dialog Box

The **Input URL** field of the dialog box must contain the full path to the WSDL document that you want to generate documentation for. The WSDL document may be a local or a remote file. You can specify the path to the WSDL file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.

Output Tab

The following options are available in the **Output** tab:

- **Format** - Allows you to choose between the following formats:
 - **HTML** - The documentation is generated in [HTML output format \(on page 821\)](#).
 - **Custom** - The documentation is generated in a [custom output format \(on page 823\)](#), allowing you to control the output. Click the **Options** button to open a **Custom format options** dialog box where you can specify a custom stylesheet for creating the output. There is also an option to **Copy additional resources to the output folder** and you can select the path to the additional **Resources** that you want to copy. You can also choose to keep the intermediate XML files created during the documentation process by deselecting the **Delete intermediate XML file** option.
- **Output file** - You can specify the path of the output file by entering it in the text field, or by using the  **Insert Editor Variables** button or the options in the  **Browse** drop-down menu.
- **Split output into multiple files** - Instructs the application to split the output into multiple files. For large WSDL documents, choosing a different split criterion may generate smaller output files providing a faster documentation browsing. You can choose to split them by namespace, location, or component name.

- **Open in Browser/System Application** - Opens the result in the system application associated with the output file type.

 **Note:**
 To set the browser or system application that will be used, go to **Window > Preferences > General > Web Browser** and specify it there. This will take precedence over the default system application settings.

- **Keep only the annotations with xml:lang set to** - The generated output will contain only the annotations with the `@xml:lang` attribute set to the selected language. If you choose a primary language code (for example, `en` for English), this includes all its possible variations (`en-us`, `en-uk`, etc.).

Setting Tab

When you generate documentation for a WSDL document, you can choose what components to include in the output and the details to be included in the documentation.

Figure 568. Settings Tab of the WSDL Documentation Dialog Box

The **Settings** tab allows you to choose whether or not to include the following:

- **Components**
 - **Services** - Specifies whether or not the generated documentation includes the WSDL services.
 - **Bindings** - Specifies whether or not the generated documentation includes the WSDL bindings.
 - **Port Types** - Specifies whether or not the generated documentation includes the WSDL port types.

- **Messages** - Specifies whether or not the generated documentation includes the WSDL messages.
- **XML Schema Components** - Specifies whether or not the generated documentation includes the XML Schema components.
- **Only global elements and types** - Specifies whether or not the generated documentation includes only global elements and types.

- **Component Details**

- **Namespace** - Presents the namespace information for WSDL or XML Schema components.
- **Location** - Presents the location information for each WSDL or XML Schema component.
- **Used by** - Presents the list of components that reference the current one.
- **Documentation** - Presents the component documentation. If you choose **Escape XML Content**, the XML tags are presented in the documentation.
- **Source** - Presents the XML fragment that defines the current component.
- **Instance** - Generates a sample XML instance for the current component.

Note:

This option applies to the XML Schema components only.

- **XML Schema Diagram** - Displays the diagram for each XML Schema component. You can choose the image format (JPEG, PNG, SVG) to use for the diagram section.
- **Diagram annotations** - Specifies whether or not the annotations of the components presented in the diagram sections are included.
- **Generate index** - Displays an index with the components included in the documentation.
 - **Include local elements and attributes** - If selected, local elements and attributes are included in the documentation index.
 - **Include resource hierarchy** - Specifies whether or not the resource hierarchy for an XML Schema documentation is generated. It is deselected by default.

Export settings - Save the current settings in a settings file for further use (for example, if you need the exported settings file for [generating the documentation from the command-line interface](#)).

Import settings - Reloads the settings from the exported file.

Generate - Use this button to generate the WSDL documentation.

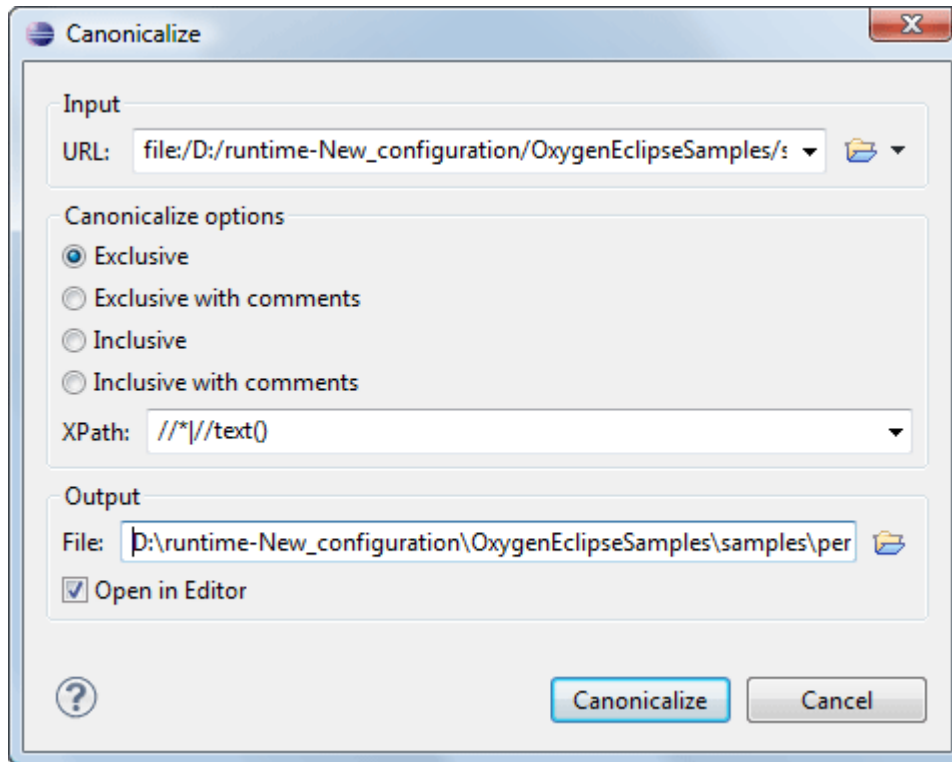

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen \(on page 2642\)](#).

Canonicalizing Files

You can select the *canonicalization* (on page 2677) algorithm to be used for a document from the dialog box that is displayed by using the **Canonicalize** action that is available from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

Figure 569. Canonicalization Settings Dialog Box

The **Canonicalize** dialog box allows you to set the following options:

- **Input URL** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the location of the input file.
- **Exclusive** - If selected, the exclusive (uncommented) *canonicalization* (on page 2677) method is used.

Note:

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* (on page 2677) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* (on page 2677) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments [canonicalization \(on page 2677\)](#) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **Output** - Available if the **Canonicalize** action was selected from the **XML Tools** menu. It allows you to specify the output file path where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in the editor.

Related Information:

[Digital Signatures Overview \(on page 645\)](#)

Signing Files

You can select the type of signature to be used for documents from a signature settings dialog box. To open this dialog box, select the **Sign** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu.

Figure 570. Signature Settings Dialog Box

The following options are available:

Note:

If Oxygen XML Editor Eclipse plugin could not find a valid certificate, a link is provided at the top of the dialog box that opens the [XML Signing Certificates preferences page \(on page 197\)](#) where you can configure a valid certificate.

Could not obtain a valid certificate. [You must configure a valid certificate.](#)

- **Input** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the location of the input URL.
- **Transformation Options** - See the [Digital Signature Overview \(on page 645\)](#) section for more information about these options.
 - **None** - If selected, no [canonicalization \(on page 2677\)](#) algorithm is used.
 - **Exclusive** - If selected, the exclusive (uncommented) [canonicalization \(on page 2677\)](#) method is used.

**Note:**

Exclusive Canonicalization just copies the namespaces you are actually using (the ones that are a part of the XML syntax). It does not look into attribute values or element content, so the namespace declarations required to process these are not copied. This is useful if you have a signed XML document that you want to insert into other XML documents (or you need self-signed structures that support placement within various XML contexts), as it will ensure the signature is verified correctly each time.

- **Exclusive with comments** - If selected, the exclusive with comments *canonicalization* (on page 2677) method is used.
- **Inclusive** - If selected, the inclusive (uncommented) *canonicalization* (on page 2677) method is used.

**Note:**

Inclusive Canonicalization copies all the declarations, even if they are defined outside of the scope of the signature, and all the declarations you might use will be unambiguously specified. *Inclusive Canonicalization* is useful when it is less likely that the signed data will be inserted in other XML document and it is the safer method from the security standpoint because it requires no knowledge of the data that are to be secured to safely sign them. A problem may occur if the signed document is moved into another XML document that has other declarations because the *Inclusive Canonicalization* will copy them and the signature will be invalid.

- **Inclusive with comments** - If selected, the inclusive with comments *canonicalization* (on page 2677) method is used.
- **XPath** - The XPath expression provides the fragments of the XML document to be signed.
- **ID** - Provides ID of the XML element to be signed.
- **Envelope** - If selected, the *enveloped* signature is used. See the [Digital Signature Overview](#) (on page 645) for more information.
- **Detached** - If selected, the *detached* signature is used. See the [Digital Signature Overview](#) (on page 645) for more information.
- **Append KeyInfo** - If this option is selected, the `<ds:KeyInfo>` element will be added in the signed document.
- **Signature algorithm** - The algorithm used for signing the document. The following options are available: **RSA with SHA1**, **RSA with SHA256**, **RSA with SHA384**, and **RSA with SHA512**.
- **Output** - Available if the **Sign** action was selected from the **XML Tools** menu. Specifies the path of the output file where the signed XML document will be saved.
- **Open in editor** - If selected, the output file will be opened in Oxygen XML Editor Eclipse plugin.

Related Information:[Digital Signatures Overview \(on page 645\)](#)[Verifying Signature \(on page 652\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 652\)](#)

Verifying Signature

You can verify the signature of a file by selecting the **Verify Signature** action from the **Source** submenu when invoking the contextual menu in **Text** mode or from the **XML Tools** menu. The **Verify Signature** dialog box then allows you to specify the location of the file whose signature is verified.

If the signature is valid, a dialog box displays the name of the signer. Otherwise, an error shows details about the problem.

Related Information:[Digital Signatures Overview \(on page 645\)](#)[Signing Files \(on page 649\)](#)[Example of How to Digitally Sign XML Files or Content \(on page 652\)](#)

WSDL SOAP Analyzer Tool (Deprecated)

WSDL SOAP Analyzer is a tool that helps you test if the messages defined in a Web Service Descriptor (WSDL) are accepted by a Web Services server.

After you edit and validate your Web service descriptor against a mix of the XML Schemas for WSDL and SOAP, it is easy to check if the defined SOAP messages are accepted by the remote Web Services server by using the integrated **WSDL SOAP Analyzer** tool (available from the toolbar or **WSDL** menu).

Oxygen XML Editor Eclipse plugin provides two ways of testing, one for the currently edited WSDL document and another for the remote WSDL documents that are published on a web server. To open the **WSDL SOAP Analyzer** tool for the currently edited WSDL document do one of the following:

- Click the  **WSDL SOAP Analyzer** toolbar button.
- Use the  **WSDL SOAP Analyzer** action from the **WSDL** menu.
- Go to **Open with > WSDL Editor** in the contextual menu of the **Project Explorer (on page 269)** view.

Figure 571. WSDL SOAP Analyzer View

This tool contains a SOAP analyzer and sender for Web Services Description Language file types. The analyzer fields are as follows:

- **Services** - The list of services defined by the WSDL file.
- **Ports** - The ports for the selected service.
- **Operations** - The list of available operations for the selected service.
- **Action URL** - The script that serves the operation.
- **SOAP Action** - Identifies the action performed by the script.
- **Version** - Choose between 1.1 and 1.2. The SOAP version is selected automatically depending on the selected port.
- **Request Editor** - It allows you to compose the web service request. When an action is selected, Oxygen XML Editor Eclipse plugin tries to generate as much content as possible for the SOAP request. The envelope of the SOAP request has the correct namespace for the selected SOAP version, that is *http://schemas.xmlsoap.org/soap/envelope/* for SOAP 1.1 or *http://www.w3.org/2003/05/soap-envelope* for SOAP 1.2. Usually you just have to change a few values for the request to be valid. The [Content Completion Assistant \(on page 2677\)](#) is available for this editor and is driven by the schema that defines the type of the current message. While selecting various operations, Oxygen XML Editor Eclipse plugin remembers the modified request for each one. You can click the **Regenerate** button to overwrite your modifications for the current request with the initial generated content.
- **Attachments List** - You can define a list of file URLs to be attached to the request.
- **Response Area** - Initially it displays an auto generated server sample response so you can have an idea about how the response looks like. After pressing the **Send** button, it presents the message received from the server in response to the Web Service request. It may show also error messages. If the response message contains attachments, Oxygen XML Editor Eclipse plugin prompts you to save them, then tries to open them with the associated system application.
- **Errors List** - There may be situations where the WSDL file is respecting the WSDL XML Schema, but it fails to be valid (for example, in the case of a message that is defined by means of an element that

is not found in the types section of the WSDL). In such a case, the errors are listed here. This list is presented only when there are errors.

- **Send Button** - Executes the request. A status dialog box is displayed when Oxygen XML Editor Eclipse plugin is connecting to the server.

The testing of a WSDL file is straight-forward. Click the WSDL analysis button, then select the service, the port, and the operation. The editor generates the skeleton for the SOAP request. You can edit the request, eventually attach files to it and send it to the server. Watch the server response in the response area. You can find more details in the [Testing Remote WSDL Files \(on page 825\)](#) section.

Note:

SOAP requests and responses are automatically validated in the **WSDL SOAP Analyzer** using the XML Schemas specified in the WSDL file.

Once defined, a request derived from a Web Service descriptor can be saved with the **Save** button to a Web Service SOAP Call (WSSC) file for later reuse. In this way, you save time in configuring the URLs and parameters.

You can open the result of a Web Service call in an editor panel using the **Open** button.

Testing Remote WSDL Files

To open and test a remote WSDL file the steps are the following:

1. Go to **Window > Show View > Other > Oxygen XML Editor Eclipse plugin >  WSDL SOAP Analyzer**.
2. Click the **Choose WSDL** button and enter the URL of the remote WSDL file.
3. Click the **OK** button.

This will open the **WSDL SOAP Analyzer tool (on page 823)**. In the **Saved SOAP Request** tab you can open directly a previously saved Web Service SOAP Call (WSSC) file, thus skipping the analysis phase.

XML Schema Regular Expressions Builder Tool

The XML Schema regular expressions builder allows you to test regular expressions on a fragment of text as they are applied to an XML instance document. Start the tool by selecting **XML Schema Regular Expressions Builder** from the **XML Tools** menu.

Figure 572. XML Schema Regular Expressions Builder Dialog Box

The dialog box contains the following:

Regular expressions editor

Allows you to edit the regular expression to be tested and used. Content completion is available and presents a list with all the predefined expressions. It is triggered by pressing **Ctrl + Space**.

Error display area

If the edited regular expression is incorrect, an error message will be displayed here. The message contains the description and the exact location of the error. Also, clicking the quick navigation button (↔) highlights the error inside the regular expression.

Category

You can choose from several categories of predefined expressions. The selected category influences the displayed expressions in the **Available expressions** table.

Available expressions

This table includes the available regular expressions and a short description for each of them. The set of expressions depends on the category selected in the previous **Category** combo box. You can add an expression in the **Regular expressions editor** by double-clicking the expression

row in the table. You will notice that in the case of **Character categories** and **Block names**, the expressions are also listed in complementary format.

Evaluate expression on

You can choose between two options:

- **Evaluate expression on each line** - The edited expression will be applied on each line in the **Test** area.
- **Evaluate expression on all text** - The edited expression will be applied on the whole text.

Test

A text editor that allows you to enter a text sample that will have the regular expression applied. All matches of the edited regular expression will be highlighted.

After editing and testing your regular expression you can insert it in the current editor. The **Insert** button will become active when an editor is opened in the background and there is an expression in the **Regular expressions editor**.

The regular expression builder cannot be used to insert regular expressions in the **Grid mode** ([on page 242](#)) or **schema Design mode** ([on page 243](#)). Accordingly, the **Insert** button will be not available if the current document is edited in these modes.

Note:

Some regular expressions may indefinitely block the Java Regular Expressions engine. If the execution of the regular expression does not end in about five seconds, the application displays a dialog box that allows you to interrupt the operation.

Comparison Tools

Oxygen XML Editor Eclipse plugin includes some useful tools for comparing files and directories. These tools are found in the **Comparison Tools** submenu within the **Tools** menu.

File Comparison Tool

Oxygen XML Editor Eclipse plugin includes a file comparison tool that provides a mechanism for comparing two XML-related resources, as well as the possibility for a three-way comparison. You can compare files in a visual comparison mode or in a text-based comparison mode. The supported XML file types include XSL, XSD, DTD, XProc, WSDL, RNG, and XSpec, as well as HTML documents.

How to Start a File Comparison

There are various ways to automatically start the file comparison, but the most common ways are:

- You can select two files (or three file if one of them is a common ancestor) in the **Project Explorer** view, right-click, and select one of the options in the **Compare With** menu (e.g. **Compare With > Each Other** to compare the selected files).
- If you use a versioning system, you can compare files directly from the **Synchronize** view (e.g. double-click a file or right-click selected files and choose **Open In Compare Editor**) or the **History** view.

Visual Author Comparison Mode

The visual **Author** file comparison mode makes it easier to see how the compared changes will look in the final output. It includes unique features such as actions to control the tags display mode, the ability to do second-level comparisons, and it presents differences made with *Change Tracking* enabled.

If there is a CSS associated with the documents (either directly in the document or in the framework definition), the visual comparison tool is presented automatically when you compare XML files in Oxygen XML Editor Eclipse plugin. If the comparison is automatically started in the text-based mode, you can switch to the visual comparison mode by clicking the  **Switch to Author Mode** toolbar button.

Attention:

If the documents do not have an associated CSS, the visual comparison mode cannot render the document properly, so the text-based mode is used in this situation.

You can compare versions in the Workbench with versions in the repository, or with the local edit history. You can also compare three files if a common ancestor exists. The two editors are constantly synchronized and the differences are refreshed when you save the modified document.

Figure 573. Visual File Comparison Tool

Text-based Comparison Mode

Oxygen XML Editor Eclipse plugin also includes a text-based comparison mode. When in the **Author** comparison mode, you can switch to the text-based mode by clicking the  **Switch to Text Mode** toolbar button.

Most of the options, features, and actions that are available for the visual-based comparison mode are also available in the **Text** comparison mode, although more [algorithms \(on page 2304\)](#) are available in **Text** mode.

Highlight Colors

The differences are also highlighted in several colors, depending on the type of change. The highlighting colors can be customized in the [Diff > Appearance preferences page \(on page 81\)](#). The default colors and their shades mean the following:

- **Pink** - Identifies modifications on either side. For 3-way comparisons, it identifies blocks of changes that include conflicts.
- **Gray** - Identifies an addition of a node in the left side (your outgoing changes). For 3-way comparisons, it identifies your outgoing changes that do not include conflicts.
- **Blue** - Identifies an addition of a node in the right side (incoming changes). For 3-way comparisons, it identifies incoming changes that do not include conflicts.
- **Lighter Shade** - Identifies blocks of changes that can be merged in their entirety.
- **Darker Shade** - Identifies specific changes within the blocks that can be merged more precisely.

Navigating Differences

To navigate through differences, do one of the following:

- Use the navigation buttons on the toolbar.
- Select a block of differences by clicking its small colored marker in the overview ruler located in the right-most part of the window. At the top of the overview ruler there is a success indicator that turns green where there are no differences, or red if differences are found.

Toolbar Actions

A variety of actions are available on the toolbar:

 **Switch to Text Mode (Not available in Author comparison mode)**

Switches to the text-based file comparison mode.

 **Switch to Author Mode (Only available in Text mode)**

Switches to the visual **Author** file comparison mode.

 **Tags Display Mode (Only available in Author comparison mode)**

Allows you to select the amount of markup to be displayed in the editors. You can choose between:  **Full Tags with Attributes**,  **Full Tags**,  **Block Tags**,  **Block Tags without Element Names**,  **Inline Tags**,  **Partial Tags**, or  **No Tags**.

Diff Options

Opens the [Diff preferences page \(on page 80\)](#) where you can configure various options.

Algorithm Drop-down menu (Only available in Text mode)

This drop-down menu allows you to select a [diff algorithm \(on page 2304\)](#) to use for the comparison (depending on whether it is a two-way or three-way comparison).

Swap Left and Right View

Swaps the file in the left pane with the one in the right pane.

Copy All Non-Conflicting Changes from Left to Right

Copies all non-conflicting changes from the file in the left pane to the file in the right pane.

Copy All Non-Conflicting Changes from Right to Left

Copies all non-conflicting changes from the file in the right pane to the file in the left pane.

Copy Current Change from Left to Right

Copies the current change from the file in the left pane to the file in the right pane.

Copy Current Change from Right to Left

Copies the current change from the file in the right pane to the file in the left pane.

Next Difference

Navigates to the next block of changes. This action is not available when the cursor is positioned on the last change block or when there are no changes.

Note:

A change block groups one or more consecutive lines that contain at least one change.

Previous Difference

Jumps to the previous block of changes. This action is not available when the cursor is positioned on the first change block or when there are no changes.

Next Change

Jumps to the next change from the current block of changes. When the last change from the current block of changes is reached, it highlights the next block of changes. This action is not available when the cursor is positioned on the last change or when there are no changes.

Previous Change

Jumps to the previous change from the current block of changes. When the first change from the current block of changes is reached, it highlights the previous block of changes. This action is not available when the cursor is positioned on the first change or when there are no changes.

Contextual Menu Actions

The following contextual menu actions are available in each editor pane:

Undo

Undo changes in the currently focused editor pane.

Redo

Redo changes in the currently focused editor pane.

Cut

Cut the selection from the currently focused editor pane to the clipboard.

Copy

Copy the selection from the currently focused editor pane to the clipboard.

Paste

Paste content from the clipboard into the currently focused editor pane.

Select all

Selects all content in the currently focused editor pane.

Find/Replace

Performs a *find/replace* operation in the currently focused editor pane.

Algorithms

In **Text** mode, you can select the diff algorithm to use for the comparison using the  **Algorithm Drop-down menu** that is available on the toolbar. The following diff algorithms are available (depending on whether it is a two-way or three-way comparison):

- **Auto (only available for two-way comparisons)** - Selects the most appropriate algorithm, based on the compared content and its size (selected by default).
- **Characters (only available for two-way comparisons)** - Computes the differences at character level, meaning that it compares two files or fragments looking for identical characters.
- **Words (only available for two-way comparisons)** - Computes the differences at word level, meaning that it compares two files or fragments looking for identical words.
- **Lines** - Computes the differences at line level, meaning that it compares two files or fragments looking for identical lines of text.
- **Syntax Aware (only available for two-way comparisons)** - Computes differences for the file types or fragments known by Oxygen XML Editor Eclipse plugin, taking the syntax (the specific types of tokens) into consideration.

- **XML Fast** - Comparison that works well on large files or fragments, but it is less precise than **XML Accurate**.
- **XML Accurate** - Comparison that is more precise than **XML Fast**, at the expense of speed. It compares two XML files or fragments looking for identical XML nodes.

In **Author** mode, only the **Auto**, **XML Fast**, and **XML Accurate** algorithms are available and you can select them from the **Diff preferences page** (*on page 80*) (easily accessible by clicking the  **Diff Options** toolbar button).

Second-Level Comparisons

The comparison tool automatically performs a second-level comparison for the **XML Fast** and **XML Accurate** algorithms. After the first comparison is finished, the second-level comparisons is processed on text nodes using a word-level comparison, meaning that it looks for identical words. This second-level comparison makes it easier to spot precise differences and you can merge or reject the precise modifications.

20.

Troubleshooting

This section provides a collection of common performance and other types of problems that might be encountered when using Oxygen XML Editor Eclipse plugin, along with their possible solutions.

Performance Problems and Solutions

This section contains solutions for some common performance problems that may appear when running Oxygen XML Editor Eclipse plugin.

Out of Memory on External Processes

Problem

Oxygen XML Editor Eclipse plugin throws an *Out Of Memory* error when trying to generate PDF output with the built-in Apache FOP processor.

Cause

The amount of allocated memory might be insufficient.

Solutions

- Open the **Preferences** dialog box ([on page 70](#)), go to **XML > PDF Output > FO Processors**, and increase the value of the **Memory available to the Apache FOP** option ([on page 184](#)).
- For external XSL-FO processors, XSLT processors, and external tools, the maximum value of the allocated memory is set in the command line of the tool using the **-Xmx** parameter set to the Java virtual machine.

Related Information:

[FO Processors Preferences \(on page 183\)](#)

[Custom Engines Preferences \(on page 199\)](#)

[How to Enable Debugging for FO Processor Transformations \(on page 1276\)](#)

Performance Issues with Large Documents

Problem

The performance of the application slows down considerably over time when working with large documents.

Cause

A possible cause is that the application needs more memory to run properly.

Solutions

- You can increase the maximum amount of memory available to Oxygen XML Editor Eclipse plugin by setting the `-vmargs` and `-Xmx` parameters in the command used to launch the Eclipse platform.

Attention:

The maximum amount of memory should be less than 75% of the physical amount of memory available on the machine. Otherwise, the operating system and other applications will have no memory available.

Note:

Misc Problems and Solutions

This chapter presents common problems that may appear when running the application along with solutions for these problems.

Address Family Not Supported by Protocol Family

Problem

I have experienced the following error: *"Address Family Not Supported by Protocol Family; Connect"*. How do I solve it?

Cause

This seems to be an IPv6 connectivity problem. By default, the Java runtime used by Oxygen XML Editor Eclipse plugin prefers to create connections via IPv6, if the support is available. However, even though it is available in appearance, IPv6 sometimes happens to be configured incorrectly on some systems.

Solution

A quick solution for this problem is to set the `java.net.preferIPv4Stack` Java property to `true` (`java.net.preferIPv4Stack=true`), by following this procedure:

1. Create a file named `custom_commons.vmoptions` and on a single line, add `-Djava.net.preferIPv4Stack=true`. Then save the file and copy it to the Oxygen XML Editor Eclipse plugin installation folder (may need admin access).
2. Restart Oxygen XML Editor Eclipse plugin.
3. Make sure the procedure was successful by going to **Help > About > System properties** and check that the value of the `java.net.preferIPv4Stack` property is `true`.

Application Takes Several Minutes to Start

Problem

Oxygen XML Editor Eclipse plugin seems to take an abnormally long amount of time to start.

Cause

Some anti-virus software can cause Java applications, such as Oxygen XML Editor Eclipse plugin, to start very slowly due to scanning compressed archives (such as the *JAR* libraries that all Java applications use).

Solution

A possible solution is to add the Oxygen XML Editor Eclipse plugin folder to the list of exceptions in the anti-virus software settings.

Blank Window is Shown When Starting the App Over an RDP Connection on Linux

Problem

When starting Oxygen XML Editor Eclipse plugin or its installer on *Linux*, a blank window is displayed when started over an RDP connection.

Cause

Oxygen XML Editor Eclipse plugin and its installer are Java Swing apps that require a 24 bit color depth from the X server.

Solution

1. If you are using *xrdp*, find the `/etc/xrdp/xrdp.ini` file.
2. Uncomment the `xserverbpp=24` line.
3. Save your files and close all the apps (the subsequent step will terminate your remote session so you could lose your progress if you do not save your files first).
4. Restart the *xrdp* service:

```
sudo systemctl restart xrdp.service
```

**Note:**

Alternatively, you can try setting `max_bpp=24` in the same `/etc/xrdp/xrdp.ini` file.

Cannot Open Files from Desktop/Downloads/OneDrive on macOS

Problem

When using Oxygen XML Editor Eclipse plugin on macOS, the application cannot open files from Desktop/Downloads/OneDrive.

Cause

Sometimes, macOS shows a popup about allowing the application access to some special folders (e.g. Downloads or Desktop), and unless you explicitly agree, it will leave it unchecked (the app does not allowed access). The popup can go unnoticed and disappears after a while, so it is easy to overlook it and the application will not have access to that folder.

Solution

Go to the macOS **System preferences > Security & Privacy > Privacy tab > Files and Folders**. You should find *Oxygen* in that list and the folders you were prompted to access. Check the box for the folder (i.e. Downloads or Desktop), if there is one unchecked.

**Note:**

If that does not work, look at "Full Disk Access" from the same Privacy tab. Add *Oxygen* there so that it has full access. However, only use this method as a last resort.

Compatibility Issue Between Java and Certain Graphics Card Drivers

Problem

Under certain settings, a compatibility issues can appear between Java and some graphics card drivers, which results in the text from the editor (in **Author** or **Text** mode) being displayed garbled.

Solution

If you encounter this problem, update your graphics card driver.

Damaged File Associations on macOS

Problem

After upgrading macOS and Oxygen XML Editor Eclipse plugin, it is no longer associated to the appropriate file types (such as XML, XSL, XSD). How can I re-create the file associations?

Cause

The upgrade damaged the file associations in the LaunchService Database on your macOS machine.

Solution

You can rebuild the LaunchService Database with the following procedure. This will reset all file associations and rescan the entire file system searching for applications that declare file associations and collect them in a database used by Finder.

1. Find all the Oxygen XML Editor Eclipse plugin installations on your hard drive.
2. Delete them by dragging them to the Trash.
3. Clear the Trash.
4. Unpack the Oxygen XML Editor Eclipse plugin installation kit on your desktop.
5. Copy the contents of the archive into the folder `/Applications/Oxygen`.
6. Run the following command in a Terminal:

```
/System/Library/Frameworks/CoreServices.framework/Versions/A/Frameworks/  
LaunchServices.framework/Versions/A/Support/lsregister -kill -r -domain local -domain system  
-domain user
```

7. Restart Finder with the following command:

```
killall Finder
```

8. Create an XML or XSD file on your desktop. It should have the Oxygen XML Editor Eclipse plugin icon.
9. Double-click the file.
10. Accept the confirmation.

Result: When you start Oxygen XML Editor Eclipse plugin, the file associations should work correctly.

Details to Submit in a Request for Technical Support Using the Online Form

Problem

What details should I add to my request for technical support on the online form in the product website?

Solution

When completing a request for Technical Support using the online form, include as many details as possible about your problem. For problems where a simple explanation may not be enough for the Technical Support team to reproduce or address the issue (such as server connection errors, unexpected delays while editing a document, an application crash, etc.), you should generate log files and attach them to the problem report. In the case of a crash, you should also attach the crash report file generated by your operating system.

If the text content of an XML document you want to send to the support team contains sensitive or private information, you can use the [Randomize XML text content](#) action (*on page 41*) to create filler content. Before

using this action, you need to copy the initial XML resources and save them in a separate folder. Otherwise, you might lose your original information.

To generate the Oxygen XML Editor Eclipse plugin log files, follow these steps:

1. Create a text file called `logback.xml` in the `lib` folder of the installed `plugin` folder, with the following content:

```
<configuration>
  <appender name="R2" class="ch.qos.logback.core.rolling.RollingFileAppender">
    <file>${user.home}/Desktop/oxygenLog/oxygen.log</file>
    <rollingPolicy class="ch.qos.logback.core.rolling.FixedWindowRollingPolicy">
      <fileNamePattern>${user.home}/Desktop/oxygenLog/oxygen%i.log.gz</fileNamePattern>
      <minIndex>1</minIndex>
      <maxIndex>20</maxIndex>
    </rollingPolicy>
    <triggeringPolicy class="ch.qos.logback.core.rolling.SizeBasedTriggeringPolicy">
      <maxFileSize>12MB</maxFileSize>
    </triggeringPolicy>
    <encoder>
      <pattern>%r %marker %p [ %t ] %c - %m%n</pattern>
    </encoder>
  </appender>

  <root level="debug">
    <appender-ref ref="R2" />
  </root>
</configuration>
```

2. Restart the application.
3. Reproduce the error.
4. Close the application.
5. Delete the `logback.xml` file because it might cause performance issues if you leave it in the `lib` folder.

Important:

The logging mode may severely decrease the performance of the application. Therefore, do not forget to delete the `logback.xml` file when you are done with the procedure.

Result: The resulting log files are named `oxygen.log` and `oxygen#.log.qz` (for example, `oxygen.log`, `oxygen1.log.qz`, `oxygen2.log.qz`, etc.) and are located in the `Desktop\oxygenLog` folder.

Dialog Boxes Cannot Be Resized on Mac

Problem

When using Oxygen XML Editor Eclipse plugin on *macOS Big Sur*, dialog boxes (for example the **Find/Replace** or **Preferences** dialog box) cannot be resized.

Cause

This is caused by an issue with resizing dialog boxes in Oxygen XML Editor Eclipse plugin on *macOS Big Sur* (and possibly later versions) causing crashes if the main application is in full screen mode.

Solution

Until this limitation is resolved in a future Oxygen XML Editor Eclipse plugin version, dialog boxes cannot be maximized or resized on *macOS Big Sur*.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

DITA map (on page 2678) transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the `force-unique` parameter set to **true** to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```

<map>
...
<topicref href="../../topics/MyTopic.dita" />
...
<topicref href="../../topics/MyTopic.dita" copy-to="../../topics/MyTopic-2.dita" />
</map>

```

DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the **Output** tab, select a local directory for **Temporary files directory** and **Output directory**).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.
- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.
- You can [increase the memory available to Oxygen XML Editor Eclipse plugin \(on page 2306\)](#). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the **Advanced** tab, enter **logger org.apache.tools.ant.listener.ProfileLogger** in the **Additional arguments** field. Then go to **Options > Preferences > DITA > Logging** and select **Always** for the **Show console output** option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see [DITA PDF Processing Common Errors \(on page 2576\)](#).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running the [Validate and Check for Completeness action \(on page 2382\)](#). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the [DITA map \(on page 2678\)](#), broken links, and missing external resources.

You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

[How to Enable Debugging for FO Processor Transformations \(on page 1276\)](#)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:  
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo  
<Failed to open C:\samples\dita\out\pdf\test.pdf>  
Failed to open samples\dita\out\pdf\test.pdf
```

```

.....
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)

```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```

[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\exml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]     at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]     at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
.....
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf

```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and look in it at the line specified in the error message (See position 179:-1).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager view** (on page 2337)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated **XSL-FO** file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -  
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the  **Validate and Check for Completeness** action available in the **DITA Maps Manager view** (*on page 2337*) to find such problems.
2. If you publish to PDF using a *DITAVAL* filter, select the same *DITAVAL* file in the **DITA Map Completeness Check** dialog box.
3. If the  **Validate and Check for Completeness** action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and search for the *unresolved ID references* (for example: `unique_4_Connect_42_wrongID`).
5. Look in the **XSL-FO** file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager view** (*on page 2337*)) to find the original DITA topic where the table was generated.

Related Information:

[How to Enable Debugging for FO Processor Transformations](#) (*on page 1276*)

DITA PDF CSS-based Processing Common Errors

For information about possible common errors that could be encountered when processing CSS-based DITA to PDF output, see the [Troubleshooting section in the CSS-based PDF Customization guide](#) (*on page 1798*).

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.`

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

**Tip:**

It is a good practice to validate the [DITA map \(on page 2678\)](#) before executing the transformation scenario. To do so, run [the Validate and Check for Completeness action \(on page 2382\)](#). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the *DITA map*), broken links, and missing external resources.

Related Information:

[DITA Map CHM \(Compiled HTML Help\) Transformation \(on page 2544\)](#)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5003: Error: Compilation failed while compiling fileName.`

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

**Tip:**

It is a good practice to validate the [DITA map \(on page 2678\)](#) before executing the transformation scenario. To do so, run [the Validate and Check for Completeness action \(on page 2382\)](#). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the *DITA map*), broken links, and missing external resources.

Related Information:

[DITA Map CHM \(Compiled HTML Help\) Transformation \(on page 2544\)](#)

Eclipse Error Messages

Problem

When using the Oxygen XML Editor Eclipse plugin, I receive unusual error messages or warnings that seem to be originating from Eclipse (as opposed to the usual messages that come from **Oxygen**).

Cause

This problem could be caused by the *Language Servers* support in Eclipse. Certain enabled language servers could send unexpected errors or warnings to the Oxygen XML Editor Eclipse plugin.

Solution

Go to **Preferences > Language Servers** and disable the language servers that could be sending the errors.

Error After Switching Oxygen Products in Eclipse

Problem

On an Eclipse deployment, after installing and using the **Editor** product, I later decided to uninstall it and use **Author** or **Developer** instead. After installing the new product, I received an error that looked like this:

```
java.lang.Exception
    at org.eclipse.ui.internal.ViewReference.createErrorPart(ViewReference.java:112)
    at org.eclipse.ui.internal.ViewReference.createPart(ViewReference.java:98)
    at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.createPart
                                                (CompatibilityPart.java:279)
    at org.eclipse.ui.internal.e4.compatibility.CompatibilityPart.create
                                                (CompatibilityPart.java:317)
    at sun.reflect.NativeMethodAccessorImpl.invoke0(Native Method)
    at sun.reflect.NativeMethodAccessorImpl.invoke(NativeMethodAccessorImpl.java:62)
    at sun.reflect.DelegatingMethodAccessorImpl.invoke
                                                (DelegatingMethodAccessorImpl.java:43)
    at java.lang.reflect.Method.invoke(Method.java:498)
    ...
```

Solution

You need to manually delete the perspective for the product you uninstalled by following this procedure:

1. Go to **Window > Preferences > General > Perspectives**.
2. Select the perspective for the product you uninstalled (for example, **<oXygen/> XML**) and click **Delete**.
3. Restart Eclipse.
4. Go to **Window > Open Perspective** and select the perspective for the new product (for example, **<oXygen/> XML Author**).

Format and Indent Fails

Problem

When I use the  **Format and Indent** function, I get an error message that indicates the *Format and Indent failed*.

Cause

This happens because the application tries to limit the exposure to XXE attacks so the parser blocks the expansion of system entities (the ones that are loaded from disk or from remote sources).

Solution

If you are in complete control of the XML documents (you manage or trust those who are creating and editing the documents), you can disable this particular check by selecting the **Enable system parameter entity expansion in other entity definitions** option (*on page 192*) in the **XML Parser** preferences page.

Hunspell Spell Checker is Unusable on Your Platform Error

Problem

When trying to use the **Check Spelling** option, I receive the error **Hunspell spell checker is unusable on your platform. It has crashed the application in a previous session**.

Cause

There are instances where Oxygen XML Editor Eclipse plugin determines that an internal component (such as the spell checker) has crashed the application and disables that component from running in the future (to prevent a possible future crash).

Solution

To re-enable the spell checker component, follow these steps:

1. Close Oxygen XML Editor Eclipse plugin.
2. Open the `%APPDATA%\com.oxygenxml` folder and look for a file called something like **HunspellCrashGuard*.txt**. Delete that file.
3. Restart Oxygen XML Editor Eclipse plugin.

High Resolution Scaling Issues

Problem

I encounter scaling detection issues in a high resolution display (for example, some GUI components are too small).

Cause

This sometimes happens when using multiple displays with different resolutions because the application cannot detect the correct scaling setting.

Solution

You can use the `sun.java2d.uiScale` Java system property to instruct Java to use a particular scaling factor:

```
-Dsun.java2d.uiScale=1.5
```

Images Appear Stretched Out in the PDF Output

Problem

When publishing XML content (DITA, DocBook, etc.), images are sometimes scaled up in the PDF outputs but are displayed perfectly in the HTML (or WebHelp) output.

Solution

PDF output from XML content is obtained by first obtaining an intermediary XML format called XSL-FO and then applying an XSL-FO processor to it to obtain the PDF. This stretching problem is caused by the fact that all XSL-FO processors take into account the DPI (dots-per-inch) resolution when computing the size of the rendered image.

The PDF processor that comes out of the box with the application is the open-source Apache FOP processor. Here is what Apache FOP does when deciding the image size:

1. If the XSL-FO output contains width, height or a scale specified for the image `<external-graphics>` tag, then these dimensions are used. This means that if in the XML (DITA, DocBook, etc.) you set explicit dimensions to the image they will be used as such in the PDF output.
2. If there are no sizes (width, height or scale) specified on the image XML element, the processor looks at the image resolution information available in the image content. If the image has such a resolution saved in it, the resolution will be used and combined with the image width and height to obtain the rendered image dimensions.
3. If the image does not contain resolution information inside, Apache FOP will look at the FOP configuration file for a default resolution. The FOP configuration file for XSLT transformations that output PDF is located in the `[OXYGEN_INSTALL_DIR]/lib/fop.xconf`. DITA publishing uses the DITA Open Toolkit that has the Apache FOP configuration file located in `[DITA-OT-DIR]/plugins/org.dita.pdf2.fop/fop/conf/fop.xconf`. The configuration file contains two XML elements called `<source-resolution>` and `<target-resolution>`. The values set to those elements can be increased (usually a DPI value of 110 or 120 should render the image in PDF the same as in the HTML output).

The commercial **RenderX XEP** XSL-FO processor behaves similarly but as a fallback it uses 120 as the DPI value instead of using a configuration file.

**Tip:**

It is best to save your images without any DPI resolution information. For example, when saving a PNG image in the open-source GIMP image editor, you do not want to save the resolution.

This allows you to control the image resolution from the configuration file for all referenced images.

Increasing the Memory for the Ant Process

Problem

The Ant build process runs out of memory.

Solution

For details about setting custom JVM arguments to the Ant build process, see [JVM Arguments \(on page 2563\)](#).

JPEG CMYK Color Space Issues

Problem

JPEG images with the CMYK color profile and have the color profiles embedded in the image aren't rendered in the **Author** mode.

Solution

If the color profile information is missing from the JPEG image but you have the ICC file available, you can copy the `profileFileName.icc` to the `[OXYGEN_INSTALL_DIR]\lib` directory.

If the color space profile is missing, JPEG images that have the CMYK color space are rendered without taking the color profile into account. The **Unsupported Image Type** message is displayed above the image.

Mac Touch Bar Function Keys Do Not Work

Problem

I am using a Mac that has a Touch Bar but its function keys do not work in Oxygen XML Editor Eclipse plugin.

Causes

By default, the Touch Bar function keys are not enabled for Oxygen XML Editor Eclipse plugin.

Solution

To enable the Touch Bar function keys for Oxygen XML Editor Eclipse plugin, follow these steps:

1. Go to **System Preferences** and select **Keyboard**.
2. Click **Shortcuts**.
3. From the left sidebar, select **Function Keys**.
4. Click the **+** symbol, select **Oxygen** from the list of apps, and click **Add**.

Server Signature Mismatch Error

Problem

I receive an error indicating that *the current license was already activated on a License Server* or that the *License Server's Signature does not match*.

During the license activation process, the license key becomes bound to a particular license server deployment. This means that a code that uniquely identifies your license server deployment (called *Server Signature*) is sent to the **Oxygen** servers, which in turn will sign the license key. The *Server Signature* is computed from the list of network interfaces of the server where you deployed the license.

When starting the license server, if you receive an error stating that your *Server Signature* does not match, there are several possible causes:

Possible Cause 1

The license key was moved to a new server that hosts your license server.

Solution

Revert to your previous configuration.

Possible Cause 2

A new network interface was changed, added, or activated in the server that hosts your license server.

Note:

A specific example of when this could happen is if the Bluetooth or the WiFi module is activated/deactivated.

Solution

If reverting is not possible, contact the [Oxygen support team](#).

Possible Cause 3

The license server was restarted from a different location as the previous restart. For example, some server configurations will have the Apache Tomcat server installed in a versioned folder (`/usr/local/apache-`

`tomcat-V.V.V`) with a symbolic link to the typical folder (`/usr/local/tomcat`). The server can be restarted from either location, but it is recommended to always restart from the typical folder (`/usr/local/tomcat`) and always restart from the same location.

Solution

The server simply needs to always be restarted from the same location.

MSXML 4.0 Transformation Issues

Problem

When running a transformation scenario that uses the MSXML 4.0 transformer, I receive an error that looks like this:

```
Could not create the 'MSXML2.DOMDocument.4.0' object.  
Make sure that MSXML version 4.0 is correctly installed on the machine.
```

Cause

It is likely that the latest MSXML 4.0 service pack is not installed on your computer.

Solution

To fix this issue, go to the Microsoft website and get the latest MSXML 4.0 service pack.

Navigation to a Web Page is Canceled when Viewing CHM on a Network Drive

Problem

When viewing a CHM on a network drive, I only see the TOC and an empty page that displays the message:
Navigation to the web page was canceled.

Cause

This is actually normal behavior. The Microsoft viewer for CHM does not display the topics for a CHM open on a network drive.

Solution

As a workaround, copy the CHM file on your local system and view it there.

References Outside the Main DITA Map Folder

Problem

A reference to a DITA topic, *map*, or binary resource (for example, an image) that is located outside of the folder where the main *DITA map* ([on page 2678](#)) is located leads to problems when publishing the content using the DITA Open Toolkit.

Cause

DITA-OT often has trouble resolving references that are outside the directory where the published *DITA map* is found. By default, it does not even copy the referenced topics to the output directory.

Solution

To solve this, try one of the following solutions:

- Create another *DITA map* that is located in a folder path above all referenced folders and reference the original *DITA map* from this new map. Then transform this *DITA map* instead.
- Edit the transformation scenario and in the **Parameters** tab, change the value of the **fix.external.refs.com.oxygenxml** parameter to `true`. This parameter is used to specify whether or not the application tries to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content.

Important:

The **fix.external.refs.com.oxygenxml** parameter is only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin or using the `transform` script.

- For PDF output, you can edit the transformation scenario and in the **Parameters** tab set the value of the **generate.copy.outer** parameter to `3`. This parameter specifies whether to generate output files for content that is not located in or beneath the directory containing the DITA map file. By setting the value of this parameter to `3`, the transformation scenario shifts the output directory so that it contains all output for the publication.

Important:

This method is recommended for transformation scenarios that use an external DITA-OT.

Syntax Highlights Not Available in Eclipse Plugin

Problem

I associated the `.ext` extension with Oxygen XML Editor Eclipse plugin in Eclipse but an `.ext` file opened with the Oxygen XML Editor Eclipse plugin does not have syntax highlights.

Solution

Associate an extension with Oxygen XML Editor Eclipse plugin in Eclipse versions 4.5-4.31 by following these steps:

1. Associate the `.ext` extension with the Oxygen XML Editor Eclipse plugin:
 - a. Open the **Preferences** dialog box ([on page 70](#)) and go to **General > Editors > File Associations**.
 - b. Add `*.ext` to the list of file types.

- c. Select `*.ext` in the list by clicking it.
 - d. Add Oxygen XML Editor Eclipse plugin to the list of **Associated editors** and make it the default editor.
2. Associate the `.ext` extension with the **Oxygen XML** content type:
 - a. Open the **Preferences** dialog box (on page 70) and go to **General > Content Types**.
 - b. Add `*.ext` to the **File associations** list for the **Text > XML > Oxygen XML Editor Eclipse plugin** content type.
 3. Click the **OK** button in the Eclipse preferences dialog box.

Result: Now when an `*.ext` file is opened, the icon and the syntax highlights should be the same as for XML files opened with the Oxygen XML Editor Eclipse plugin plugin.

TocJS Transformation Does not Generate All Files for a Tree-Like TOC

Problem

The *TocJS* transformation of a *DITA map* (on page 2678) does not generate all the files needed to display the tree-like table of contents.

Solution

To get a complete set of output files, follow these steps:

1. Run the *XHTML* transformation on the same *DITA map*. Make sure the output gets generated in the same output folder as for the *TocJS* transformation.
2. Copy the content of the `DITA-OT-DIR/plugins/com.sophos.tocjs/basefiles` folder to the transformation output folder.
3. Copy the `DITA-OT-DIR/plugins/com.sophos.tocjs/sample/basefiles/frameset.html` file to the transformation output folder.
4. Edit `frameset.html` file.
5. Locate element `<frame name="contentwin" src="concepts/about.html">`.
6. Replace `"concepts/about.html"` with `"index.html"`.

Text Rendering Issues on macOS

Problem

On macOS, I sometimes encounter issues there text is not rendered properly. For example, when tags are displayed in **Author** mode, sometimes the tag icon is rendered over the top of text (hiding the text) and sometimes text flows outside of code blocks.

Cause

This is an uncommon error that cannot be fixed in current versions.

Solution

Open the **Preferences** dialog box (*on page 70*), go to **Editor > Edit modes > Author**, and deselect the **Fast text layout** option (*on page 137*).

XSLT Debugger Is Very Slow

Problem

When I run a transformation in the **XSLT Debugger perspective** (*on page 2680*), it is very slow.

Solution

If the transformation produces HTML or XHTML output, you can **disable rendering of output in the XHTML output view** (*on page 201*) during the transformation process. To view the XHTML output result do one of the following:

- Run the transformation in the **Editor perspective** (*on page 2680*) and make sure the **Open in Browser/System Application** option (*on page 1216*) is selected.
- Run the transformation in the **XSLT Debugger perspective** (*on page 2680*), save the text output area to a file, and use a browser application for viewing it (for example, Firefox or Chrome).

21.

DITA Authoring

DITA is an XML standard, an architectural approach, and a writing methodology, developed by technical communicators for technical communicators. It provides a standardised architectural *framework* ([on page 2679](#)) for a common structure for content that promotes the consistent creation, sharing, and re-use of content.

Some of the benefits of using DITA include the following:

- **Flexibility** - DITA is a topic-based architecture and it offers flexibility in content organization.
- **Modularity** - DITA allows for content reuse that saves time and reduces the number of modifications.
- **Structured Authoring** - DITA offers a standardized, methodological approach that helps to reduce authoring time and improve consistency.
- **Single-Source Publishing** - DITA provides the ability to change content in one place and have the change propagate everywhere.
- **Multiple Output Formats** - DITA supports multiple types of output.
- **Inheritance** - The DITA inheritance model makes it easy to specialize topics or elements within topics and you only have to define how the element is different from its immediate ancestor.
- **Process Automation** - DITA offers various ways to automate processes, such as with index or glossary production, output delivery, validation, and more.
- **Specialization** - DITA allows you to define your own information types and semantic elements/ attributes to suit the needs of your particular content model.
- **Multi-Lingual** - DITA is a translation-friendly structure that supports numerous languages and text encodings.
- **Conditional Profiling** - DITA supports conditional text processing and profiling to filter content in the publishing stage.

This chapter is designed to be a guide to help content authors who use DITA. It also presents the Oxygen XML Editor Eclipse plugin features that are specific to working with DITA documents and concepts.

DITA Resources

For more information and technical details about working with DITA, refer to the following resources:

- [The DITA Specifications.](#)
- [The DITA Style Guide Best Practices for Authors.](#)
- Various sample DITA topics and maps can be found in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.

- Webinar: [DITA Project Management, Validation, and Translation in a Docs as Code Environment](#)

Related information[DITA Topics Document Type \(Framework\) \(on page 1075\)](#)[DITA Map Document Type \(Framework\) \(on page 1099\)](#)

Getting Started with DITA

The information in this topic is meant to be a very basic starting point for those who are just getting started using DITA in Oxygen XML Editor Eclipse plugin. Oxygen XML Editor Eclipse plugin makes it easy to create, edit, manage, and publish DITA content, but it requires at least some basic DITA knowledge. To truly get the most out of Oxygen XML Editor Eclipse plugin and all of its DITA-related features, you should explore resources in the online DITA community to acquire knowledge of its concepts and uses.

Understanding DITA Topics

It is important to understand the role that a DITA topic plays in a DITA project. A DITA topic is not associated with a single published document. It is a separate entity that can potentially be included in many different books, help systems, or websites. Therefore, when you write a DITA topic you are not writing a book, a help system, or a website. You are writing an individual piece of content. This affects how you approach the writing task and how Oxygen XML Editor Eclipse plugin works to support you as you write.

Most of your topics are actually related to other topics, and those relationships can affect how you write and handle things such as links and content reuse. Oxygen XML Editor Eclipse plugin helps you manage those relationships. Depending on how your topics are related, you can use the tools provided in Oxygen XML Editor Eclipse plugin, along with the features of DITA, in a variety of ways.

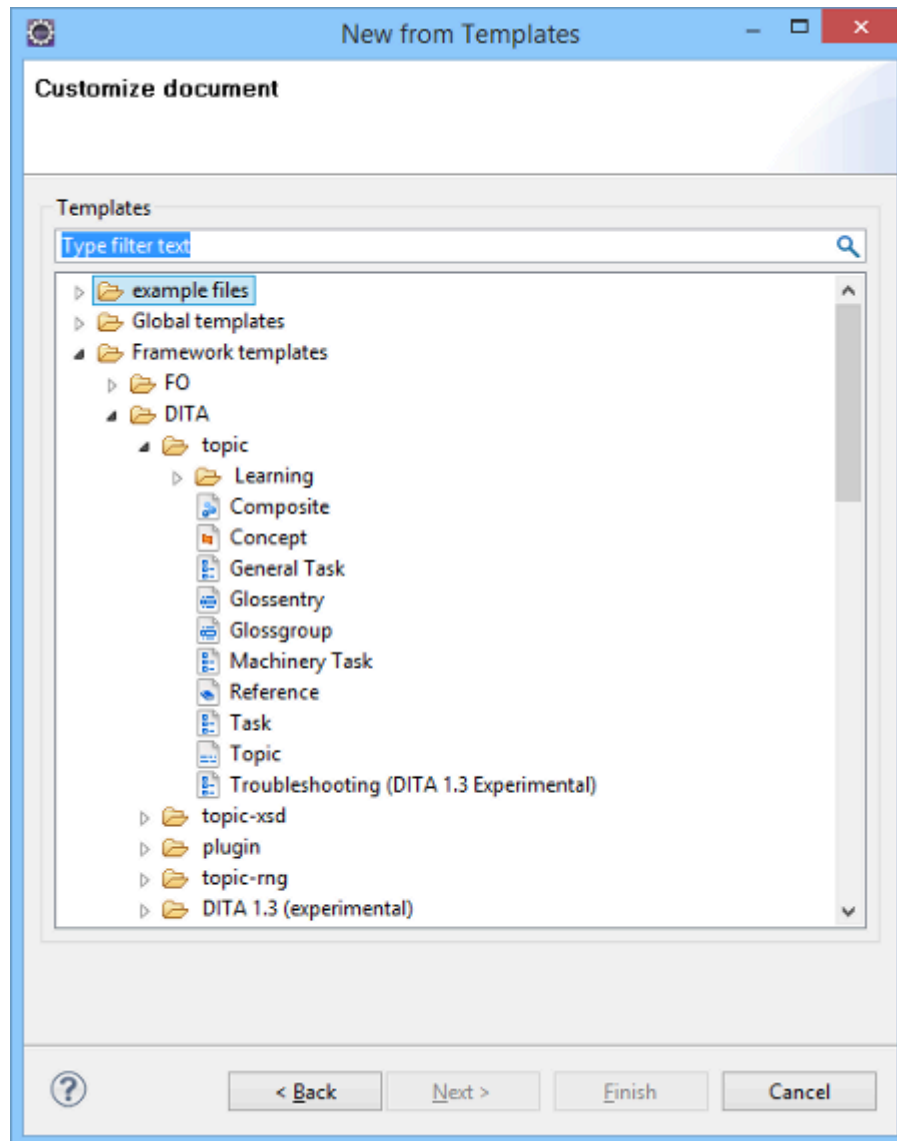

Creating a DITA Topic in Oxygen XML Editor Eclipse plugin

To [create a DITA topic \(on page 2402\)](#):

1. Select **File > New > Other > Oxygen XML Editor Eclipse plugin**, or click the  **New** button on the toolbar, and select **New from Templates**.

Step Result: The [New from Templates Wizard \(on page 246\)](#) is displayed:

Figure 574. New DITA Document from Templates Wizard

2. Go to **Framework templates > DITA > topic** and select the type of topic that you want to create, then click **Next**.

**Note:**

If your organization has created DITA customizations, the appropriate template files may be in another location, and various types of topics may be provided for your use. Check with the person who manages your DITA system to see if you should be using templates from another directory.

3. Select a file path where it will be saved.
4. Click **Finish**.

Result: Your document is opened in the editor. Eventually, you will need to [add a reference to it in your DITA map \(on page 2331\)](#).

Your DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents ([on page 27](#)) also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides additional specific DITA-related support for [working with DITA topics \(on page 2400\)](#), their associated [DITA maps \(on page 2335\)](#), and for [creating DITA output \(on page 2524\)](#).

Role of Maps

The basic method that DITA uses to express the relationship between topics is through a [DITA map \(on page 2678\)](#). Other relationships between topics, such as cross references, generally need to be made between topics in the same root map. DITA uses maps to determine which topics are part of any output that you create. While customized DITA solutions can use other mechanisms, generally DITA is not used as a way to publish individual topics. Output is created from a map and includes all the topics referenced by the map.

A publication is not always represented by a single map. For instance, if you are writing a book, you might use a submap to create each chapter and then organize the chapters in a main root map to create the book. This helps you to manage your content, offers the possibility of reusing submaps, and segregates content to support multiple people working on the same project.

Creating a Map in Oxygen XML Editor Eclipse plugin

To create a map ([on page 2353](#)):

1. Select **File > New > Other > Oxygen XML Editor Eclipse plugin**, or click the  **New** button on the toolbar, and select **New from Templates**.
2. Go to **Framework templates > DITA Map > map** and select the type of map you want to create.
3. Choose whether you want to open the map in the **Editor** or in the **DITA Maps Manager** ([on page 2337](#)). Usually, opening it in the **DITA Maps Manager** is the best choice. The **DITA Maps Manager** presents a view of the *DITA map* that is similar to a table of contents.

Figure 575. DITA Maps Manager View

Adding Existing Topics to a Map in Oxygen XML Editor Eclipse plugin

There are several ways to [add a topic reference to a map \(on page 2357\)](#). Perhaps the easiest method is to add a reference to a topic that is already open in the editor:

1. Open the DITA topic in the main editing window.
2. Right-click the *DITA map* in the **DITA Maps Manager** view [\(on page 2337\)](#) and choose **Reference to the currently edited file** from the **Append Child**, **Insert Before**, or **Insert After** submenu.

Step Result: This opens the **Insert Reference** dialog box [\(on page 2363\)](#) with all of the required fields already filled in for you.

Figure 576. Insert Reference Dialog Box

3. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
4. Select **Insert and close** to add a reference to your topic in the map.
5. Save the *DITA map*.

Adding New Topics to a Map in Oxygen XML Editor Eclipse plugin

As you add topics to your map, you may want to create a new topic as a child or sibling of another topic. This is usually done at the map level.

To [add a new topic to a map \(on page 2357\)](#), follow these steps:

1. In the **DITA Maps Manager** ([on page 2337](#)), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
 - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

**Note:**

The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the [DITA > Topics preferences page \(on page 86\)](#) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a `<topicref>`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.

3. Save the *DITA map*.

You can also change the order and nesting of topics in the **DITA Maps Manager** view by doing either of the following:

- Select the topic to move while holding down the **Alt** key and use the arrow keys to move it around.
- Use the mouse to drag and drop the topic to the desired location.

The way your parent and child topics are organized in any particular output depends on both the configuration of those topics in the map and the rules of the output transformation that is applied to them. Do not assume that your topics must have the same organization for all output types. The map defines the organization of the topics, not the topics themselves. It is possible to create a variety of maps, each with different organization and configuration options to produce a variety of outputs.

Adding Submaps in Oxygen XML Editor Eclipse plugin

If you have a large set of information, such as a long book or extensive help system, a single map can become long and difficult to manage. To make it easier to manage, you can [break up the content into smaller submaps \(on page 2355\)](#). A submap might represent a chapter of a book, a section of a user manual, or a page on a website. To build a publication out of these smaller maps, you must add them to a map that represents the overall publication.

To [add a child map to the current map \(on page 2355\)](#):

1. Right-click the parent *DITA map* in the **DITA Maps Manager view (on page 2337)** and choose **Append child > Map reference**.

Step Result: This opens the **Insert Reference dialog box (on page 2363)** with all of the required fields already filled in for you.

2. You can fill in additional information in the various tabs in this dialog box or add it to the map later.
3. Select **Insert and close** to add a reference to your submap in the main map.
4. Save the main *DITA map*.

Validating a Map in Oxygen XML Editor Eclipse plugin

Just as it is with your individual topics, it is important to [validate your maps \(on page 2382\)](#). Oxygen XML Editor Eclipse plugin provides a validation function for *DITA maps* that does more than simply validating that the XML is well-formed. It also does the following:

- Validates all of the relationships defined in the maps.
- Validates all of the files that are included in the map.
- Validates all of the links that are expressed in the files.

Validating the map that describes your entire publication validates all the files that make up the publication and all of the relationships between them.

To validate a map:

1. Click the  **Validate and Check for Completeness** button in the **DITA Maps Manager view (on page 2337)**.

Step Result: This opens the **DITA Map Completeness Check dialog box (on page 2383)**.

2. Select any of the various options you want to check.
3. Click **Check** to run the validation process.

Publishing Your Topics in Oxygen XML Editor Eclipse plugin

As noted previously, in DITA standards you usually do not publish output from an individual topic. Instead, you [create published output \(on page 2524\)](#) by running a DITA transformation on a map. This collects all the topics that are referenced in the map, organizes them, and produces output in a particular format. By default,

Oxygen XML Editor Eclipse plugin uses the transformations provided by the **DITA Open Toolkit** for publishing to various output formats (such as PDF, WebHelp or EPUB). Your organization may have created various custom transformations or modified the built-in **DITA Open Toolkit** transformations. In either case, Oxygen XML Editor Eclipse plugin manages them by using transformation scenarios.

To publish output for a map:

1. Click the  **Configure Transformation Scenario(s)** button in the **DITA Maps Manager** view (on page 2337).

Step Result: This opens the **Configure Transformation Scenario(s)** dialog box (on page 1300).

Figure 577. Configure Transformation Scenarios Dialog Box

2. Select the appropriate transformation depending on the type of output you desire.
3. To change or view the configuration or storage options for a transformation scenario, select the transformation and click **Edit**.
4. Click **Apply associated**.

Result: Depending on the configuration of the transformation scenario, when the transformation is finished, your output may automatically be opened in the appropriate application.

[Doctales - DITA Introduction](#)

Working with Projects in DITA

Oxygen XML Editor Eclipse plugin provides the ability to organize your DITA resources in projects, the same as with other XML-related files. This helps you manage and organize your files and projects allow you to perform batch operations (such as validation and transformation) over multiple files or to use [Main Files support to rename or move DITA resources \(on page 2628\)](#) while updating the references to them.

To learn how to create a new project and how add resources and manage it, see [Creating a New Project \(on page 268\)](#).

To help you get more familiar with how to use projects in DITA, there are two DITA-specific sample project templates available when using the  **New Project** action (available, for example, from the **Project** menu):

- **DITA Project With Editing Customizations** - This sample DITA project imposes custom general settings and an editing behavior using a DITA framework extension. More details can be found in the project's [Readme.html](#) file.
- **Sample DITA Project** - This sample DITA project is a best practice example that shows how DITA content can be organized to provide a scalable and flexible project structure. More details can be found in the project's [Readme.html](#) file.

For more information about working with DITA projects, see our webinar: [Working with DITA in Oxygen - Quick Start with the DITA Startup Project](#).

Related information

[Using Projects to Group Documents \(on page 268\)](#)

Working with DITA Maps

In the DITA standard architecture you create documents by collecting topics into maps.

DITA Maps

A *DITA map* (on page 2678) organizes a set of topics into a hierarchy. In most output formats, the structure of the map becomes the structure of the table of contents. Oxygen XML Editor Eclipse plugin provides support for creating (on page 2353) and managing *DITA maps* (on page 2356) through the **DITA Maps Manager** (on page 2337). There are also specialized types of *DITA maps*, such as a *bookmap* (on page 2676), which is intended for creating the structure of a book.

Submaps

You do not have to create an entire publication using a single map. It is generally good practice to break up a large publication into several smaller *submaps* (on page 2355) that are easier to manage. You can reuse submaps in multiple publications by including them in each of the main maps. The **DITA Maps Manager** (on page 2337) provides support for easily creating and managing submaps.

Opening a DITA Map

There are several ways to open a *DITA map* and you can choose to open it in the **DITA Maps Manager** (on page 2337) or in the XML Editor. Use any of the following methods to open a map:

- To open a submap in its own tab in the **DITA Maps Manager**, simply double-click it (or right-click it and select **Open**).
- To open a map in the XML editor from the **DITA Maps Manager**, right-click it and select **Open Map in Editor**.
- Drag a *DITA map* file from your system browser and drop it in the XML editor. This will open the map in the editor.
- To open a map in the **DITA Maps Manager**, you can right-click a map file in the **Project Explorer** view (on page 269) and select **Open in DITA Maps Manager**.

Chunking DITA Maps

By default, many output types place a single topic on each output page. In some cases you may want to *output multiple topics as a single output page* (also known as *chunking*) (on page 2382). To support this, Oxygen XML Editor Eclipse plugin provides an **Edit Properties** dialog box (on page 2373) that allows you to easily configure the attributes of a topic to control how your table of contents and topics are rendered in the output.

Validating a Map

You should *validate your maps* (on page 2382) to make sure that the individual topics are valid and that the relationships between them are working. Oxygen XML Editor Eclipse plugin provides a validation function for *DITA maps* that performs a comprehensive validation of a map and its topics.

Resources

For more information about getting started with DITA and how to work with DITA in Oxygen XML Editor Eclipse plugin, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: [Webinars: Working with DITA in Oxygen](#).

Related information

[DITA Map Document Type \(Framework\) \(on page 1099\)](#)

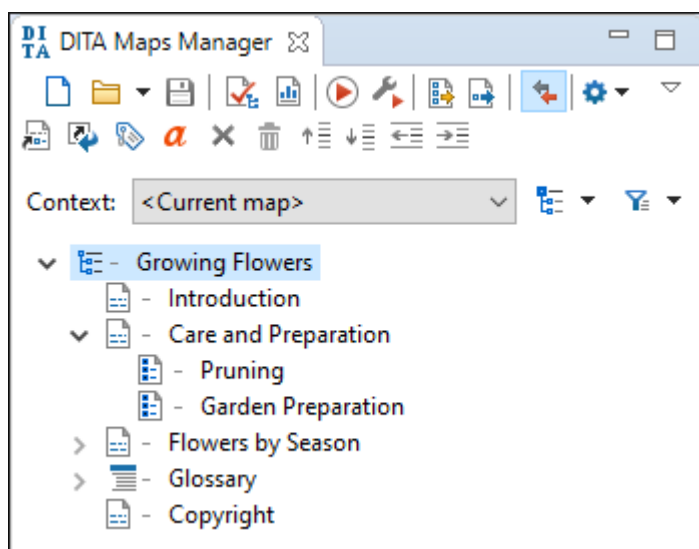

[DITA Map Author Mode Actions \(on page 2388\)](#)

DITA Maps Manager

Oxygen XML Editor Eclipse plugin provides a view for managing and editing *DITA maps*. The **DITA Maps Manager** view presents a *DITA map* as a tree or table of contents. It allows you to navigate the topics and maps, make changes, and apply transformation scenarios to obtain various output formats. By default, it is located to the left of the main editor. If the view is not displayed, it can be opened by selecting it from the **Window > Show View** menu.

The **DITA Maps Manager** includes a variety of useful actions to help you edit and organize the structure of your *DITA maps* and topics. The actions that are available and their functions depend on the type of nodes that are selected in the **DITA Maps Manager**. If you select multiple sibling nodes, the result of the actions will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the actions will be applied to the parent node and the child nodes will inherit certain attributes from the parent node.

Figure 578. DITA Maps Manager View

An icon that represents its type of DITA resource is displayed on the left side of each node. For example, a DITA **Map** is displayed with the  icon, a DITA **Topic** is displayed with , a DITA **Task** is displayed with , etc. Any node that has `processing-role="resource-only"` set in its properties is displayed with a gray dot in the bottom-right corner of the icon (.

The title of the DITA resource is also displayed for each node. The displayed title depends on how the referenced resource is configured within the DITA structure. For example, the title could be resolved as the text value inside the referenced topic's `<title>` element or the value of the `@navtitle` attribute specified within the DITA map. For non-DITA resources that are referenced in a DITA map, the file name of the resource is usually displayed for the title. However, it is possible to obtain the title from the referenced non-DITA documents by dynamically converting them using the process described in: [Dynamic Word, Excel, OpenAPI, HTML, Markdown to DITA Conversion \(on page 2571\)](#). In this case, the document title obtained from the conversion process is displayed as the resource title in the **DITA Maps Manager**.

Opening Maps in the DITA Maps Manager

The **DITA Maps Manager** view supports opening multiple maps at the same time, with each one presented in its own tab. To open a *DITA map* in the **DITA Maps Manager**, use any of the following methods:

- To open a submap in its own tab, simply double-click it (or right-click it and select **Open**).
- Right-click a map file in the **Project Explorer view (on page 269)** and select **Open in DITA Maps Manager**.

Submap Nodes

If your *root map (on page 2682)* (*main DITA map*) references other maps (submaps), they can be expanded and you can navigate their content in the **DITA Maps Manager**.

References within those submaps are not editable, by default, unless you open the submap separately in its own tab. If you want to be able to edit submaps when the main (root/parent) map is open in the **DITA Maps Manager**, go to **Options > Preferences > DITA > Maps** and select the **Allow referenced submaps to be edited option (on page 84)**. The references within submap nodes are shown with a gray background if they are not editable.

Moving Nodes in the DITA Maps Manager

You can move topics or nodes within the same map, or other maps, by dragging and dropping them into the desired position. You can arrange the nodes by dragging and dropping one or more nodes at a time. You can arrange multiple topics by dragging them while pressing the **Ctrl** or **Shift** key. Drop operations can be performed before, after, or as child of the targeted node.

Operations include:

Copy

Select the nodes you want to copy and start dragging them. Before dropping them in the appropriate place, press and hold the **Ctrl** key. The mouse pointer changes to a  symbol to indicate that a copy operation is being performed.

Move

Select the nodes you want to move and drag and drop them in the appropriate place.

Promote (**Alt + LeftArrow**) /Demote (**Alt + RightArrow**)

You can move nodes between child and parent nodes by using the **Promote** (**Alt + LeftArrow**) and **Demote** (**Alt + RightArrow**) operations.

DITA Maps Manager Toolbar

The toolbar includes the following actions (also available in the **DITA Maps** menu) and their availability depend on the nodes that are selected:

New DITA Map

Opens the **New Document wizard** ([on page 246](#)) that you can use to create a new DITA map document.

Open Drop-down Menu

You can use this drop-down menu to open new *DITA maps* or to reopen recently viewed maps. The drop-down menu contains the following:

- List of recently viewed *DITA maps* that can be selected to reopen them.
- **Clear history** - Clears the history list of the recently viewed *DITA maps*.
-  **Open** - Allows you to open the map in the **DITA Maps Manager view** ([on page 2337](#)). You can also open a map by dragging it from the file system explorer and dropping it into the **DITA Maps Manager view** ([on page 2337](#)).
-  **Browse workspace** - Opens a file browser dialog box allowing you to select a file from the local workspace.
-  **Open URL** - Displays the **Choose DITA Map** dialog box where you can specify a URL (defined by a protocol, host, resource path, and an optional port) or use the browsing actions in the  **Browse for remote file** drop-down menu.

Save (Ctrl + S** (**Meta + S** on macOS))**

Saves the current *DITA map*.

Validate and Check for Completeness

Opens the **DITA Map Completeness Check** dialog box where you can configure options for [checking the validity and integrity](#) ([on page 2382](#)) of the map.

Generate Metrics Report

Generate a [report that contains statistics](#) ([on page 2545](#)) about the entire DITA map in HTML format.

Apply Transformation Scenario(s)

Applies the [DITA Map transformation scenario \(on page 1173\)](#) that is associated with the current map.

Configure Transformation Scenario(s)

Opens the **Configure Transformation Scenarios(s)** dialog box [\(on page 1300\)](#) where you can edit or create transformation scenarios or [associate a DITA Map transformation scenario \(on page 1233\)](#) with the current map.

Open Map in Editor with Resolved Topics

Opens the *DITA map* in the main editor area with content from all topic references expanded in-place. Referenced content is presented as read-only by default. To edit it, you must use the **Edit Reference** contextual menu action to open the source topic that contains the referenced content.

If you want to edit the referenced topics directly without having to open the source document, go to **Options > Preferences > Editor > Edit Modes > Author** and select the **Allow referenced content to be edited** option [\(on page 139\)](#). Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.

Tip:

If you want to print the expanded content, you should consider changing selecting **+ Print ready** from the **Styles** drop-down menu on the toolbar.

Open Map in Editor

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Note:

You can also use this action to open referenced *DITA maps* in the **Editor**.

Link with Editor

Toggles the synchronization between the file path of the current editor and the selected topic reference in the **DITA Maps Manager** view. If enabled, it results in the following types of synchronizations:

- If you select a topic tab in the main editing area and it is referenced in the map currently opened in the **DITA Maps Manager**, the reference to that topic is selected in the **DITA Maps Manager**.
- If you have a map opened in both the **DITA Maps Manager** and the main editor, selecting the map tab in the main editing area opens that map in the **DITA Maps Manager**.

- If you have a map opened in both the **DITA Maps Manager** and the main editor (**Author** mode), selecting one or more *topicrefs* in the **DITA Maps Manager** will also select the same *topicrefs* in the main editor.
- If you have a map opened in both the **DITA Maps Manager** and the main editor (**Author** mode), selecting one or more *topicrefs* in the main editor will also select the same *topicrefs* in the **DITA Maps Manager**.

Settings

Show extended toolbar

Toggles whether or not the extended toolbar will be displayed in the **DITA Maps Manager** toolbar.

Show context toolbar

Toggles whether or not the **Context** option ([on page 2341](#)) will be displayed in the **DITA Maps Manager** toolbar.

Show topic titles

Toggles how topics are presented in the **DITA Maps Manager**. If selected, the title of each topic is shown. Otherwise, the file path (value of the `@href` attribute) for each topic is shown.

Show key reference values

Toggles how key references are presented in the **DITA Maps Manager**. If selected, the value of the `@keyref` attribute for each key reference is shown.

Context Root Map Drop-down menu

The drop-down menu displayed after **Context** can be used to specify the *DITA root map* ([on page 2682](#)) that Oxygen XML Editor Eclipse plugin uses to define a hierarchical structure of submaps and to establish a *key space* ([on page 2679](#)) that defines the keys that are propagated throughout the entire map structure. For more information, see [Selecting a Root Map](#) ([on page 2353](#)).

Choose context root map browsing/search menu

You can use this drop-down menu to browse or search for *root maps* with the following choices:

-  **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local *root map*.
-  **Browse workspace** - Allows you to select a *root map* from the local workspace.
-  **Browse for remote file** - Displays the **Open using FTP/SFTP** dialog box ([on page 261](#)) that allows you to select a remotely stored *root map*.
-  **Browse for archived file** - Displays the **Archive Browser** ([on page 1825](#)) that allows you to browse the content of an archive and choose a *root map*.

-  **Browse Data Source Explorer** - Opens the **Data Source Explorer** (on page 1831) that allows you to browse the data sources defined in the **Data Sources preferences page** (on page 74).

**Tip:**

You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.

-  **Search for file** - Displays the **Find Resource** dialog box to search for a *root map*.
-  **Choose context from main files** - Allows you to choose a context root map from the DITA maps and the DITA-OT project files that are set in the **Main Files** (on page 2628) folder.

**Profiling/Conditional Text Drop-down Menu**

You can use this drop-down menu to select and [apply a defined profiling condition set](#) (on page 2588) to filter the content based on that condition set. The drop-down menu also contains the following other options:

- **Show Profiling Colors and Styles** - Select this option to turn on conditional styling. To configure the colors and styles [open the Preferences dialog box](#) (on page 70) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Colors and Styles**.
- **Show Profiling Attributes** - Select this option to display the values of the profiling attributes at the end of the titles of topic references. When selected, the values of the profiling attributes are displayed in both the **DITA Maps Manager** view and in the **Author** view.
- **Show Excluded Content** - Controls if the content filtered out by a particular condition set is hidden or grayed-out in the editor area and in the **Outline** (on page 326) and **DITA Maps Manager** views. When this option is selected, the content filtered by the currently applied condition set is grayed-out. To show only the content that matches the currently applied condition set, deselect this option.
-  **Profiling Settings** - Opens the preferences page for adding and editing the profiling conditions that you can apply in the **DITA Maps Manager** view and the **Author** mode editing pane. When a [profiling condition set](#) (on page 448) is applied, the keys that are defined in the *DITA map* are gathered by filtering out the excluded content.

**Insert Topic Reference**

Opens [the Insert Reference dialog box](#) (on page 2363) that allows you to insert references to targets such as topics, maps, topic sets, or key definitions.

**Refresh References**

You can use this action to manually trigger a refresh and update of all referenced documents. This action is useful when the referenced documents are modified externally. When they

are modified and saved from Oxygen XML Editor Eclipse plugin, the *DITA map* is updated automatically.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box \(on page 2373\)](#).

Edit Attributes

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the [Attributes View in Author Mode \(on page 405\)](#) topic.

Delete

Deletes the selected node.

Move Up

Moves the selected node up within the *DITA map* tree.

Move Down

Moves the selected node down within the *DITA map* tree.

Promote

Moves the selected node up one level to the level of its parent node.

Demote

Moves the selected node down one level to the level of its child nodes.

Contextual Menu of the DITA Maps Manager

Root Map

The following actions can be invoked from the contextual menu on the *root map (on page 2682)* of an opened *DITA map* (many of them are also available in the **DITA Maps** menu):

Open Map in Editor

For complex operations that cannot be performed in the simplified **DITA Maps Manager** view (for instance, editing a relationship table) you can open the map in the main editing area.

Open Map in Editor with Resolved Topics

Opens the *DITA map* in the main editor area with content from all topic references, expanded in-place. Content from the referenced topics is presented as read-only and you have to use the contextual menu action **Edit Reference** to open the topic for editing.

Export DITA Map

Opens a dialog box that allows you to choose a destination for exporting the *DITA map*. It also includes an **Export as Zip archive** option that allows you to package the *DITA map* as a zip archive. The result will contain all directly and indirectly referenced topics from the DITA Map.

Find Unreferenced Resources

Allows you to search for orphaned resources that are not referenced in the *DITA maps*.

Show Feedback Comments Manager

Opens the **Feedback Comments Manager** view. This view is for those who use **Oxygen Feedback** to provide a commenting component in WebHelp output. This view makes it possible to see all the comments added by users in WebHelp output directly in Oxygen XML Editor Eclipse plugin.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box \(on page 2373\)](#).

Fast Create Topics

Opens the **Fast Create Topics** dialog box ([on page 2405](#)) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map* ([on page 2678](#)).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for [inserting a new topic \(on page 2402\)](#).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References \(on page 2363\)](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References \(on page 2363\)](#) topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to [insert a targeted key definition \(on page 2372\)](#) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to [define a key and a value inside a keyword \(on page 2372\)](#).

- A set of actions that open the **Insert Reference** dialog box (*on page 2363*) that allows you to insert various reference specializations (such as **Anchor Reference**, **Glossary Reference**, **Map Reference**, **Navigation Reference**, **Topic Group**, **Topic Head**, **Topic Reference**, **Topic Set**, **Topic Set Reference**).

Search References

Searches all references to the current topic in the entire *DITA map* (*on page 2678*). It also reports references that are defined as related links in relationship tables. If you have *enabled Main Files support* (*on page 2628*), it also searches for references in the DITA maps added to the Main Files folder.

Refactoring submenu

The following actions are available from this submenu when invoked from a root map:

Rename resource

Allows you to *change the name of a resource linked in the edited DITA map* (*on page 2360*) and you have the option of updating all the references to the renamed DITA resource. If you have *enabled Main Files support* (*on page 2628*), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

Move resource

Allows you to *change the location on disk of a resource linked in the edited DITA map* (*on page 2360*) and you have the option of updating all the references to the moved DITA resources. If you have *enabled Main Files support* (*on page 2628*), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A

DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations \(on page 608\)](#) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens the [XML Refactoring tool wizard \(on page 608\)](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to [spell check multiple files \(on page 295\)](#).

Paste

Allows you to paste content from the clipboard into the *DITA map*.

Paste Before

Pastes the content of the clipboard (only if it is a part of the *DITA map*) before the currently selected *DITA map* node.

Paste After

Pastes the content of the clipboard (only if it is a part of the *DITA map*) after the currently selected *DITA map* node.

Expand All

Allows you to expand the entire *DITA map* structure.

Collapse All

Allows you to collapse the entire *DITA map* structure.

Editable Child Nodes

The following actions are available when the contextual menu is invoked on an editable child node of a *DITA map*:

Note:

If multiple nodes are selected, the availability of the actions depends on the nodes that are selected.

Note:

Topic references inside submaps are not editable by default. If you want to be able to edit submaps when the main (root/parent) map is open in the **DITA Maps Manager**, go to **Options > Preferences > DITA > Maps** and select the **Allow referenced submaps to be edited** option (*on page 84*).

Open

Opens the selected resource in the editor.

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box \(on page 2373\)](#).

Fast Create Topics

Opens the **Fast Create Topics** dialog box (*on page 2405*) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map* (*on page 2678*).

Append Child submenu

Container sub-menu for a number of actions that create a map node as a child of the currently selected node:

- **New** - Opens a dialog box that allows you to configure some options for [inserting a new topic \(on page 2402\)](#).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the [Inserting References \(on page 2363\)](#) topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References \(on page 2363\)](#) topic.

- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a *targeted key definition (on page 2372)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to define a key and a value inside a *keyword (on page 2372)*.
- A set of actions that open the **Insert Reference** dialog box (on page 2363) that allows you to insert various reference specializations (such as **Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference**).

Insert Before submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, above the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2402).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References (on page 2363)* topic.
- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the *Inserting References (on page 2363)* topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to insert a *targeted key definition (on page 2372)* (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to define a key and a value inside a *keyword (on page 2372)*.
- A set of actions that open the **Insert Reference** dialog box (on page 2363) that allows you to insert various reference specializations (such as **Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference**).

Insert After submenu

Container sub-menus for a number of actions that create a map node as a sibling of the currently selected node, below the current node in the map:

- **New** - Opens a dialog box that allows you to configure some options for inserting a new topic (on page 2402).
-  **Reference** - Inserts a reference to a topic file. You can find more details about this action in the *Inserting References (on page 2363)* topic.

- **Reference to the currently edited file** - Inserts a reference to the currently edited file. You can find more details about this action in the [Inserting References \(on page 2363\)](#) topic.
- **Key Reference** - Opens an **Insert Key Definition** dialog box that allows you to [insert a targeted key definition \(on page 2372\)](#) (for example, to target a resource such as an image or external link).
- **Key Reference with Keyword** - Opens an **Insert Key Definition** dialog box that allows you to [define a key and a value inside a keyword \(on page 2372\)](#).
- A set of actions that open the **Insert Reference** dialog box [\(on page 2363\)](#) that allows you to insert various reference specializations (such as **Anchor Reference, Glossary Reference, Map Reference, Navigation Reference, Topic Group, Topic Head, Topic Reference, Topic Set, Topic Set Reference**).

Search References

Searches all references to the current topic in the entire [DITA map \(on page 2678\)](#). It also reports references that are defined as related links in relationship tables. If you have [enabled Main Files support \(on page 2628\)](#), it also searches for references in the DITA maps added to the Main Files folder.

Refactoring submenu

The following actions are available from this submenu:

Convert Markdown to DITA Topic (Available for Markdown documents)

Opens a dialog box that allows you to configure options for [converting the Markdown document into a DITA topic \(on page 2468\)](#).

Rename resource

Allows you to [change the name of a resource linked in the edited DITA map \(on page 2360\)](#) and you have the option of updating all the references to the renamed DITA resource. If you have [enabled Main Files support \(on page 2628\)](#), it also searches for references in the DITA maps added to the Main Files folder and it provides the option of updating all the references even for non-DITA resources.

Move resource

Allows you to [change the location on disk of a resource linked in the edited DITA map \(on page 2360\)](#) and you have the option of updating all the references to the moved DITA resources. If you have [enabled Main Files support \(on page 2628\)](#), it also searches for references in the DITA maps added to the Main Files folder and it

provides the option of updating all the references even for non-DITA resources.

Extract to New DITA Map

Use this operation to extract editable topics into a new *DITA map*. The operation will open a map creation dialog box where you can select the type of map and configure the title or file name. Click **Create** to complete the operation and a new DITA map will be inserted at the location where the action was invoked with the selected topic references moved into the new map.

Rename Key

Use this operation to rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the [DITA Maps Manager \(on page 2337\)](#))

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the [DITA Maps Manager \(on page 2337\)](#))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Note:

As long as the DITA topic is of the type *topic*, *concept*, or *reference*, the new topics that will be created from the inner sections will retain the same topic type as the original topic.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Other XML Refactoring Actions

For your convenience, the last 5 [XML Refactoring tool operations \(on page 608\)](#) that were finished or previewed will also appear in this submenu.

XML Refactoring

Opens [the XML Refactoring tool wizard \(on page 608\)](#) that presents refactoring operations to assist you with managing the structure of your XML documents.

Check Spelling in Files

Allows you to [spell check multiple files \(on page 295\)](#).

Cut

Deletes the currently selected node and copies it to the clipboard.

Copy

Copies the currently selected node to the clipboard.

Paste

Allows you to paste content from the clipboard into the *DITA map*.

Paste Before

Pastes the content of the clipboard (only if it is a part of the *DITA map*) before the currently selected *DITA map* node.

Paste After

Pastes the content of the clipboard (only if it is a part of the *DITA map*) after the currently selected *DITA map* node.

✕ Delete

Deletes the currently selected node from the *DITA map*.

🗑️ Remove from Disk

This action can be used to remove the selected resource(s) from disk. Selecting this action will open a confirmation dialog box where you can also choose to remove the descendants by selecting the **Also remove all descendants** option. If you proceed, a search for references is triggered. If multiple references are detected for any of the selected resources, you will have the option to review them since this would lead to broken links. If you have [enabled Main Files support \(on page 2628\)](#), it also searches for references in the DITA maps added to the Main Files folder.

Organize

Allows you to organize the *DITA map* with the several submenu actions:

-  **Move Up** - Moves the selected node up within the *DITA map* tree.
-  **Move Down** - Moves the selected node down within the *DITA map* tree.
-  **Promote** - Moves the selected node up one level to the level of its parent node.
-  **Demote** - Moves the selected node down one level to the level of its child nodes.

📁 Expand All

Allows you to expand the entire *DITA map* structure.

📁 Collapse All

Allows you to collapse the entire *DITA map* structure.

Other Nodes

The following additional actions are available when the contextual menu is invoked from other nodes, such as a *submap* node or a relationship table:

Open Map in Editor (available when invoking on a submap)

Opens the currently selected *DITA map* in the editor.

Open parent DITA map (available when invoking on a read-only topic reference or a submap reference)

Opens the parent *DITA map* of the currently selected reference in the **DITA Maps Manager**.

🔗 Edit Attributes (only available for relationship table nodes)

Opens a small in-place editor that allows you to edit the attributes of a selected node. You can find more details about this action in the [Attributes View in Author Mode \(on page 405\)](#) topic.

Edit Profiling Attributes (only available for relationship table nodes)

Allows you to change the [profiling attributes \(on page 442\)](#) defined on the selected node.

[DITA Map Author Mode Actions \(on page 2388\)](#)

Creating a Map

To create a *DITA map* ([on page 2678](#)), *subject scheme map* ([on page 2682](#)), *bookmap* ([on page 2676](#)), or other types of *DITA maps*, follow these steps:

1. Use the **New Document** wizard ([on page 246](#)) to start creating your map.

Tip:

If you want the *map* to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager** ([on page 2337](#))) and selecting **New** from the **Append Child, Insert Before, or Insert After** submenu.

2. Select one of the **DITA Map** templates from the **Framework templates** folder.
3. Click the **Next** button.
4. Select a parent folder and the file name and click **Finish**.
5. Save the map after opening it in the **DITA Maps Manager** ([on page 2337](#)) or the Editor.

Related Information:

[Customizing Profiling Values with a Subject Scheme Map \(on page 2597\)](#)

[Managing DITA Maps \(on page 2356\)](#)

Selecting a Root Map

Oxygen XML Editor Eclipse plugin allows you to select a *root map* ([on page 2682](#)) (a main *DITA map* ([on page 2678](#))) that defines a hierarchical structure of submaps and establishes a *key space* ([on page 2679](#)) that

defines the keys used in all the other *DITA maps* and topics in the project. Specifying the correct *root map* helps to prevent validation problems when you work with *keyrefs* and also acts as the foundation for content completion. All the *keys* that are defined in a *root map* are available in the submaps that are contained within the *root map*.

There are several ways to select or change the *root map*:

- The easiest method is to use the **Context drop-down menu** ([on page 2341](#)) on the **DITA Maps Manager** ([on page 2337](#)) toolbar to select the appropriate *context root map* that Oxygen XML Editor Eclipse plugin uses to define a hierarchical structure of submaps and to establish a *key space* ([on page 2679](#)) that defines the keys that are propagated throughout the entire map structure.
 - You can use the  **Choose context root map** drop-down on the **DITA Maps Manager** ([on page 2337](#)) toolbar to browse or search for *root maps* with the following choices:
 -  **Browse for local file** - Opens a local file browser dialog box, allowing you to select a local *root map*.
 -  **Browse workspace** - Allows you to select a *root map* from the local workspace.
 -  **Browse for remote file** - Displays the **Open using FTP/SFTP** dialog box ([on page 261](#)) that allows you to select a remotely stored *root map*.
 -  **Browse for archived file** - Displays the **Archive Browser** ([on page 1825](#)) that allows you to browse the content of an archive and choose a *root map*.
 -  **Browse Data Source Explorer** - Opens the **Data Source Explorer** ([on page 1831](#)) that allows you to browse the data sources defined in the **Data Sources preferences page** ([on page 74](#)).
-  **Tip:**
You can open the **Data Sources** preferences page by using the **Configure Database Sources** shortcut from the **Open URL** dialog box.
-  **Search for file** - Displays the **Find Resource** dialog box to search for a *root map*.
 -  **Choose context from main files** - Allows you to choose a context root map from the DITA maps and the DITA-OT project files that are set in the **Main Files** ([on page 2628](#)) folder.
- If you insert a *key reference* using the **Cross Reference** action from the  **Link** drop-down menu (from the toolbar or **Link** submenu of the contextual menu) and keys are not gathered from the expected *DITA map*, you can change the *root map* by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the  **Choose Key Reference** button.
 - If you insert a *content key reference* or *key reference* using the  **Reuse Content** action (from the toolbar, **DITA** menu, or **Reuse** submenu of the contextual menu) and keys are not gathered from the expected *DITA map*, you can change the *root map* by using the **Change Root Map** link in the **Choose Key** dialog box that is opened when you click the  **Choose Key Reference** button.

Creating DITA Submaps

You can break up a large *DITA map* (on page 2678) into more manageable pieces by creating submaps. A submap is simply a *DITA map* that is included by another *DITA map*. There is no separate markup for a submap.

For example, if you are creating a book, you might use one submap for each chapter of the book. If you are reusing a set of topics in multiple publications, you might collect them into a map and reuse the map as a submap in multiple other maps, rather than referencing the topics individually from the new maps.

You add a submap to a map the same way that you would [add a new topic or insert an existing topic into a map](#) (on page 2357), except you choose a map rather than a topic to create or add. When adding a submap to a map make sure that you use a `<mapref>` element or a `<topicref>` element with the `@format` attribute set to `ditamap`. In most cases, Oxygen XML Editor Eclipse plugin takes care of this for you.

Adding a Submap to a Map

To add a submap to a map:

1. Right-click the place in the current map where you want to add the new submap.
2. To insert the submap as a child of the selected node, select **Append Child > New**. To insert the submap as a sibling to the current node, select **Insert After > New** or **Insert Before > New**.

Step Result: This opens a **New DITA file dialog box** (on page 2402) that allows you to select the type of document and assists you with naming it.

3. Select the type of map in one of the folders inside the **DITA Map** folder and give it a name (the file should have a `.ditamap` file extension).
4. Click **Create** to insert the submap.

You can manage and move submaps the same as you would with topics. They can also be expanded and you can navigate their content in the **DITA Maps Manager** when the root (main) DITA map is open, but the references within those submaps are not editable, by default, unless you open the submap separately in its own tab.

**Tip:**

If you want to be able to edit submaps when the main (root/parent) map is open in the **DITA Maps Manager**, go to **Options > Preferences > DITA > Maps** and select the **Allow referenced submaps to be edited** option (on page 84).

Related Information:

[Managing DITA Maps](#) (on page 2356)

Creating a Bookmap in DITA

If you want to create a traditional book in DITA, you can use a *bookmap* (on page 2676) to organize your topics into a book. A DITA *bookmap* is a specialized type of map, intended for creating output that is structured like a book. A *bookmap* allows you to add book-specific elements such as `<frontmatter>`, `<part>`, `<chapter>`, `<appendix>`, and `<backmatter>` to the map. How these book-specific elements are processed for publication is up to the processing script for each media. See the [DITA documentation](#) for details.

You can find additional support for creating books in DITA in the DITA for Publishers plugin, which is included with Oxygen XML Editor Eclipse plugin.

To create a book in DITA using a *bookmap*, follow these steps:

1. Create a new *bookmap* (on page 2356) (**File > New > Framework templates > DITA Map > map > Bookmap**). If you want the *bookmap* to be a submap, you can create it the same way by right-clicking the place in the current map where you want to add it (in the **DITA Maps Manager** (on page 2337)) and selecting **New** from the **Append Child**, **Insert Before**, or **Insert After** submenus.
2. Create the structure of your book by adding the appropriate book sections and defining containers for chapters and any appendices. To add sections to a *bookmap*, or children to a section, right-click the *bookmap* or section icon and choose any of the reference actions in the **Append child** menu. The selections offered in the menu will adjust depending on the element they are applied to. Consult the [DITA documentation](#) to fully understand the structure of a DITA *bookmap* and where to create each element.
3. Create special elements such as an *index* (on page 2380) and *table of contents* (on page 2379). The index and table of contents will be generated by the build process, based on the content of the map and the topics it points to.
4. [Add topics](#) (on page 2357) to your chapters to add content to your book. You may find it easier to manage if you [use submaps](#) (on page 2355) to create the content of your chapters. This keeps your *bookmap* from becoming long and difficult to manage.

Managing DITA Maps

This section includes various topics that describe how you can manage *DITA maps* and resources. You may want to manage your *DITA maps* (on page 2678) in a variety of ways, including:

- Change the order and nesting of topics in a map.
- Add topics to a map.
- Insert various types of references in a map.
- Find, move, or rename resources in a map.
- Change other properties of the items in a map.
- Use the Edit Properties dialog box to manage attributes, keys, metadata, or add profiling to any section of a map.

Resources

For more information about the **DITA Maps Manager** view and many of its features, watch our video demonstration:

<https://www.youtube.com/embed/ozFZz6YZMCY>

Change the Order of Topics in DITA Maps

You can change the order and nesting of the topics in a map in several ways:

- By dragging and dropping topics within the **DITA Maps Manager** (*on page 2337*).
- By showing the extended **DITA Maps Manager** (*on page 2337*) toolbar (click the  **Settings** icon on the **DITA Maps Manager** (*on page 2337*) toolbar and select the extended toolbar) and then using the node moving buttons (     ) on the toolbar to move topics around in the map.

To understand how to organize topics in a *DITA map* using the **DITA Maps Manager** (*on page 2337*), you can examine and experiment with the sample map called `flowers.ditamap`, located in the `[OXYGEN_INSTALL_DIR]/samples/dita` folder.

Adding Topics to a DITA Map

When you are working in DITA, there are several approaches that you can use to create topics and maps. You can start by first creating topics and then assembling your finished topics into one or more documents by creating one or more maps, or you can start by creating a map and then adding new topics to it as you work.

The topics-first approach is generally more appropriate if you intend to do a lot of content reuse, as it encourages you to think of each topic as an independent unit that can be combined with other topics in various ways. The map-first approach will be more familiar to you if you are used to creating books or manuals as a whole. Oxygen XML Editor Eclipse plugin supports both approaches.

A *DITA map* (*on page 2678*) organizes content hierarchically, so you can add a topic as a child of the map root element or as a child or sibling of any item already in the map. Therefore, the first step to adding a topic to a map is always to choose the place it will be inserted into the map.

Adding Existing Topics to a Map

At the XML-level, a topic is added to a map by adding a reference to the map that points to the topic. There are a variety of reference types that you can use. The default type is the `<topicref>` element. See the [DITA documentation](#) for the full range of reference elements and their uses. Oxygen XML Editor Eclipse plugin provides several tools for inserting reference elements into a map:

Using the Insert Reference Dialog Box

The **Insert Reference** dialog box (*on page 2363*) allows you to create various reference types and configure the most commonly used attributes. You can open the **Insert Reference** dialog box with any of the following methods:

- Right-click an item in the current map where you want to add the reference, select **Append Child**, **Insert Before**, or **Insert After** and select the type of reference to enter.
- If the topic you want to add is currently open in the editor, you can right-click an item in the current map where you want to add the reference and select **Reference to the currently edited file**.
- Selecting an item in the map and click the  **Insert Reference** button from the **DITA Maps Manager** (on page 2337) toolbar.
- Select  **Insert Reference** from the **DITA Maps** menu.

Dragging and Dropping a File into the DITA Maps Manager

You can add a topic to a *DITA map* by dragging and dropping the file into the **DITA Maps Manager** (on page 2337). You can drag and drop files from any of the following:

- Your OS file system explorer.
- The **Project Explorer view** (on page 269).

Adding topics this way will not open the **Insert Reference** dialog box, but you can adjust all the same properties by invoking the contextual menu from the topic and selecting **Edit Properties**.

Adding a New Topic to a Map

To add a new topic to a map, follow these steps:

1. In the **DITA Maps Manager** (on page 2337), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
 - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** (on page 2403) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** (on page 2403) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** (on page 2403) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly

created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

Note:

The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the [DITA > Topics preferences page \(on page 86\)](#) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a `<topicref>`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.

3. Save the *DITA map*.

Adding Multiple Skeleton Topics at Once

Oxygen XML Editor Eclipse plugin includes a feature in the [DITA Maps Manager \(on page 2337\)](#) that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map (on page 2678)*.

To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

For more information, see [Fast Create Multiple DITA Topics \(on page 2405\)](#).

Adding Multiple References to the Same Topic in a Map

Oxygen XML Editor Eclipse plugin allows you to reuse entire topics by adding multiple references to the same topic in a *DITA map*. Whenever multiple references to the same topic are detected in the context of the current map in the [DITA Maps Manager \(on page 2337\)](#), an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the topic is referenced in the *DITA map*. It also includes navigation arrows that allow you to jump to the next or previous reference.

References in map: [1 of 6] ↑ ↓

Remove Topics from a Map

You can remove topics from a map in a number of ways. Some ways to remove a topic from a map include:

- Highlight the topic and press the **Delete** key on your keyboard.
- Highlight the topic and click the **✕ Delete** button on the [DITA Maps Manager \(on page 2337\)](#) extended toolbar.

Related Information:

[Fast Create Multiple DITA Topics \(on page 2405\)](#)

Moving and Renaming Resources

You can move or rename resources referenced in your DITA project on disk directly from Oxygen XML Editor Eclipse plugin and you have the option of updating all the references to the moved or renamed resources. If the resources are referenced in the DITA map, you can do this from the **DITA Maps Manager view** ([on page 2337](#)). You can also move and rename resources (DITA topics, maps, or other resources such as folders, images, HTML files, audio, video, text files, Markdown documents) from the **Project Explorer view** ([on page 269](#)). If you have **enabled Main Files support** ([on page 2628](#)), you will also have the option to update all the references to the moved or renamed resource.

Moving or Renaming DITA Resources (Topics or Maps)

To move or rename resources (such as topics, maps, or other referenced non-DITA resources) referenced directly in the DITA map, use one of the following actions available in the **Refactoring** submenu of the contextual menu when invoked on the resource in the **DITA Maps Manager view** ([on page 2337](#)):

Refactoring > Move resource

This action allows you to change the location of a resource linked in the edited *DITA map* using the **Move resource** dialog box. This dialog box contains the following options:

- **Destination** - Specifies the target location of the edited resource.
- **File name** - Allows you to change the name of the edited resource.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.
- **Move** - Moves the edited resource in the target location on disk.
- **Cancel** - Cancels the **Move resource** operation. No changes are applied.

Refactoring > Rename resource

This action allows you to change the name of a resource linked in the edited *DITA map* ([on page 2678](#)) using the **Rename resource** dialog box. This dialog box contains the following options:

- **New name** - Presents the current name and allows you to change it.
- **Preview** - Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.
- **Rename** - Executes the **Rename resource** operation.
- **Cancel** - Cancels the **Rename resource** operation. No changes are applied.

Note:

If a *root DITA map* ([on page 2682](#)) is not defined, the move and rename actions are executed in the context of the current *DITA map*.

Moving or Renaming Resources and Updating the References to Them Using the Project View

To move or rename DITA (topics, maps) or non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents), you can simply follow the procedures described in [Moving/Renaming Resources in the Project Explorer View \(on page 276\)](#). However, this approach will not give you the option to update the references to the moved or renamed resources.

To perform move or rename operation on resources while also updating all the references to them, use the following sets of procedures:

1. Enable *Main Files* support and add your *root DITA map (on page 2682)* to the *Main Files* folder by following the procedure found here: [How to Enable Main Files Support in DITA \(on page 2628\)](#).
2. Move or rename resources and update the references to them by following the procedure found here: [Moving or Renaming Non-DITA Resources and Updating the References to Them \(on page 2629\)](#).

Related Information:

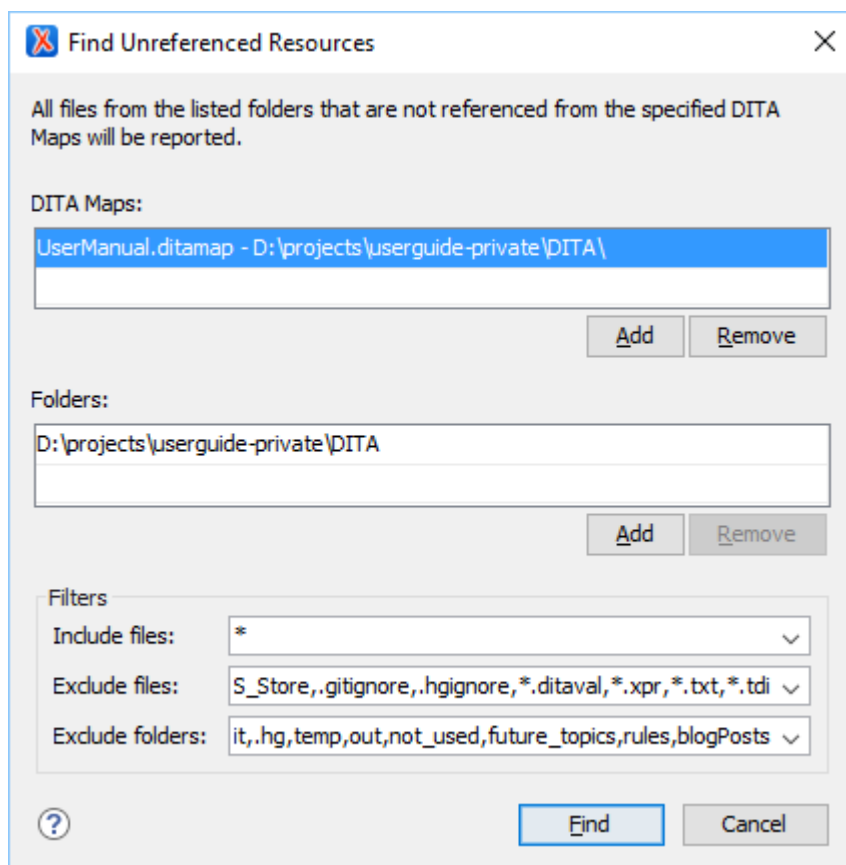

[Main Files Support in DITA \(on page 2628\)](#)

[Finding Resources Not Referenced in DITA Maps \(on page 2361\)](#)

Finding Resources Not Referenced in DITA Maps

Over the course of time, large projects can accumulate a vast amount of resources from a variety of sources. Especially in organizations with a large number of content authors or complex project structures, organizing the project resources can become a challenge. Over time a variety of actions can cause resources to become orphaned from *DITA maps (on page 2678)*. To assist you with organizing project resources, Oxygen XML Editor Eclipse plugin includes the **Find Unreferenced Resources** action, that searches for such resources.

To perform this search, open the *DITA map* in the **DITA Maps Manager (on page 2337)**, invoke the contextual menu on the *map*, and select the **Find Unreferenced Resources** action. This action opens the **Find Unreferenced Resources** dialog box, shown below.

Figure 579. Find Unreferenced Resources Dialog Box

The **Find Unreferenced Resources** dialog box includes the following options:

- **DITA Maps** - Provides a list of *DITA maps* to be included in the search and allows you to **Add** maps to the list or **Remove** them.
- **Folders** - Provides a list of folders to be included in the search and allows you to **Add** or **Remove** specific folders. All files from this list of folders that are not referenced from the maps specified in the **DITA Maps** list will be reported.
- **Filters** - Provides three combo boxes that allow you to filter the search to include or exclude certain files or folders:
 - **Include files** - Allows you to filter specific files to include in the search.
 - **Exclude files** - Allows you to filter specific files to exclude from the search.
 - **Exclude folders** - Allows you to filter specific folders to exclude from the search.

**Note:**

In any of the filter combo boxes you can enter multiple filters by separating them with a comma and you can use the ? and * wildcards. Use the drop-down arrow to select a previously used filter pattern.

When you click the **Find** button, if the search operation finds unreferenced resources, they are displayed in the **Results** panel at the bottom of the editor. If you want to delete an unreferenced resource, you can right-click

its result and select **Remove from Disk**. If you want to see the resource before deciding what to do with it, you can right-click its result and select **Show in Explorer**.

Inserting References in DITA Maps

A *DITA map* (on page 2678) may contain various types of references. The targets of the references can be a variety of references, such as chapters, maps, topics, topic sets, or key definitions. You can insert references to such targets with the **Insert Reference** dialog box (on page 2363).

This section explains how to insert and configure references (such as topic references, topic groups, topic headings, and key definitions) in a *DITA map*.

Insert Reference Dialog Box

The **Insert Reference** dialog box allows you to insert and configure references in *DITA maps* (on page 2678). There are numerous types of references that can be inserted into maps. They include references to topics, other maps, glossary terms, and keys. You can also use this dialog box to configure the attributes of a reference, add profiling or metadata, and define keys.

To open the **Insert Reference** dialog box, use one of the following methods:

- Select  **Reference, Reference to the currently edited file**, or any of the other specific reference actions that are available from the **Append Child, Insert Before, and Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** (on page 2337).
 - To insert the reference as a child of the current node, select the reference from the **Append Child** submenu.
 - To insert the reference as a sibling of the current node, below the current node in the map, select the reference from the **Insert After** submenu.
 - To insert the reference as a sibling of the current node, above the current node in the map, select the reference from the **Insert Before** submenu.

Note:

The content of these submenus depends on the node that is selected in the *DITA map* tree when the contextual menu is invoked. For example, if the selected node is a topic reference (`<topicref>`), its possible child nodes include the following elements: `<anchorref>`, `<chapter>`, `<keydef>`, `<mapref>`, `<topicgroup>`, `<topichead>`, `<topicref>`, `<topicset>`, and `<topicsetref>`.

- Click the  **Insert Reference** button on the **DITA Maps Manager** extended toolbar. This action will insert the reference as a sibling of the current node (below the current node in the map).
- Select  **Insert Reference** from the **DITA Maps** menu. This action will insert the reference as a sibling of the current node (below the current node in the map).

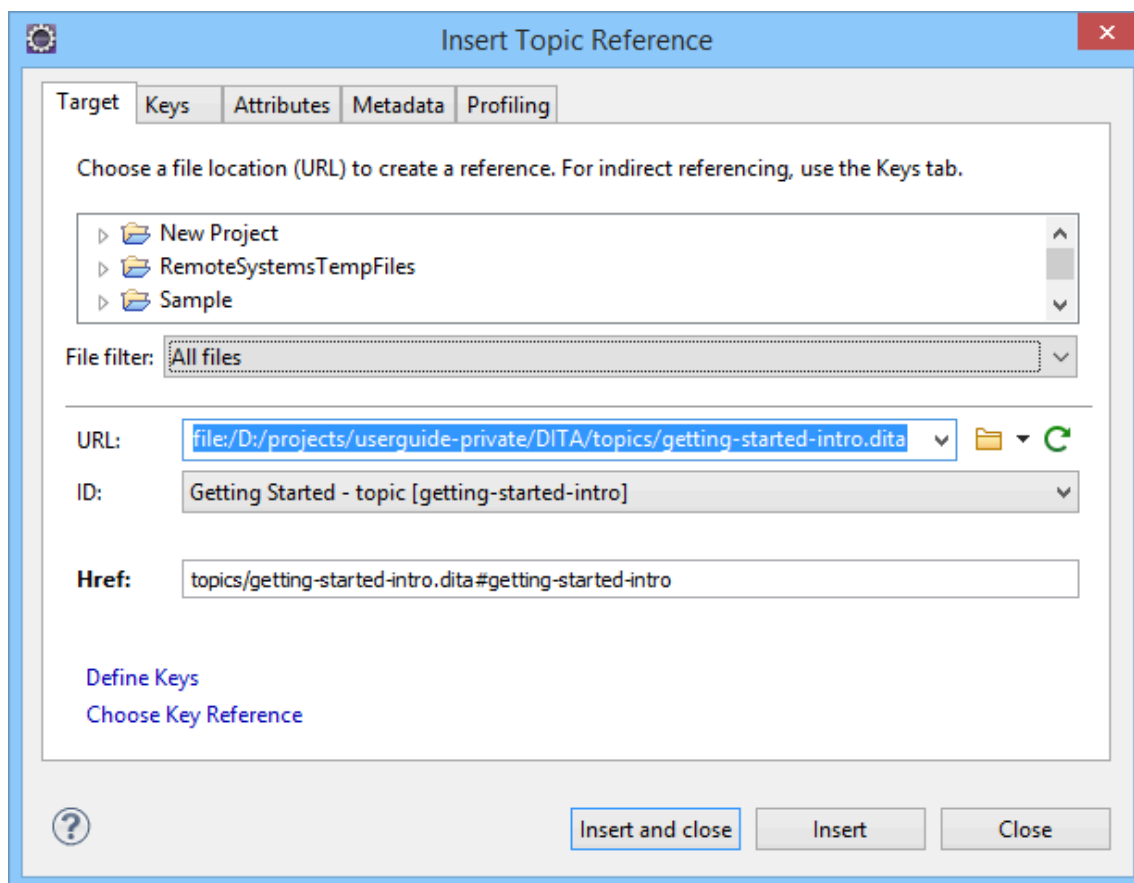

For the  **Reference** or **Reference to the currently edited file** actions, a **Reference type** drop-down list is displayed at the top of the **Insert Reference** dialog box and you can select the type of reference you want

to insert. Depending on the place where the reference will be inserted, Oxygen XML Editor Eclipse plugin will propose only valid reference types. When you change the reference type, the fields in the various tabs of the dialog box are reconfigured depending upon the availability of the associated attributes. For the other reference actions in the **Append Child**, **Insert Before**, and **Insert After** submenus, the reference type is automatically chosen based upon the invoked action and you cannot change it.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**.

Target Tab

Figure 580. Insert Reference Dialog Box - Target Tab

The **Target** tab of the **Insert Reference** dialog box allows you to specify information about the target reference. It includes the following sections and fields:

Choose a file location section

You can browse for and select the source target file by using the file window in this section. You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

**Note:**

If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `<navref>` element requires a `@mapref` attribute instead.

Keys Tab

Figure 581. Insert Reference Dialog Box - Keys Tab

Target Keys Attributes Metadata Profiling

Keys are used for indirect referencing.

Define keys:

Use space as separator for multiple values.

Key scopes:

Use space as separator for multiple values.

Key reference: reusable_links

[Choose target for defined key\(s\)](#)

[Edit metadata information for defined key\(s\)](#)

The **Keys** tab allows you to use and *define keys* (*on page 2371*) for indirect referencing. For more information, see *Working with Keys in DITA* (*on page 2471*). This tab includes the following:

Define keys

Use this text field to define the `@keys` attribute for the target.

Key scopes

Use this text field to define or edit the value of a `@keyscope` attribute. *Key scopes* allow you to specify different sets of key definitions for different map branches.

Key reference

Instead of using the **Target** tab to select a file that contains the target reference, you can reference a key definition by using this text field. Use the  **Choose key reference** button to access the list of keys that are already defined in the current *root map* (*on page 2682*).

Attributes Tab

Figure 582. Insert Reference Dialog Box - Attributes Tab

Attribute	Value
collection-type	unordered
type	topic
audience	

The **Attributes** tab of the **Insert Reference** dialog box allows you to insert and edit attribute values for the target reference. This tab includes the following sections and actions:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 84). For references to DITA resources, you can enforce the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

Collection type

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a *DITA map* (for example, `unordered`, `sequence`, `choice`, `family`, `-dita-use-conref-target`).

Type

Allows you to select a `@type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 84).

Scope

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 84).

Format

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 84).

Processing Role

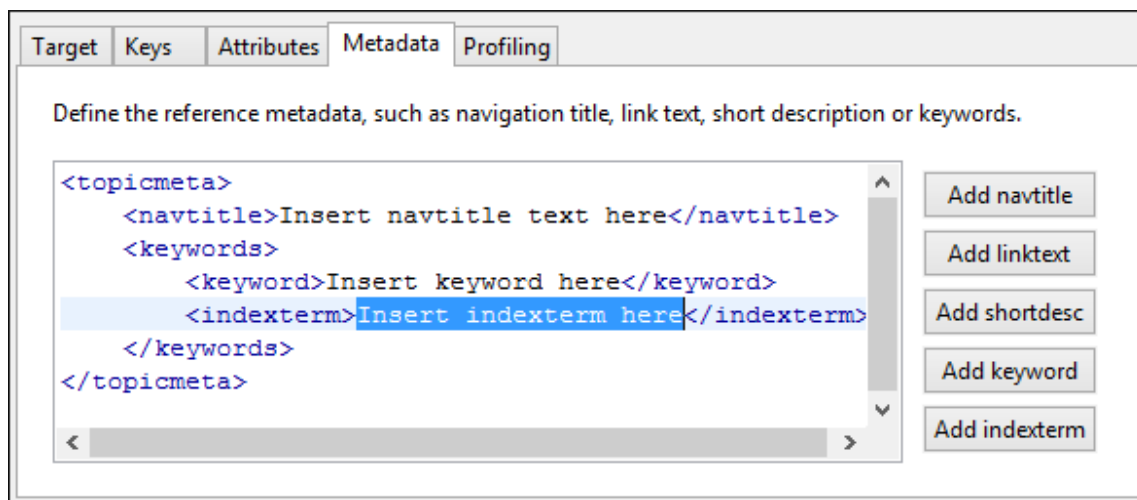

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

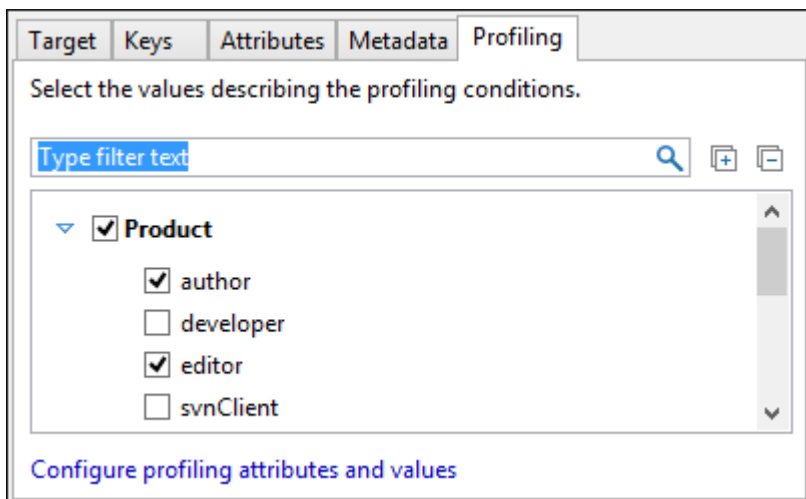

Figure 583. Insert Reference Dialog Box - Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target reference. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

Figure 584. Insert Reference Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected reference. This tab displays profiling attributes and their values as determined by the following:

- If your *root map* (on page 2682) references a DITA *subject scheme map* (on page 2682) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see [DITA Profiling / Conditional Text](#) (on page 2580).

Finalizing Your Insert Reference Configuration

Once you click **Insert** or **Insert and close**, the configured reference is added in the map.

Tip:

You can easily insert multiple references by keeping the **Insert Reference** dialog box opened, using the **Insert** button.

Related Information:

[DITA Profiling / Conditional Text](#) (on page 2580)

[Working with Keys in DITA](#) (on page 2471)

Inserting Topic Headings

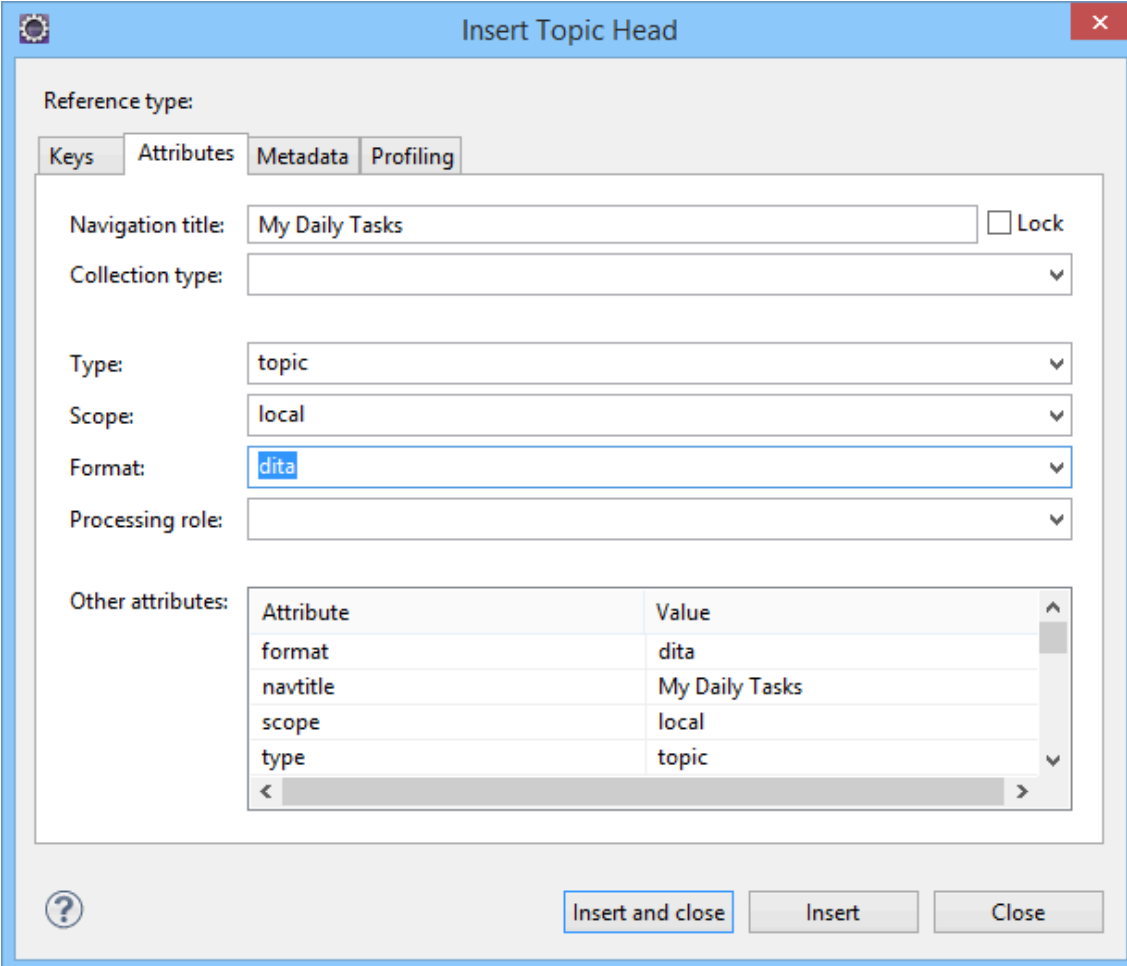

The `<topichead>` element provides a title-only entry in a navigation map, as an alternative to the fully-linked title provided by the `<topicref>` element.

You can insert a topic heading by doing the following:

- Select **Topic Head** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (*on page 2337*).
- Open the *DITA map* in the XML editor (*on page 2336*) and select the  **Insert Topic Heading** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Head** dialog box (*on page 2363*) that allows you to easily insert a `<topichead>` element. A **Navigation title** (`@navtitle` attribute) is required but other attributes can also be specified from this dialog box (such as **Type**, **Scope**, **Format**, etc.)

Figure 585. Insert Topic Heading Using the Insert Reference Dialog Box

Reference type:

Keys Attributes Metadata Profiling

Navigation title: Lock

Collection type:

Type:

Scope:

Format:

Processing role:

Other attributes:

Attribute	Value
format	dita
navtitle	My Daily Tasks
scope	local
type	topic

Related Information:

[Insert Reference Dialog Box](#) (*on page 2363*)

Inserting Topic Groups

The `<topicgroup>` element identifies a group of topics (such as a concepts, tasks, or references) or other resources. A `<topicgroup>` can contain other `<topicgroup>` elements, allowing you to express navigation or table-of-contents hierarchies, as well as implying relationships between the containing `<topicgroup>` and its children. You can set the collection-type of a container `<topicgroup>` to determine how its children are related to each

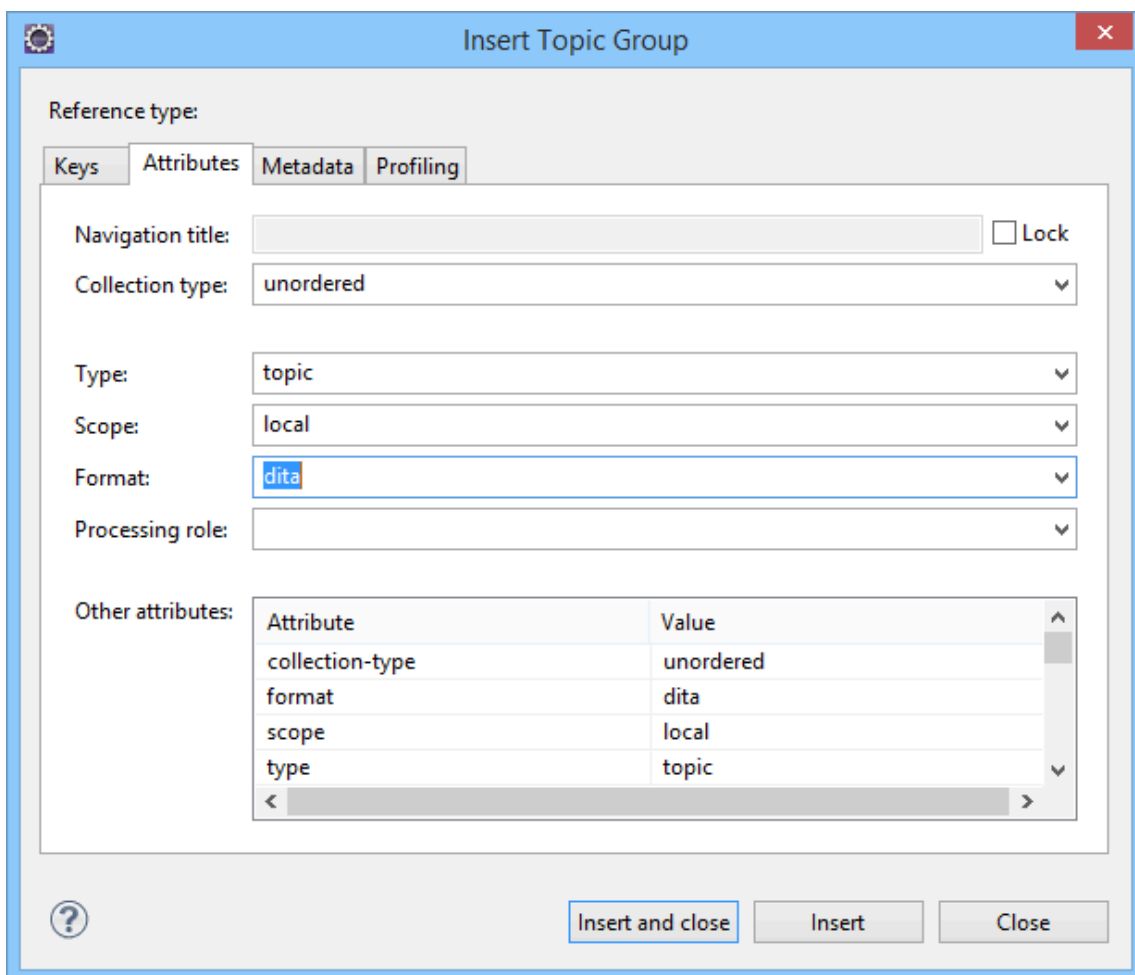

other. Relationships end up expressed as links in the output (with each participant in a relationship having links to the other participants by default).

You can insert a topic group by doing the following:

- Select **Topic Group** from the **Append Child**, **Insert Before**, or **Insert After** submenus when invoking the contextual menu in the **DITA Maps Manager** view (on page 2337).
- Open the *DITA map* in the XML editor (on page 2336) and select the  **Insert Topic Group** action from the main toolbar (or from the **Insert** submenu of the contextual menu).

Those actions open the **Insert Topic Group** dialog box (on page 2363) that allows you to easily insert a `<topicgroup>` element and various attributes can be specified (such as **Collection type**, **Type**, **Scope**, **Format**, etc.)

Figure 586. Insert Topic Group Using the Insert Reference Dialog Box

Related Information:

[Insert Reference Dialog Box \(on page 2363\)](#)

Defining Keys in DITA Maps

DITA uses *keys* (on page 2471) to insert content that may have different values in various circumstances. Keys provide the means for indirect referencing in DITA. This can make it easier to manage and to reuse content. In DITA, keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the *main (root) map* (on page 2682). This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map.

- Key with a value inside a *keyword*.
- Key with a target (for example, to target a resource such as an image or external link).

The following example is a *DITA map* (on page 2678) (a *key definition submap*) that contains some key definitions with various values for the *product* key and some targets to external URLs:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE map PUBLIC "-//OASIS//DTD DITA Map//EN" "map.dtd">
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="product" product="basic">
    <topicmeta>
      <keywords>
        <keyword>Basic Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="product" product="pro">
    <topicmeta>
      <keywords>
        <keyword>Professional Widget</keyword>
      </keywords>
    </topicmeta>
  </keydef>
  <keydef keys="url_eula" href="https://www.example.com/eula.html" format="html"
    scope="external" />
  <keydef keys="url_eula2" href="https://www.example.com/eula2.html" format="html"
    scope="external" />
</map>
```

**Note:**

The profiling of the names is now contained in the map, where it only has to occur once to reuse throughout the whole map structure.

Key Definition with a Keyword Value

To define a key with a value inside a *keyword*, follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 2355) that will contain all of your key definitions and reference the submap in your *main (root) map* (if you don't already have one created).
2. Open that map in the **DITA Maps Manager** (on page 2337).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition with Keyword** from the **Append Child, Insert Before, or Insert After** submenu (depending on where you want to insert the *key definition*). This opens an **Insert Key Definition** dialog box.
4. Enter the name of the key in the **Key** field.
5. Enter the key's value in the **Keyword** field.
6. Click **Insert and close**.

**Tip:**

If you need to profile the key or add other attributes, you can right-click the key definition in the **DITA Maps Manager**, select  **Edit properties**, and configure them in the **Profiling** tab or **Attributes** tab, respectively.

Key Definition with a Target

To insert a *targeted key definition* (for example, to target a resource such as an image or external link), follow these steps:

1. **[Optional but Recommended]** Create a submap (on page 2355) that will contain all of your key definitions and reference the submap in your *main (root) map* (if you don't already have one created).
2. Open that map in the **DITA Maps Manager** (on page 2337).
3. Right-click the map or an item in the map where you want to add the reference and select **Key Definition** from the **Append Child, Insert Before, or Insert After** submenu (depending on where you want to insert the *key definition* in the *DITA map*). This opens an **Insert Key Definition** dialog box.
4. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.
5. Go to the **Target** tab and select a target resource (such as an image or external link).

**Tip:**

You can profile the key by using the **Profiling** tab and other attributes can also be defined in the **Attributes** tab.

6. Once you are done configuring the *targeted key definition*, click **Insert and close**.

Related Information:[Working with Variable Text in DITA \(on page 2501\)](#)[Working with Keys in DITA \(on page 2471\)](#)[DITA 1.3 Specification: Indirect Key-based Addressing](#)

Edit Properties Dialog Box

The **DITA Maps Manager view** (on page 2337) includes a feature that allows you to view and edit the properties of a selected node. The  **Edit properties** action is available on both the **DITA Maps Manager** toolbar and in the contextual menu. This action is also available in the contextual menu when you edit a *DITA map* (on page 2678) document in **Author** mode. The action opens the **Edit Properties** dialog box and it includes several tabs with various functions and fields that are initialized with values based upon the node where the action was invoked.

**Note:**

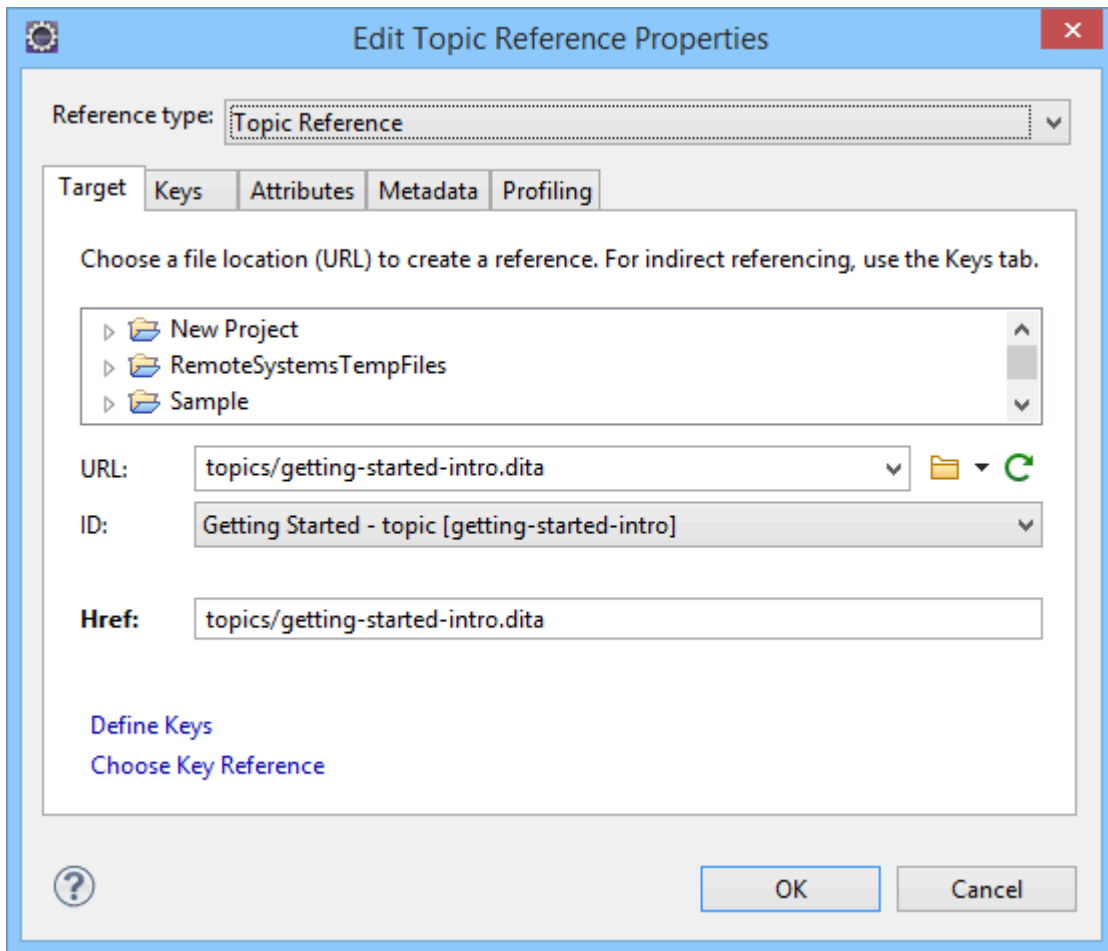

If you select multiple sibling nodes and invoke the  **Edit properties** action, only the **Profiling** tab will be available and your modifications in that tab will be applied to all the selected nodes. If you select multiple nodes that are not on the same hierarchical level, the other tabs will also be available and your modifications will be applied to the parent node (the child nodes will inherit the attributes of the parent node).

You can use the **Edit Properties** dialog box to modify or define attributes, metadata, profiling, or keys in *DITA maps* or topics. You can also use it to modify the title of *root maps* (on page 2682).

At the top of the **Edit Properties** dialog box, the **Reference type** drop-down list displays the type of the selected node and it depends on the node where the action was invoked.

The main section of the dialog box includes the following tabs: **Target**, **Keys**, **Attributes**, **Metadata**, and **Profiling**. The availability of the tabs and their functions depend on the selected node. For example, if you invoke the action on a *root map* (on page 2682), only the **Attributes**, **Metadata**, and **Profiling** tabs are accessible and the **Title** property can be configured. Also, if you select multiple nodes, only the **Profiling** tab is available.

Target Tab

Figure 587. Edit Properties Dialog Box - Target Tab

The **Target** tab of the **Edit Properties** dialog box displays information about the target node on which the action was invoked and allows you to change the target. It includes the following sections and fields:

Choose a file location section

You can browse for and select the source target file by using the file window in this section.

You can use the **File filter** drop-down menu to narrow the list of possible file types that will be displayed.

URL

Displays the path to the target and allows you to select or change it by using the combo box or browsing buttons.

ID

The drop-down list displays all of the target elements that are available for the selected target URL.

Href

The selected target automatically modifies this value to point to the corresponding `@href` attribute of the target element.

**Note:**

If the **Reference type** is a **Navigation Reference**, the **Href** field is changed to **Mapref**, since a `<navref>` element requires a `@mapref` attribute instead.

Keys Tab

Figure 588. Edit Properties Dialog Box - Keys Tab

Keys are used for indirect referencing.

Define keys:
Use space as separator for multiple values.

Key scopes:
Use space as separator for multiple values.

Key reference: reusable_links

[Choose target for defined key\(s\)](#)
[Edit metadata information for defined key\(s\)](#)

The **Keys** tab allows you to use and [define keys \(on page 2371\)](#) for indirect referencing. For more information, see [Working with Keys in DITA \(on page 2471\)](#). This tab includes the following:

Define keys

Use this text field to define the `@keys` attribute for the target.

Key scopes

Use this text field to define or edit the value of a `@keyscope` attribute. *Key scopes* allow you to specify different sets of key definitions for different map branches.

Key reference

Use this combo box (or the **Choose key reference** button) to select a key that is already defined in the *root map (on page 2682)*.

Attributes Tab

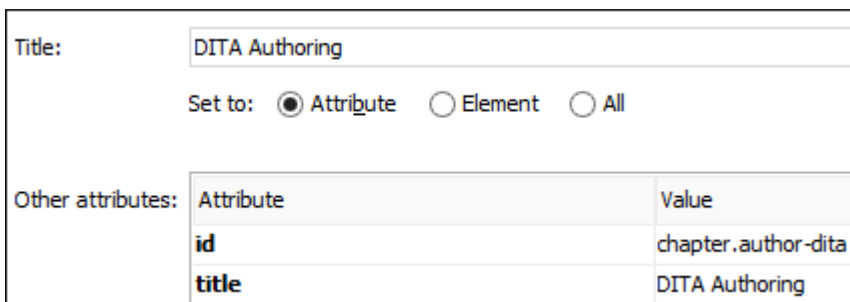

Figure 589. Edit Properties Dialog Box - Attributes Tab

The **Attributes** tab of the **Edit Properties** dialog box allows you to insert and edit attribute values for the target node where the action was invoked.

If the target is a *root map* (on page 2682), the tab displays the title of the map. You can change it in the **Title** text field and assign it to an **Attribute**, **Element**, or **All**. However, if the title of the map contains elements other than plain text, the title is not editable and cannot be changed using this dialog box (you would need to open the DITA map in the main editor to edit the title).

Figure 590. Attributes Tab for a Root Map

For other types of targets, the tab includes the following sections and fields that can be used to edit the attributes of the target:

Navigation title

This text field allows you to specify a custom navigation title for the target reference. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Navigation title** checkbox for the **Always fill values for attributes** option in the **DITA preferences page** (on page 84). For references to DITA resources, you can enforce

the use of the specified title by selecting the **Lock** checkbox (otherwise, the topic `<title>` takes precedence).

Tip:

You can also select the **Prefer navigation title for topicref rendering** option in the [DITA preferences page \(on page 84\)](#) to always enforce the use of the `@navtitle` value rather than selecting this **Lock** option on individual topics.

Collection type

This drop-down list allows you to select the `@collection-type` attribute to create hierarchical linking between topics in a *DITA map* (for example, `unordered`, `sequence`, `choice`, `family`, `-dita-use-conref-target`).

Type

Allows you to select a `@type` attribute (such as `topic`, `task`, `concept`, etc.) for the target element. If you want this attribute to always be populated with a detected value (based on the specifications for the target file), select the **Type** checkbox for the **Always fill values for attributes** option in the [DITA preferences page \(on page 84\)](#).

Scope

This property corresponds to the `@scope` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Scope** checkbox for the **Always fill values for attributes** option in the [DITA preferences page \(on page 84\)](#).

Format

This property corresponds to the `@format` attribute of the target element. It is populated automatically, based on the selected file type, unless its value for the selected target file is the same as the default attribute value. If you want this attribute to always be populated with a detected value based on the specifications (regardless of the default value), select the **Format** checkbox for the **Always fill values for attributes** option in the [DITA preferences page \(on page 84\)](#).

Processing Role

This drop-down list allows you to set the `@processing-role` attribute to one of the allowed values for DITA reference elements (for example, `resource-only`, `normal`, `-dita-use-conref-target`).

Other attributes table

This table contains the attributes that are available for the selected reference. You can use this table to insert or edit the values of any of the listed attributes. Clicking a cell in the **Value** column allows you to use the combo box to enter, edit, or select attribute values.

Metadata Tab

Figure 591. Edit Properties Dialog Box - Metadata Tab

The **Metadata** tab allows you to add metadata elements to the target node. Use the buttons on the right side of the tab to insert specific metadata elements (you can add the following metadata elements: `<navtitle>`, `<linktext>`, `<shortdesc>`, `<keyword>`, `<indexterm>`). The metadata elements are inserted inside a `<topicmeta>` element. The editing window allows you to easily insert and modify the content of the metadata that will be inserted.

Profiling Tab

Figure 592. Edit Properties Dialog Box - Profiling Tab

The **Profiling** tab allows you to select or change profiling attributes for the selected target nodes. This tab displays profiling attributes and their values as determined by the following:

- If your *root map* (on page 2682) references a DITA *subject scheme map* (on page 2682) that defines values for the profiling attributes, those values are used.
- Otherwise, a basic default set of profiling attributes and values are used.

If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the  **Expand All**/ **Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

When you modify a selection of values in this tab, the change will also automatically be reflected in the **Attributes** tab. For more information, see [DITA Profiling / Conditional Text \(on page 2580\)](#).

Note:

If you invoke the  **Edit properties** action on a selection of multiple nodes that have different values for the same profiling attribute, a conflict panel will be displayed in the **Profiling** tab and you can choose between the following actions for resolving it:

- **Keep** - Preserves the current attribute values.
- **Change Now** - Allows you to edit the selection of values in this **Profiling** tab and the changes will be applied to all the selected nodes.

Figure 593. Profiling Conflict Panel

Finalizing Your Modifications

Once you click **OK**, all your changes are applied to the target node.

Related Information:

[DITA Profiling / Conditional Text \(on page 2580\)](#)

[Working with Keys in DITA \(on page 2471\)](#)

Generating a Table of Contents in DITA

In DITA, the order and hierarchy of the table of contents of a document is based directly on [the DITA map that defines the document \(on page 2335\)](#). In most cases, the processor generates a table of contents (TOC)

based on the hierarchy of the topics in a DITA map. By default, each `<topicref>` element in a map represents a node in the TOC.

It is also possible to instruct DITA where the table of contents should occur (or other content lists, such as a list of figures or tables). If you want to instruct the processor to generate a table of contents at a particular location within your DITA map structure, you can use the `<toc>` element in a *bookmap* (on page 2356) (as in the example below). For more information about the `<toc>` element, see <https://docs.oasis-open.org/dita/v1.2/os/spec/langref/toc.html>.

Example:

```
<bookmap>
.....
  <frontmatter>
    <booklists>
      <toc href="chapter1.dita" />
    </booklists>
  </frontmatter>
.....
```

Creating an Index in DITA

In DITA, indexes are created from `<indexterm>` elements. You can insert index term elements in the following:

- **The header of a topic:** In paginated media, such as a printed book or a PDF, this results in an index entry that points to the page where the topic starts, even if it is not the page in which the indexed term occurs.
- **In the `<topicref>` element in a map that references the topic:** This applies those index terms to that topic only when used in that map, allowing you to index topics differently in various publications. In paginated media, index entries point to the page where the topic starts.
- **In the body of a topic:** In paginated media, this results in an index entry that points to the page where the `<indexterm>` element occurs, even if that is not the page where the topic starts.

To add index terms to the text of a topic of the topic header, [create the elements as you normally would in Oxygen XML Editor Eclipse plugin](#) (on page 2408). To add index terms to a map, open the map in the editor and add the elements, as you normally would, in a topic.

In some media, indexes will be generated automatically when index entries are found in the source. For other media, such as books, you may need to tell DITA where to place the index. For instance, to add an index to a *bookmap* (on page 2676), you need to add an `<indexlist>` element to the `<backmatter>` of the book.

1. Open your *bookmap* (on page 2356) in the **DITA Maps Manager** (on page 2337).
2. Right-click the *bookmap* and select **Append Child > Backmatter**.
The **Insert Reference** dialog box (on page 2363) appears.
3. Click **Insert and Close** to insert the `<backmatter>` element.

4. Right-click the `<backmatter>` element and create a `<booklists>` element using **Append Child > Book Lists**.
5. Use the same steps to create an `<indexlist>` element.

**CAUTION:**

Adding *index* entries and an `<indexlist>` to your project creates an instruction to the DITA publishing routines to create an index. There is no guarantee that all DITA output types or third-party customizations obey that instruction or create the index the way you want it. Modifying the output may be necessary to get the result you want.

Resolving Topic References Through an XML Catalog

There are situations where you want to resolve references with an *XML Catalog (on page 2683)*:

- You customized your *DITA map (on page 2678)* to reference topics using URIs instead of local paths.
- You have URI content references in your DITA topic files and you want to map them to local files when the map is transformed.

In such situations, you have to add the catalog to Oxygen XML Editor Eclipse plugin. The **DITA Maps Manager view (on page 2337)** will solve the displayed topic refs through the added *XML catalog* URI mappings. The resolution through the XML catalog URI mappings are done only for reference values starting with the `urn:` prefix.

To add an *XML catalog* to the DITA *framework (on page 2679)*, follow these steps:

1. Create an *XML catalog* using the guidelines described in *Working with XML Catalogs (on page 594)*.
2. Open the **Preferences** dialog box (on page 70) and go to **Document Type Association**.
3. Select the **DITA** document type and use the **Edit**, **Duplicate**, or **Extend** button to open a **Document type configuration dialog box (on page 90)**.
4. Go to the **Catalogs** tab (on page 114).
5. Click on the **+** **Add** button to open a dialog box that allows you to add your created *XML Catalog* to the list.
6. After adding your catalog, click **OK**. You may need to reopen any currently edited files that use the new catalog or run a manual **Validate** action (on page 547) for the changes to take effect.

**Note:**

You could also add your created catalog to the list of global catalogs in the **XML Catalog preferences (on page 189)** page.

Adding a Custom URI Resolver to Oxygen XML Editor Eclipse plugin

You can use the `XMLUtilAccess.addPriorityURIResolver(URIResolver)` API to add your own priority URI resolver from a `Workspace Access plugin extension`, allowing you to take control over how topic references in a DITA map are located or how references in DITA topics are resolved.

Publishing a DITA Map with References Resolved Through the XML Catalog

If you are publishing a DITA map that contains references to topics that need to be resolved through the XML catalog support in Oxygen XML Editor Eclipse plugin, you must enable the `fix.external.refs.com.oxygenxml` parameter in the **Parameters** tab of the transformation scenario configuration dialog box.

Chunking DITA Topics

By default, when a *DITA map (on page 2678)* is published to an online format, each topic becomes a separate page in the output. In some cases, you may want to combine multiple source topics into one output page. For instance, you may want to combine several types of information into a single page, or you may have chosen to create many small DITA topics for reuse purposes but feel they are too small to be useful to a reader by themselves. This is referred to as *chunking*.

To chunk DITA topics, you set the chunking attribute on the `<topicref>` that contains the sub-topics in a *DITA map*. There are several values that you can set on the chunking attribute (for example, `by-topic` or `to-content`). See the [DITA documentation](#) for full details. To achieve the effects you want in your topics and table of contents, you may also need to set the `@toc` and `@collection-type` attributes on the sub-topics or container topic to suitable values. See the [DITA documentation](#) for details.

You can set the `@collection-type` attribute on your topics using the **Edit Properties** action in the **DITA Maps Manager (on page 2337)**. To set the `@toc` and `@chunk` attributes, you must open the map file in the editor and add or edit the attributes directly (double-click the map icon  in the **DITA Maps Manager (on page 2337)** to open the map in the editor).

DITA Map Validation and Completeness Check

You should validate your *DITA maps (on page 2678)* regularly to make sure that your maps and topics are valid, and all of the relationships between them are working. Changing one topic, image, or piece of metadata may create errors in references that rely on them. You may not discover these problems all at once. Validate your map to catch all of these kinds of problems. The longer you wait between validating your maps, the more difficult it may be to detect and correct any errors you find.

Validating a DITA Map

To validate a DITA, follow these steps:

1. In the **DITA Maps Manager view (on page 2337)**, make sure that the tab that holds your *root map (on page 2682)* is selected and that the **Context** selection is set either to the name of your *root map* or to `<current map>`.
2. It is a good practice to refresh your *DITA map* before running the validation process. To do so, select the *DITA map* in the **DITA Maps Manager** view and click **File > Refresh (F5)**.
3. Click the  **Validate and Check for Completeness** button on the **DITA Maps Manager** toolbar to open the **DITA Map Completeness Check dialog box (on page 2383)**.
4. If you are using profiling, check the **Use DITAVAL filters** box and select the appropriate option.

5. Select any other options you want to check.
6. Click **Check** to run the validation process.

Result: The progress of the operation is shown as a task in the **Progress** view and the operation can be stopped from there.

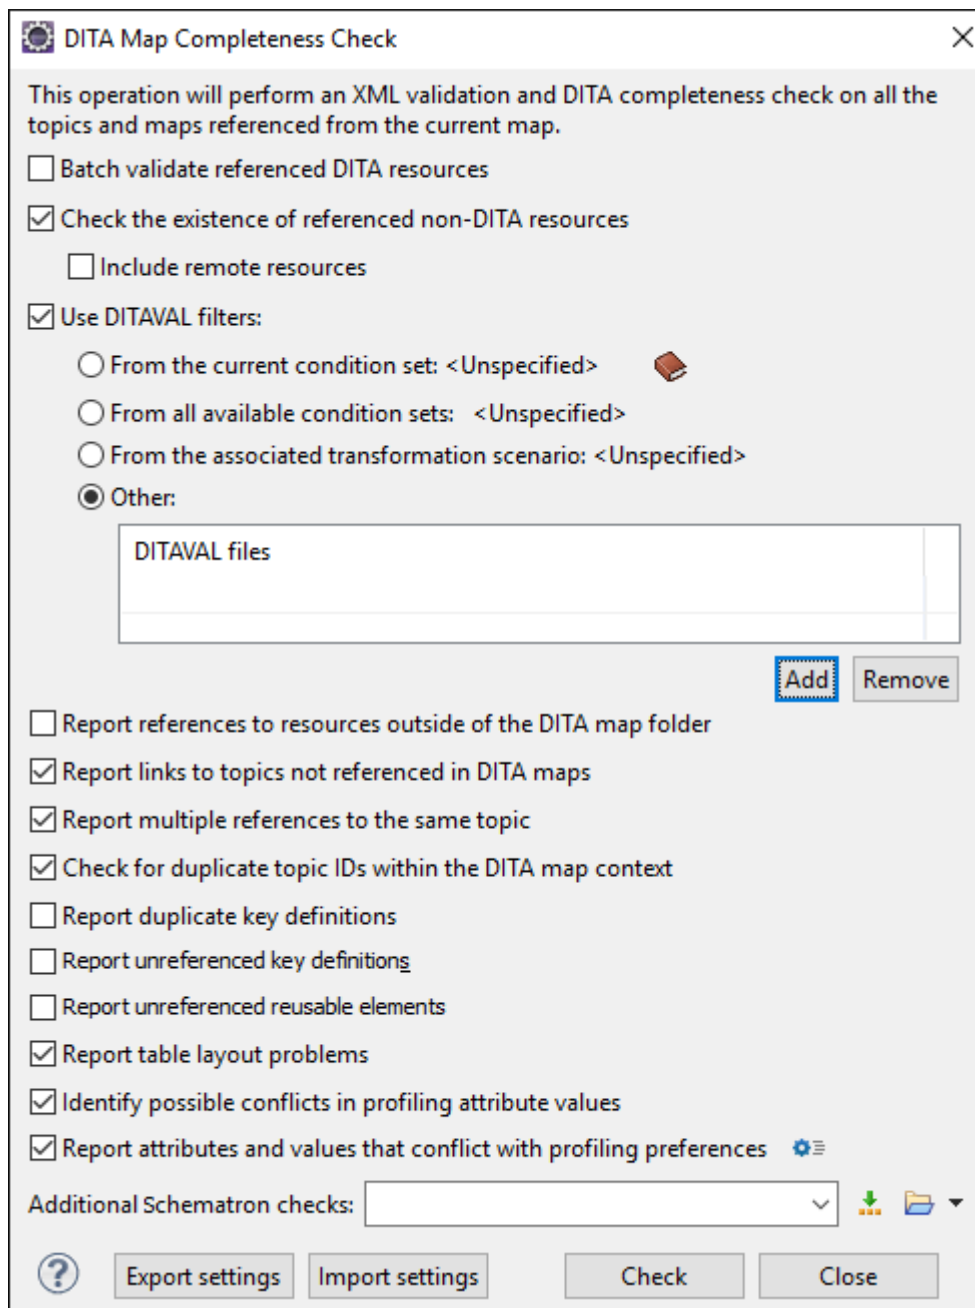

Validation Process

The validation process of a *DITA map* includes the following:

- Verifies that the file paths of the topic references are valid. For example, if an `@href` attribute points to an invalid file path, it is reported as an error in the message panel at the bottom of the editor.
- Validates each referenced topic and map. Each topic file is opened and validated against the appropriate DITA DTD. If another *DITA map* is referenced in the main one, the referenced *DITA map* is verified recursively, applying the same algorithm as for the main map.
- If errors or warnings are found, they are displayed in a separate message pane at the bottom of the editor and clicking them takes you to the location of the error or warning in the file where it was found.

DITA Map Completeness Check Dialog Box

The **DITA Map Completeness Check** dialog box allows you to configure the *DITA map* validation.

Figure 594. DITA Map Completeness Check Dialog Box

You can configure the validation process with the following options that are available in the **DITA Map Completeness Check** dialog box:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated [validation scenario \(on page 557\)](#).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Use DITAVAL filters

The content of the map is filtered by applying a [profiling condition set \(on page 2580\)](#) before validation.

Note:

The validation process also takes branch filtering `<ditavalref>` elements into account as long as they appear before the referenced topics.

You can choose between the following options:

- **From the current condition set** - The map is filtered using the condition set currently applied in the [DITA Maps Manager view \(on page 2337\)](#). Clicking the  **Details** icon opens a topic in the Oxygen XML Editor Eclipse plugin User Guide that explains how to create a profiling condition set.
- **From all available condition sets** - For each available condition set, the map content is filtered using that set before validation.
- **From the associated transformation scenario** - The filtering condition set is specified explicitly as a DITAVAL file in the current transformation scenario associated with the *DITA map*.
- **Other DITAVAL files** - For each DITAVAL file from this list, the map content is filtered using the DITAVAL file before validation. Use the **Add** or **Remove** buttons to configure the list. The **Add** button opens a dialog box that allows you to select a local or remote path to a DITAVAL file. You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 218\)](#) button, or the browsing actions in the  **Browse** drop-down list.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map (on page 2682)* folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita"/>
.....
<topicref href="topic.dita" copy-to="topic2.dita"/>
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes [key scopes \(on page 2503\)](#) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2"/>
  <topicgroup keyscope="ks">
    <topicref href="t2.dita" keys="k2"/>
  </topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a [key scope \(on page 2503\)](#) on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITAVAL filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page \(on page 145\)](#) (you can click the  **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.

Advanced Tip:

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLTExtensionFunctionUtil](#).

Export settings

Allows you to export the settings assigned in this dialog box to an XML file that you can share with other users or use on other systems.

Import settings

Allows you to import settings for this dialog box from an XML file that was created by the **Export settings** action.

Check

Use the **Check** button to begin the validation process. The options that you choose in this dialog box are preserved between sessions.

Tip:

This function can be executed from an automated command-line script, for more details, see [Scripting Oxygen](#) (on page 2642).

Related information

[DITA Maps Manager](#) (on page 2337)

DITA Map Author Mode Actions

A variety of actions are available for DITA map documents that can be found in **DITA** menu, toolbar, contextual menu, and the *Content Completion Assistant* (on page 2677).

DITA Map Toolbar and Menu Actions

When a *DITA map* is opened in **Author** mode, the following default actions are available on the DITA Map toolbar (by default, they are also available in the **DITA** menu and in various submenus of the contextual menu):

Insert New DITA Resource

Opens a **New DITA file dialog box** (on page 2402) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

Insert Topic Reference

Opens the **Insert Reference dialog box** (on page 2363) where you can configure a topic reference and inserts it at the current position within the map.

Insert Key Definition with Keyword

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

Reuse Content

Opens the **Reuse Content dialog box** (on page 2488) that allows you to insert and configure a content reference (`@conref`), or a content key reference (`@conkeyref`) at the cursor position.

 **Insert Topic Heading**

Opens the **Insert Reference dialog box** (*on page 2363*) that allows you to insert a topic heading at the cursor position.

 **Insert Topic Group**

Opens the **Insert Reference dialog box** (*on page 2363*) that allows you to insert a topic group at the cursor position.

 **Insert Relationship Table**

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

 **Relationship Table Properties**

Allows you to change the properties of rows in relationship tables.

 **Insert Relationship Row**

Inserts a new table row with empty cells. The action is available when the cursor position is inside a table.

 **Insert Relationship Column**

Inserts a new table column with empty cells after the current column. The action is available when the cursor position is inside a table.

 **Delete Relationship Column**

Deletes the table column where the cursor is located.

 **Delete Relationship Row**

Deletes the table row where the cursor is located.

 **Move Up**

Moves the selected node up one position on its same level.

 **Move Down**

Moves the selected node down one position on its same level.

 **Promote**

Moves the selected node up one level to the level of its parent node.

 **Demote**

Moves the selected node down one level to the level of its child nodes.

DITA Map Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

Edit Properties

Opens the **Edit Properties** dialog box that allows you to configure the properties of a selected node. For more details about this dialog box, see [Edit Properties Dialog Box \(on page 2373\)](#).

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps (on page 2678)*. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA Map *framework*:

Insert New DITA Resource

Opens a **New DITA file dialog box** ([on page 2402](#)) where you can choose the type of DITA document to create and inserts a reference to it at the current position within the map.

Insert Topic Reference

Opens the **Insert Reference dialog box** ([on page 2363](#)) where you can configure a topic reference and inserts it at the current position within the map.

Insert Key Definition with Keyword

Opens a dialog box where you can choose the name of a key and its keyword value and inserts the key definition at the current position within the map.

Reuse Content

Opens the **Reuse Content dialog box** ([on page 2488](#)) that allows you to insert and configure a content reference (`@conref`), or a content key reference (`@conkeyref`) at the cursor position.

Insert Topic Heading

Opens the **Insert Reference dialog box** ([on page 2363](#)) that allows you to insert a topic heading at the cursor position.

Insert Topic Group

Opens the **Insert Reference dialog box** ([on page 2363](#)) that allows you to insert a topic group at the cursor position.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range #x10000 to #x10FFFF) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. #65
- `&#<decimal value>` - e.g. A
- `#x<hexadecimal value>` - e.g. #x41
- `&#x<hexadecimal value>` - e.g. A

Relationship Table > Insert Relationship Table

Opens a dialog box that allows you to configure the relationship table to be inserted. The dialog box allows you to configure the number of rows and columns of the relationship table, if the header will be generated and if the title will be added.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

Note:

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Search References

Finds the references to the `@href` or `@keys` attribute value of the topic/map reference element at the current cursor position, in all the topics from the current *DITA map* (opened in the **DITA Maps Manager view** (on page 2337)). The current topic/map reference element must have an `@href` or `@keys` attribute defined to complete the search.

Show Key Definition

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the *DITA map* (on page 2678) that contains the definition of the key with the element that defines that key selected.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (**Ctrl + Shift + H** (**Command + Shift + H** on **macOS**))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the `0x` or `0X` prefix. Examples of valid sequences and the characters they will be converted to:

- `0x0045` will be converted to `E`
- `0x0125` to `ĥ`
- `265` to `ı`

• 2190 to ←

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements (on page 2676)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags option (on page 120)** is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags option (on page 120)** is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

 **Surround with '[tag]' (Alt + Shift + ForwardSlash)**

Surround the selected content with the last tag used.

 **Rename Element**

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

 **Delete Element Tags**

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

 **Remove All Markup**

Removes all the XML markup inside the selected block of content and keeps only the text content.

 **Remove Text**

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

 **Track Changes**

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (Ctrl + NumPad+ (Command + NumPad+ on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

About Element > Go to Definition

Moves the cursor to the definition of the current element.

Inspect Styles

Opens the [CSS Inspector view \(on page 414\)](#) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page \(on page 136\)](#) where you can configure various options with regard to the **Author** editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

The *floating contextual toolbar* is automatically displayed when editing DITA map documents when a `<topicref>` element is selected and it includes actions for moving the topic reference node up or down (or promoting/demoting the node).

DITA Map Drag/Drop Actions

Dragging a file from the **Project Explorer** view ([on page 269](#)) or **DITA Maps Manager** view ([on page 2337](#)) and dropping it into a *DITA map* document that is edited in **Author** mode creates a link to the dragged file (a `<topicref>` element, `<chapter>`, `<part>`, etc.) at the drop location.

Opening a Topic from a DITA Map in Author Mode

If a *DITA map* is open in the **Author** visual editing mode, you can open a referenced topic by clicking the  icon to the left of the particular topic. The source topic is opened in a new tab in the main editor.

Tip:

For information about customizing **Author** mode actions for a particular *framework* ([on page 2679](#)) (document type), see the [Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#)) section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework](#) ([on page 1955](#))

Opening a DITA Map With Topic Content Resolved

It is possible to open a DITA map in the main editor with all the content from the referenced topics resolved and presented in one document. To do this, select the DITA map in the **DITA Maps Manager** view and click the  **Open Map in Editor with Resolved Topics** toolbar button. This opens the *DITA map* in the main editor area with content from all topic references expanded in-place.

If the **Display referenced content** setting in the [Author Preferences](#) ([on page 136](#)) page is not selected, references to maps, topics, and content references can be expanded on demand by clicking the small **Expand Reference** expansion button located next to each element that contains a reference.

Content from the resolved topics that is referenced using a `@conref` or `@conkeyref` attribute is presented as read-only by default. To edit it, you must use the **Edit Reference** contextual menu action to open the source topic that contains the referenced content.

Editing Referenced Content Directly

If you want to edit the referenced content directly without having to open the source document, go to **Options > Preferences > Editor > Edit Modes > Author** and select the **Allow referenced content to be edited** option ([on page 139](#)). The referenced content becomes editable in-place and saving the document will save all other modified topics.

Things to be Aware of When Enabling This Option:

- The references become editable only if the referenced topics are the root elements. If, for example, in the DITA map, there are references directly to subtopics embedded in a larger topic, those references will not be editable.
- If the content is stored in a CMS, you need to deselect the **Local files only** option ([on page 139](#)) to edit such remote referenced topics directly but this feature might not function properly with remote resources (it depends on the capabilities of the CMS connector).
- Since a single topic may be referenced in multiple places in the DITA map, be careful not to make conflicting changes to that topic.
- When modified topics are saved, the **Only modified content** option in the **Options > Preferences > Editor > Edit Modes > Author > Serialization** page ([on page 157](#)) is ignored.
- The toolbar has two DITA map-specific actions for inserting topic references and all DITA topic-specific actions that can be used to make changes in the referenced DITA topics.
- The content completion and schema-aware insertion strategies work in each referenced topic according to their respective schema.
- The contextual menu presents the relevant actions in each referenced topic.
- Validation works for each individual referenced topic but only if it contains modifications.

Working with DITA Topics

DITA is a structured writing format. Structure can have several meanings, all of which are relevant to DITA. This section includes information about working with DITA topics and the structure.

Information Types

The structure of a piece of content refers to how the words and images are selected and organized to convey information. One approach to structured writing is to divide content into discrete blocks that contain various types of information, and then to combine those blocks to form publications. DITA is based on this approach, and encourages the author to write in discrete blocks called topics. DITA provides three base topic types (concept, task, and reference), a number of extended topic types, and the capability to create new topic types through specialization.

Text Structure

Every piece of text is made up of certain text structures, such as paragraphs, lists, and tables. DITA supports text structures through XML elements such as `<p>`, ``, and `<simpletable>`. [The DITA markup](#) specifies the text structures, but not how they will be published in various types of media. The formatting of text structures is determined by the output transformations and may be customized to meet the needs of various organizations and type of media.

Semantic Structure

Semantic structure is structure that shows the meaning of things. For example:

- A `<task>` element specifies that a block of content contains the description of a task.
- A `<codeblock>` element specifies that a block of text consists of programming code.
- A `<uicontrol>` element specifies that a word is the name of a control in a computer GUI.
- The `@platform` profiling attribute specifies that a particular piece of content applies only to certain computing platforms.

Semantic structure is important in a structured writing system because it allows both authors and readers to find content, and it allows processing scripts to process various pieces of content differently, based on their role or meaning. This can be used to do things such as filtering content related to a specific product so that you can produce documentation on many products from the same source.

There can be many forms of semantics captured in a document set. DITA captures some of these in topics and some of them in maps. If you are using a CMS, it may capture additional semantics.

Document Semantics

Documents consist of elements that may be made up of the same basic text structures as the rest of the text, but have a special function within the structure of the document. For instance, both tables of contents and indexes are lists, but they play a special role in the document. Chapters and sections are just sequences of paragraphs and other text structures, yet they are meaningful in the structure of the document. In some cases, such as indexes and tables of contents, these structures can be generated from semantic information embedded in the source. For instance, a table of contents can be built by reading the titles of chapters and sections. DITA provides elements to describe common document semantics.

Subject Matter Semantics

In some cases, the semantics of the content relate directly to the subject matter that the content describes. For instance, DITA supports tags that allow you to mark a piece of text as the name of a window in a software application (`<wintitle>`), or to mark a piece of text as applying only to a particular product.

Audience Semantics

In some cases, the semantics of the content relate to the audience that it is addressed to. For instance, a topic might be addressed to a particular role, or to a person with a particular level of experience. DITA provides an `<audience>` element to capture audience metadata.

Creating Topic Structures

Oxygen XML Editor Eclipse plugin provides a number of tools to help you create topic structures:

- *Content Completion Assistant (on page 2677)* - Shows you which elements can be created at the current position.
- **Model view (on page 331)** - Shows you the complete structure supported by the current element.

- **Outline view** ([on page 326](#)) - Shows you the current structure of your document.
- **DITA toolbar** - Helps you to easily insert many common structures.

Resources

For more information about getting started with DITA and how to work with DITA in Oxygen XML Editor Eclipse plugin, see our compiled collection of DITA-related webinars that are meant to help you with your journey into working with DITA: [Webinars: Working with DITA in Oxygen](#).

[Getting Started with DITA \(on page 2328\)](#)

[DITA Topics Document Type \(Framework\) \(on page 1075\)](#)

Creating a New DITA Topic

The basic building block for DITA information is the DITA topic. DITA provides a variety of specialized topic types, the most common of which are:

- *Topic* - The base topic type from which all other topic types are specialized. Typically, it is used when a more specialized topic type is inappropriate.
- *Task* - For procedural information such as how to use a dialog box.
- *Concept* - For general, conceptual information such as a description of a product or feature.
- *Reference* - For reference information.

Oxygen XML Editor Eclipse plugin also supports numerous other specialized topic types that you will find templates for in the various folders in the [New DITA file dialog box \(on page 2403\)](#). They include DITA 1.3 specializations, Lightweight DITA templates, MathML composites, Markdown documents, and other DITA specialized topic and *DITA map* ([on page 2678](#)) types such as *Glossentry*, *Troubleshooting*, *Questions and Answers*, *Bookmap* ([on page 2676](#)), and *Subject Scheme Map* ([on page 2682](#)).

To create a new DITA topic and add a reference to it in your *DITA map* ([on page 2678](#)), follow these steps:

1. In the **DITA Maps Manager** ([on page 2337](#)), right-click the node in the current map where you want to add the new topic.
2. Select one of the following actions:
 - **Append Child > New** - Select this action to insert the new topic as a child of the selected node. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert Before > New** - Select this action to insert the new topic as a sibling to the current node, before it. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the type of document and assists you with naming it. After you have configured your new topic, click **Create**.
 - **Insert After > New** - Select this action to insert the new topic as a sibling to the current node, after it. This action opens a **New file dialog box** ([on page 2403](#)) that allows you to select the

type of document and assists you with naming it. After you have configured your new topic, click **Create**.

- **Duplicate** - Select this action to create a copy of the selected topic and insert it as a sibling. This action opens a dialog box that allows you to choose the file name and location for the newly created copy of the topic. After you have selected the name and path for your new topic, click **OK**.

Note:

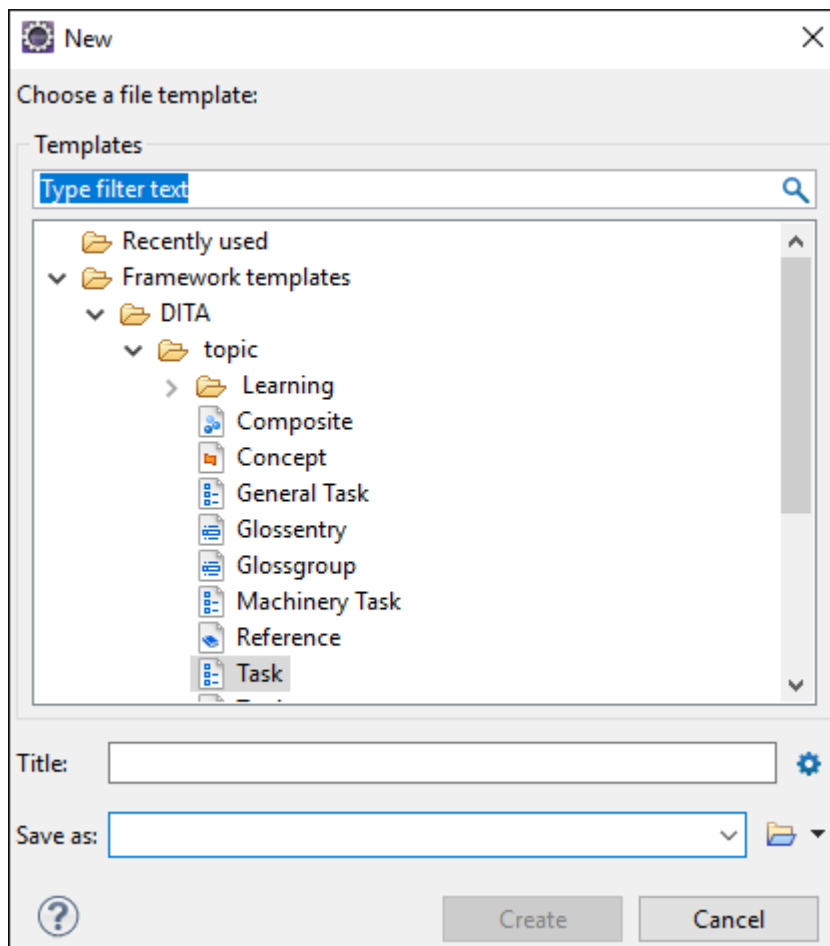

The value of the root ID is generated taking the *Use the file name as the value of the root ID attribute* option from the [DITA > Topics preferences page \(on page 86\)](#) into account. When the option is deselected, a unique ID is generated.

Step Result: The new topic is now referenced (as a `<topicref>`) in the *DITA map* at the location where you inserted it and the new topic is opened in the editor.

3. Save the *DITA map*.

Creating a New DITA Topic Using the New File Wizard

The **New** DITA file dialog box allows you to create a new DITA topic using various types of DITA file templates and provides some options that help you to configure the new topic.

Figure 595. New DITA File Dialog Box**Note:**

The templates that appear in this dialog box include all templates that have an associated `.properties` file and the `type` property is set to **dita**, as well as templates that do not have an associated properties file or the `type` property is not defined. It will also include custom templates that you create using the procedures presented in [Creating New Document Templates \(on page 253\)](#).

The **New** DITA file dialog box includes the following features and options:

Choose a file template

Use the template preview pane to select the appropriate type of DITA file you want to create. Once you select a template, the other options will appear below the preview pane.

**Tip:**

You can use the text filter field at the top of the dialog box to search for a specific template.

Title

Depending on the selected file template, the value of the **Title** field is set in:

- The `<title>` element of a DITA topic file. The `<title>` element needs to be the first child of the root element.
- The `<glossterm>` element of a *Glossentry* file.

New Topics Preferences

Pressing this button opens the [DITA New Topics preference page \(on page 86\)](#).

Save as

Use this option to specify a file name and path for the new file. You can specify the path by using the text field, the history drop-down, or the browsing actions in the  **Browse** drop-down menu.

Create

When you click this button, a reference (`<topicref>`) to the new topic is added to the current *DITA map* and the new topic is opened in the editor.

Other Ways to Create a New DITA Topic

In addition to the methods described above, Oxygen XML Editor Eclipse plugin also provides other ways to create DITA topics, including the following:

- **Fast Create Topics** - You can use the [Fast Create Topics feature \(on page 2405\)](#) to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the *DITA map*.
- **Extract Topic From Selection** - When editing a DITA topic in **Author** mode, an **Extract Topic From Selection** action is available in the contextual menu (and the **DITA** menu). It creates a new DITA topic from a selection of content in the current topic.

Related Information:

[Getting Started with DITA \(on page 2328\)](#)

[Adding Topics to a DITA Map \(on page 2357\)](#)

[Working with Markdown Documents in DITA \(on page 2467\)](#)

[Fast Create Multiple DITA Topics \(on page 2405\)](#)

Fast Create Multiple DITA Topics

The [DITA Maps Manager \(on page 2337\)](#) includes a feature that allows you to quickly create multiple skeleton topics at once and you can specify their hierarchical structure within the [DITA map \(on page 2678\)](#). A common use-case for using this feature is when you need to insert a new chapter or section that will include multiple topics and you have the structure and titles planned out in advance.

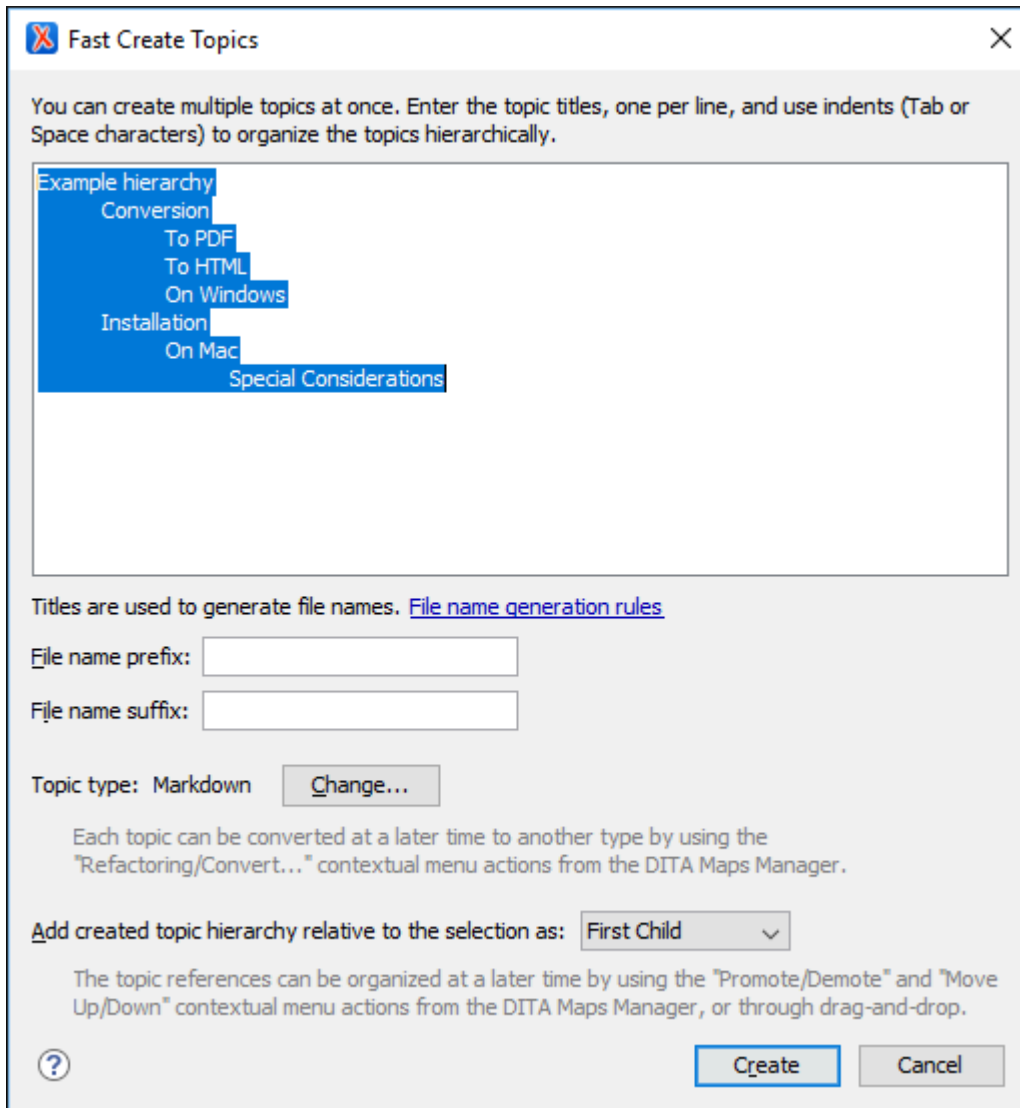

Note:

The **Fast Create Topics** feature works for the following types of local and remote resource protocols: *file*, *http*, *https*, *ftp*, *ftps*.

To access this feature, right-click a node in the **DITA Maps Manager** where you want the new topics to be inserted and select **Fast Create Topics**. This opens the **Fast Create Topics** dialog box where you can configure the structure for the new topics.

Figure 596. Fast Create Topics Dialog Box

The **Fast Create Topics** dialog box includes the following features and options:

Hierarchy Text Pane

Use this text area to enter the titles for your new topics, one per line, and specify the hierarchy by using indents (**Tab** or **Space**). Topic references will be created in the *DITA map* according to the hierarchy you enter in this section.

File name generation rules

The titles that you enter in the text pane will not only be used for the topic titles but also to generate their file names and you can click the **File name generation rules** link to [configure the rules \(on page 86\)](#) for how those file names will be generated.

**Tip:**

If you have added a [file name prefix or suffix to the properties file \(on page 256\)](#) for DITA document templates, the generated file name will include that prefix or suffix.

File name prefix

Use this option to add a specified prefix to the file name. If you have added a [file name prefix to the properties file \(on page 256\)](#) for DITA document templates, the prefix you enter here will override the one from the properties file.

File name suffix

Use this option to add a specified suffix to the end of the file name. If you have added a [file name suffix to the properties file \(on page 256\)](#) for DITA document templates, the suffix you enter here will override the one from the properties file.

Topic type

All of the topics that will be created will have the same DITA topic type, which is detected from the most recently created topic. You can click the **Change** button to select a different type from a list of possible DITA templates.

**Tip:**

You can convert any of these new files to a different DITA topic type at a later time by using another [feature that allows you to easily convert DITA documents to other types \(on page 2411\)](#).

Add created topic hierarchy relative to the selection as

By default, the hierarchy of topics will be added to the *DITA map* as the **First Child** of the node where the action was invoked. You can change this to **Last Child**, **Preceding Sibling**, or **Following Sibling** if the selected node allows topics to be inserted as such.

Create

When you click **Create**, the specified hierarchy is added as topic references in the *DITA map*. The new documents are created as bare skeleton topics with only the topic title and possibly the root ID populated.

**Tip:**

You can easily [change the order of the topics in the DITA map \(on page 2357\)](#) at a later time,

[Adding Topics to a DITA Map \(on page 2357\)](#)

[Converting DITA Topics to Another Type \(on page 2411\)](#)

Editing DITA Topics

Oxygen XML Editor Eclipse plugin provides a number of features to help you edit DITA topics. A DITA topic is an XML document, thus all the editing features that Oxygen XML Editor Eclipse plugin provides for editing XML documents also apply to DITA topics. Oxygen XML Editor Eclipse plugin also provides extensive additional support specifically for DITA.

Opening a DITA Topic

There are several ways to open a DITA topic in the XML editor. Use any of the following methods to open a topic:

- Double-click the topic in the **DITA Maps Manager** (*on page 2337*) (or right-click the topic and select **Open**).
- Double-click the file in the **Project Explorer** view (*on page 269*) (or right-click the file and select **Open**).
- If you have a *DITA map* (*on page 2678*) opened in the XML editor, you can click the  icon to the left of the topic.
- Drag a DITA file from your system browser and drop it in the XML editor.

Visual Editing in Author Mode

DITA is an *XML format* (*on page 27*), although you do not have to write raw XML to create and edit DITA topics. Oxygen XML Editor Eclipse plugin provides a graphical view of your topics in **Author mode** (*on page 242*). Your topics will likely open in **Author** mode by default, so this is the first view you will see when you open or edit a DITA topic. If your topic does not open in **Author** mode, just click **Author** at the bottom left of the editor window to switch to this mode.

Author mode presents a graphical view of the document you are editing, similar to the view you would see in a word processor. However, there are some differences, including:

- **Author** mode is not a **WYSIWYG** view. It does not show you exactly what your content will look like when printed or displayed on-screen. The appearance of your output is determined by the DITA publishing process, and your organization may have modified that process to change how the output is displayed. Oxygen XML Editor Eclipse plugin has no way of determining what your final output will look like or where line breaks or page breaks will fall. Treat **Author** mode as a friendly visual editing environment, not a faithful preview of your output.
- Your document is still an XML document. **Author** mode creates a visual representation of your document by applying a CSS stylesheet to the XML. You can see the XML at any time by switching to **Text mode** (*on page 241*). You, or someone in your organization, can change how the **Author** view looks by changing the CSS stylesheet or providing an alternate stylesheet.
- Your aim in editing a DITA document is not to make it look right, but to create a complete and correct DITA XML document. **Author** mode keeps you informed of the correctness of your content by highlighting XML errors in the text and showing you the current status in a box at the top right of the editor window. Green means that your document is valid, yellow means valid with warnings, and red means invalid. Warnings and errors are displayed when you place the cursor on the error location.

- Your XML elements may have attributes set on them. Conventionally, attributes are used to contain metadata that is not displayed to the reader. By default, attributes are not displayed in the **Author** view (though there are some exceptions) and cannot be edited directly in the **Author** view (though in some cases the CSS that drives the display may use form controls to let you edit attributes directly). To edit the attributes of an element, place your cursor on the element and press **Alt+Enter** to bring up the attribute editor. Alternatively, you can use the **Attributes** view (on page 405) to edit attributes.

**Tip:**

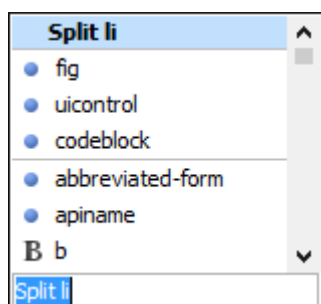

You can select **Hints** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display tooltips throughout the DITA document that offers additional information to help you with the DITA structure. For more information, see the [Selecting and Combining Multiple CSS Styles \(on page 1955\)](#) section.

Content Completion Assistance

Since it is a structured format, DITA only allows certain elements in certain places. The set of elements allowed differs from one DITA topic type to another (this is what makes one topic type different from another). To help you figure out which elements you can add in any given place and help you understand what they mean, Oxygen XML Editor Eclipse plugin has a number of *Content Completion Assistant (on page 2677)* features.

- **The Enter key:** In **Author** mode, the **Enter** key does not create line breaks, it brings up the *Content Completion Assistant* to help you enter a new element. In XML, you do not use line breaks to separate paragraphs. You create paragraphs by creating paragraph elements (element `<p>` in DITA) and tools insert the line breaks in the output and on-screen.

Figure 597. Content Completion Assistant

The *Content Completion Assistant* not only suggests new elements you can add. If you press **Enter** at the end of a *block element (on page 2676)* (such as a paragraph) it suggests creating a new element of the same type. If you press **Enter** in the middle of a *block element*, it suggests splitting that element into two elements.

A useful consequence of this behavior is that you can create a new paragraph simply by hitting **Enter** twice (just as you might in a text editor).

As you highlight an element name, a basic description of the element is displayed. Select the desired element and press **Enter** to create it.

To wrap an element around an existing element or piece of text, simply select it and press **Enter** and use the *Content Completion Assistant* to choose the wrapper element.

- **The Model view:** You can see the entire model of the current element by opening the **Model view** ([on page 331](#)) (**Window > Show View > Model**, if the view is not already open). The **Model** view shows you what type of content the current element can contain, all the child elements it can contain, all its permitted attributes, and their types.

Tip:

You can also select **Inline actions** from the **Styles** drop-down menu (available on the **Author Styles** toolbar) to display possible elements that are allowed to be inserted at various locations throughout the DITA document. For more information, see the [Selecting and Combining Multiple CSS Styles](#) ([on page 1955](#)) section.

DITA Editing Actions

A variety of actions are available in the DITA *framework* ([on page 2679](#)) to specifically assist you with editing DITA documents. These various actions are available in the contextual menu, the **DITA** menu, the **DITA (Author Custom Actions)** toolbar, or the *Content Completion Assistant*.

The **DITA** toolbar contains buttons for inserting a number of common DITA elements (elements that are found in most DITA topic types).

If the **DITA** toolbar is not displayed, right-click anywhere on the toolbar area, select **Configure Toolbars**, and select it from the displayed dialog box.

Note:

The **DITA** toolbar contains a list of the most common elements and actions for DITA, such as inserting an image, creating a link, inserting a content reference, or creating a table. It does not contain a button for inserting every possible DITA element. For a complete list of elements that you can insert at the current location in your document, press **Enter** to open the *Content Completion Assistant*.

Whenever the current document in the editor is a DITA document, the **DITA** menu is displayed in the menu bar. It contains a large number of actions for inserting elements, creating content references and keys, editing DITA documents, and controlling the display. These actions are specific to DITA and supplement the general editing commands available for all document types. Many of these actions are also conveniently available in the contextual menu. In addition to the *DITA framework-specific actions* ([on page 2444](#)), the contextual menu also includes various *general Author mode contextual menu actions* ([on page 531](#)).

Related Information:[Getting Started with DITA \(on page 2328\)](#)[DITA Topic Author Mode Actions \(on page 2444\)](#)

Converting DITA Topics to Another Type

Oxygen XML Editor Eclipse plugin includes a feature that allows you to convert an existing DITA document to a different topic type. For example, if you want to convert a DITA Task to a DITA Topic, or vice versa. There are several ways to access these refactoring actions and you can choose a scope for the operation and some filtering options.

DITA Conversion Refactoring Operations for *DITA*

The following conversion operations are available:

Convert Nested Topics to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2337))

Use this operation on topics that contain nested `<topic>` elements to convert each nested topic to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

Convert Sections to New Topics (Available from the contextual menu of editable maps/nodes in the DITA Maps Manager (on page 2337))

Use this operation on topics that contain multiple sections to convert each section to a new topic. Also, the new topics are added in the **DITA Maps Manager** as the first child topics of the original topic.

**Note:**

As long as the DITA topic is of the type *topic*, *concept*, or *reference*, the new topics that will be created from the inner sections will retain the same topic type as the original topic.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Methods for Accessing the DITA Conversion Refactoring Operations

To access the conversion operations, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the **DITA Maps Manager** (*on page 2337*)), go to the **Refactoring** submenu, and choose whichever operation is appropriate for your needs.

Multiple Documents At Once Method

Select  **XML Refactoring** from the **XML Tools** menu (or from the **Refactoring** submenu when you right-click one or more documents in the **Project Explorer view** (*on page 269*) or the **DITA Maps Manager view** (*on page 2337*)). Then select whichever operation is appropriate for your needs.

XML Refactoring Wizard Dialog Box

When you select any of the operations, Oxygen XML Editor Eclipse plugin proceeds to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method** (*on page 2412*), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, **Selected reference**, and others depending on the context.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the **Single Document Method** (*on page 2412*), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Warning:

It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

Finish

When you use the **Finish** button, behind the scenes Oxygen XML Editor Eclipse plugin maps the structure of the previous DITA document type to a structure that fits the new type. In some cases, especially when the previous structure was very complex, the conversion might result in an invalid structure and some manual adjustments might be required.

Handling Special Characters When Generating New File Names

For refactoring operations that generate a new file, if special characters are detected in an element that will be used to generate the new file name, the special characters will automatically be replaced with their ASCII equivalents (for example, **Ä** is changed to **AE**). If an ASCII equivalent does not exist, it will be replaced with an underline character (**_**). The purpose of this functionality is to avoid generating invalid file names.

It is possible to customize the list of replaceable symbols by editing the following XSLT character map file:

`[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/utils/character-map.xsl`.

Converting To and From DITA Specialization Document Types

If you use your own [DITA specialization document type \(on page 2623\)](#), you can modify mappings for the predefined conversion operations to work with your specialization.

To use the conversion operations with your DITA specialization, follow these steps:

1. Locate the conversion stylesheets in the following directory (and its subdirectories):

`[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/`.

Note:

The stylesheets for converting entire files (from one type to another) are located in the `dita-files-conversion-stylesheets` folder. Each of these conversion operations has a stylesheet with the word **entrypoint** at the end of its name. Edit the appropriate `*-entrypoint.xsl` file (for example, to modify the **Convert to Task** operation, edit the `convert-resource-to-task-entrypoint.xsl` file).

2. Depending on whether you use a DTD, XML Schema, or Relax NG-based specialization, you can:

- a. Modify the values of the declared **root-element**, **public-literal-target**, and **system-literal-target** variables to match your specialization's DTD information.
 - b. Modify the value of the declared **schema-location** variable to match the location of your specialization's XML schema.
 - c. Modify the value of the declared **xml-model-location** variable to match your Relax NG specialization.
3. For the **Convert Nested Topics to New Topics** and **Convert Sections to New Topics** operations, if your DITA specialization uses your own custom URN or DOCTYPE, you can replace the default mappings in the `[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/utils/dita-formats.xsl` stylesheet with your own values for the `DOCTYPE` or `xml-model`.
 4. If you want to change the name of the operation that will be displayed in Oxygen XML Editor Eclipse plugin, follow these substeps:
 - a. Locate the resource XML file for the same conversion operation in the following directory: `[OXYGEN_INSTALL_DIR]/frameworks/dita/refactoring/` (for example, for the **Convert to Task** operation, it is `convertResource2Task.xml`).
 - b. Edit that XML file and change the **name** attribute to match whatever you want to be displayed for that operation (for example, `name="Convert to My DocType"`).
 5. Save your changes to all modified files.
 6. Restart Oxygen XML Editor Eclipse plugin

Result: You should now see your changes when [accessing the conversion operations \(on page 2412\)](#).

Tip:

You can also create your own customized refactoring operations. For more information, see [Custom Refactoring Operations \(on page 624\)](#).

Related Information:

[Editing DITA Topics \(on page 2408\)](#)

[Refactoring XML Documents \(on page 608\)](#)

Changing the Look of DITA Documents in Author Mode Using the Styles Menu

The **Author** mode renders the content of the DITA documents visually, based on CSS stylesheets associated with the document.

Oxygen XML Editor Eclipse plugin provides a **Styles** drop-down menu on the toolbar that allows you to select one *main (non-alternate) CSS style (on page 2680)* and multiple *alternate CSS styles (on page 2676)*. This makes it easy to change the look of the document as it appears in **Author** mode.

Figure 598. Styles Drop-down Menu in a DITA Document

You can use the **Styles** drop-down menu to select a *main css style* (on page 2680) that applies to the whole document and then select one or more *alternate css styles* (on page 2676) that behave like layers and are merged sequentially with the *main style*. Each of the styles that are listed in this drop-down menu have a corresponding CSS file that defines how your documents are rendered in **Author** mode and in the output. Also, the selections from this drop-down menu are persistent, meaning that Oxygen XML Editor Eclipse plugin remembers them when subsequent documents are opened.

Unique CSS Styles for DITA

Oxygen XML Editor Eclipse plugin comes with a set of built-in CSS layer stylesheets for DITA documents (as well as some that are specifically for *DITA maps* (on page 2678)).

Some of these unique alternate styles for DITA documents include:

- **Hints** - Displays tooltips throughout DITA documents that offer additional information to help you with the DITA structure.
- **Inline actions** - Displays possible elements that are allowed to be inserted at various locations throughout DITA documents.
- **Inline insertion actions** - Displays a widget (+) near each empty paragraph that makes it easy to insert DITA elements (for example, to insert lists, notes, or tables).

Tip:

For information about configuring the **Styles** drop-down menu, see [Configuring and Managing Multiple CSS Styles for a Framework](#) (on page 1955).

Working with Images in DITA Topics

There are several ways to add images to a DITA topic, depending on if you want to create a figure element (with a title and caption), just insert an image inline, or if you want to use multiple versions of a graphic depending on the situation. For instance, you might want to use a specific image for each different product version or output media.

Adding an Image Inline with the Insert Image Dialog Box

Use the following procedure to add an image inline:

1. Place the cursor in the position you want the graphic to be inserted.
2. Select the  **Insert Image** action. The **Insert Image** dialog box appears.

Figure 599. Insert Image Dialog Box

3. Configure the options in this dialog box and click **Insert**.

The **Insert Image** dialog box includes the following options and features for inserting images into a DITA document:

Location

Use this option to specify a URL for the image as the value of an `@href` attribute inside the `<image>` element. You can type the URL of the image you want to insert or use browsing actions in the  **Browse** drop-down menu (there is also a history drop-down).

Key

Use this option to insert the selected key as the value of a `@keyref` attribute inside the `<image>` element. All keys that are presented in the dialog box are gathered from the *root map (on page 2682)* of the current *DITA map*. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected *root map*.

Note:

If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong *root map*. You can change the *root map* by using the **Change Root Map** link in the **Choose Key** dialog box or change it in the **Context** option in the toolbar of the **DITA Maps Manager**.

Figure title

Use this text box to insert a `<title>` and `<image>` element inside a `<fig>`.

Alternate text

Use this text box to insert an `<alt>` element inside the `<image>`.

Size

Use this section to configure the **Width** and **Height** of the image, or **Scale** the image. Specifying a value in these options inserts a `@width`, `@height`, and `@scale` attribute, respectively.

Layout

Use the options in this section to insert `@placement` and `@align` attributes into the `<image>` element.

Preview

The **Preview** box shows a thumbnail of the selected image so that you can see a preview of the image before clicking **Insert**.

Adding an Image Inline with Drag/Drop (or Copy/Paste) Actions

You can drag images from your system explorer or the **Project Explorer view (on page 269)** and drop them into a DITA document (or copy and paste). This will insert the path of the image file as the value of the `@href` attribute in a DITA `<image>` element:

```
<image href="../../../images/image_file.png" />
```

Tip:

To replace an image, just drag and drop a new image over the existing one. Oxygen XML Editor Eclipse plugin will automatically update the reference to the new image.

Adding an Image in a Figure Element

To add an image in a figure:

1. Add a `<fig>` element to your document at the appropriate place.
2. Add a `<title>` and/or `<desc>` element to `<fig>`, according to your needs.
3. Add an `<image>` element (on page 2416) to the `<fig>` element.

Note:

The `<fig>` element has a number of other child elements that may be appropriate to your content. See the [DITA documentation](#) for complete information about `<fig>`.

Note:

The order that the content of the `<image>`, `<title>`, and `<desc>` elements will appear in the output is determined by the output transformation. If you want to change how they appear, you may have to modify the output transformation, rather than your source content.

Floating Images in DITA Topics for PDF or XHTML Output

Oxygen XML Editor Eclipse plugin provides the possibility of floating an image to the left or right of blocks of content in DITA topics, for both PDF and XHTML output.

To float an image, you simply need to set the `@outputclass` attribute on the `<image>` element. The possible values are:

- **float-left**
- **float-right**

For example, the following DITA structure will present the image to the right of the paragraph content in the output:

```
<p><image href="../../../images/Lilac.jpg" scale="45" outputclass="float-right" />
  <b>Lilac</b> (<b>Syringa</b>) is a genus of about 20–25 species of flowering plants
  in the olive family (<b>Oleaceae</b>), native to Europe and Asia.
</p>
```

Figure 600. Image Floated to the Right

Lilac (Syringa) is a genus of about 20–25 species of flowering plants in the olive family (**Oleaceae**), native to Europe and Asia.

Searching for References to Images

You can search for all references to an image by selecting  **Search References** from the contextual menu. The result depends on how the image is defined, as follows:

- If the action is invoked on an `<image>` element that contains an `@href` attribute but does not include an `@id` attribute, all direct references to the image are reported. If the `<image>` element does have an `@id` attribute, all links to the specified *ID* are also reported.
- If the action is invoked on an `<image>` element that contains a `@keyref` attribute but does not include an `@id` attribute, all direct references to the image are reported along with all instances where the key is used. If the `<image>` element does have an `@id` attribute, all links to the specified *ID* are also reported.

[Working with Image Maps in DITA \(on page 2422\)](#)

[Short Video Clip: Learn DITA Editing with Oxygen - Various Ways to Insert Image References](#)

Adding Video, Audio, and Embedded HTML Resources in DITA Topics

You can insert references to media resources (such as videos, audio clips, or embedded HTML frames) in your DITA topics. The media resources can be played directly in **Author** mode and in all HTML5-based outputs.

There is a toolbar button () that allows you to insert and configure a reference to the media resource. You can also drag media files from your system explorer or the **Project Explorer** view (on page 269) and drop them into your documents (or copy and paste them).

Table 50. Supported Media Types

Media	Description	Type	Supported Size Properties
<i>mp3</i>	Moving Picture Experts Group Layer-3 Audio	audio	Width
<i>wav</i>	Windows Wave	audio	Width
<i>pcm</i>	Pulse Code Modulation	audio	Width
<i>m4a</i>	Moving Picture Experts Group Layer-4 Audio	audio	Width
<i>aif</i>	Audio Interchange Format	audio	Width
<i>mp4</i>	Moving Picture Experts Group Layer-4 Video	video	Width & Height

Table 50. Supported Media Types (continued)

Media	Description	Type	Supported Size Properties
<i>m4v</i>	Itunes Video File	video	Width & Height
<i>avi</i>	Audio Video Inter-leaved	video	Width & Height
embedded video (such as <i>YouTube</i> , <i>Vimeo</i> , or <i>Vidyard</i>)	Embedded Iframe Code	iframe	Width & Height

Adding a Media Resource

To insert a media resource in a DITA document, use the following procedure:

1. Place the cursor at the location where you want the media resource.
2. Select the  **Insert Media Resource** action from the toolbar. The **Insert Media** dialog box appears.

Note:

You can also drag media files from your system explorer or the [Project Explorer view \(on page 269\)](#) and drop them into your documents (or copy and paste them). Note that this method will bypass the **Insert Media** dialog box, so if you need to adjust the size you will need to adjust the `@width` or `@height` attributes manually.

Figure 601. Insert Media Dialog Box

3. Configure the options in this dialog box and click **Insert**.

The **Insert Media** dialog box includes the following options:

Location

Use this option to specify a URL for the media resource as the value of a `@data` attribute inside the `<object>` element. You can type the URL of the resource you want to insert or use browsing actions in the  **Browse** drop-down menu (there is also a history drop-down).

Key

Use this option to insert the selected key as the value of a `@datakeyref` attribute inside the `<object>` element. All keys that are presented in the dialog box are gathered from the *root map* (on page 2682) of the current *DITA map*. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that presents the list of keys available in the selected *root map*.

Note:

If your defined keys are not listed in this dialog box, it is most likely trying to gather keys from the wrong *root map*. You can change the *root map* by using the **Change Root Map** link in the **Choose Key** dialog box or change it in the **Context** option in the toolbar of the **DITA Maps Manager**.

Type

Oxygen XML Editor Eclipse plugin detects and automatically selects the media type based upon the specified resource in the *URL field* (on page 2421). You can manually change the type, but keep in mind that in the publishing stage the *object element is converted to an HTML5 element* (on page 2421) based upon the type selected here. You can choose between: **audio**, **video**, or **iframe**.

Size

Use this section to configure the **Width** and **Height** of the frame for the media resource. Specifying a value in these options inserts a `@width` and `@height` attribute, respectively. For audio clips, only the **Width** can be adjusted.

Result in Author Mode: A reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in **Author** mode so that it can be played directly from there.

Attention:

- On Ubuntu 17.10, if you receive an error when trying to play videos in **Author** mode, you need to install the `libavformat57` library.

Result in Output: In the publishing stage, the `<object>` element is converted to an HTML5 element so that it can be rendered properly and played in all HTML5-based outputs.

- **Videos** - The `<object>` element is converted to an HTML5 `<video>` element.
- **Audio Clips** - The `<object>` element is converted to an HTML5 `<audio>` element.
- **Embedded HTML Frames** - The `<object>` element is converted to an HTML5 `<iframe>` element.

**Tip:**

There is an even faster way of inserting an embedded video (such as a YouTube, Vimeo, or Vidyard). If you copy the embed code from the source (for example, you can right-click on a YouTube video and select **Copy embed code**), you can then paste the contents of the clipboard in the **URL field** ([on page 2421](#)) and the **Type** ([on page 2421](#)) will automatically be set on **iframe**, while the **Width and Height** ([on page 2421](#)) will be populated according to the detected size, and an `allowfullscreen` parameter will automatically be added (set the value of this parameter to **true** to allow videos to play in full screen mode once the document is converted to XHTML output).

Inserting Media in HTML Outputs That Do Not Support Embedded Media

For certain types of HTML output (for example, CHM) that do not support embedded media (such as videos or audio files), Oxygen XML Editor Eclipse plugin provides a parameter that can be set in the transformation scenario to present the media object as a plain link in the output.

This can be achieved by following these steps:

1. [Edit the DITA transformation scenario](#) ([on page 2551](#)) for the output type that does not support embedded objects (for example, **DITA Map CHM**).
2. Go to the **Parameters** tab ([on page 2558](#)) and click the **New** button to add a new parameter.
3. For the **Name**, enter: **com.oxygenxml.xhtml.linkToMediaResources**.
4. For the **Value**, enter: **true**.
5. Click **OK** and run the transformation.

Result: The media object will appear in the output as a plain link instead of an embedded object.

[Working with Images in DITA Topics](#) ([on page 2416](#))

[How to Add Video and Audio Objects in DITA WebHelp Output](#) ([on page 1425](#))

Working with Image Maps in DITA

Oxygen XML Editor Eclipse plugin includes support for **image maps** in DITA documents through the use of the `<imagemap>` element. This feature provides an easy way to create hyperlinks in various areas within an image

without having to divide the image into separate image files. The visual **Author** editing mode includes an **Image Map Editor** that helps you to easily create and configure image maps.

Figure 602. Image Map Editor in DITA

Image Map Editor Interface in DITA

The interface of the **Image Map Editor** consists of the following sections and actions:

Toolbar

New Rectangle

Use this button to draw a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Use this button to draw a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Use this button to draw a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

New Free Form Shape

Use this button to draw a free form shape over an area in the image. After selecting this button, left-click anywhere in the image to place the first point of your shape. Then move the cursor to the location of the next desired point and left-click to place the next point, and so on. To complete the shape (area), click the first point again and a line will automatically be added from the last point that was added, or simply double-click the last point to automatically add the line from the last point back to the first.

 **Duplicate**

Use this button to create a duplicate of the currently selected shape.

 **Delete**

Use this button to delete the currently selected shape.

 **Undo**

Use this button to undo the last action.

 **Redo**

Use this button to redo the last action that was undone.

 **Show/Hide Numbers**

Use this button to toggle between showing or hiding the numbers for the shapes.

 **Bring Shape to Front**

Use this button to bring the currently selected shape forward to the top layer.

 **Bring Shape Forward**

Use this button to bring the currently selected shape forward one layer.

 **Send Shape Backward**

Use this button to send the currently selected shape back one layer.

 **Send Shape to Back**

Use this button to send the currently selected shape back to the bottom layer.

 **Color Chooser**

Use this drop-down menu to select a color scheme for the lines and numbers of the shapes.

 **Zoom Slider**

Use this slider to zoom the image in or out in the main image pane.

Image Pane

This main Image Pane is where you work with shapes to add hyperlinks to multiple areas within an image. The editing mechanisms that are supported in the Image Pane include the following:

Mouse Controls and Keyboard Shortcuts

- Use the mouse to select and move shapes around in the image pane. It is easy to see which shape is selected in this image pane because the border of the selected shape changes from a solid line to a dotted one.
- You can also drag any of the points of a selected shape to adjust its size and shape.
- You can hold down the **Ctrl** key to select multiple shapes and then move them simultaneously.
- You can also move shapes by using the arrow keys on your keyboard. In addition, you can hold down **Shift** while using the arrow keys to move the shape further or **Alt** to move it 1 pixel at a time.
- To zoom in or out, you can use the **NumPad +** or **NumPad -** keys respectively. Use **Ctrl + NumPad 0** to reset the zoom level to its default value.
- You can use **Ctrl + Z** to undo an action or **Ctrl + Y** to redo the last action that was undone.

Contextual Menu Actions Available in the Image Pane

You can right-click the shapes, points, or anywhere in the Image Pane to invoke the contextual menu where the following actions are available:

Add Point

Adds a point to *Polygon* or *Free Form* shapes.

Remove Point

Removes the current point from *Polygon* or *Free Form* shapes.

Duplicate

Create a duplicate of the currently selected shape.

Delete

Delete the currently selected shape.

New Rectangle

Creates a rectangular shape over an area in the image. You can drag any of the four points to adjust the size and shape of the rectangle.

New Circle

Creates a circle over an area in the image. You can drag any of the four points to adjust the size of the circle.

New Polygon

Creates a polygon shape over an area in the image. This action opens a dialog box that allows you to select the number of points for the polygon. You can drag any of the points to adjust the size and shape of the polygon.

Undo

Use this action to undo the last action.

Redo

Use this action to redo the last action that was undone.

Shape Table

The table at the right of the *Image Pane* is a sequential list of all the areas (shapes) that have been added in the image. It shows their number, type, and description (if one has been added). If you select one of the entries in the table, the corresponding shape will be selected in the *Image Pane*.

Properties

Type

Displays information about the selected coordinate.

Target

Allows you to choose the target resource that you want the selected area (shape) to be linked to. Select a target by using the  **Link** drop-down menu to the right of the text field. You can choose between the following types of links: **Cross Reference**, **File Reference**, or **Web Link**. All three types will open a dialog box that allows you to define the target resource. This linking process is similar to the normal process of [inserting links in DITA \(on page 2515\)](#) by using the identical  **Link** drop-down menu from the main toolbar.

When you click **OK** to finalize your changes in the **Image Map Editor**, an `<xref>` element will be inserted with either an `@href` attribute or a `@keyref` attribute. Additional attributes may also be inserted and their values depend on the target and the type of link. For details about the three types of links and their dialog boxes, see [Inserting a Link in Oxygen XML Editor Eclipse plugin \(on page 2515\)](#).

Description

You can enter an optional description for the selected area (shape) that will be displayed in the **Image Map Details** section [\(on page 2427\)](#) in **Author** mode and as a tooltip message when the end-user hovers over the hyperlink in the output.

How to Create an Image Map in DITA

To create an image map on an existing image in a DITA document, follow these steps:

1. Right-click the image and select **Image Map Editor**.

Step Result: This action will apply an *image map* to the current image and open the **Image Map Editor** dialog box.

2. Add hyperlinks to the image by selecting one of the shape buttons ( **New Rectangle**,  **New Circle**, or  **New Polygon**).
3. Move the shape to the desired area in the image and drag any of the points on the shape to adjust its size or form. You can use the [other buttons on the toolbar \(on page 2423\)](#) to adjust its layer and color, or to perform other editing actions.

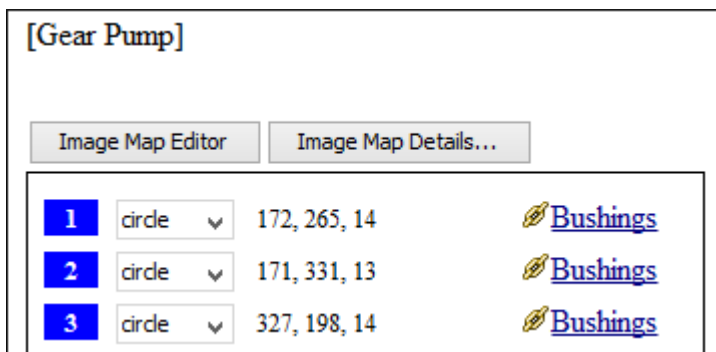

Tip:

You can right-click any of the points, shapes, or anywhere in the Image Pane to access various helpful [contextual menu actions \(on page 2425\)](#). For example, the easiest way to remove a point is to right-click the point and select  **Remove Point**.

4. With the shape selected, use one of the [linking options \(on page 2426\)](#) in the  **Link** drop-down menu to select a target resource (or enter its path in the **Target (on page 2426)** text field).
5. (Optional) Enter a **Description (on page 2426)** for the selected area (shape).
6. If you want to add more hyperlinks to the image, select a shape button again and repeat the appropriate steps.
7. When you are finished creating hyperlinks, click **OK** to process your changes.

Result: The *image map* is applied on the image and the appropriate elements and attributes are automatically added. In **Author** mode, the image map is now rendered over the image. If the image includes an `<alt>` element, its value will be displayed under the image. The following two buttons will also now be available under the image in **Author** mode:

- **Image Map Editor** - Click this button to open the **Image Map Editor**.
- **Image Map Details** - Click this button to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Figure 603. Image Map Details

How to Edit an Existing Image Map in DITA

To edit an existing image map, use any of the following methods:

- Simply double-click the image.
- Right-click the image and select **Image Map Editor**.
- Click the **Image Map Editor** button below the image.

All three methods open the **Image Map Editor** where you can make changes to the image map using the various features described above. You can also make changes to the XML structure of the image map in the **Text** editing mode.

You can also click the **Image Map Details** button below the image to expand a section that displays the details of the image map and allows you to change the shape and coordinates of the hyperlinked areas. Keep in mind that if you change the shape in this section, you also need to add or remove coordinates to match the requirements of the new shape.

Overlapping Areas

If shapes overlap one another in the **Image Map Editor**, the one on the top layer takes precedence. The number shown inside each shape represents its layer (if the numbers are not displayed, click the **Show/Hide Numbers** button on the **Image Map Editor** toolbar (*on page 2423*). To change the layer order for a shape, use the layer buttons on the **Image Map Editor** toolbar (*on page 2423*) ().

If you insert a shape and all of its coordinates are completely inside another shape, the **Image Map Editor** will display a warning to let you know that the shape is entirely covered by a bigger shape. Keep in mind that if a shape is completely inside another shape, its hyperlink will only be accessible if its layer is on top of the bigger shape.

[DITA 'imagemap' Element Specifications](#)

[Working with Images in DITA Topics \(on page 2416\)](#)

Adding Tables in DITA Topics

You can use the  **Insert Table** action on the toolbar or from the contextual menu to add a table in a DITA topic. By default, DITA supports four types of tables:

- *DITA Simple table model (on page 2429)* - This is the most commonly used model for basic tables.
- *CALS table model (OASIS Exchange Table Model) (on page 2431)* - This is used for more advanced functionality.
- *DITA Choice table model (on page 2434)* - This is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding.
- *DITA Properties table model (on page 2435)* - This is used in DITA Reference documents to describe a property (for example, its type, value, and description).

If you are using a specialized DITA vocabulary, it may contain specialized versions of these table models.

Since DITA is a structured format, you can only insert a table in places in the structure of a topic where tables are allowed. The Oxygen XML Editor Eclipse plugin toolbar provides support for entering and editing tables. It also helps to indicate where you are allowed to insert a table or its components by disabling the appropriate buttons.

Inserting a Simple Table Model

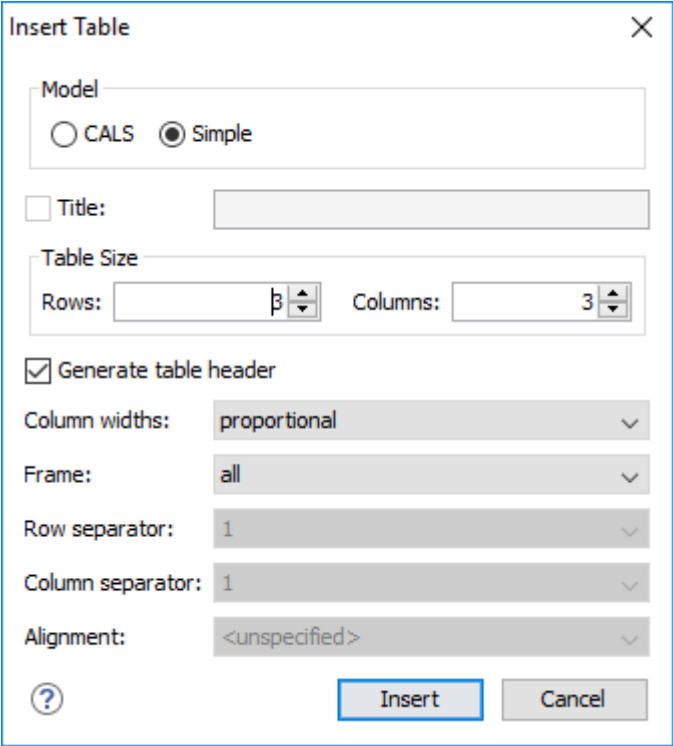

To insert a **Simple** DITA table, select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 604. Insert Table Dialog Box - Simple Model

The dialog box is titled "Insert Table" and contains the following options:

- Model:** Radio buttons for "CALs" and "Simple" (selected).
- Title:** A text input field.
- Table Size:** "Rows" set to 3 and "Columns" set to 3.
- Generate table header:** Checked.
- Column widths:** Set to "proportional".
- Frame:** Set to "all".
- Row separator:** Set to "1".
- Column separator:** Set to "1".
- Alignment:** Set to "<unspecified>".

Buttons at the bottom include a help icon (?), "Insert", and "Cancel".

The dialog box allows you to configure the following options when you select the **Simple** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:**

The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a simple table is inserted into your document at the current cursor position.

Inserting a CALS Table Model (OASIS Exchange Table)

To insert an OASIS Exchange Table (**CALS**), select the  **Insert Table** action on the toolbar or from the contextual menu (or the **Table** submenu from the **DITA** menu). The **Insert Table** dialog box appears. Select **CALS** for the table **Model**. This model allows you to configure more properties than the *Simple* model.

Figure 605. Insert Table Dialog Box - CALS Model

The dialog box allows you to configure the following options when you select the **CALS** table model:

Title

If this checkbox is selected, you can specify a title for your table in the adjacent text box.

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@colwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `colwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@colwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@colwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width (`@colwidth` attribute). Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.
- **fixed** - The width is specified in fixed units. By default, the `pt` unit is inserted, but you can change the units in the **colspecs** (column specifications) section above the table or in **Text** mode. The following units are allowed: `pt` (points), `cm` (centimeters), `mm` (millimeters), `pi` (picas), `in` (inches).

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Row separator

Specifies whether or not to include row separators (`@rowsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Column separator

Specifies whether or not to include column separators (`@colsep` attribute). The allowed values are: `0` (no separator) and `1` (include separators).

Alignment

Specifies the alignment of the text within the table (`@align` attribute). The allowed values are:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

**Note:**

The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

**Note:**

The options in the **Insert Table** dialog box for DITA documents are persistent, so changes made in one session will carry over to another.

When you click **Insert**, a CALS table is inserted into your document at the current cursor position.

When you insert a CALS table, you see a link for setting the `colspecs` (column specifications) of your table. Click the link to open the controls that allow you to adjust various column properties. Although they appear as part of the **Author mode** (on page 242), the `colspecs` link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 606. CALS Table in DITA

▼ **Sample CALS Table with Fixed Width**

▼ `colspecs...`

name number width align colsep rowsep

name number width align colsep rowsep

Inserting a Choice Table Model

To insert a **Choice** table within a `<step>` element in a DITA Task document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **choicetable** from the *Content Completion Assistant (on page 2677)*. The **Insert Table** dialog box appears. Select **Simple** for the table **Model**.

Figure 607. Insert Table Dialog Box - Choice Model

The dialog box allows you to configure the following options when you insert a *Choice* table model within a DITA Task:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Column widths

Allows you to specify the type of properties for column widths (`@colwidth` attribute). You can choose one of the following properties for the column width:

- **proportional** - The width is specified in proportional (relative) units of measure. The proportion of the column is specified in a `@relcolwidth` attribute with the values listed as the number of shares followed by an asterisk. The value of the shares is totaled and rendered as a percent. For example, `relcolwidth="1* 2* 3*"` causes widths of 16.7%, 33.3%, and 66.7%. When entering content into a cell in one column, the width proportions of the other columns are maintained. If you change the width by dragging a column in **Author** mode, the values of the `@relcolwidth` attribute are automatically changed accordingly. By default, when you insert, drag and drop, or copy/paste a column, the value of the `@relcolwidth` attribute is `1*`.
- **dynamic** - If you choose this option, the columns are created without a specified width. Entering content into a cell changes the rendered width dynamically. If you change the width by dragging a column in **Author** mode, a dialog box will be displayed that asks you if you want to switch to proportional or fixed column widths.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Choice* table is inserted into your DITA Task document at the current cursor position (within a `<step>` element).

Inserting a Properties Table Model

To insert a **Properties** table within a `<refbody>` element in a DITA Reference document, select the  **Insert Table** action on the toolbar or in the **Insert** submenu from the contextual menu (or the **Table** submenu from the **DITA** menu), or select **properties(wizard)** from the *Content Completion Assistant (on page 2677)*. The **Insert Table** dialog box appears. Select **Properties** for the table **Model**.

Figure 608. Insert Table Dialog Box - Properties Model

The dialog box allows you to configure the following options when you insert a *Properties* table model within a DITA Reference:

Table Size

Allows you to choose the number of **Rows** and **Columns** for the table.

Generate table header

If selected, an extra row will be inserted at the top of the table to be used as the table header.

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

When you click **Insert**, a *Properties* table is inserted into your DITA Reference document at the current cursor position (within a `<refbody>` element).

Editing an Existing Table

You can edit the structure of an existing table using the table buttons on the toolbar (or in the contextual menu) to add or remove cells, rows, or columns, and to set basic table properties. Additional attributes can be used to fine-tune the formatting of your tables by using the **Attributes view** (on page 405) (**Window > Show View > Attributes**). See the [DITA documentation](#) for a full explanation of these attributes.

You can also use the  **Table Properties (Ctrl + T (Command + T on macOS))** (on page 2439) action from the toolbar or contextual menu (or **DITA** menu) to **modify many of the properties of the table** (on page 2439).

Also, remember that underneath the visual representation, both table models are really just XML. If necessary, you can edit the XML directly by switching to **Text mode** (on page 241).

You can use normal copy/paste shortcuts to move content between cells. Oxygen XML Editor Eclipse plugin includes a **Smart Paste feature** (on page 390) that preserves certain style and structure information when pasting content.

i Tip:
 When copying a multiple selection of table cells and pasting them outside the table, a new table will be created. When pasting into space-preserved elements, the cell content will be pasted as plain text.

Related Information:
[Editing Tables in Author Mode \(on page 456\)](#)

DITA Table Layouts

Depending on the context, DITA accepts the following table layouts:

- *CALS* table model (on page 2437)
- *Simple* table model (on page 2438)
- *Choice* table model (on page 2438)
- *Properties* table model (on page 2438)

CALS Table Model Layout

The **CALS** table model allows for more flexibility and table customization than other models. When choosing a **CALS** table model from the **Insert Table** dialog box, you have access to more configurable properties. The layout of a **CALS** table includes a **colspecs** section that allows you to easily configure some properties without opening the **Table Properties** dialog box. For example, you can change the value of column widths (`@colwidth` attribute) or the text alignment (`@align` attribute). Although they appear as part of the **Author mode (on page 242)**, the *colspecs* link and its controls will not appear in your output. They are just there to make it easier to adjust how the columns of your table are formatted.

Figure 609. CALS Table in DITA

▼ *Sample CALS Table with no specified width and proportional column widths*

▼ *colspecs...*

column name	<input type="text" value="c1"/>	number	<input type="text" value="1"/>	width	<input type="text" value="0.32*"/>	align	<input type="text" value=""/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	<input type="text" value="c2"/>	number	<input type="text" value="2"/>	width	<input type="text" value="1.49*"/>	align	<input type="text" value=""/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	<input type="text" value="c3"/>	number	<input type="text" value="3"/>	width	<input type="text" value="1.15*"/>	align	<input type="text" value=""/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep
column name	<input type="text" value="c4"/>	number	<input type="text" value="4"/>	width	<input type="text" value="0.4*"/>	align	<input type="text" value=""/>	<input type="checkbox"/> colsep	<input type="checkbox"/> rowsep

<i>f1</i>	<i>f2</i>	<i>f3</i>	<i>f4</i>	<i>f5</i>
b1	b2	b3	b4	▶ Vertical Span
c1	Spans ▶ Both directions		c4	
d1			d4	d5

**Tip:**

A sample plugin is available that can be used as inspiration to add support for CALS tables in any XML document: [Sample Plugin: Add CALS Support for any XML Document](#).

Simple Table Model Layout

When choosing a **Simple** table model from the **Insert Table** dialog box, you only have access to configure a few properties. For example, you can choose the number of rows and columns, specify values for frames, and choose from a few types of properties for the column width. The layout of this type of table is very simple, as the name suggests.

Figure 610. DITA Simple Table

Header 1	Header 2
Column 1	Column 2

Choice Table Model Layout

A **Choice** table model is used within a `<step>` element in a DITA Task document to describe a series of optional choices that a user must make before proceeding. The `<choicetable>` element is a useful device for documenting options within a single step of a task. You can insert *Choice* tables in DITA Task documents either by selecting **choicetable** from the *Content Completion Assistant (on page 2677)* (within a `<step>` element) or by using the  **Insert Table** action on the toolbar or from the contextual menu). The options and layout of a *Choice* table is similar to the *Simple* table model.

Figure 611. DITA Choice Table

Option	Description
Opt A	
Opt B	
Opt C	

Properties Table Model Layout

A **Properties** table model is used within a `<refbody>` element in a DITA Reference document to describe a property (for example, its type, value, and description). You can insert *Properties* tables in DITA Reference documents either by selecting **properties(wizard)** from the *Content Completion Assistant (on page 2677)* (within a `<refbody>` element) or by using the  **Insert Table** action on the toolbar (or from the contextual menu) and selecting **Properties** for the **Model**. The layout of a *Properties* table is very simple. It allows for a maximum of 3 columns (typically for property type, value, and description) and the only options available are for whether or not you want a header row and for specifying frames (borders).

Figure 612. DITA Properties Table

Property Type	Property Value	Property Description
A	B	C

Table Validation in DITA

Oxygen XML Editor Eclipse plugin reports table layout problems that are detected in manual or automatic validations. When you validate a *DITA map* (on page 2678) with the  **Validate and Check for Completeness** action, if the **Report table layout problems** option (on page 2387) is selected in the **DITA Map Completeness Check** dialog box, table layout problems will be reported in the validation results. The types of errors that may be reported for DITA table layout problems include:

CALS Tables

- A row has fewer cells than the number of columns detected from the table `@cols` attribute.
- A row has more cells than the number of columns detected from the table `@cols` attribute.
- A cell has a vertical span greater than the available rows count.
- The number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- The number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- The value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- The `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Simple or Choice Tables

A row has fewer cells than the number of table columns.

Editing Table Properties in DITA

To customize the look of a table in DITA, place the cursor anywhere in a table and invoke the  **Table Properties** (**Ctrl + T** (**Command + T** on macOS)) action from the toolbar or the **Table** submenu of the contextual menu (or **DITA** menu). This opens the **Table properties** dialog box.

The **Table properties** dialog box allows you to set specific properties to the table elements. The options that are available depend on the context and location within the table where the action was invoked.

Note:

Some properties allow the following special values, depending on the context and the current properties or values:

- **<not set>** - Use this value if you want to remove a property.
- **<preserve>** - If you select multiple elements that have the same property set to different values, you can choose this value to keep the values that are already set. In some cases it can also be used to keep the current non-standard value for a particular property.

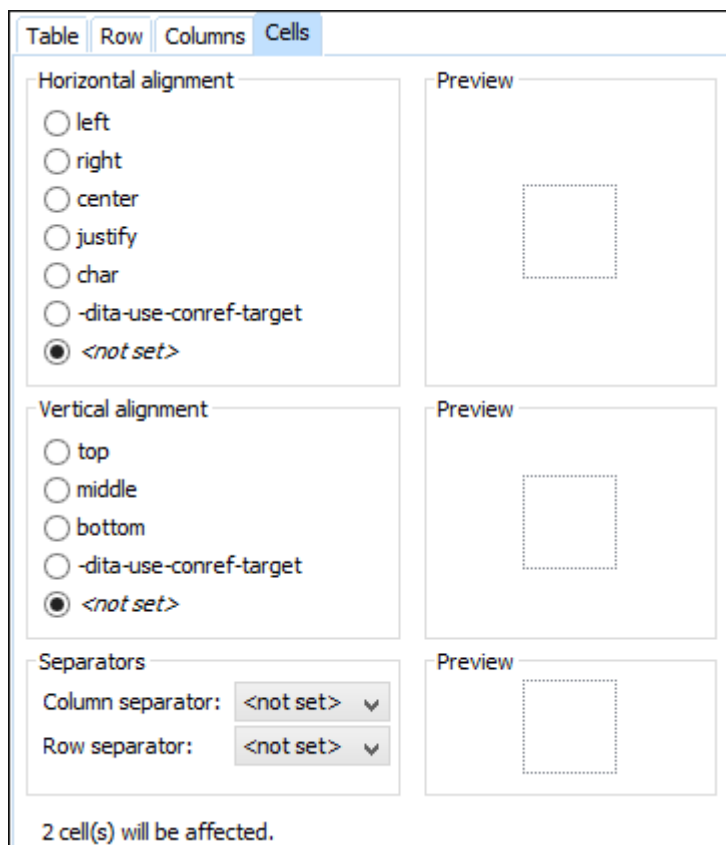

Edit Table Properties for a CALS Table Model

For a **CALS** table model, the **Table properties** dialog box includes four tabs of options:

- **Table** tab - The options in this tab apply to the entire table.
- **Row** tab - The options in this tab apply to the current row or selection of multiple rows. A message at the bottom of the tab tells you how many rows will be affected.
- **Column** tab - The options in this tab apply to the current column or selection of multiple columns. A message at the bottom of the tab tells you how many columns will be affected.
- **Cell** tab - The options in this tab apply to the current cell or selection of multiple cells. A message at the bottom of the tab tells you how many cells will be affected.

The options in four tabs include a **Preview** pane that shows a representation of the modification.

Figure 613. Table Properties Dialog Box with Cell Tab Selected (DITA CALS Table Model)

The options in the four tabs include the following:

Horizontal alignment (Available in the Table, Column, and Cell tabs)

Specifies the horizontal alignment of text within the current table/column/cell or selection of multiple columns/cells (`@align` attribute). The allowed values are as follows:

- **left** - Aligns the text to a left position.
- **right** - Aligns the text to a right position.
- **center** - Aligns the text to a centered position.
- **justify** - Stretches the line of text so that it has equal width.

Note:

The `justify` value cannot be rendered in **Author** mode, so you will only see it in the output.

- **char** - Aligns text to the leftmost occurrence of the value specified on the `@char` attribute for alignment.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Vertical alignment (Available in the Row and Cell tabs)

Specifies the vertical alignment of text within the current row/cell or selection of multiple rows/cells (`@valign` attribute). The allowed values are as follows:

- **top** - Aligns the text at the top of the cell.
- **middle** - Aligns the text in a vertically centered position.
- **bottom** - Aligns the text at the bottom of the cell.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Column separator (Available in the Table, Column, and Cell tabs)

Specifies whether or not to include column separators (borders/grid lines) in the form of the `@colsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Row separator (Available in all four tabs)

Specifies whether or not to include row separators (borders/grid lines) in the form of the `@rowsep` attribute. The allowed values are: `0` (no separator) and `1` (include separators).

Frame (Available only in the Table tab)

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Edit Table Properties for a Simple, Choice, or Properties Table Model

For a *Simple, Choice, Properties* table model, the **Table properties** dialog box only allows you to edit a few options.

Table tab

Frame

Allows you to specify a value for the `@frame` attribute. It is used to specify where a border should appear in the table. The allowed values are as follows:

- **none** - No border will be added.
- **all** - A border will be added to all frames.
- **top** - A border will be added to the top frame.
- **topbot** - A border will be added to the top and bottom frames.
- **bottom** - A border will be added to the bottom frame.
- **sides** - A border will be added to the side frames.
- **-dita-use-conref-target** - Normally, when using a `@conref`, the values of attributes specified locally are preserved. You can choose this option to override this behavior and pull the value of this particular attribute from the `@conref` target. For more information, see <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/ditauseconreftarget.html>.

Row tab (not available for *Properties* tables)

Row type

Allows you change the row to a body or header type of row.

Related Information:

[Adding Tables in DITA Topics \(on page 2429\)](#)

[Editing Tables in Author Mode \(on page 456\)](#)

Adding MathML Equations in DITA Topics

You can add MathML equations in a DITA document open in the **Author** visual editing mode using one of the following methods:

- Embed MathML directly into a DITA topic. You can use **Insert > Σ Insert Equation** from the contextual menu or the main menu **DITA > Insert > Insert Equation** action to insert a MathML equation. Clicking on the equation will open a **MathML Editor** where you can edit the code.
- Reference an external MathML file as an image, using the  **Insert Image** action that is available on the DITA toolbar (or from the **DITA > Insert** menu).

Publishing Notes:

- MathML equations contained in DITA topics can be published out-of-the-box in PDF using the **DITA PDF** transformation scenario.
- The **DITA Map PDF - based on HTML5 & CSS** transformation scenario (*on page 1537*) support MathML equations (*on page 1715*).
- For details about HTML output, see [How to View MathML Equations in HTML Output](#) (*on page 1471*).
- For other publishing formats, you might need to employ additional customizations for handling MathML content.

Adding LaTeX Equations in DITA Topics

LaTeX is a high-quality typesetting system that includes features designed for the production of technical and scientific documentation. LaTeX can also be used to express mathematical formulas in a textual format. By default, web browsers and PDF readers do not have support to show mathematical equations written in LaTeX, but there are open-source projects that can read LaTeX and convert it to other image types.

Adding support for writing LaTeX equations in a DITA topic implies three stages:

1. Find a way to write the equation in the DITA XML content. You can either create a DITA DTD specialization and add a new element (for example, called `<latex>` and it extends the DITA `<foreign>` element). Alternatively, you can directly use the DITA `<foreign>` element with a specific `@outputclass` attribute value:

```
<!DOCTYPE topic PUBLIC "-//OASIS//DTD DITA Topic//EN" "topic.dtd">
<topic id="testEquation">
  <title>Test equation</title>
  <body>
    <p><foreign outputclass="embed-latex">L' = {L}{\sqrt{1-\frac{v^2}{c^2}}}</foreign></p>
  </body>
</topic>
```

2. If you want Oxygen XML Editor Eclipse plugin to properly present the LaTeX equation when editing in the **Author** visual mode, you need a plugin that converts the equation content to an image. There is a sample plugin that does that here: <https://github.com/oxygenxml/wsaccess-javascript-sample-plugins/tree/master/latex-images-support>. You can download and copy the plugin folder **latex-images-support** to the Oxygen XML Editor Eclipse plugin **plugins** folder, then restart Oxygen XML Editor Eclipse plugin.
3. The final stage would be to publish the content to HTML-based or PDF output. The following DITA Open Toolkit plugin automatically converts LaTeX images to SVG when publishing: <https://github.com/oxygenxml/dita-latex>.

DITA Questions and Answers Topic Type

You can create a new DITA *Questions and Answers* topic using the Oxygen XML Editor Eclipse plugin **File > New** file wizard. It is found in the **Framework templates > DITA > Topics > RNG** folder (or you can search for it using the search filter at the top of the dialog box).

This type of topic groups together multiple question/answer sections and can be used to create a frequently asked questions document (for example).

There is an **Insert Question/Answer Group** action that is available on the toolbar and in the **DITA Q/A** main menu that can be used to insert multiple question/answer groups. You can also define multiple questions in the same group, all paired to the same answer.

When producing WebHelp output from DITA content, Q/A-specific **Google Structured Data** in the HTML files is generated from these Questions and Answers DITA topic types.

Related information

[How to Generate Google Structured Data \(on page 1477\)](#)

DITA Topic Author Mode Actions

A variety of actions are available for DITA documents that can be found in **DITA** menu, toolbar, contextual menu, and the *Content Completion Assistant (on page 2677)*.

DITA Toolbar Actions

The following default actions are available on the DITA toolbar when editing in **Author** mode (by default, most of them are also available in the **DITA** menu and in various submenus of the contextual menu):

B Bold

Surrounds the selected text with a `` tag. You can use this action on multiple non-contiguous selections.

I Italic

Surrounds the selected text with an `<i>` tag. You can use this action on multiple non-contiguous selections.

Underline

Surrounds the selected text with a `<u>` tag. You can use this action on multiple non-contiguous selections.

Link Actions Drop-Down Menu

The following link actions are available from this menu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box (*on page 2515*) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* (*on page 2678*) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see *Linking in DITA Topics* (*on page 2515*).

File Reference

Opens the **File Reference** dialog box (*on page 2516*) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see *Linking in DITA Topics* (*on page 2515*).

Web Link

Opens the **Web Link** dialog box (*on page 2516*) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see *Linking in DITA Topics* (*on page 2515*).

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box (*on page 2516*) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see *Linking in DITA Topics* (*on page 2515*).

Tip:

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens the **File Reference** dialog box (on page 2517) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) (on page 2515).

Related Link to Web Page

Opens the **Web Link** dialog box (on page 2517) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics](#) (on page 2515).

Insert Image

Opens the **Insert Image** dialog box (on page 2416) that allows you to configure the properties of an image to be inserted into a DITA document at the cursor position.

Insert Media Resource

Opens the **Insert Media** dialog box (on page 2419) that allows you to select and configure the properties of a media object to be inserted into a DITA document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted in an `<object>` element and it is rendered in **Author** mode so that it can be played directly from there.

§ ▾ Insert Section Drop-Down Menu

The following insert actions are available from this menu:

§ Insert Section

Inserts a new `<section>` element in the document, depending on the current context.

Insert Concept

Inserts a new `<concept>` element, depending on the current context. Concepts provide background information that users must know before they can successfully work with a product or interface.

Insert Task

Inserts a new `<task>` element, depending on the current context. Tasks are the main building blocks for task-oriented user assistance. They generally provide step-by-step instructions that will help a user to perform a task.

Insert Topic

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Reference

Inserts a new `<reference>` element, depending on the current context. A reference is a top-level container for a reference topic.

Insert Note

Inserts a new `<note>` element, depending on the current context.

Insert Codeblock

Inserts a new `<codeblock>` element, depending on the current context.

Insert Intent Question

Inserts a new special `<data>` element that contains a question or intent. The intent can be used to [generate Google Structured data \(on page 1477\)](#) content in WebHelp Responsive output.

Insert Paragraph

Inserts a new paragraph at current cursor position.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box (on page 2488)** that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include [content references \(@conref\) \(on page 2489\)](#), [content key references \(@conkeyref\) \(on page 2491\)](#), or [key references to metadata \(@keyref\) \(on page 2494\)](#).

Insert step or list item

Inserts a new list or step item in the current list type.

Insert Unordered List

Inserts an unordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an unordered list.

Insert Ordered List

Inserts an ordered list at the cursor position. A child list item is also automatically inserted by default. You can also use this action to convert selected paragraphs or other types of lists to an ordered list.

Sort

Sorts cells or list items in a table.

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

**Note:**

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

**Insert Row**

Inserts a new table row with empty cells below the current row. This action is available when the cursor is positioned inside a table.

**Delete Row(s)**

Deletes the table row located at the cursor position or multiple rows in a selection.

**Insert Column**

Inserts a new table column with empty cells after the current column. This action is available when the cursor is positioned inside a table.

**Delete Column(s)**

Deletes the table column located at the cursor position or multiple columns in a selection.

**Table Properties**

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

**Join Cells**

Joins the content of the selected cells (both horizontally and vertically).

**Split Cell**

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

DITA Contextual Menu Actions

The following actions are available in the contextual menu when editing in **Author** mode (most of them are also available in the **DITA** menu at the top of the interface):

**Edit Attributes**

Displays an [in-place attributes editor \(on page 407\)](#) that allows you to manage the attributes of an element.

Edit Profiling Attributes

Allows you to change the [profiling attributes \(on page 442\)](#) defined on all selected elements.

Cut (Ctrl + X (Command + X on macOS))

Removes the currently selected content from the document and places it in the clipboard.

Copy (Ctrl + C (Command + C on macOS))

Places a copy of the currently selected content in the clipboard.

Paste (Ctrl + V (Command + V on macOS))

Inserts the current clipboard content into the document at the cursor position.

Paste special submenu

This submenu includes the following special paste actions that are specific to the DITA framework:

Paste as content reference

Inserts a content reference (a DITA element with a `@conref` attribute) to the DITA XML element from the clipboard. An entire DITA XML element with an ID attribute must be present in the clipboard when the action is invoked. The `conref` attribute will point to this ID value.

Paste as content key reference

Allows you to indirectly reference content using the `@conkeyref` attribute. When the DITA content is processed, the key references are resolved using key definitions from [DITA maps \(on page 2678\)](#). To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Paste as link

Looks for the first element with an ID value in the clipboard and inserts an `<xref>` that points to that element. If no elements with an ID value are found, a message

will appear that informs you that to use this action, the clipboard contents must include at least one element with a declared ID.

Paste as link (keyref)

Inserts a link to the element that you want to reference. To use this action, you must first do the following:

1. Make sure the DITA element that contains the copied content has an ID attribute assigned to it.
2. In the **DITA Maps Manager** view, make sure that the **Context** combo box points to the correct map that stores the keys.
3. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager**, select **Edit Properties**, and enter a value in the **Keys** field.

Insert submenu

This submenu includes the following insert actions that are specific to the DITA *framework*:

Insert Table

Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table and decide how the table is framed. You can also use this action to convert selected paragraphs, lists, and inline content (mixed content, text plus markup, that is rendered inside a *block element (on page 2676)*) into a table, with the selected content inserted in the first column, starting from the first row after the header (if a header is inserted).

Note:

If the selection contains a mixture of elements that cannot be converted, you will receive an error message saying that **Only lists, paragraphs, or inline content can be converted to tables.**

Insert Image

Inserts an *image reference (on page 491)* at the cursor position. Depending on the current location, an image-type element is inserted.

Insert Media Resource

Opens a **Choose Media dialog box (on page 519)** that allows you to select the URL of a media object to be inserted into a document at the cursor position. The result will be that a reference to the specified video, audio, or embedded HTML frame is inserted and rendered in **Author** mode so that it can be played directly from there.

Insert Equation

Opens the **XML Fragment Editor** that allows you to insert and [edit MathML notations](#) (*on page 521*).

Insert Note

Inserts a new `<note>` element at the current cursor position.

Insert Code Block

Inserts a new `<codeblock>` element at current cursor position.

Insert Menu Cascade

Inserts a new `<menucascade>` element at current cursor position.

Insert Label

Inserts a special label keyword in the prolog. The label is helpful for searching WebHelp Responsive output for similar topics with the same label.

Insert Paragraph

Inserts a new `<p>` (paragraph) element at current cursor position.

Insert Section

Inserts a new `<section>` element in the document, depending on the current context.

Insert Topic

Inserts a new `<topic>` element, depending on the current context. Topics are the basic units of DITA content and are usually organized around a single subject.

Insert Entity

Allows you to insert a predefined entity or character entity. Surrogate character entities (range `#x10000` to `#x10FFFF`) are also accepted. Character entities can be entered in one of the following forms:

- `#<decimal value>` - e.g. `#65`
- `&#<decimal value>` - e.g. `A`
- `#x<hexadecimal value>` - e.g. `#x41`
- `&#x<hexadecimal value>` - e.g. `A`

Style submenu

This submenu includes the following text styling actions:

B Bold

Emphasizes the selected text by surrounding it with a `` (bold) tag. You can use this action on multiple non-contiguous selections.

I Italic

Emphasizes the selected text by surrounding it with an `<i>` (italic) tag. You can use this action on multiple non-contiguous selections.

Underline

Emphasizes the selected text by surrounding it with a `<u>` (*underline*) tag. You can use this action on multiple non-contiguous selections.

Subscript

Surrounds the selected text with a `<sub>` (subscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly below the baseline and slightly smaller than the rest of the text.

Superscript

Surrounds the selected text with a `<sup>` (superscript) tag, used for inserting a character (number, letter, or symbol) that will appear slightly above the baseline and slightly smaller than the rest of the text.

Code

Surrounds the selected text with a `<codeph>` tag.

UI Control

Surrounds the selected text with a `<uicontrol>` tag, used to mark up names of buttons, entry fields, menu items, or other interface objects.

Filepath

Surrounds the selected text with a `<filepath>` tag, used to indicate the name, and optionally the location of a referenced file. You can specify the directory that contains the file and other directories that may precede it in the system hierarchy.

Image Map Editor

This action is available in the contextual menu when it is invoked on an image. This action applies an *image map* to the current image (if one does not already exist) and opens the **Image Map Editor** dialog box. This feature allows you to create hyperlinks in specific areas of an image that will link to various destinations.

Table Actions

A variety of table editing actions are available in the contextual menu when it is invoked on a table (depending on the context, the table-related actions are promoted to the top level of the contextual menu and the **Other Actions** submenu provides access to the other actions):

Insert Rows

Opens a dialog box that allows you to insert any number of rows and specify the position where they will be inserted (**Above** or **Below** the current row).

Delete Row(s)

Deletes the table row located at the cursor position or multiple rows in a selection.

Insert Columns

Opens a dialog box that allows you to insert any number of columns and specify the position where they will be inserted (**Above** or **Below** the current column).

Delete Column(s)

Deletes the table column located at the cursor position or multiple columns in a selection.

Join Cells

Joins the content of the selected cells (both horizontally and vertically).

Split Cell

Splits the cell at the cursor location. If Oxygen XML Editor Eclipse plugin detects more than one option to split the cell, a dialog box will be displayed that allows you to select the number of rows or columns to split the cell into.

Sort

Sorts cells or list items in a table.

Table Properties

Opens the **Table properties** dialog box that allows you to configure properties of a table (such as frame borders).

Other Actions submenu

This submenu give you access to all the usual contextual menu actions.

Link submenu

The following link actions are available from this submenu:

Cross Reference

Opens the **Cross Reference (xref)** dialog box (*on page 2515*) that allows you to insert a link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* (*on page 2678*) structure. Once the target resource has been selected, you can also target specific elements within that resource. For more information, see [Linking in DITA Topics](#) (*on page 2515*).

File Reference

Opens the **File Reference** dialog box (*on page 2516*) that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics](#) (*on page 2515*).

Web Link

Opens the **Web Link** dialog box (on page 2516) that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box (on page 2516) that allows you to insert a link to a target DITA resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

**Tip:**

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens the **File Reference** dialog box (on page 2517) that allows you to insert a link to a target non-DITA file resource in a related links section at the bottom of the current document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Related Link to Web Page

Opens the **Web Link** dialog box (on page 2517) that allows you to insert a link to a target web-related resource in a related links section at the bottom of the current document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. For more information, see [Linking in DITA Topics \(on page 2515\)](#).

Sort

Available when invoked on a list, it opens a dialog box where you can configure a sorting operation for an entire list or a selection of list items.

Generate IDs

Oxygen XML Editor Eclipse plugin generates unique IDs for the current element (or elements), depending on how the action is invoked:

- When invoked on a single selection, an ID is generated for the selected element at the cursor position.
- When invoked on a block of selected content, IDs are generated for all top-level elements and elements listed in the **ID Options** dialog box that are found in the current selection.

Note:

The **Generate IDs** action does not overwrite existing ID values. It only affects elements that do not already have an `@id` attribute.

Reuse submenu

This submenu includes the following actions regarding reusing content in DITA:

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box** ([on page 2488](#)) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include **content references** (`@conref`) ([on page 2489](#)), **content key references** (`@conkeyref`) ([on page 2491](#)), or **key references to metadata** (`@keyref`) ([on page 2494](#)).

Push Current Element

Opens the **Push current element dialog box** ([on page 2497](#)) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `@conref` or `@conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`@conref/@conkeyref` and `@conrefend` attributes). For more information, see [Reuse Content Dialog Box](#) ([on page 2488](#)).

Replace Reference with Content

Replaces the referenced fragment (`@conref` or `@conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

Replace All References with Content

Replaces all referenced fragments (`@keyref`, `@conref`, or `@conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

For *keyrefs* inside `<xref>` or `<link>` elements, the `@keyref` attribute is changed to an `@href` attribute, while the rest of the content for the *keyref* is replaced with its source content.

If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (`@conref` or `@conkeyref`) inside the element at the cursor position.

Create Reusable Component

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the **Replace selection with content reference** option is selected in the dialog box, the selection will be replaced with a content reference (`@conref`). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range (`@conref` and `@conrefend`). For more information, see [Creating a Reusable Content Component \(on page 2500\)](#).

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see [Inserting a Reusable Content Component \(on page 2501\)](#).

Extract Topic From Selection

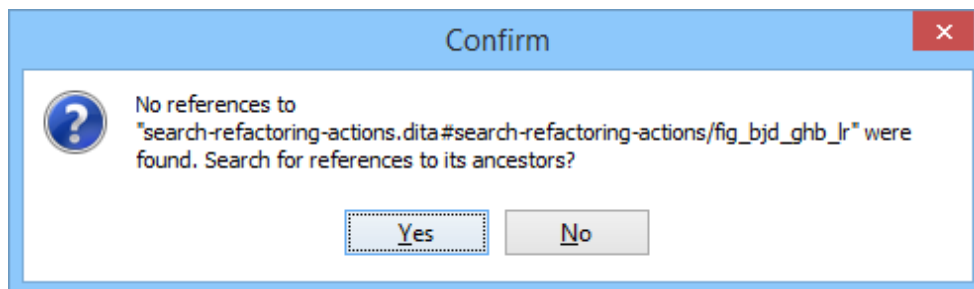

Creates a new DITA topic from a selection of content in the current topic.

Search References (Ctrl + Shift + G (Command + Shift + G on macOS))

Finds the references to the `@id` attribute value for the element at the current cursor position, in all the topics contained in the current *DITA map (on page 2678)* (opened in the **DITA Maps Manager view (on page 2337)**). If no references are found for the current element, a dialog box will be displayed that offers you the option of searching for references to its ancestor elements.

Figure 614. Search References to Ancestors Dialog Box

Tip:

If you are invoking the action on an image, see [Searching for References to Images \(on page 2419\)](#) for details about what will be reported.

Find Similar Topics

Opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements. It is helpful for quickly finding related topics that can be added as related links.

Show Key Definition

Available for elements that have a `@conkeyref` or `@keyref` attribute set (or elements with an ancestor element that has a `@conkeyref` or `@keyref` attribute). It computes the key name and opens the *DITA map (on page 2678)* that contains the definition of the key with the element that defines that key selected.

About Element submenu

This submenu includes the following actions:

Style Guide

Opens the **DITA Style Guide Best Practices for Authors** in your browser and displays a topic that is relevant to the element at the cursor position. When editing DITA documents, this action is available in the contextual menu of the editing area (under the **About Element** sub-menu), in the **DITA** menu, and in some of the documentation tips that are displayed by the *Content Completion Assistant (on page 2677)*.

Browse reference manual

Opens a reference to the documentation of the XML element closest to the cursor position in a web browser.

Go to Definition

Moves the cursor to the definition of the current element.

Select submenu

This submenu allows you to select the following:

Element

Selects the entire element at the current cursor position.

Content

Selects the entire content of the element at the current cursor position, excluding the start and end tag. Performing this action repeatedly will result in the selection of the content of the ancestor of the currently selected element content.

Parent

Selects the entire parent element at the current cursor position.

Text submenu

This submenu contains the following actions:

To Lower Case

Converts the selected content to lower case characters.

To Upper Case

Converts the selected content to upper case characters.

Capitalize Sentences

Converts to upper case the first character of every selected sentence.

Capitalize Words

Converts to upper case the first character of every selected word.

Count Words

Counts the number of words and characters (no spaces) in the entire document or in the selection for regular content and read-only content.

Note:

The content marked as deleted with [change tracking \(on page 2683\)](#) is ignored when counting words.

Convert Hexadecimal Sequence to Character (Ctrl + Shift + H (Command + Shift + H on macOS))

Converts a sequence of hexadecimal characters to the corresponding [Unicode character \(on page 299\)](#). The action can be invoked if there is a selection

containing a valid hexadecimal sequence or if the cursor is placed at the right side of a valid hexadecimal sequence. A valid hexadecimal sequence can be composed of 2 to 4 hexadecimal characters and may or may not be preceded by the 0x or 0X prefix. Examples of valid sequences and the characters they will be converted to:

- 0x0045 will be converted to **E**
- 0x0125 to **h**
- 265 to **q**
- 2190 to **+**

Note:

For more information about finding the hexadecimal value of a character, see [Finding the Decimal, Hexadecimal, or Character Entity Equivalent \(on page 301\)](#).

Refactoring submenu

Contains a series of actions designed to alter the XML structure of the document:

Toggle Comment

Encloses the currently selected text in a comment, or removes the comment if it is commented.

Move Up (Alt + UpArrow (Option + UpArrow on macOS))

Moves the current node or selected nodes in front of the previous node.

Move Down (Alt + DownArrow (Option + DownArrow on macOS))

Moves the current node or selected nodes after the subsequent node.

Split Element

Splits the content of the closest element that contains the position of the cursor. Thus, if the cursor is positioned at the beginning or at the end of the element, the newly created sibling will be empty.

Join Elements

Joins two adjacent *block elements (on page 2676)* that have the same name. The action is available only when the cursor position is between the two adjacent *block elements*. Also, joining two *block elements* can be done by pressing the **Delete** or **Backspace** keys and the cursor is positioned between the boundaries of these two elements.

Surround with Tags (Alt + Shift + E)

Allows you to choose a tag to enclose a selected portion of content. If there is no selection, the start and end tags are inserted at the cursor position.

- If the **Position cursor between tags** option (*on page 120*) is selected in the **Content Completion** preferences page, the cursor is placed between the start and end tag.
- If the **Position cursor between tags** option (*on page 120*) is not selected in the **Content Completion** preferences page, the cursor is placed at the end of the start tag, in an insert-attribute position.

Surround with '[tag]' (Alt + Shift + ForwardSlash)

Surround the selected content with the last tag used.

Rename Element

The element from the cursor position, and any elements with the same name, can be renamed according with the options from the **Rename** dialog box.

Delete Element Tags

Deletes the tags of the closest element that contains the position of the cursor. This operation is also executed if the start or end tags of an element are deleted by pressing the **Delete** or **Backspace** keys.

Remove All Markup

Removes all the XML markup inside the selected block of content and keeps only the text content.

Remove Text

Removes the text content of the selected block of content and keeps the markup intact with empty elements.

DITA-related Refactoring Actions

A variety of built-in XML refactoring operations that pertain to DITA documents with some of the information preconfigured based upon the current context.

Change Topic ID to File Name

Use this operation to change the ID of a topic to be the same as its file name.

Convert CALS Tables to Simple Tables

Use this operation to convert DITA CALS tables to simple tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert conrefs to conkeyrefs

Use this operation to convert `@conref` attributes to `@conkeyref` attributes.

Convert Simple Tables to CALS Tables

Use this operation to convert DITA simple tables to CALS tables. If you invoke this operation from a nested table (a table inside a table), only the nested table will be affected. If it is invoked on a parent table that contains nested tables, all of the contained tables will be converted.

Convert to Concept

Use this operation to convert a DITA topic (of any type) to a DITA Concept topic type (for example, Topic to Concept).

Convert to General Task

Use this operation to convert a DITA topic (of any type) to a DITA General Task topic type (for example, Task to General Task). A DITA *General Task* is a less restrictive alternative to the *Strict Task* information type.

Convert to Reference

Use this operation to convert a DITA topic (of any type) to a DITA Reference topic type (for example, Topic to Reference).

Convert to Task

Use this operation to convert a DITA topic (of any type) to a DITA Task topic type (for example, Topic to Task).

Convert to Topic

Use this operation to convert a DITA topic (of any type) to a DITA Topic (for example, Task to Topic).

Convert to Troubleshooting

Use this operation to convert a DITA topic (of any type) to a DITA Troubleshooting topic type (for example, Topic to Troubleshooting).

Rename Key

Available when invoked on a key, and can be used to quickly rename a key. It also updates all references to it. Note that it does not work on DITA 1.3 key scopes.

Generate IDs

Use this operation to automatically generate unique IDs for elements.

Attributes Refactoring Actions

Contains built-in XML refactoring operations that pertain to attributes with some of the information preconfigured based upon the current context.

Add/Change attribute

Allows you to change the value of an attribute or insert a new one.

Convert attribute to element

Allows you to change an attribute into an element.

Delete attribute

Allows you to remove one or more attributes.

Rename attribute

Allows you to rename an attribute.

Replace in attribute value

Allows you to search for a text fragment inside an attribute value and change the fragment to a new value.

Comments Refactoring Actions

Contains built-in XML refactoring operations that pertain to comments with some of the information preconfigured based upon the current context.

Delete comments

Allows you to delete comments found inside one or more elements.

Elements Refactoring Actions

Contains built-in XML refactoring operations that pertain to elements with some of the information preconfigured based upon the current context.

Delete element

Allows you to delete elements.

Delete element content

Allows you to delete the content of elements.

Insert element

Allows you to insert new elements.

Rename element

Allows you to rename elements.

Unwrap element

Allows you to remove the surrounding tags of elements, while keeping the content unchanged.

Wrap element

Allows you to surround elements with element tags.

Wrap element content

Allows you to surround the content of elements with element tags.

Fragments Refactoring Actions

Contains built-in XML refactoring operations that pertain to XML fragments with some of the information preconfigured based upon the current context.

Insert XML fragment

Allows you to insert an XML fragment.

Replace element content with XML fragment

Allows you to replace the content of elements with an XML fragment.

Replace element with XML fragment

Allows you to replace elements with an XML fragment.

Review submenu

This submenu includes the following actions:

Track Changes

Enables or disables the *Track Changes (on page 2683)* support for the current document.

Accept Change(s) and Move to Next

Accepts the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is accepted.

Accept All Changes

Accepts all *Tracked Changes (on page 2683)* in the current document.

Reject Change(s) and Move to Next

Rejects the *Tracked Change (on page 2683)* located at the cursor position or all of the changes in a selection and then moves to the next change. If you select a part of a *deletion* or *insertion* change, only the selected content is rejected.

Reject All Changes

Rejects all *Tracked Changes (on page 2683)* in the current document.

Comment Change

Opens a dialog box that allows you to add a comment to an existing *Tracked Change (on page 2683)*. The comment will appear in a callout and a tooltip when

hovering over the change. If the action is selected on an existing commented change, the dialog box will allow you to edit the comment.

Highlight

Enables the highlighting tool that allows you to mark text in your document.

Colors

Allows you to select the color for highlighting text.

Stop highlighting

Use this action to deactivate the highlighting tool.

Remove highlight(s)

Use this action to remove highlighting from the document.

Add Comment

Inserts a comment at the cursor position. The comment appears in a callout box and a tooltip (when hovering over the change).

Show/Edit Comment

Opens a dialog box that displays the discussion thread and allows the current user to edit comments that do not have replies. If you are not the author who inserted the original comment, the dialog box just displays the comment without the possibility of editing it.

Remove Comment

Removes a selected comment. If you remove a comment that contains replies, all of the replies will also be removed.

Manage Reviews

Opens the [Review view \(on page 438\)](#).

Manage IDs submenu

This submenu is available for topics that have an associated DTD or schema. It includes the following actions:

Rename in

Renames the ID and all its occurrences. Selecting this action opens the **Rename XML ID** dialog box. This dialog box lets you insert the new ID value and choose the scope of the rename operation.

Search References

Searches for the references of the ID. By default, the scope of this action is the current project. If you configure a scope using the [Select the scope for the Search and Refactor operations \(on page 600\)](#) dialog box, this scope will be used instead.

Search References in

Searches for the references of the ID. Selecting this action opens the [Select the scope for the Search and Refactor operations](#) (on page 600).

Search Occurrences in file

Searches for the occurrences of the ID in the current document.

Folding submenu

This submenu includes the following actions:

Toggle Fold

Toggles the state of the current fold.

Collapse Other Folds

Folds all the elements except the current element.

Collapse Child Folds

Folds the elements indented with one level inside the current element.

Expand Child Folds (**Ctrl + NumPad+** (**Command + NumPad+** on macOS))

Unfolds all child elements of the currently selected element.

Expand All

Unfolds all elements in the current document.

Inspect Styles

Opens the [CSS Inspector view](#) (on page 414) that allows you to examine the CSS rules that match the currently selected element.

Options

Opens the [Author mode preferences page](#) (on page 136) where you can configure various options with regard to the **Author** editing mode.

Floating Contextual Toolbar for DITA

Oxygen XML Editor Eclipse plugin includes a dynamic feature where certain editing contexts will trigger a floating toolbar with common actions that are available in the current editing context.

Figure 615. DITA Floating Contextual Toolbar

The *floating contextual toolbar* is automatically displayed when editing DITA documents in various situations, including:

- When a `<p>`, ``, or `<shortdesc>` element has a selection inside, the floating toolbar includes actions such as **B Bold**, **I Italic**, **U Underline**, a **Link** submenu, and more.
- When an `<image>` or `<xref>` element is selected:
 - If the element has an `@href` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
 - If the element has a `@keyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an `<object>` element is selected:
 - If the element has a `@data` attribute, the floating toolbar includes a URL chooser where you can select the appropriate target.
 - If the element has a `@datakeyref` attribute, the floating toolbar includes a drop-down control where you can select the appropriate target key reference.
- When an element with a `@conref` attribute is selected, the floating toolbar includes actions for editing, removing, or replacing content references.
- When a `<codeblock>` element is selected, the floating toolbar includes a drop-down control where you can select the value of the `@outputclass` attribute.
- When a `` element is selected, the floating toolbar includes actions for converting it to an ordered list or sorting the list.
- When an `` element is selected, the floating toolbar includes actions for converting it to an unordered list or sorting the list.
- When an `` or `<step>` element is selected, the floating toolbar includes actions for moving the item up or down in the list/procedure.
- When a `<row>` or `<strow>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting rows, or deleting rows).
- When an `<entry>` or `<stentry>` element is selected in a table, the floating toolbar includes various table-related actions (such as actions for editing table properties, inserting/deleting rows, or inserting/deleting columns).
- When a `<table>` or `<simpletable>` element is selected, the floating toolbar includes actions for editing table properties or sorting the table.

DITA Drag/Drop (or Copy/Paste) Actions

Dragging a file from the **Project Explorer view** (on page 269) or **DITA Maps Manager view** (on page 2337) and dropping it into a DITA document that is edited in **Author** mode, creates a link to the dragged file (the `<xref>` DITA element with the `@href` attribute) at the drop location. Copy and paste actions work the same.

You can also drag images or media files from your system explorer or the **Project Explorer view** (on page 269) and drop them into a DITA document (or copy and paste). This will insert the appropriate element at the drop or paste location (for example, dropping/pasting an image will insert the DITA `<image>` element with an `@href` attribute).

**Tip:**

For information about customizing **Author** mode actions for a particular *framework (on page 2679)* (document type), see the *Customizing the Author Mode Editing Experience for a Framework (on page 1955)* section.

Related Information:

[Customizing the Author Mode Editing Experience for a Framework \(on page 1955\)](#)

Working with Markdown Documents in DITA

The Oxygen XML Editor Eclipse plugin has special features that make it easy to incorporate Markdown documents into a DITA project. This is particularly useful for teams with members who are familiar with Markdown syntax but want to generate their output from DITA projects. The integration between the Markdown editor and DITA includes options to export or convert Markdown documents into DITA topics, as well as a live preview of the edited Markdown content.

Preview

The changes made to the Markdown content can be previewed live in three separate tabs: **DITA**, **XDITA**, and **HTML**.

The **DITA** tab in the *Preview* pane shows how an equivalent DITA topic will look after conversion. Similarly, the **XDITA** tab shows how a Lightweight DITA topic will look after conversion. The **HTML** tab shows a preview of the HTML equivalent.

Keys that are defined in the root map are also resolved in the *Preview* pane in the **XDITA** and **DITA** tabs.

**Note:**

To make the content generated for preview in the **DITA** and **XDITA** preview tabs more readable and to improve the conversion of Markdown to DITA in the editor, you can add an XML catalog to the [XML catalogs \(on page 594\)](#) list. This XML catalog will help with post-processing before the content is displayed. Here is an example of an XML catalog that you can use:

```
<catalog
  xmlns="urn:oasis:names:tc:entity:xmlns:xml:catalog">
  <uri
    name="http://www.oxygenxml.com/ns/preview/postprocess/dita" uri="postProcessDITA.xsl" />
  <uri
    name="http://www.oxygenxml.com/ns/preview/postprocess/lwdita" uri="postProcessLWDITA.xsl" />
</catalog>
```

Export Markdown as a DITA Topic

The Markdown editor includes an option to quickly convert the current Markdown document into a DITA topic. The **Export as DITA Topic** action is available in the contextual menu.

The conversion creates a new XML file that is defined as a DITA topic and opens it in the **Text** editing mode. You can then work with the document as you would with any other DITA topic, although you may need to manually correct some issues where the parser could not properly map Markdown syntax to DITA markup.

Working with Markdown Documents in the DITA Maps Manager

Oxygen XML Editor Eclipse plugin has some specialized features that allow you to integrate Markdown documents directly into your DITA project using the **DITA Maps Manager** (on page 2337). The following features are available for Markdown documents in the **DITA Maps Manager** view:

- **Insert Reference to Markdown Document** - You can use the **New**, **Reference**, and **Reference to the currently edited file** actions from the **Append Child**, **Insert Before**, or **Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a Markdown document at the selected location in the map. Markdown documents will be inserted as a topic reference (`topicref` element) with the `format` attribute set to `markdown`.
- **Validate Markdown Documents in DITA Maps** - When you use the  **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, Markdown documents that are referenced in the *DITA map* will be converted to DITA topics in the background and validated the same as any other DITA topic.
- **Transforming DITA Maps with Markdown Documents** - When transforming *DITA maps* that have Markdown documents referenced, the transformation will convert the Markdown documents to normal DITA output without you needing to manually convert the Markdown documents to DITA topics.
- **Manually Convert Markdown Documents to DITA Topics** - If you need to use DITA semantics that are not possible in Markdown syntax (such as content references, related links, and other DITA-specific syntax), you can manually convert the Markdown document into a DITA topic. To do so, right-click the Markdown document in the **DITA Maps Manager** and select **Refactoring > Convert Markdown to DITA Topic**. This will open a dialog box that allows you to configure options for converting the document to an XML file that is defined as a DITA topic.

Figure 616. Convert Markdown to DITA Topic Dialog Box

This dialog box includes the following options:

Destination

The destination path for the new DITA topic.

File Name

Presents the current name and allows you to change it.

Update references

Select this option to update all references of the file in the *DITA map* and in the files referenced from the *DITA map*.

Delete Markdown file

If selected, the Markdown version of the file is deleted when the document is converted into a DITA file. If deselected (default value), when the document is converted into a DITA file, the original Markdown file is also preserved in its current location.

Preview

Select this button to display a preview of the changes Oxygen XML Editor Eclipse plugin is about to make.

Convert

Select this button to perform the conversion. If the Markdown file has `format="markdown"`, it will be converted to a DITA topic. If it has `format="mdita"`, it will be converted to a [LightWeight DITA topic](#).

Tip:

Oxygen XML Editor Eclipse plugin comes with a sample ditamap project for converting Markdown to DITA. Go to the [Project Explorer view \(on page 269\)](#), open the `sample.xpr` project, and navigate to the `dita/markdown-dita` folder.

DITA-Related Markdown Syntax

For a list of Markdown rules and syntax examples that are specific to DITA, see the [Markdown DITA Syntax Reference](#).

Working with DITA-Compatible Documents

Oxygen XML Editor Eclipse plugin includes powerful [dynamic publishing features \(on page 2571\)](#) that allow you to easily integrate **Word, Excel, OpenAPI, HTML, Markdown** documents into a DITA project and have them automatically converted to DITA at the time of publishing. This is especially helpful for teams that have contributors who work with non-DITA documents but want their output to be generated from DITA projects.

Attention:

These features are available with no restrictions when the publishing process is done using the default publishing engine that is bundled in Oxygen XML Editor Eclipse plugin or if you have integrated the DITA-OT dynamic converter plugin into a custom DITA-OT distribution.

Working with DITA-Compatible Documents in the DITA Maps Manager

Oxygen XML Editor Eclipse plugin has some specialized features that allow you to integrate DITA-compatible documents directly into your DITA project using the [DITA Maps Manager \(on page 2337\)](#). The following features are available in the **DITA Maps Manager** view:

- **Insert References to DITA-Compatible Documents** - You can use the **New, Reference, and Reference to the currently edited file** actions from the **Append Child, Insert Before, or Insert After** submenu when invoking the contextual menu in the **DITA Maps Manager** to insert a reference to a **Word, Excel, OpenAPI, HTML or Markdown** document at the selected location in the map. A topic reference (`<topicref>`) element with the appropriate `@format` attribute value will be inserted.
- **Title of Referenced Resources is Displayed** - The title of each referenced DITA-compatible resource is presented in the **DITA Maps Manager** view.
- **Validate DITA-Compatible Documents in DITA Maps** - When you use the  **Validate and Check for Completeness** action from the **DITA Maps Manager** toolbar to check the integrity of the structure of a *DITA map*, DITA-compatible documents that are referenced in the *DITA map* are converted to DITA topics in the background and validated the same as any other DITA topic.

- **IDs Presented When Inserting References** - When inserting topic references, cross references, or content references to content inside DITA-compatible documents, the application presents a list of DITA-specific IDs from the target document.
- **Transform DITA Maps with DITA-Compatible Documents** - When transforming *DITA maps* that have DITA-compatible documents referenced, the transformation converts the documents to normal DITA output without you needing to manually convert the documents to DITA topics.

[Dynamic Word, Excel, OpenAPI, HTML, Markdown to DITA Conversion \(on page 2571\)](#)

Working with Keys in DITA

DITA uses keys to insert content that may have different values in particular circumstances. [Keys provide a way to reference something indirectly](#). This can make it easier to manage and to reuse content in a various ways.

You can think of keys as like renting a post office box. Instead of the mail going directly from the sender to your house, it now goes to the post office box. You then go to the post office box and bring the mail back to your house. If you move to a new house, your mail still gets to you because it comes to the same post office box. You do not have to send change of address cards to all the people who send you mail. Your mailbox address is the key that makes sure your mail always reaches you, even if you move.

Similarly, if you use keys in your content to reference other content, you do not have to update the source content to change the value of the key or what it points to. You just change the definition of the key.

Defining Keys in DITA Maps

Keys are defined in maps and can then be reused and referenced throughout the whole structure of the map. It is considered best practice to create a separate submap that contains all of the key definitions and reference that submap in the *main (root) map (on page 2682)*. This makes it easier to manage since they're all in one location.

There are two types of key definitions that can be created in a map:

- Key with a value inside a `<keyword>`. To define this type of key, follow these instructions: [Key Definition with a Keyword Value \(on page 2372\)](#).
- Key with a target (for example, to target a resource such as an image or external link). To define this type of key, follow these instructions: [Key Definition with a Target \(on page 2372\)](#).

Using Keys for Values

You can use keys to represent values that may vary depending on the type of output. For instance, you may have several products that share a common feature. When you want to describe that feature, you need a way to insert the name of the product, even though that name is different depending on which product the feature description is being used for. For more information, see [Working with Variable Text in DITA \(on page 2501\)](#).

Assigning Keys to Topics

You can assign a key to a topic and use that key to reference that topic for various purposes, such as reuse or linking. As always, keys are defined in maps, so the key definition is done using the `keys` attribute of the `<topicref>` element:

```
<topicref href="quick-heat.dita" keys="feature.quick-heat" />
```

The easiest way to assign keys to a topic (and insert the `<topicref>` element in its *DITA map (on page 2678)*) is to use the **Keys** tab in the **Edit Properties** dialog box *(on page 2375)*. In the **DITA Maps Manager (on page 2337)**, invoke the contextual menu on the topic that will have the key assigned and select  **Edit Properties**. Go to the **Keys** tab and enter the name of the key in the **Define keys** field.

Once a key is assigned to a topic, you can use it to reference that topic for various purposes:

- You can [create a link \(on page 2515\)](#) to it using `<xref keyref="feature.quick-heat">`. This allows you to change the target of the link by changing the topic that is pointed to by the key (for example, by profiling).
- You can use it [in a map to create a reference to a topic \(on page 2357\)](#) by key: `<topicref keyref="feature.quick-heat">`. This allows you to change which topic is inserted in the map by the build, by changing the topic that is pointed to by the key.
- You can use it to [insert a content reference \(on page 2483\)](#). In this case, the content reference uses the key to locate the topic to pull content from. It uses a `@conkeyref` attribute: `<procedure conkeyref="feature.quick-heat/preheat-procedure">`. In this example, `feature.quick-heat` is the key, and `preheat-procedure` is the ID of a procedure within the topic for that key. Using this mechanism, you could have multiple versions of the preheat procedure in various topics and control which one is inserted by changing the topic that is pointed to by the key.

Assigning Keys to Graphics

You can assign a key to an image (using a map to point to the image file *(on page 2372)*) and then [insert the image using the key \(on page 2416\)](#).

Example of a key definition for a targeted image file:

```
<map id="keydefs">
  <!-- product name -->
  <title>Key Definitions</title>
  <keydef keys="image1" href="../img/image1.png" format="png" />
</map>
```

Working with a Glossary of Terms in DITA

There are several ways to manage a Glossary of Terms in DITA, but it is considered best practices to create a separate submap for the glossary and embed that glossary map in the *main (root) map* (on page 2682). The actual glossary terms are small *glossary entry* topics that are referenced in the glossary map. You can add [links to the glossary terms \(on page 2474\)](#) in the output and you can even [define abbreviated forms \(on page 2475\)](#) for terms that have an acronym or some other type of abbreviation.

How to Create a Glossary of Terms in Oxygen XML Editor Eclipse plugin

Even though there are several ways to create a glossary and reference the glossary terms, the following is the recommended approach:

1. [Create a new submap \(on page 2355\)](#) for your glossary and embed it in your main map.
2. Create a glossary entry topic (`<glossentry>`) for each glossary term. The `<glossentry>` element may contain numerous [optional glossentry elements](#), but every glossentry topic must contain a `<glossterm>` and `<glossdef>` element. The `<glossterm>` is the name of the term while the `<glossdef>` is its definition.

Here is an simple example:

```
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossdef>A language used for defining database schemas.</glossdef>
</glossentry>
```

The easiest way to create a glossentry topic in Oxygen XML Editor Eclipse plugin:

- a. Click the  **New** file wizard button on the toolbar.
 - b. Type *glossentry* in the search field at the top of the dialog box.
 - c. Select the **Glossentry** DITA topic type, configure the name and optionally the title, and click **Create**.
3. Reference each glossary entry topic in your glossary submap using the `<glossref>` element. This element requires a `@keys` attribute. Please make sure the `@print` attribute is set to `yes` to show the glossary also in the PDF output.

```
<glossref keys="gloss_ddl" href="ddl.dita" print="yes"/>
```

The easiest way to reference a glossentry in Oxygen XML Editor Eclipse plugin:

- a. With the glossary entry topic opened in the main editor, open the glossary submap in the **DITA Maps Manager**, right-click the map node and select **Append Child > Reference to the currently edited file** (if you already have existing glossentry topics, you can right-click the glossentry where you want to insert the new one and select **Insert After > Reference to the currently edited file**).

Step Result: This opens the **Insert Reference** dialog box (*on page 2363*).

- b. Go to the **Keys** tab and enter a name in the **Define keys** field.
- c. Go to the **Attributes** tab and select **Glossary Reference** from the **Reference type** drop-down list at the top of the dialog box.
- d. Click **Insert and Close**.

Tip:

You could also group multiple glossentry topics into a single collection by using the `<glossgroup>` element.

How to Create Links to Glossary Terms

To specify that a link is generated in the output from the glossary term to its definition, use the `<term>` element (or `<abbreviated-form>` element as described in *the next section (on page 2475)*) with a `@keyref` attribute that references the corresponding key specified in the `<glossref>`. Of course, the `<glossref>` points to the `<glossentry>` topic where the glossary term is defined.

```
<term keyref="gloss_ddl"/>
```

In the output, the text specified in the `<glossterm>` element is displayed for the glossary term with a link to its glossentry topic that contains its definition.

The easiest way to add a `<term>` element and reference the glossary term in Oxygen XML Editor Eclipse plugin:

1. Place the cursor at the location where you want to insert a link to the glossary term.
2. In the **DITA Reusable Components** view (on page 2506), go to the **Keys** tab and use the search filter field at the top of the view to find the key for the particular glossary term.
3. Right-click the key and select **Insert as Keyref > More > Term**.

Using Abbreviated Forms (Acronyms) with Glossary Terms

The `<abbreviated-form>` element can be used for glossary terms that you want to appear in an abbreviated form (such as an acronym). Abbreviated forms are expanded to their full form the first time that they appear in a document, and then all subsequent instances will display the short form (or acronym). You would need to define the long and short forms in the `<glossentry>` and then reference it with the `<abbreviated-form>` element (instead of the `<term>` element).

The recommended best practices for defining the long and short forms would be to use a structure similar to this:

```
<glossentry id="ddl">
  <glossterm>Data Definition Language</glossterm>
  <glossBody>
    <glossSurfaceForm>Data Definition Language (DDL)</glossSurfaceForm>
    <glossAlt>
      <glossAcronym>DDL</glossAcronym>
    </glossAlt>
  </glossBody>
</glossentry>
```

The long form is declared using the `<glossSurfaceForm>` element while the short form is declared using the `<glossAcronym>` element.

Then you need to reference the glossentry that contains the long and short forms using the `<abbreviated-form>` element:

```
<abbreviated-form keyref="gloss_ddl" />
```

For more information about the recommended best practices for using abbreviations, including information about using multiple languages, see: http://www.oasis-open.org/committees/download.php/29734/AcronymBestPractice_08112008.doc.

Reusing DITA Content

Reusing content is one of the key features of DITA and DITA provides several methods for reusing content. Oxygen XML Editor Eclipse plugin provides support for each of these methods.

Reusing Topics in DITA Maps

A DITA topic does not belong to any one publication. You add a DITA topic to a publication by referencing it in a map. You can [reference the same topic in multiple maps \(on page 2478\)](#).

Reusing Content with References and Keys

DITA allows you to reuse content by referencing it in another topic. DITA provides [several mechanisms for including content by reference \(on page 2480\)](#) (*conref*, *conkeyref*, *coderef*). A `conref` ([content reference \(on page 2481\)](#)) creates a direct reference to a specific element of another topic. A `conkeyref` ([content key reference \(on page 2483\)](#)) creates a reference to a key, which then points to a specific element in another topic. The advantage of using a *conkeyref* is that you can change the element that is included by changing the key reference. For example, since keys are defined in maps, if you include a topic in multiple maps, you can use a different key reference in each map. A *coderef* references an external file that contains literal code.

Oxygen XML Editor Eclipse plugin provides support for all of these mechanisms.

While the *conref* and *conkeyref* mechanisms can be used to reference any content element, it is considered best practice to only *conref* or *conkeyref* content that is specifically set and managed as reusable content. This practice helps reduce expensive errors, such as an author accidentally deleting the source element that other topics are including by the reference. Oxygen XML Editor Eclipse plugin can help you create a reusable component from your current content.

Reusing Content with Reusable Components

DITA allows you to select content in a topic, create a [reusable component \(on page 2499\)](#) from it and reference that component in other locations. Each reusable component is created as a separate file. Anytime the content needs to be edited, you only need to update it in the component file and all the locations in your topics that reference it will also be updated. This can help you to maintain continuity and accuracy throughout your documents.

Reusing Content with Variables

DITA allows you to replace the content of certain elements with a value that is pointed to by a key. This mechanism effectively means that you can [create variables in your content \(on page 2501\)](#), which you can then create multiple outputs by changing the value that the key points to. This is done by profiling the definition of the key value, or by substituting another map with a different key value.

Reusing Content with DITA 1.3 Concepts

DITA 1.3 allows you to use some advanced concepts to expand content reuse possibilities even further. [Key Scopes \(or scoped keys\) \(on page 2503\)](#) allow you to reuse topics with variable content depending on the particular context and it maximizes reuse possibilities for keys. [Branch Filtering \(on page 2505\)](#) allows you to reuse the same content that is profiled in multiple ways within the same publication, each time using a different filter.

DITA Reusable Components View

If you use a large amount of keys or reusable components in your DITA project, the **DITA Reusable Components view** ([on page 2506](#)) can be quite helpful. It collects all of the keys and reusable components that are defined in the *root map* ([on page 2682](#)) and presents them in a dynamic table where you can easily locate and insert references to them.

Reuse Actions in Oxygen XML Editor Eclipse plugin

Oxygen XML Editor Eclipse plugin includes some actions that are specifically designed for DITA reusable content. These actions are available in the contextual menu, the **DITA** menu, and some are available on the toolbar.

Reuse Content

This action provides a mechanism for reusing content fragments. It opens the **Reuse Content dialog box** ([on page 2488](#)) that allows you to insert several types of references to reusable content at the cursor position. The types of references that you can insert using this dialog box include **content references** (`@conref`) ([on page 2489](#)), **content key references** (`@conkeyref`) ([on page 2491](#)), or **key references to metadata** (`@keyref`) ([on page 2494](#)).

Push Current Element

Opens the **Push current element dialog box** ([on page 2497](#)) that allows content from a source topic to be inserted into another topic without any special coding in the topic where the content will be re-used.

Edit Content Reference

This action is available for elements with a `@conref` or `@conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`@conref/@conkeyref` and `@conrefend` attributes). For more information, see [Reuse Content Dialog Box](#) ([on page 2488](#)).

Replace Reference with Content

Replaces the referenced fragment (`@conref` or `@conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

Replace All References with Content

Replaces all referenced fragments ([@keyref](#), [@conref](#), or [@conkeyref](#)) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for [@id](#) attributes.

For *keyrefs* inside `<xref>` or `<link>` elements, the [@keyref](#) attribute is changed to an [@href](#) attribute, while the rest of the content for the *keyref* is replaced with its source content.

If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference ([@conref](#) or [@conkeyref](#)) inside the element at the cursor position.

Create Reusable Component

Opens a dialog box that helps you to create a reusable component from the current element or selection of elements. If the **Replace selection with content reference** option is selected in the dialog box, the selection will be replaced with a content reference ([@conref](#)). If multiple elements are selected (for example, multiple steps or list items), the selection will be replaced with a content reference range ([@conref](#) and [@conrefend](#)). For more information, see [Creating a Reusable Content Component \(on page 2500\)](#).

Insert Reusable Component

Inserts a reusable component at cursor location. For more information, see [Inserting a Reusable Content Component \(on page 2501\)](#).

Resources

Reusing DITA Topics in Multiple Maps

You can reuse an entire DITA topic simply by referencing it in multiple maps (or [multiple locations within the same map \(on page 2359\)](#)) using one of the following procedures:

Reuse Topics Using the DITA Maps Manager

1. Make sure the *DITA map* (on page 2678) is opened in the **DITA Maps Manager** (on page 2337).
2. Add a reference to an existing topic by using one of the following methods (depending on your particular situation):
 - a. If the topic already exists in this *DITA map*, do one of the following:
 - Simply drag the topic and press **Ctrl** (or **Alt** on macOS) at the new location within the map (or use the  **Copy** and  **Paste** contextual menu actions).
 - If the topic is the currently open document in the main editor, determine the new location in the map (in the **DITA Maps Manager** (on page 2337)), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.
 - b. If the topic already exists in another *DITA map*, do one of the following:
 - Open the other map in the **DITA Maps Manager** (on page 2337), right-click the topic, select  **Copy**, switch back to the original *DITA map* in the **DITA Maps Manager**, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions ( **Paste**, **Paste Before**, or **Paste After**).
 - If the topic is the currently open document in the main editor, determine the new location in the map (in the **DITA Maps Manager** (on page 2337)), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.
 - c. If the topic exists in the project, but has not yet been added to a *DITA map*, do one of the following:
 - Right-click the topic in the **Project Explorer view** (on page 269) (or the file system), select  **Copy**, switch to the **DITA Maps Manager** (on page 2337) view, determine the new location in the map, right-click a parent or sibling topic, and use one of the **Paste** contextual menu actions ( **Paste**, **Paste Before**, or **Paste After**).
 - If the topic is the currently open document in the main editor, determine the new location in the map (in the **DITA Maps Manager** (on page 2337)), right-click a parent or sibling topic, and select **Append Child > Reference to the currently edited file** or **Insert After > Reference to the currently edited file**.
3. If your topic uses a *key reference* (on page 2471), set up the appropriate *key definition in your map* (on page 2371).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can *add a relationship table to your map* (on page 2521).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this *validation*, click the  **Validate and Check for Completeness** action (on page 2382) on the toolbar in the **DITA Maps Manager**.

Reuse Topics Using Author Mode Editor

1. Open the *DITA map* (on page 2336) in the **Author** mode editor.
2. Add a reference to an existing topic by dragging it from the **Project Explorer view** (on page 269) (or the file system) and dropping it in the desired location in the *DITA map* opened in **Author** mode. You can also accomplish the same thing by using the  **Copy** and  **Paste** contextual menu actions.
3. If your topic uses a *key reference* (on page 2471), set up the appropriate *key definition in your map* (on page 2371).
4. If you want to define relationships between topics, other than those defined in the topics themselves, you can *add a relationship table to your map* (on page 2521).
5. When you have finished adding topics, check that your map is complete and that all topic links and keys resolve correctly. To do this *validation*, click the  **Validate and Check for Completeness** action (on page 2382) on the toolbar in the **DITA Maps Manager**.

Displaying Multiple References to the Same Topics

Whenever multiple references to the same topic are detected in the context of the current map in the **DITA Maps Manager** (on page 2337), an indicator will appear in the top-right corner of the **Author** mode editor that shows the number of times the current topic is referenced in the *DITA map*. It also includes navigation arrows that allow you to jump to the next or previous reference in the **DITA Maps Manager**.

References in map: [1 of 6]  

Working with Content References

The DITA *content reference* feature lets you insert a piece of source content by referencing it from its source. When you need to update that content, you only need to do it in one place. The source content can be referenced using the DITA `@conref` or `@conkeyref` attributes.

There are several strategies for managing content references:

- *Reusable components* - With this strategy, you create a new file for each piece of content that you want to reuse and you insert references from the content of the reusable component files. For example, suppose that you have a disclaimer that needs to be included in certain sections of your documentation. You can create a reusable component that contains your disclaimer and reuse it as often as you need to. If the disclaimer ever needed to be updated, you only have to edit it in one file.
- *Single-source content references* - You may prefer to keep many pieces of reusable content in one file. For example, you might want to create a single file that contains all the actions that are available in various menus or toolbars for your software application. Then, wherever you need to describe or display an action in your documentation, you can reuse content from that single file by inserting content references. This strategy requires more setup than reusable components, but might make it easier to centrally managing the reused content and it allows for more flexibility in the XML structure of the reusable content.

- *Arbitrary content references* - Although it is not recommended, you can create content references among topics without storing the reusable content in components or a single file. This strategy might make it difficult to manage content that is reused and to maintain continuity and accuracy, since you may not have any indication that content you are editing is reused elsewhere.

A reference to the external content is created by adding a `@conref` or `@conkeyref` attribute to an element in the local document. The `@conref` or `@conkeyref` attribute defines a link to the referenced content, made up of a path to the file and the topic ID within the file. The path may also reference a specific element ID within the topic. Referenced content is not physically copied to the referencing file. However, by default, Oxygen XML Editor Eclipse plugin displays it in **Author** mode as if it is there in the referencing file. If you want to expand referenced content on demand (rather than having it be automatically expanded), [open the Preferences dialog box \(on page 70\)](#), go to **Editor > Edit modes > Author**, and deselect the **Display referenced content** option [\(on page 139\)](#).

**Note:**

A reference also displays [tracked changes \(on page 2683\)](#) and comments that are included in the source fragment. To edit these comments (or accept/reject changes) right-click the comment or tracked change and select **Edit Reference**.

**Tip:**

To search for references made through a direct content reference, use the **Search References** action from the contextual menu.

[Doctales - Content Reference](#)

[Doctales - Content Key Reference](#)

Creating a DITA Content Reference

DITA Content Reference

A DITA content reference, or `conref`, is one of the main *content reuse* features of DITA [\(on page 2475\)](#). It is a mechanism for re-using the same content in multiple topics (or even in multiple locations within the same topic).

For a `conref` to be created, the source content must have an `id` attribute that the `conref` can reference. Therefore, creating a `conref` requires that you add an `id` to the content to be reused before inserting a `conref` into the topic that reuses the referenced content.

Assigning an ID to the Referenced Content

To add an `id` to a DITA element in a topic, place the cursor on the element and select  **Edit Attributes** from the contextual menu to open the **in-place attribute editor** (on page 407). Enter `id` as the **Name** of the attribute and a value of your choice in the **Value** field. You can also use the **Attributes view** (on page 405) to enter a value in the `id` attribute.

Note:

The element may already have an `id`, since in some cases, Oxygen XML Editor Eclipse plugin automatically generates an *ID* value when the `id` attribute is created.

Creating a Content Reference

To create a content reference (`conref`), follow these steps:

1. Make sure the element you want to reference has an *ID assigned to it* (on page 2482).
2. In **Author mode** (on page 242), place the cursor at the location where you want the reused content to be inserted.
3. Select the  **Reuse Content** action on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content dialog box** (on page 2488) is displayed.
4. In the **Location** field of the **Reuse Content** dialog box, select the topic that contains the element you want to reference. The elements that you can reference are presented in a table.
5. Select the **Target ID** of the element (or elements) to have their content inserted, and verify the content in the **Preview** pane. The `id` value of the element that you select is automatically added to the **Reference to (conref)** field.
6. Make any other selections you need in the **Reuse Content dialog box** (on page 2488). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `id` value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Using Copy/Paste Actions to Create a Content Reference

Oxygen XML Editor Eclipse plugin also includes support for creating content references with simple copy/paste actions. The copied content must be an entire DITA XML element with an ID attribute. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop option** (on page 155) is selected in the **Schema-Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content reference (`conref`) using copy/paste actions, follow these steps:

1. Copy an entire DITA element that has an ID attribute assigned to it.
2. Place the cursor at a location where the copied element will be valid.
3. Select the **Paste as Content Reference** action from the  **Paste Special** submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view (*on page 2510*) to easily insert content references.
- An alternate way to reuse content is to use the Oxygen XML Editor Eclipse plugin **Create Reusable Component** (*on page 2500*) and **Insert Reusable Component** (*on page 2501*) actions (available in the **DITA** menu and the **Reuse** submenu of the contextual menu). They handle the details of creating an *ID* and *conref* and create reusable component files, separate from your normal content files. This can help you manage your reusable content more effectively.
- You can also **insert reusable content using content key references** (*on page 2483*). This may also make reusable content easier to manage, depending on your particular situation and needs.
- Other topics in this section include information about more specialized or advanced ways of reusing content, such as *code references* (*on page 2496*), the *conref push mechanism* (*on page 2497*), *variable text* (*on page 2501*), *key scopes* (*on page 2503*), and *branch filtering* (*on page 2505*).

[Reuse Content Dialog Box](#) (*on page 2488*)

[DITA Reusable Components View](#) (*on page 2506*)

[Creating a DITA Content Key Reference](#) (*on page 2483*)

[Editing DITA Content References](#) (*on page 2485*)

[Working with Reusable Components](#) (*on page 2499*)

[Working with Content References](#) (*on page 2480*)

Creating a DITA Content Key Reference

DITA Content Key Reference

A DITA content key reference, or `@conkeyref`, is a mechanism for inserting a piece of content from one topic into another. It is a version of the [DITA content reference mechanism](#) (*on page 2481*) that uses [keys](#) (*on page 2471*) to locate the content to reuse rather than direct references to topics that contain reused content.

As with a *conref*, a *conkeyref* requires that the element to be reused has an `@id` attribute. It also requires the topic that contains the reusable content to be assigned a [key](#) (*on page 2471*) in a map. As with all uses of keys, you can substitute multiple maps or [use profiling](#) (*on page 2580*) to create multiple definitions of keys in a single map. This allows the same `@conkeyref` to pull in content from various sources, depending on how your build is configured. This can make it easier to create and manage sophisticated content reuse scenarios.

Creating a Content Key Reference

To create a content key reference (`@conkeyref`), follow these steps:

1. Make sure the topic that contains the reusable content is assigned a key in the *DITA map* and the element you want to reference has an *ID* assigned to it.
2. In **Author mode** ([on page 242](#)), place the cursor at the location where you want the reused content to be inserted.
3. Select  **Reuse Content** on the main toolbar (or from the **DITA** menu or **Reuse** submenu of the contextual menu). The **Reuse Content dialog box** ([on page 2488](#)) is displayed.
4. Select the **Key** radio button for the content source and use the  **Choose Key Reference** button to select the key for the topic that contains the reusable content (you can also select one from the drop-down list in the **Key** field). The elements that you can reference from the source are presented in the table in the middle of the **Reuse Content** dialog box.
5. Select the **Target ID** of the element (or elements) that you want to insert, and verify the content in the **Preview** pane. The `@id` value of the element that you select is automatically added to the **Reference to (conkeyref)** field.
6. Make any other selections you need in the **Reuse Content dialog box** ([on page 2491](#)). If you select multiple elements, the **Expand to (conrefend)** field is automatically filled with the `@id` value of the last element in your selection.
7. Click **Insert** or **Insert and close** to create the content reference.

Note:

If you are using **Text mode** ([on page 241](#)), when you insert a `@conkeyref` attribute, after you enter the first quote (`conkeyref="`), the **Content Completion Assistant** will list all the defined keys that you can select from. Also, after you select the key, the **Content Completion Assistant** will then list the element IDs from the referenced topic, allowing you to insert an anchor. Note that this only works for local files.

Using Copy/Paste Actions to Create a Content Key Reference

Oxygen XML Editor Eclipse plugin also includes support for creating content key references with simple copy/paste actions. When the DITA content is processed, the key references are resolved using key definitions from *DITA maps*. The copied content must be an entire DITA XML element with an ID attribute and the topic that contains the reusable content must have a key assigned in a *DITA map*. Also, the location in the document where you paste the element must be valid, although as long as the **Smart paste and drag and drop option** ([on page 155](#)) is selected in the **Schema-Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

To create a content key reference (`@conkeyref`) using copy/paste actions, follow these steps:

1. In the **DITA Maps Manager** view (on page 2337), make sure that the **Context** combo box (on page 2341) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager** (on page 2337), select **Edit Properties**, and enter a value in the **Keys** field.
3. In a topic with an assigned key, copy an entire DITA element that has an ID attribute assigned to it.
4. Place the cursor at a location where the copied element will be valid.
5. Select the **Paste as Content Key Reference** action from the  **Paste Special** submenu from the contextual menu.

Other Ways to Reuse Content

- You can use the **Components** tab in the **DITA Reusable Components** view (on page 2510) to easily insert content key references.
- You can also [insert reusable content using content references \(conref\)](#) (on page 2481).
- Other topics in this section include information about more specialized or advanced ways or reusing content, such as [code references](#) (on page 2496), the [conref push mechanism](#) (on page 2497), [variable text](#) (on page 2501), [key scopes](#) (on page 2503), and [branch filtering](#) (on page 2505).

Related Information:

[Reuse Content Dialog Box](#) (on page 2488)

[DITA Reusable Components View](#) (on page 2506)

[Creating a DITA Content Reference](#) (on page 2481)

[Editing DITA Content References](#) (on page 2485)

[Working with Reusable Components](#) (on page 2499)

[Working with Content References](#) (on page 2480)

Editing DITA Content References

When you reference reusable content using a `@conref` or `@conkeyref` attribute, by default, the content is grayed out in the document and can only be edited from the source document. To edit the source of the referenced content, click the  icon at the beginning of the inserted content. This will open the source document where you can edit the referenced content.

Oxygen XML Editor Eclipse plugin also includes some actions that allow you to quickly edit existing content references. When the element that contains a content reference (`@conref` or `@conkeyref`) is selected, the following actions are available in the **DITA** menu and the **Reuse** submenu of the contextual menu:

Edit Content Reference

This action is available for elements with a `@conref` or `@conkeyref` attribute. It opens the **Edit Content Reference** dialog box that allows you to edit the source location (or key) and source element of a content reference (or content key reference), and the reference details (`@conref/@conkeyref` and `@conrefend` attributes). For more information, see [Reuse Content Dialog Box](#) (on page 2488).

Replace Reference with Content

Replaces the referenced fragment (`@conref` or `@conkeyref`) at the cursor position with its content from its source. This action is useful if you want to make changes to the content in the currently edited document without changing the referenced fragment in its source location. If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

Replace All References with Content

Replaces all referenced fragments (`@keyref`, `@conref`, or `@conkeyref`) in the current document with the content. Attributes are preserved according to the following priority:

1. Attributes from the elements in the current document that reference other content are preserved except for attributes with a `-dita-use-conref-target` value.
2. Attributes from the referenced content are brought into the replaced elements in the current document except for `@id` attributes.

For *keyrefs* inside `<xref>` or `<link>` elements, the `@keyref` attribute is changed to an `@href` attribute, while the rest of the content for the *keyref* is replaced with its source content.

If the source content includes references to other topics/resources (*hrefs*), the operation also resolves those references relative to the new location.

Remove Content Reference

Removes the content reference (`@conref` or `@conkeyref`) inside the element at the cursor position.

Converting Conrefs to Conkeyrefs

Oxygen XML Editor Eclipse plugin includes a DITA refactoring operation called **Convert conrefs to conkeyrefs** that will find all *content references* (that reference content outside the current document) and convert them to *content key references*. You can also use it to quickly convert all *content references* in the current document or multiple documents at once.

To access the **Convert conrefs to conkeyrefs** operation, use one of the following methods:

Single Document Method

With the document opened in the editor, right-click anywhere in the main editing pane (or right-click the topic reference in the **DITA Maps Manager** (*on page 2337*)), go to the **Refactoring** submenu, and choose **Convert conrefs to conkeyrefs**.

Multiple Documents At Once Method

Select  **XML Refactoring** from the **XML Tools** menu (or from the **Refactoring** submenu when you right-click a document in the **Project Explorer** view ([on page 269](#)) or the **DITA Maps Manager** view ([on page 2337](#))). Then select **Convert conrefs to conkeyrefs** from the **DITA** section and click **Next**.

Either method will proceed to the **XML Refactoring Wizard**. If you used the **Multiple Documents At Once Method** ([on page 2487](#)), the wizard page allows you to choose a scope for the operation and some filtering options:

- **Scope** - Select from a variety of options to define the scope that will have resources affected by the operation. For example, you can choose to affect all resources in the **Project**, **All opened files**, **Current DITA map hierarchy**, or just the **Current file**.
- **Filters** section
 - **Include files** - Specifies files to be excluded from the operation. You can specify multiple files by separating them with commas and the patterns can include wildcards (such as * or ?).
 - **Restrict to known XML file types only** - Excludes non-XML file types from the operation.

If you used the **Single Document Method** ([on page 2486](#)), the scope will be the current file so the scope and filtering options are not displayed.

You can then use one of the following buttons to proceed with the operation:

Preview

You can use the **Preview** button to open a comparison panel where you can review all the changes that will be made by the refactoring operation before applying the changes.

Warning:

It is always recommended to use the **Preview** button to make sure the operation is not going to do something unexpected and after you click the **Finish** button, any **Undo** action will only revert changes on the current document.

Finish

When you use the **Finish** button, the operation will be processed and all *content references* will be converted to *content key references* (either all *content references* in the current document or all *content references* in all of the documents specified in the scope). The file name for each converted document is used as the value for its new key. However, the operation does NOT automatically add the key to the *DITA Map* ([on page 2678](#)), so you still need to manually *define each key in your DITA map* ([on page 2371](#)).

[Creating a DITA Content Key Reference \(on page 2483\)](#)

[Defining Keys in DITA Maps \(on page 2371\)](#)

Reuse Content Dialog Box

The **Reuse Content** dialog box provides a mechanism for reusing content fragments. DITA `@conref`, `@conkeyref`, and `@keyref` attributes can be used to insert references to reusable content. The `@conref` attribute stores a reference to another element and is processed to replace the referencing element with the referenced element. The `@conkeyref` attribute uses [keys \(on page 2471\)](#) to locate the content to reuse rather than direct references to the topic that contains the reusable content. The `@keyref` attribute also uses [keys \(on page 2471\)](#) and can be used to indirectly reference metadata that may have different values in various circumstances.

**Note:**

For a `conref` or `conkeyref`, to reference the content inside a DITA element, the source element must have an `@id` attribute assigned to it. The element containing the content reference acts as a placeholder for the referenced element. For more details about DITA `@conref` and `@conkeyref` attributes, go to <https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/conref.html>.

**Note:**

For the purposes of using a `@keyref`, keys are defined at map level and referenced afterward. For more information about the DITA `@keyref` attribute, go to <https://www.oxygenxml.com/dita/1.3/specs/langRef/attributes/thekeyrefattribute.html>.

Oxygen XML Editor Eclipse plugin [displays the referenced content \(on page 373\)](#) of a DITA content reference if it can resolve it to a valid resource. If you use URIs instead of local paths in your XML documents and your DITA-OT transformation needs an [XML Catalog \(on page 2683\)](#) to map the URIs to local paths, you need to [add the catalog in Oxygen XML Editor Eclipse plugin \(on page 594\)](#). If the URIs can be resolved, the referenced content is displayed in **Author** mode and in the transformation output.

In **Author** mode, a reference to reusable content (`@conref`, `@conkeyref`, or `@keyref`) can easily be inserted at the cursor position by using the **Reuse Content** dialog box. It can be opened with any of the following methods:

- Click the  **Reuse Content** action on the main toolbar.
- In the contextual menu of the editing area, go to **Reuse** >  **Reuse Content**.
- Go to **DITA** >  **Reuse Content**.

Your selection at the top of the dialog box for choosing the content source determines whether Oxygen XML Editor Eclipse plugin will insert a `@conref`, `@conkeyref`, or `@keyref`.

If you select **Location** for the content source, a *content reference* (`@conref`) will be inserted. If you select **Key** for the content source, keys will be used to insert a *content key reference* (`@conkeyref`) or a *key reference* (`@keyref`).

Content Reference (`@conref`) Options Using the Reuse Content Dialog Box

Figure 617. Reuse Content Dialog Box (with the Default Insert Content Reference Options Displayed)

Choose the content source Section

When **Location** is selected for the content source, a *content reference* (`@conref`) will be inserted. Here you can specify the path of the topic that contains the content you want to reference.

The dialog box offers the following options:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference to (conref)

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the `@conref` attribute to be inserted. However, you can edit this value if need be.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor Eclipse plugin automatically fills this text field with the `@id` value of the last element in your selection. This value will be inserted as a `@conrefend` attribute, defining the end of the *conref* range.

Content Key Reference (@conkeyref) Options Using the Reuse Content Dialog Box

Figure 618. Insert Content Key Reference Options

Choose the content source:

Fallback to (conref):

Reference to range end (conrefend):

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the *root map* (on page 2682) (you can also select one from the drop-down list in the **Key** field).

Note:

If the current *DITA map* is not selected as the *root map*, no keys will be listed.

Tip:

You can also use the **DITA Reusable Components view** (on page 2506) for similar purposes.

Figure 619. Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to [select a root map \(on page 2353\)](#).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
 - **Key** - The name of the key (the value of the `@keys` attribute).
 - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
 - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
 - **Definition Location** - The name of the [DITA map \(on page 2678\)](#) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a *content key reference* (`@conkeyref`), select the key that contains the content you want to reference. Notice that the file path is shown in the **Href** column. Keys that do not have a value in the **Href** column are for referencing metadata with a `@keyref` attribute. Therefore, to insert a `@conkeyref`, you need to select a key that does have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that is defined as a *content key reference* has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `@conkeyref`:

Select an element from the content source Section

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference. You can select multiple contiguous elements to reference a block of content.

Preview Pane

Displays the content that will be references. If you select multiple elements in the element table, the content from all the selected elements is displayed.

Source Pane

Displays the source code of the element to be referenced.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that references a DITA resource, you will notice that **conkeyref** value is automatically selected.

Reference to

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the `@conkeyref` attribute to be inserted. However, you can edit this value if need be.

Fallback to (conref)

You can select this option to define a `@conref` attribute to be used as a fallback to determine the content reference relationship if the specified *conkeyref* cannot be resolved.

Reference to range end (conrefend)

If you select multiple elements (of the same type) in the element table, Oxygen XML Editor Eclipse plugin automatically fills this text field with the `@id` value of the last element in your selection. This value will be inserted as a `@conrefend` attribute, defining the end of the *conkeyref* range.

Choose the content source Section

When **Key** is selected for the content source, you can use keys to reference content. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the *root map* (on page 2682) (you can also select one from the drop-down list in the **Key** field).

Note:

If the current *DITA map* is not selected as the *root map*, no keys will be listed.

Tip:

You can also use the **DITA Reusable Components view** (on page 2506) for similar purposes.

**Figure 621. Choose Key Dialog Box**

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to [select a root map \(on page 2353\)](#).
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for a specific key.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
 - **Key** - The name of the key (the value of the `@keys` attribute).
 - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
 - **Href** - Keys that are defined with a value in an `href` attribute have that href value listed in this column.
 - **Definition Location** - The name of the [DITA map \(on page 2678\)](#) where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

To insert a *key reference* to metadata (`@keyref`), select the key you want to reference. Keys that do not have a value in the **Href** column are for referencing metadata with a `@keyref` attribute. Therefore, to insert a `@keyref`, you need to select a key that does not have a value (file path) in the **Href** column.

After you select a key, click **OK** to return to the **Reuse Content** dialog box.

When a key that references metadata has been selected, the **Reuse Content** dialog box offers the following additional options for inserting a `@keyref`:

Select an element from the content source Section

This section is not used when referencing metadata.

Reference details Section

Reference type

The type of reference that will be inserted. If you selected a key that does not reference a DITA resource, you will notice that **keyref** value is automatically selected.

Reference to

Oxygen XML Editor Eclipse plugin automatically fills this text field with the value of the `@keyref` attribute to be inserted.

Element name

Oxygen XML Editor Eclipse plugin automatically selects the element that is most commonly used for the selected type of key reference, but you can use the drop-down list to choose another element to use for the reference.

Finalizing Your Content Reference Configuration

Once you click **Insert** or **Insert and close**, the configured content reference is inserted into your document.

Tip:

You can easily insert multiple content references by keeping the **Reuse Content** dialog box opened, using the **Insert** button.

[DITA Reusable Components View \(on page 2506\)](#)

[Working with Content References \(on page 2480\)](#)

Working with Code References

Code References

The DITA `<coderef>` element can be used to reference an external file that contains literal code. This is especially useful if you need to reference code from an external source that may occasionally change. Another advantage is that you don't have to convert illegal characters into their character equivalents. When the `<coderef>` is processed, the referenced code file is imported and delimiting characters (such as `<` or `&`) are displayed as standard text, rather than treated as XML markup.

For more information about code references, see [DITA 1.3 Specification: Coderef](#).

Example of using a Coderef

```
<p>This code is an example of how to use a coderef.</p>  
<codeblock><coderef href="MyExternalCode.xml" /></codeblock>
```

Defining Line Ranges

DITA-OT provides additional code reference processing support that allows you to define line ranges in case you only want to reference certain parts of the external file, rather than the whole file.

For information and examples of how to define line ranges, see [DITA Open Toolkit Documentation: Extended Code Reference Processing](#).

Working with the Conref Push Mechanism

Content Reference Push Mechanism

The usual method of using content references pulls element content from a source element and inserts it in the current topic. DITA 1.2 introduced an alternative method of content referencing, allowing element content to be pushed, or injected, from a source topic to another topic without any special coding in the topic where the content will be re-used. This technique is known as a content reference *push* mechanism (*conref push*).

The *conref push* mechanism requires elements in the target topic (the topic where the content is to be pushed) to have ID elements, as the push mechanism inserts elements *before* or *after* a named element, or *replaces* the named element. Assuming the source topic is included in the *DITA map (on page 2678)*, the *conref push* will be processed during the publishing stage for the *DITA map*.

Example of a Conref Push Scenario

An example of a scenario where a *conref push* would be useful is where a car manufacturer produces driver manuals that are distributed to various regions with their own specific regulations and certain sections need to be customized by the local car dealers before publishing. The local dealer could use a *conref push* technique to insert specific content without modifying the manufacturer-supplied content.

Push Current Element Action

Oxygen XML Editor Eclipse plugin includes an action that allows you to easily reference content with a *conref push* mechanism. The **Push Current Element** action is available in the **DITA** menu and in the **Reuse** subfolder of the contextual menu when editing in **Author** mode. Selecting this action opens the **Push current element** dialog box that allows you to select a target resource and element, and where to insert the current element content.

Figure 622. Push Current Element Dialog Box

Choose the target resource:

Location: file:/D:/projects/userguide-private/DITA/topics/author-dita-extensions.dita

Key:

Select the target element:

Target ID	Element	Content	Topic ID
bold-dlentry	dlentry	Bold Surrounds the selected text with a b tag. You can ...	author-dita-ex...
italic-dlentry	dlentry	Italic Surrounds the selected text with an i tag. You can...	author-dita-ex...
underline-dlentry	dlentry	Underline Surrounds the selected text with a u tag. You...	author-dita-ex...

B Bold

Surrounds the selected text with a b tag. You can use this action on multiple non-contiguous selections.

Preview Source

Push action:

replace the target element

push before

push after

This dialog box allows you to configure the following options for the *conref push* action:

Choose the target resource

Allows you to select a **Location** URL or a **Key** for the target resource and the table in the next section of the dialog box will be populated using the information from the specified resource.

Select the target element

The table in this section contains the available elements (identified by their ID) that can be replaced by, or pushed before/after, the current element, according to the push action.

Push action

Allows you to choose one of the following options for where you want to insert the current element content:

replace the target element

The target element will be replaced with the current element content.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `push replace` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

push before

The current element content will be inserted before the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushbefore`. Another element with the same name and class as the target element will be inserted in the document after the current element. The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

push after

The current element content will be inserted after the specified target element in the target resource.

On the technical side, the value of the `@conaction` attribute in the current element will be set to `pushafter`. Another element with the same name and class as the target element will be inserted in the document before the current element.

The new element will have the `@conaction` attribute set to `mark` and the `@conref` or `@conkeyref` attribute will be set to the specified reference.

You can also use the **Preview** panel to view the content that will be pushed and the **Source** panel to see the XML code for the content to be pushed. After you click **OK**, the *conref push* mechanism is inserted in the current document. The changes in the target resource will be processed when you transform the *DITA map*.

[The DITA Style Guide Best Practices for Authors: The Conref Push Technique](#)

[Doctales - Content Reference Push](#)

Working with Reusable Components

In DITA, the content of almost any element can be made reusable simply by adding an `@id` attribute to the element. The DITA content reference mechanism can reuse any element with an *ID*. However, it is not considered best practice to arbitrarily reuse pieces of text from random topics due to the difficulties this creates in trying to manage it. It also creates the possibility of authors deleting or changing content that is reused in other topics without being aware that the content is reused.

To prevent these types of problems, you can create reusable components to manage a separate set of topics that contain topics designed specifically for reuse. Then, all of your reusable content can be referenced from the reusable components and if the content needs to be updated you only need to edit it in one place.

Oxygen XML Editor Eclipse plugin allows you to select content in a topic, create a reusable component from it and reference that component in other locations by using the **Create Reusable Component** (*on page 2500*) and **Insert Reusable Component** (*on page 2501*) actions.

Related Information:

[DITA Reusable Components View](#) (*on page 2506*)

Creating a Reusable Content Component

Oxygen XML Editor Eclipse plugin makes it easy to create a reusable component from existing topic content.

**Note:**

To ensure that the topic file that contains the reusable component is a valid container for the reusable content component, Oxygen XML Editor Eclipse plugin attempts to use the same schema information in the current topic for the file that contains the reused component. If it cannot create a valid instance of the reused content file with this approach, the application creates a specialized topic type automatically. This specialization is designed to make sure that the content is compatible with the topic type that it is created from. You can make changes to the configuration file (`OXYGEN_INSTALL_DIR\frameworks\dita\reuse\reuse_configuration.properties`) or override it from a framework extension to control if the created reusable component file should be based on the currently edited topic or it should be an automatically created DITA specialization topic.

Follow these steps to create a reusable component:

1. In **Author** mode, select the content you want to make into a reusable component (or place the cursor inside an element you want to reuse).
2. Select the **Create Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
The **Create Reusable Component** dialog box is displayed.
3. Use the **Reuse Content** drop-down list to select the scope of the content to be made reusable. It allows you to select how much of the current content you want to make reusable. The choices presented include the element at the current cursor position and its ancestor elements.
4. Add a description. This is used as a description for the reusable component, but is not part of the reused content. It is just to help you identify the reusable content and will not become part of your output.
5. If the **Replace selection with content reference** option is selected, the selection in the current topic will be replaced with a content reference (`@conref`) that points to the new reusable component. If multiple elements are selected (for example, multiple steps or list items), the selection is replaced with a content reference range (`@conref` and `@conrefend`).
6. Select a file name and location to save the topic containing the reusable component and click **Save**. It is considered best practice to save or store reusable components in an area set aside for that purpose.

A file is created that contains **one** reusable component. You can reference the reused content in other topics by using a [content reference \(on page 2481\)](#) or [content key reference \(on page 2483\)](#). Also, if the **Replace selection with content reference** option was selected, Oxygen XML Editor Eclipse plugin replaces the selected content with a content reference that will be displayed in your current topic with a gray background and it can only be edited in the source file (the new reusable component). To edit the source file, click the  **Edit Content** icon at the beginning of the content reference.

Inserting a Reusable Content Component

Oxygen XML Editor Eclipse plugin includes an **Insert Reusable Content** action that allows you to easily insert a reusable content component that you [created using the Create Reusable Component action \(on page 2500\)](#).

CAUTION:

This action is only designed to insert reusable components created using the Oxygen XML Editor Eclipse plugin **Create Reusable Component** action. It assumes certain things about the structure of the reusable content file that may not be true of reusable content created by other methods and it may not provide the expected results if used with content that does not have the same structure.

The **Insert Reusable Content** action creates a DITA `@conref` to insert the content, and creates a parent element for the `@conref` attribute based on the type of the reusable element in the reusable component file. This action ensures that the correct element is used to create the `@conref`. However, that element must still be inserted at a point in the current topic where that element type is permitted.

To insert a reusable component that was created using the **Create Reusable Component** action, follow these steps:

1. Place the cursor at the insertion point where you want the reusable component to be inserted.
2. Select the **Insert Reusable Component** action that is available in the **DITA** menu or the **Reuse** submenu of the contextual menu.
The **Insert Reusable Component** dialog box is displayed.
3. Locate the reusable content file that you want to insert its content.
4. If you select **Content reference** in the **Insert as** drop-down list, the action will add a `@conref` attribute to the DITA element at the current location. If you select **Copy** in the drop-down list, the content of the reusable component file will simply be pasted at the current location (assuming the content is valid at the current location).
5. Click **Insert** to perform the action.

Working with Variable Text in DITA

You may often find that you want a certain piece of text in a topic to have a different value in various circumstances. For example, if you are reusing a topic about a feature that is shared between several products, you might want to make the name of the product a variable so that the correct product name is used in the manual for each product.

For example, you might have a sentence like this:

```
The quick-heat feature allows [product-name] to come up to temperature quickly.
```

You need a way to substitute the correct product name for each product.

One way to do this would be to use conditional profiling to provide conditional values using the `@product` profiling attribute, as in the following example:

```
<p>The quick-heat feature allows
  <ph product="basic">Basic Widget</ph>
  <ph product="pro">Pro Widget</ph>
to come up to temperature quickly.</p>
```

However, this approach means that you are repeating the product names over and over again everywhere the product name is mentioned. This is time consuming for authors and will create a maintenance problem if the product names change.

The alternative is to use a key reference, as in the following example:

```
<p>The quick-heat feature allows <ph keyref="product"/>
to come up to temperature quickly.</p>
```

The definition of the key reference determines the name of the product:

```
<keydef keys="product" product="basic">
  <topicmeta>
    <keywords>
      <keyword>Basic Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
<keydef keys="product" product="pro">
  <topicmeta>
    <keywords>
      <keyword>Pro Widget</keyword>
    </keywords>
  </topicmeta>
</keydef>
```

When the content is published, the value defined in the *product* key will be inserted for each product.

Inserting a Keyref

To insert a [defined key reference \(on page 2371\)](#) into a document in Oxygen XML Editor Eclipse plugin **Author** mode, use one of the following methods (the method you choose simply depends on which Oxygen XML Editor Eclipse plugin feature you prefer):

• **DITA Reusable Components View Method**

Use the **DITA Reusable Components** view (*on page 2506*) to insert a *variable reference* to the **defined key** (*on page 2371*). For example, in the **Keys** tab, find a key defined as a variable and double-click it. Oxygen XML Editor Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key

• **Code Template Method**

Add the source code pattern of the **defined key** (*on page 2371*) to a **code template** (*on page 122*) so that it appears in the list of proposals in the **Content Completion Assistant** (*on page 2677*). For example, the code pattern could be something like `<ph keyref="product">` for defined *product* key.

• **Reuse Content Dialog Box Method**

Use the  **Reuse Content** action on the main toolbar to open the **Reuse Content** dialog box (*on page 2488*). Use the **Key** option to select a key that is defined as a **variable** (*key reference to metadata*) (*on page 2494*) and Oxygen XML Editor Eclipse plugin will insert the variable as a `<ph>` element with a `@keyref` attribute that references the specified key.

• **Manual Method**

Manually insert the `@keyref` attribute using the attributes editor as follows:

1. Press **Enter** and select a DITA element (for example, `<ph>`) that supports the `@keyref` attribute.
2. Select  **Edit Attributes** from the contextual menu to bring up the **attributes editor** (*on page 407*).
3. In the **Name** field, select **keyref**.
4. In the **Value** field, select or enter the name of the **defined key** (*on page 2371*).

[DITA Reusable Components View](#) (*on page 2506*)

[Defining Keys in DITA Maps](#) (*on page 2371*)

[Doctales - Key Reference \(keyref\)](#)

Working with DITA 1.3 Key Scopes

DITA 1.3 includes the possibility of using a concept called *Key Scopes* (or *scoped keys*). It allows you to reuse a topic in multiple places within the same *DITA map* (*on page 2678*), but with slightly different content in each instance.

Key Scopes Use-Case

Suppose that you develop a software product and you have a topic in your user guide that explains how to install your product on a Windows operating system. Suppose that the steps are exactly the same for installing it on Linux and the only difference is the name of the operating system. Therefore, it would be helpful if you could reuse the exact same content in two different topics, but with the name of the operating

system different in each instance. In DITA 1.2, this is not possible since keys can only be resolved to a single value. However, with the DITA 1.3 *Key Scopes* mechanism, you can define multiple values for the same key depending on the context.

How to Use Key Scopes in Oxygen XML Editor Eclipse plugin

To use DITA 1.3 key scopes in Oxygen XML Editor Eclipse plugin, follow these steps:

1. Define the keys ([on page 2471](#)) to be used in multiple places within your *DITA map*.
2. For each particular topic that contains the keys, define the key scopes:
 - a. Right-click the topic in the **DITA Maps Manager** ([on page 2337](#)) and select  **Edit properties**.
 - b. In the **Keys** tab ([on page 2375](#)), enter a value (or multiple values) in the **Key scopes** field.
 - c. Click **OK** to save your changes.
3. Save the *DITA map*.

Result: In the **DITA Maps Manager** ([on page 2337](#)), you can now see the key scopes in brackets and when you open each topic reference.

Figure 623. Key Scopes in DITA Maps Manager

The content will also be expanded in **Author** mode according to the context of the key scope you defined for that particular topic. Also, when you transform the *DITA map*, the scoped keys will be reflected in the published content.

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the [DITA 1.3 Key Scopes - Next Generation of Reuse](#) blog post.

[Oxygen XML Blog: DITA 1.3 Key Scopes - Next Generation of Reuse](#)

[Oxygen Video Tutorial: DITA 1.3 \(Key Scopes, Branch Filtering\)](#)

[Doctales - Key Scopes](#)

Working with DITA 1.3 Branch Filtering

DITA 1.3 allows you to use a mechanism called *Branch Filtering* that enables you to set filtering conditions for specific branches of a *DITA map* (on page 2678). This makes it possible for multiple conditional profiles to be applied within a single publication, each time with a different filter.

Branch Filtering Use-Case

Suppose that you sell two models of a mobile phone and you need to create a brochure for each model. You want both brochures to have the same structure and most of the content is the same for both brochures. The only differences are in the values for certain details (for example, the model name, size dimensions, battery life, etc.) Therefore, it would be helpful if you could use the same topic and reference it twice in the same map, with each reference using different filtering conditions. In DITA 1.2, this is not possible since you can only apply one DITAVAL filter to a map. However, with the DITA 1.3 *Branch Filtering* mechanism, you can reuse content multiple times within the same map, each time using different filters.

How to Use Branch Filtering in Oxygen XML Editor Eclipse plugin

To use DITA 1.3 branch filtering in Oxygen XML Editor Eclipse plugin, follow these steps:

1. The support for DITA 1.3 must be enabled in the *DITA preferences page* (on page 82).
2. Assuming you have already defined your profiling attributes (on page 443), create a DITAVAL filter file (on page 2603).
3. Insert a reference to the DITAVAL filter file in the *DITA map*:
 - a. Right-click the *DITA map* reference in the **DITA Maps Manager** (on page 2337) and select **Append Child > DITAVAL Reference**.
 - b. Select the DITAVAL file.
 - c. Click **Insert and Close**.
4. Save the *DITA map*.

Result: You can now see the **ditaval** files referenced in the **DITA Maps Manager** (on page 2337) and when you transform the *DITA map*, filtered content will be reflected in the published output.

Figure 624. Branch Filtering in DITA Maps Manager

Resources

- You can find a more detailed example and download samples for reuse possibilities based on key scopes in the [DITA 1.3 Branch Filtering - Next Generation of Reuse](#) blog post.
- You can also watch our [DITA 1.3 video tutorial](#) to see how branch filtering can be used in Oxygen XML Editor Eclipse plugin.
- For more information about branch filtering and other advanced DITA reuse concepts, watch our Webinar: [Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies](#).

[Oxygen XML Blog: DITA 1.3 Branch Filtering - Next Generation of Reuse](#)

[Oxygen Video Tutorial: DITA 1.3 \(Key Scopes, Branch Filtering\)](#)

DITA Reusable Components View

The **DITA Reusable Components** view is helpful if you use a large number of keys or reusable components in your DITA project. It collects all of the keys and reusable components that are defined in the [root map \(on page 2682\)](#) and presents them in a side view where you can easily locate and insert references to them. It recollects the keys anytime the [root map is changed \(on page 2353\)](#) or you switch the editor focus to a different file.

If the view is not displayed, it can be opened by selecting it from **Window > Show View > Other**. By default, it appears in the bottom-right section of the editor.

It includes the following tabs:

- **Keys (on page 2507)** - Displays all the *keys* that are defined in the [root map \(on page 2682\)](#) and provides ways to easily insert references to them as cross reference links, key references, or variables. It includes a search field, some filtering and sorting options to help you find particular keys, and some contextual menu actions. It also supports drag and drop actions and double-clicking a key is the fastest way to insert a reference.

Note:

If the keys are gathered from peer DITA maps (used in cross publication references), the keys that define variables are not presented.

- **Components (on page 2510)** - Displays all the *reusable components* found in the [root map \(on page 2682\)](#) and provides ways to easily insert them as content references or content key references. To determine which components to display in this tab, Oxygen XML Editor Eclipse plugin looks for any *topicref* in the [root map \(on page 2682\)](#) that is marked as *resource-only* and then looks for elements

with an assigned `@id` attribute value. This tab includes a search field, some filtering options, and some simple links and contextual menu actions to quickly insert references or open their source file. It also supports drag and drop and double-clicking actions.

Keys Tab

The **DITA Reusable Components** view collects all the *keys* that are defined in the current *root map* (on page 2682) and displays them in the **Keys** tab. This tab has two view modes. The default *tiles* style view mode and a *table* style view mode.

Tiles Mode

The default *tiles* mode displays the keys as blocks (cards). The advantage of this display mode is that more information about each particular key can be seen even when the view is sized with a small width. Each block (card) displays the name of the key (the value of the `@keys` attribute), followed by its description and/or `@href` value, then followed by the name of the DITA map file where the key is defined.

Figure 625. DITA Reusable Components View - Keys Tab (Default tiles mode)

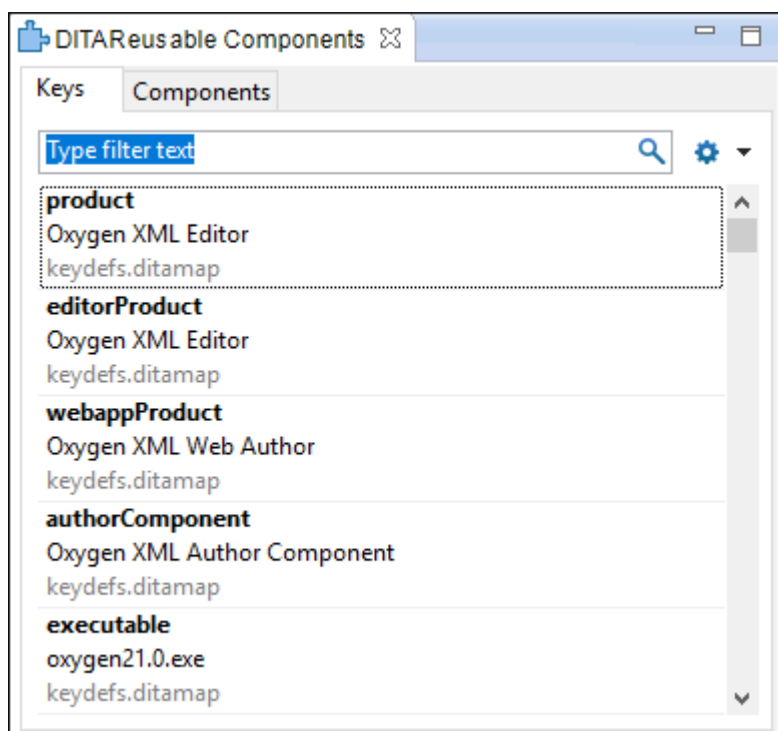

Table Mode

You can switch to a *table* style display mode by selecting the **Table mode** toggle action from the  **Settings** menu. The advantage of this display mode is that more keys can be listed at once. In this mode, keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in the **Description** column, while keys that are defined with a value in an `@href` attribute have that href value listed in the **Href** column.

Figure 626. DITA Reusable Components View - Keys Tab (Table mode)

Both display modes in the **Keys** tab include a variety of features and options:

Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for specific keys.

Sorting

Tiles Mode: In the default *tiles* display mode, to sort the keys alphabetically in ascending order, select **Sort by key name** from the  **Settings** menu.

Table Mode: In the *table* display mode, the following columns can be sorted by clicking the heading:

- **Key** - The name of the key (the value of the `@keys` attribute).
- **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
- **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
- **Definition Location** - The name of the *DITA map (on page 2678)* where the key is defined.

Double-Click Mechanism

You can double-click any key listed in this tab to insert a key reference at the current cursor position or surrounding the current selection.

- If the selected key points to an `@href` value, it is inserted as a **cross reference link (*xref*) (on page 2515)**.
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a **variable reference (*ph*) (on page 2501)**.

Drag and Drop Mechanism

You can drag a key from this tab and drop it in the main editor to insert a key reference at the current cursor position.

- If the selected key points to an `@href` value, it is inserted as a [cross reference link \(*xref*\) \(on page 2515\)](#).
- If the selected key is a reference to an image, it is inserted as an `<image>` element.
- If the selected key does not have an associated `@href`, it is inserted as a [variable reference \(*ph*\) \(on page 2501\)](#).

Contextual Menu Actions

Insert as Link

Inserts a [cross reference link \(*xref*\) \(on page 2515\)](#) to the selected key at the current cursor position or surrounding the current selection.

Insert as Variable

Inserts a [variable reference \(*ph*\) \(on page 2501\)](#) to the selected key at the current cursor position or surrounding the current selection. However, if the selected key is a reference to an image, this action inserts the key reference in an `<image>` element.

Insert as Keyref

Presents a submenu with all the elements that can be inserted at the current cursor position. Selecting an element will insert that element at the current cursor position or surrounding the current selection with a `@keyref` attribute and its value set to the selected key.

Insert as Figure

Available if the selection is an image, it inserts the image inside a figure element (`<fig>`). Note that the `<title>` element of the inserted figure will be empty.

Rename Key

Opens a [refactoring wizard \(on page 611\)](#) where you can easily rename the key and define the scope of the operation. It also updates all references to it.

Notes:

- This action does not work on DITA 1.3 key scopes.
- This action is only available if the DITA map opened in the **DITA Maps Manager** is also selected as the **Root map**.

Go to Definition

Opens the DITA map where the key is defined.

Search References

Searches for all references to the selected key in the entire DITA map structure.

Group by Definition Location (Available in Table mode only)

A toggle action that can be used to group (and sort) all the keys based on the value in the **Definition Location** column.

Settings Menu

This menu includes the following options:

Filtering Options

- **Show all** - Shows all defined keys found in the current *root map* (on page 2682).
- **Show only variables** - Filters the keys to show only those defined as *variable references* (on page 2501).
- **Show only maps and topics** - Filters the keys to show only those that reference DITA maps or topics.
- **Show only multimedia resources** - Filters the keys to show only those that reference multimedia resources (such as images).
- **Show only external resources** - Filters the keys to show only those that reference external resources (such as web links).

Sort by key name (Available in Tiles mode only)

Sorts the keys alphabetically in ascending order.

Table mode

A toggle action that switches between the *table* and *tiles* display modes.

Components Tab

The **DITA Reusable Components** view collects all the topics from the current *root map* (on page 2682) that are marked as *resource-only*, then collects the reusable components from those topics, and displays them in the **Components** tab. To set a topic as *resource-only*, the `<topicref>` in the DITA map file must have a `@processing-role` attribute set like this:

```
<topicref href="topics/randomize-xml-content.dita" processing-role="resource-only" />
```

The **DITA Reusable Components** view considers topic references that contain `processing-role="resource-only"` to be candidates to contain reusable components. The reusable components inside these topics are collected from all elements that have an *ID* specified. These reusable components are displayed in the **Components** tab along with the file name and the specific names of the elements that contain an *ID* attribute.

Figure 627. DITA Reusable Components View - Components Tab

The **Components** tab includes the following features and options:

Search Filter

You can enter text in the filter field at the top of this tab to filter the list and search for specific content inside the list of reusable components. This field supports many of the [Lucene-based search patterns](#), such as wildcards (* or ?), boolean operators (**AND**, **OR**, **NOT**), fuzzy searches (~), boosting searches (^), and more.

Settings Menu

This menu includes the following options:

Compact Mode

You can use this toggle action to switch the display for the **Components** tab to a compact visualization mode. When switched to **Compact mode**, fewer details are shown for each component, but more components are displayed in the view.

Reindex

You can use this action force a re-indexing of the reusable components.

Show Elements of Type

You can use this drop-down list to select specific types of elements to be displayed in the list of components. This can help you narrow down the list of possible source elements that you can select.

Source File(s)

You can use this combo box to search for specific source files (the topics that contain reusable components) or select a file from its drop-down list. You can also use wildcards (such as * or ?) in this field.

Double-Click Mechanism

You can double-click any reusable component listed in preview window in this tab to insert it as a content reference or content key reference at the current cursor position or replace the current selection.

- If the parent topic of the selected component has a key defined, it is inserted as a [content key reference \(*conkeyref*\) \(on page 2483\)](#).
- If the parent topic of the selected component does not have a key defined, it is inserted as a [content reference \(*conref*\) \(on page 2481\)](#).

Drag and Drop Mechanism

You can drag a reusable component from the preview window in this tab and drop it in the main editor to insert a content reference or content key reference at the current cursor position.

- If the parent topic of the selected component has a key defined, it is inserted as a [content key reference \(*conkeyref*\) \(on page 2483\)](#).
- If the parent topic of the selected component does not have a key defined, it is inserted as a [content reference \(*conref*\) \(on page 2481\)](#).

Hover and Click Actions

If you hover over a component shown in the preview window, you have access to the following link actions:

Insert

Inserts the component as a content reference or content key reference at the current cursor position or replaces the current selection. If the parent topic has a key defined, it is inserted as a [content key reference \(*conkeyref*\) \(on page 2483\)](#). Otherwise, it is inserted as a [content reference \(*conref*\) \(on page 2481\)](#).

Open

Opens the source file that contains the reusable component.

Contextual Menu Actions

Insert Content Reference

Inserts the component as a [content reference \(*conref*\) \(on page 2481\)](#) at the current cursor position or replaces the current selection.

Insert Content Key Reference

Inserts the component as a [content key reference \(*conkeyref*\) \(on page 2483\)](#) at the current cursor position or replaces the current selection. This action is only available if the parent topic has a key defined.

Go to Definition

Opens the source file that contains the reusable component.

Search References

Searches for all references to the selected component in the entire [DITA map \(on page 2678\)](#) structure.

[Short Video Clip: Learn DITA Editing with Oxygen - Add a Content Reference Using the DITA Reusable Components View](#)

Linking in DITA

DITA provides support for various types of linking between topics, some of which is automated, while others are specified by the author. Oxygen XML Editor Eclipse plugin provides support for all forms of linking in DITA.

Linking Between Parent, Child, and Sibling Topics

A [DITA map \(on page 2678\)](#) creates a hierarchical relationship between topics. That relationship map expresses a narrative flow from one topic to another, or it may be used as a classification system to help the reader find topics based on their classification, without creating a narrative flow. Since there may be various types of relationships between topics in a hierarchy, you may want to create links between topics in a variety of ways. For instance, if your topics are supposed to be organized into a narrative flow, you may want to have links to the next and previous topics in that flow. If your topics are part of a hierarchical classification, you may want links from parent to child topics, and vice versa, but not to the next and previous topics.

Parent, child, and sibling links are created automatically by the DITA output transformations (and may differ between various output formats). The kinds of links that are created are determined by the DITA [collection-type attribute \(on page 2377\)](#).

In-Line Linking in the Content of a Topic

DITA supports linking within the text of a topic using the `<xref>` element. The destination of the link can be expressed directly using the `@href` attribute or indirectly using the `@keyref` attribute. If you use the `@keyref`

attribute, you link to a key rather than directly to a topic. That key is then assigned to a topic in a map that includes that topic. This means that you can change the destination that a key points to by editing the key definition in the map or by substituting another map in the build.

Linking Between Related Topics

In addition to the relationships between topics that expressed by their place in the hierarchy of a map, a topic may be related to other topics in various ways. For instance, a task topic may be related to a concept topic that gives the background of the task, or to a reference topic that provides data needed to complete the task. Task topics may also be related to other tasks in a related area, or concepts to related concepts.

Typically, they are grouped in a list at the end of the topic, although this depends on the behavior of the output transformation. DITA provides two mechanisms for expressing relationships between topics at the topic level: the **Related Links** section of a topic and relationship tables in maps. To add related links, select **Related Link to Topic**, **Related Link to File**, or **Related Link to Web Page** from the  **Link** drop-down menu from the toolbar (or the  **Link** submenu in the contextual menu or **DITA** menu).

Tip:

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the **Open/Find Resource** view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Managing Links

Links can break for a variety of reasons. The topic that a link points to may be renamed or removed. A topic may be used in a map that does not include a linked topic. A topic or a key may not exist in a map when a particular profile is applied. The **DITA Maps Manager** (*on page 2337*) provides a way to **validate all the links in the documents that are included in the map** (*on page 2382*). This can include validating all the profiling conditions that are applied.

Related information

[Short Video Clip: Learn DITA Editing with Oxygen - Various Ways to Insert Links](#)

Hierarchical Linking in DITA Maps

To create hierarchical linking between the topics in a *DITA map* (*on page 2678*), you set the appropriate value of the `@collection-type` attribute on the map. See the [DITA documentation](#) for the meaning of each of the values of the `@collection-type` attribute.

Note:

Publishing scripts determine when and how to create hierarchical links. The `@collection-type` attribute does not force a particular style of linking. Instead, it declares what the nature of the relationship is between the topics. The publishing scripts use that information to determine how to link topics.

Scripts for different types of media might make the determination depending on what is appropriate for the particular type of media. You can provide additional instructions to the scripts using the `@linking` attribute.

To add the `@collection-type` to an item in a map:

1. Right-click the topic and choose  **Edit Properties**. The **Edit Properties** dialog box is displayed.
2. In the **Attributes** tab, select the appropriate value from the **Collection type** drop-down list.
3. You can use the **Other attributes** table to add a value to the `@linking` attribute.

Linking in DITA Topics

Direct Links

Inline links can be created DITA topics using the `<xref>` element. The destination of the link can be expressed directly by using the `@href` attribute and the target can be another topic or a specific element within the other topic, another location within the same topic, a file, or a web link. You can also create direct *related links* to topics, files, or websites in a DITA topic using the `<related-links>` element.

Indirect Links Using Keys

The destination of the link can also be expressed indirectly by using *keys (on page 2471)* to create either inline links or *related links* (with the `@keyref` attribute). By using keys, you avoid creating a direct dependency between topics. This makes links easier to manage and can make it easier to reuse topics in various publications. It can also be helpful in verifying the completeness of a publication, by ensuring that a publication map provides a key definition for every key reference used in the content.

Links based on keys require two pieces:

- Key Definition - Assigns a key to a topic so that other topics can link to it. For more information, see [Defining Keys in DITA Maps \(on page 2371\)](#).
- Key Reference - Created in an `<xref>` element and specifies the key to link to.

The key reference points to a key definition, and the key definition points to a topic. Key definitions are created in maps, as an element on the `<topicref>` element that points to a topic. This allows you to assign a particular key to one topic in one map and to another topic in another map. When a topic that links to that key is used in each of these maps, the links work correctly in both maps.

Inserting a Link in Oxygen XML Editor Eclipse plugin

To insert a link in **Author mode (on page 242)**, use the actions available in the  **Link** drop-down menu from the toolbar (or the  **Link** submenu in the contextual menu or **DITA** menu). You can choose between the following types of inline links:

Cross Reference

Opens the **Cross Reference (xref)** dialog box (*on page 2517*) that allows you to insert a cross reference link to a target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. Depending on the context where it is invoked, the action inserts one of the following two elements:

- `<xref>` - Used to link to other topics or another location within the same topic and points to the target using the `@href` or `@keyref` attribute.
- `<fragref>` - A logical reference to a fragment element within a syntax diagram and points to the target using the `@href` or `@keyref` attribute.

File Reference

Opens a dialog box that allows you to insert a link to a target non-DITA file resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select **Location** for the target, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the  **Choose Key Reference** button to use the **Choose Key** dialog box (*on page 2518*).

Web Link

Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your *DITA map* structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute. If you select **URL** for the target resource, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the  **Choose Key Reference** button to use the **Choose Key** dialog box (*on page 2518*).

Related Link to Topic

Opens the **Cross Reference (xref)** dialog box (*on page 2517*) that allows you to insert a link to a target DITA resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a *related-links* element.

Tip:

You can use the **Find Similar Topics** action (available in the contextual menu or **DITA** menu) to quickly find related topics that can be added as related links. It opens the

Open/Find Resource view and performs a search using text content from the `<title>`, `<shortdesc>`, `<keyword>`, and `<indexterm>` elements.

Related Link to File

Opens a dialog box that allows you to insert a link to a target non-DITA file resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a *related-links* element. If you select **Location** for the target, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the  **Choose Key Reference** button to use the **Choose Key** dialog box (on page 2518).

Related Link to Web Page

Opens the **Web Link** dialog box that allows you to insert a link to a target web-related resource in a related links section that is typically at the bottom of your topic (although this depends on the behavior of the output transformation). The target resource can be a URL or a key that is already defined in your *DITA map* structure. If a related links section does not already exist, this action creates one. Specifically, it inserts a `<link>` element inside a *related-links* element. If you select **URL** for the target resource, the link is expressed in an `@href` attribute. If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can select a key from the drop-down list or click the  **Choose Key Reference** button to use the **Choose Key** dialog box (on page 2518).

Cross Reference (xref) Dialog Box

The **Cross Reference (xref)** dialog box is displayed when you insert a **Cross Reference** or **Related Link to Topic** (from the  **Link** drop-down menu). It allows you to insert a link to a target resource at the current location within a document (for a **Cross Reference** link) or in a related links section (for a **Related Link to Topic**). The target resource can be the location of a file or a key that is already defined in your *DITA map* structure. Once the target resource has been selected, you can also target specific elements within that resource.

Figure 628. Cross Reference (xref) Dialog Box

This dialog box includes the following sections and fields:

Choose the Target Resource Section

Location

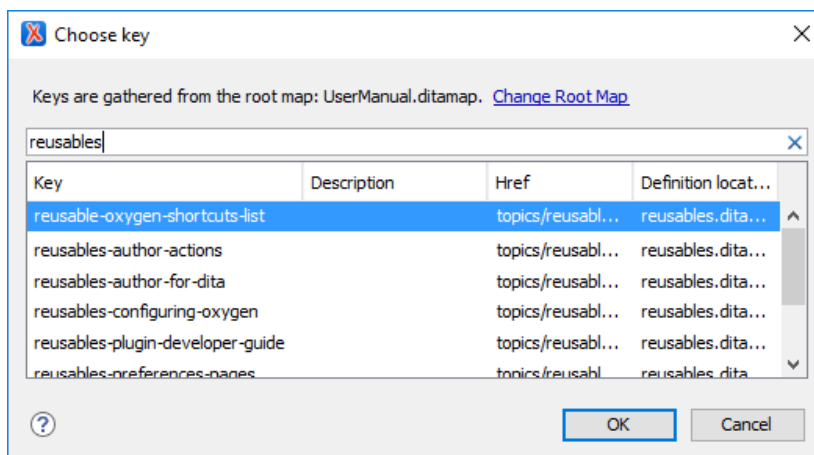

If you select **Location** for the target, the link is expressed in an `@href` attribute.

Key

If you select **Key** for the target, keys will be used to express the link in a `@keyref` attribute. You can use the  **Choose Key Reference** button to open the **Choose Key** dialog box that allows you to select one from a list of all the keys that are gathered from the *root map (on page 2682)* (you can also select one from the drop-down list in the **Key** field).

**Tip:**

You can also use the **DITA Reusable Components** view (*on page 2506*) for similar purposes.

Figure 629. Choose Key Dialog Box

The **Choose Key** dialog box includes the following:

- **Change Root Map** - Opens a small dialog box that allows you to *select a root map (on page 2353)*.
- **Search Filter** - You can enter text in the filter field at the top of the dialog box to filter the list and search for specific keys.
- **Sortable Columns** - The dialog box includes the following columns that can be sorted by clicking on the heading:
 - **Key** - The name of the key (the value of the `@keys` attribute).
 - **Description** - The description of the key that is obtained from its definition. Keys that are defined with a text value in the `<navtitle>` or `<keyword>` element have that value listed in this column.
 - **Href** - Keys that are defined with a value in an `@href` attribute have that href value listed in this column.
 - **Definition Location** - The name of the *DITA map (on page 2678)* where the key is defined.
- **Group by Definition Location** - A contextual menu action that can be used to group (and sort) all the keys based upon the value in the **Definition Location** column.

Select the Target Element Section

This section can be used to target a specific element inside the target resource.

Show elements of type

You can use this drop-down list to select specific types of elements to be displayed in the subsequent table. This can help you narrow down the list of possible source elements that you can select.

Text Filter Field

You can also use the text filter field to narrow down the list of possible source elements to be displayed in the subsequent table.

Element Table

Presents all the element IDs defined in the source topic. Use this table to select the **Target ID** of the element that you want to reference.

Preview Pane

Displays the content that will be references.

Source Pane

Displays the XML source code of the element to be referenced.

Once you click **Insert** or **Insert and close**, the configured cross reference is inserted into your document.

Tip:

You can easily insert multiple cross references by keeping the dialog box opened, using the **Insert** button.

Using Copy/Paste or Drag/Drop Actions to Insert a Cross Reference

Oxygen XML Editor Eclipse plugin also includes support for inserting cross reference links with simple copy/paste or drag/drop actions (additionally, you can insert them using the **Paste as Link** or **Paste as Link (keyref)** actions found in the  **Paste Special** submenu from the contextual menu). The copied/dragged content must be an entire DITA XML element with an `@id` attribute or a `<topicref>`. Also, the location in the document where you paste or drop the link must be valid, although as long as the **Smart paste and drag and drop option** ([on page 155](#)) is selected in the **Schema-Aware** preferences page, if you try to paste it in an invalid location, Oxygen XML Editor Eclipse plugin will attempt to place it in a valid location, and may prompt you with one or more choices for where to place it.

When the link is inserted, Oxygen XML Editor Eclipse plugin automatically tries to populate certain attributes based on detected values. The `@format`, `@scope`, and `@type` attributes are populated if their corresponding options are selected in the **Inserting Links** section of the **DITA Topics preferences page** ([on page 87](#)). Even if their corresponding options are not selected, the `@format` and `@scope` attributes are populated if their detected values are different than the default values.

Note:

For the sake of performance, the `@type` attribute is never automatically computed in the following cases:

- When using drag/drop or copy/paste actions from the **DITA Maps Manager** view (*on page 2337*) or from the **Keys** tab of the **DITA Reusable Components** view (*on page 2506*).
- When using the **Paste as Link** or **Paste as Link (keyref)** actions to paste a topic reference that was copied from the **DITA Maps Manager** view (*on page 2337*) and its `<topicref>` elements do not have the `@type` attribute defined.

Typically, cross reference links are inserted with an `@href` attribute, but it is also possible to insert them with a `@keyref` attribute using the **Paste as Link (keyref)** contextual menu action or copy/paste or drag/drop actions. For the latter method, follow these steps :

1. In the **DITA Maps Manager** view (*on page 2337*), make sure that the **Context** combo box (*on page 2341*) points to the correct map that stores the keys.
2. Make sure the topic that contains the content you want to reference has a key assigned to it. To assign a key, right-click the topic with its parent map opened in the **DITA Maps Manager** (*on page 2337*), select **Edit Properties**, and enter a value in the **Keys** field.
3. Copy an entire DITA element that has an ID attribute assigned to it from a topic with an assigned key, or a `<topicref>` from a *DITA map*.
4. Place the cursor at a location, where you want to insert the link.
5. Select the **Paste as Link (keyref)** action from the  **Paste Special** submenu from the contextual menu.

Linking with Relationship Tables in DITA

A relationship table is used to express relationships between topics outside of the topics themselves. The DITA publishing scripts can then create links between related topics when the content is published.

The reason for using a relationship table is to help make topics easier to reuse. If a topic links directly to another topic, this creates a dependency between the topics. If one topic is reused in a publication where the other is not used, the link is broken. By defining relationships between topics in a relationship table, you avoid creating this dependency.

To create an appropriate set of links between topics in multiple publications, you can create a separate relationship table for each publication. If you are creating multiple publications by applying profiling conditions to a single map, you can also profile your relationship table.

To create a relationship table, follow these steps:

1. If the map is currently open in the **DITA Maps Manager** (on page 2337), double-click the map icon (🗑️) to open the map in **Author** mode. If it opens in **Text** mode, click **Author** at the bottom left to switch to **Author** mode.
2. Move the insertion point inside the *map* root element (usually `<map>`, but it might be `<bookmap>`, or another specialization of the `<map>` element). The easiest way to do this is to click below the title of the map in the editor and then press the up arrow once. Confirm that you are inside the *map* root element by checking the breadcrumbs at the top left of the editor window. You should only see the name of the *map* root element.

3. Select the  **Insert Relationship Table** action on the toolbar or from the **Relationship Table** submenu of the contextual menu.

The **Insert Relationship Table** dialog box is displayed.

4. Set the number of rows, the number of columns, a table title (optional), and select whether or not you want a table header. Click **Insert**.
5. Enter the type of the topics in the header of each column.

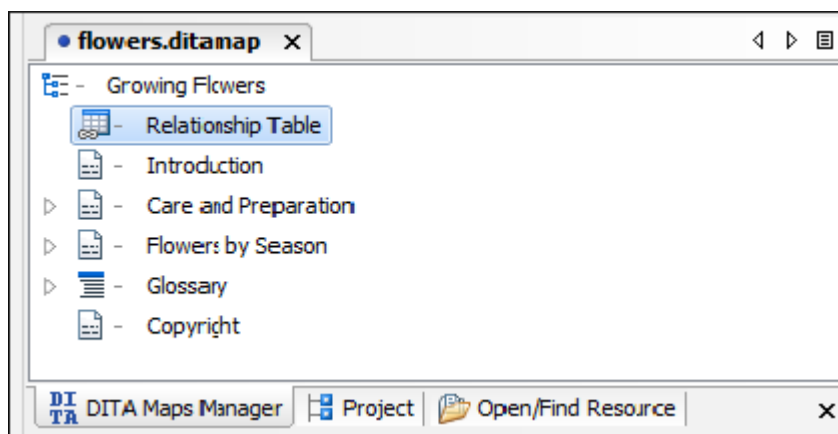

The header of the table (the `<relheader>` element) already contains a `<relcolspec>` element for each table column. You should set the value of the `@type` attribute of each `<relcolspec>` element to a value such as *concept*, *task*, or *reference*. When you click in the header cell of a column (that is a `<relcolspec>` element), you can see all the attributes of that `<relcolspec>` element, including the `@type` attribute in the **Attributes view** (on page 405). You can edit the attribute type in this view.

6. To insert a topic reference in a cell, place the cursor in a table cell and select  **Insert Reference** (on page 2402) from the contextual menu or the **DITA Map** toolbar.
7. To add a new row to the table or remove an existing row use  **Insert Relationship Row**/ **Delete Relationship Row** from the contextual menu or the **DITA Map** toolbar.
8. To add a new column to the table or remove an existing column, use  **Insert Relationship Column**/ **Delete Relationship Column** contextual menu or the **DITA Map** toolbar. If you double-click the relationship table (or select it and press **Enter**, or choose **Open** from the contextual menu) the *DITA map* is opened in the editor with the cursor positioned inside the corresponding relationship table.
9. To add topic references to your relationship table, drag and drop topics from the **DITA Maps Manager** (on page 2337) or the **Project Explorer** (on page 269) view into the appropriate cell in the relationship table.

See the [DITA documentation](#) for a full explanation of the relationship table format and its options. Note that you can change all the selections that you make here later by using the actions on the toolbar (or in the **Relationship Table** submenu of the contextual menu) or by editing the underlying XML in **Text** mode.

10. Save the *DITA map*.

Relationship tables are also displayed in the **DITA Maps Manager view** (on page 2337), along with the other elements in its *DITA map*.

Figure 630. Relationship Table

You can open the DITA map to edit the relationship table by doing one of the following:

- Double-click the appropriate relationship table in the **DITA Maps Manager** ([on page 2337](#)).
- Select the relationship table in the **DITA Maps Manager** ([on page 2337](#)) and press **Enter**.
- Select **Open** from the contextual menu of the relationship table in the **DITA Maps Manager** ([on page 2337](#)).

Content Completion in DITA

Oxygen XML Editor Eclipse plugin includes an intelligent *Content Completion Assistant* ([on page 2677](#)) that offers proposals for inserting structured language elements, attributes, and attribute values that are valid in the current editing context. The functionality of the feature is slightly different for each editing mode:

- For detailed information about using the feature in **Text** mode, see: [Content Completion Assistant in Text Mode](#) ([on page 319](#)).
- For detailed information about using the feature in **Author** mode, see: [Content Completion Assistant in Author Mode](#) ([on page 393](#)).

In addition to the general functionality and types of proposals that are offered in the *Content Completion Assistant* (as described in the two topics listed above), some DITA-specific actions are offered as proposals in the content completion when using the feature in DITA documents. These actions include:

- **keyref** - Opens a pop-up window that allows you to choose a key from a list all the keys that are gathered from the context DITA map (except for those that point to *resource-only* topics). If the chosen key defines a keyword, the `@keyref` attribute is inserted inside a `<ph>` element, while if the chosen key points to a resource, the `@keyref` attribute is inserted inside an `<xref>` element.
- **conref** - Opens a pop-up window that allows you to choose reusable content from a list all the reusable components (elements with IDs in topics that are referenced as *resource-only* in the context DITA map). For each element, a preview of the content is shown in the documentation panel to the right of the pop-up. Once an element is chosen, a `@conref` or `@conkeyref` is inserted, depending on the defined component.

- **xref (cross reference)** - Opens the dialog box that allows you to insert a link to a specified target DITA resource at the current location within a document. The target resource can be the location of a file or a key that is already defined in your DITA map structure. Once the target resource has been selected, you can also target specific elements within that resource. The action inserts an `<xref>` element with an `@href` or `@keyref` attribute that points to the target.
- **xref (web link)** - Opens a dialog box that allows you to insert a link to a target web-related resource at the current location within a document. The target resource can be a URL or a key that is already defined in your DITA map structure. It inserts an `<xref>` element with either an `@href` attribute or a `@keyref` attribute.
- **simpletable** - Opens a dialog box that allows you to configure and insert a table. You can generate a header and footer, set the number of rows and columns of the table, and decide how the table is framed.

Publishing DITA Output

As a structured writing format, DITA produces structured content (content that is annotated with specific structural and semantic information rather than with formatting information). To create a publication, your *DITA map* (on page 2678) and its associated topics must be processed by a transformation script. That script is responsible for how the structural and semantic information in the DITA files is converted into formatting information for display.

Oxygen XML Editor Eclipse plugin publishes DITA content to various output sources using a bundled version of the *DITA Open Toolkit*. The DITA-OT is an open-source publishing engine that can publish DITA content to various output sources such as **XHTML**, **PDF**, or **Windows Help (CHM)**. Since it has a plugin-based architecture, it can be extended with extra plugins that either define new formats for conversion or customize an existing conversion format. You can run the DITA-OT from Oxygen XML Editor Eclipse plugin using a transformation scenario or you can run it directly from a command line: <http://www.dita-ot.org/dev/topics/building-output.html>.

The DITA-OT that comes bundled with Oxygen XML Editor Eclipse plugin contains more plugins than the standard DITA-OT that can be downloaded from their official website. For example, it contains pre-installed plugins for converting DITA content to Word, EPUB, WebHelp, or to publish to PDF using CSS to customize the output.

You can download and install extra publishing plugins either from the [DITA Open Toolkit registry](#) or from the [list of free plugins \(on page 2614\)](#) on the Oxygen XML Editor Eclipse plugin GitHub account.

**Warning:**

Keep in mind that there could be instances where there are differences between what you see in **Author** mode and what you see in the published output. This is typically due to certain limitations in the publishing engine, especially when the source documents contain advanced constructs such as key scopes, branch filtering, chunking, or reusing content through direct references between topics marked for publishing.

DITA Map Transformation Scenarios

Built-in transformation scenarios allow you to transform *DITA maps* (on page 2678) to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, and MS Word. Oxygen XML Editor Eclipse plugin also includes a special **Integrate/Install DITA-OT Plugins** (on page 1197) that can be used to integrate a DITA-OT plugin and a **DITA Map Metrics Report** transformation that generates a statistics report for your DITA map. All of them are listed in the **DITA Map** section in the **Configure Transformation Scenario(s)** dialog box (on page 1300).

A variety of transformations scenarios are available for *DITA maps* (on page 2678):

- Built-in transformation scenarios allow you to transform a *DITA map* to a variety of outputs, such as WebHelp, PDF, ODF, XHTML, EPUB, CHM, Kindle, Metrics Report, and MS Word.
- **Integrate/Install DITA-OT Plugins** (on page 1197) - Use this transformation scenario if you want to integrate a DITA-OT plugin (on page 2611). This scenario runs an Ant task that integrates all the plugins from the DITA-OT/plugins directory.

DITA Map WebHelp Responsive Transformation

DITA content can be transformed into several types of WebHelp Responsive systems (with or without a feedback section). The [WebHelp Responsive layout and features](#) (on page 1311) are designed to adapt to any device and screen size to provide an optimal viewing and interaction experience. Oxygen XML Editor Eclipse plugin also provides numerous possibilities for [customizing the WebHelp Responsive output](#) (on page 1395).

WebHelp Responsive Transformation Scenario

To publish a *DITA map* (on page 2678) as **WebHelp Responsive** output, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** (on page 2337) toolbar.
2. Select the **DITA Map WebHelp Responsive** scenario from the **DITA Map** section.

3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (*on page 2552*) - This tab contains a set of built-in **publishing templates** (*on page 1356*) that you can use for the layout of your WebHelp system output. You can also **create your own publishing templates or edit existing ones** (*on page 1395*).
- **Parameters Tab** (*on page 2558*) - This tab includes numerous parameters that can be set to customize your WebHelp system output. See the **Parameters section** (*on page 1175*) below for details about the most commonly used parameters for WebHelp Responsive transformations.
- **Feedback Tab** (*on page 2559*) - This tab is for those who want to add the **Oxygen Feedback** comments component at the bottom of each WebHelp page so that you can interact with your readers.
- **Filters Tab** (*on page 2560*) - This tab allows you to filter certain content elements from the generated output.
- **Advanced Tab** (*on page 2561*) - This tab allows you to specify some advanced options for the transformation scenario.
- **Output Tab** (*on page 2564*) - This tab allows you to configure options that are related to the location where the output is generated.

4. Click **Apply associated** to process the transformation.

Result: When the **DITA Map WebHelp Responsive** transformation is complete, the output is automatically opened in your default browser.

General Parameters for Customizing WebHelp Responsive Output

To customize a transformation scenario, you can edit various parameters, including the following most commonly used ones:

default.language

This parameter is used if the language is not detected in the *DITA map*. The default value is `en-us`.

clean.output

Deletes all files from the output folder before the transformation is performed (only `no` and `yes` values are valid and the default value is `no`).

editlink.remote.ditamap.url

Use this parameter in conjunction with `editlink.web.author.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the custom URL of the *main DITA map*. For example, a GitHub custom URL might look like this: `https://getFileContent/oxyengxml/userguide/master/UserGuide.ditamap`.

editlink.web.author.url

This parameter needs to be used in conjunction with `editlink.remote.ditamap.url` to add an *Edit* link next to the topic title in the WebHelp output. When a user clicks the link, the topic is opened in Oxygen XML Web Author where they can make changes that can be saved to a file server. The value should be set as the URL of the Web Author installation. For example: `https://www.oxygenxml.com/oxygen-xml-web-author/`.

editlink.present.only.path.to.topic

When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the WebHelp Responsive output. Also, when this parameter is used, the `editlink.ditamap.edit.url`, `editlink.remote.ditamap.url`, and `editlink.web.author.url` parameters are ignored.

fix.external.refs.com.oxygenxml (Only supported when the DITA-OT transformation process is started from Oxygen XML Editor Eclipse plugin)

The DITA Open Toolkit usually has problems processing references that point to locations outside of the directory of the processed *DITA map*. This parameter is used to specify whether or not the application should try to fix such references in a temporary files folder before the DITA Open Toolkit is invoked on the fixed references. The fix has no impact on your edited DITA content. Allowed values: `true` or `false` (default).

force.unique

When set to `true` (default value), the transformation will be forced to create unique output files for each instance of a resource when a map contains multiple references to a single topic.

use.stemming

Controls whether or not you want to include stemming search algorithms into the published output (default setting is `false`).

webhelp.csh.disable.topicID.fallback

Specifies whether or not topic ID *fallbacks* are enabled when computing the mapping of context sensitive help and `resourceid` information is not available. Possible values are **false** (default) and **true**.

webhelp.custom.resources

The file path to a directory that contains resources files. All files from this directory will be copied to the root of the WebHelp output.

webhelp.favicon

The file path that points to an image to be used as a *favicon* in the WebHelp output.

webhelp.reload.stylesheet

Set this parameter to `true` if you have out of memory problems when generating WebHelp. It will increase processing time but decrease the memory footprint. The default value is `false`.

webhelp.search.custom.excludes.file

The path of the file that contains name patterns for HTML files that should not be indexed by the WebHelp search engine. Each exclude pattern must be on a new line. The patterns are considered to be relative to the output directory, and they accept wildcards such as '*' (matches zero or more characters) or '?' (matches one character). For more information about the patterns, see <https://ant.apache.org/manual/dirtasks.html#patterns>.

webhelp.search.japanese.dictionary

The file path of the dictionary that will be used by the *Kuromoji* morphological engine for indexing Japanese content in the WebHelp pages. The encoding for the dictionary must be **UTF8**.

webhelp.search.enable.pagination

Specifies whether or not search results will be displayed on multiple pages. Allowed values are `yes` or `no`.

webhelp.search.index.elements.to.exclude

Specifies a list of HTML elements that will not be indexed by the search engine. The value of the `@class` attribute can be used to exclude specific HTML elements from indexing. For example, the **div.not-indexed** value will not index all `<div>` elements that have a `@class` attribute with the value of **not-indexed**. Use a comma separator to specify more than one element.

webhelp.search.page.numberOfItems

Specifies the number of search results items displayed on each page. This parameter is only used when the **webhelp.search.enable.pagination** parameter is enabled.

webhelp.search.ranking

If this parameter is set to `false` then the 5-star rating mechanism is no longer included in the search results that are displayed on the **Search** tab (default setting is `true`).

webhelp.search.stop.words.include

Specifies a list of words that will be ignored by the search engine. Use a comma separator to specify more than one word.

webhelp.show.changes.and.comments

When set to `yes`, user comments, replies to comments, and tracked changes are published in the WebHelp output. The default value is `no`.

webhelp.sitemap.base.url

Base URL for all the `<loc>` elements in the generated `sitemap.xml` file. If this parameter is specified, the `loc` element will contain the value of this parameter plus the relative path to the page. If this parameter is not specified, the `loc` element will only contain the relative path of the page (the relative file path from the `@href` attribute of a `<topicref>` element from the *DITA map*, appended to this base URL value).

webhelp.sitemap.change.frequency

The value of the `<changefreq>` element in the generated `sitemap.xml` file. The `<changefreq>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<changefreq>` element is not added in `sitemap.xml`. Allowed values: `<empty string>` (default), `always`, `hourly`, `daily`, `weekly`, `monthly`, `yearly`, `never`.

webhelp.sitemap.priority

The value of the `<priority>` element in the generated `sitemap.xml` file. It can be set to any fractional number between 0.0 (least important priority) and 1.0 (most important priority). For example, 0.3, 0.5, or 0.8. The `<priority>` element is optional in `sitemap.xml`. If you leave this parameter set to its default empty value, then the `<priority>` element is not added in `sitemap.xml`.

Parameters Specific to Oxygen WebHelp Responsive

webhelp.fragment.feedback

You can integrate **Oxygen Feedback** with your WebHelp Responsive output to provide a comments area at the bottom of each page where readers can offer feedback. When you create an **Oxygen Feedback site configuration**, an HTML fragment is generated during the final step of the creation process and that fragment should be set as the value for this parameter.

webhelp.default.collection.type.sequence

Specifies if the **sequence** value will be used by default when the `@collection-type` attribute is not specified. This option is helpful if you want to have *Next* and *Previous* navigational buttons generated for all HTML pages. Allowed values are **no** (default) and **yes**.

webhelp.enable.search.autocomplete

Specifies if the *Autocomplete* feature is enabled in the WebHelp search text field. The default value is `yes`.

webhelp.enable.html.fragments.cleanup

Enables or disables the automatic conversion of HTML fragments to well-formed XML. If set to **true** (default), the transformation automatically converts non-well-formed HTML content to a well-formed XML equivalent. If set to **false**, the transformation will fail if at least one HTML fragment is not well-formed.

webhelp.enable.scroll.to.search.term

Specifies whether or not the page should scroll to the first search term when opening the search results page. Possible values are **no** (default) and **true**.

webhelp.fragment.after.body

This parameter can be used to display a given XHTML fragment after the body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.main.page

This parameter can be used to display a given XHTML fragment after the body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.topic.page

This parameter can be used to display a given XHTML fragment after the body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.search.page

This parameter can be used to display a given XHTML fragment after the body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.body.terms.page

This parameter can be used to display a given XHTML fragment after the body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.logo_and_title

This parameter can be used to display a given XHTML fragment after the logo and title in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.after.search.input.main.page` instead.

webhelp.fragment.after.search.input.main.page

This parameter can be used to display a given XHTML fragment after the search field in all the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.topic.page

This parameter can be used to display a given XHTML fragment after the search field in all the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.search.page

This parameter can be used to display a given XHTML fragment after the search field in all the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input.terms.page

This parameter can be used to display a given XHTML fragment after the search field in all the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.toc_or_tiles

This parameter can be used to display a given XHTML fragment after the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.top_menu

This parameter can be used to display a given XHTML fragment after the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body

This parameter can be used to display a given XHTML fragment before the page body in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.main.page

This parameter can be used to display a given XHTML fragment before the page body in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.topic.page

This parameter can be used to display a given XHTML fragment before the page body in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.search.page

This parameter can be used to display a given XHTML fragment before the page body in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.body.terms.page

This parameter can be used to display a given XHTML fragment before the page body in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.logo_and_title

This parameter can be used to display a given XHTML fragment before the logo and title. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.page.search (deprecated)

This parameter is deprecated. Use `webhelp.fragment.before.search.input.main.page` instead.

webhelp.fragment.before.search.input.main.page

This parameter can be used to display a given XHTML fragment before the search field in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.topic.page

This parameter can be used to display a given XHTML fragment before the search field in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.search.page

This parameter can be used to display a given XHTML fragment before the search field in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input.terms.page

This parameter can be used to display a given XHTML fragment before the search field in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.toc_or_tiles

This parameter can be used to display a given XHTML fragment before the table of contents or tiles in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.top_menu

This parameter can be used to display a given XHTML fragment before the top menu in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.footer

This parameter can be used to display a given XHTML fragment as the page footer in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

Important:

This parameter should only be used if you are using a valid, purchased license of Oxygen XML Editor Eclipse plugin (do not use it with a trial license).

webhelp.fragment.head

This parameter can be used to display a given XHTML fragment in the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.main.page

This parameter can be used to display a given XHTML fragment in the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.topic.page

This parameter can be used to display a given XHTML fragment in the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.search.page

This parameter can be used to display a given XHTML fragment in the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.head.terms.page

This parameter can be used to display a given XHTML fragment in the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.welcome

This parameter can be used to display a given XHTML fragment as a welcome message (or title). The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header

This parameter can be used to display a given XHTML fragment after the header section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.main.page

This parameter can be used to display a given XHTML fragment after the header section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.topic.page

This parameter can be used to display a given XHTML fragment after the header section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.search.page

This parameter can be used to display a given XHTML fragment after the header section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.header.terms.page

This parameter can be used to display a given XHTML fragment after the header section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.search.input

This parameter can be used to display a given XHTML fragment before the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.search.input

This parameter can be used to display a given XHTML fragment after the search field in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area

This parameter can be used to display a given XHTML fragment before the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.main.page

This parameter can be used to display a given XHTML fragment before the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment before the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.search.page

This parameter can be used to display a given XHTML fragment before the main content section in the search results page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.main.content.area.terms.page

This parameter can be used to display a given XHTML fragment before the main content section in the index terms page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area

This parameter can be used to display a given XHTML fragment after the main content section in all types of pages. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.main.page

This parameter can be used to display a given XHTML fragment after the main content section in the main page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.main.content.area.topic.page

This parameter can be used to display a given XHTML fragment after the main content section in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toolbar

This parameter can be used to display a given XHTML fragment before the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toolbar

This parameter can be used to display a given XHTML fragment after the toolbar buttons above the topic content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.breadcrumb

This parameter can be used to display a given XHTML fragment before the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.breadcrumb

This parameter can be used to display a given XHTML fragment after the breadcrumb component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.publication.toc

This parameter can be used to display a given XHTML fragment before the publication's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.content

This parameter can be used to display a given XHTML fragment before the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.content

This parameter can be used to display a given XHTML fragment after the topic's content in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.feedback

This parameter can be used to display a given XHTML fragment before the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.feedback

This parameter can be used to display a given XHTML fragment after the **Oxygen Feedback** commenting component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.before.topic.toc

This parameter can be used to display a given XHTML fragment before the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.after.topic.toc

This parameter can be used to display a given XHTML fragment after the topic's table of contents component in the topic page. The value of the parameter can be either a **well-formed** XHTML fragment or a path to a file that contains a **well-formed** XHTML fragment.

webhelp.fragment.custom.search.engine.results

This parameter can be used to replace the search results area with custom XHTML content. The value of the parameter is the path to an XHTML file that contains your custom content.

webhelp.fragment.custom.search.engine.script

This parameter can be used to replace WebHelp's built-in search engine with your own custom search engine. The value of the parameter is the path to an XHTML file that contains the scripts required for your custom search engine to run.

webhelp.labels.generation.mode

Controls whether or not labels are generated in the output. These labels are useful because users can easily search for topics with the same label by simply clicking on the label presented in the output. Possible values are:

- **keywords-label** - Generates labels for each defined `<keyword>` element that has the `@outputclass` attribute value set to **label**.
- **keywords** - Generates labels for each defined `<keyword>` element. If the topic contains `<keyword>` elements with the `@outputclass` attribute value set to **label**, then only these elements will have labels generated for them in the output.
- **disable** - Disables the generation of labels in the Webhelp Responsive output.

webhelp.merge.nested.topics.related.links

Specifies if the related links from nested topics will be merged with the links in the parent topic. Thus the links will be moved from the topic content to the related links component and all of the links from the same group (for example, *Related Tasks*, *Related References*, *Related Information*) are merged into a single group. The default value is `yes`.

webhelp.publication.toc.hide.chunked.topics

Specifies if the table of contents will contain links for *chunked* topics. The default value is `yes`.

webhelp.publication.toc.links

Specifies which links will be included in the table of contents. The possible values are:

- **chapter** (default) - The TOC will include links for the current topic, its children, its siblings, and its direct ancestor (including the direct ancestor's siblings), and the parent chapter.
- **topic** - The TOC will only include links for the current topic and its direct children.
- **all** - The TOC will include all links.

webhelp.publication.toc.tooltip.position

By default, if a topic contains a `<shortdesc>` element, its content is displayed in a tooltip when the user hovers over its link in the table of contents. This parameter controls whether or not this tooltip is displayed and its position relative to the link. The possible values are:

- **left**
- **right** (default)
- **top**
- **bottom**
- **hidden** - The tooltip will not be displayed.

webhelp.search.default.operator

Makes it possible to change the default operator for the search engine. Possible values are `and`, `or` (default). If set to `and` while the search query is WORD1 WORD2, the search engine only returns results for topics that contain both WORD1 and WORD2. If set to `or` and the search query is WORD1 WORD2, the search engine returns results for topics that contain either WORD1 or WORD2.

webhelp.search.stop.words.exclude

Specifies a list of words that will be excluded from the default list of *stop words* that are filtered out before the search processing. Use comma separators to specify more than one word (for example: `if, for, is`).

webhelp.show.breadcrumb

Specifies if the breadcrumb component will be presented in the output. The default value is `yes`.

webhelp.show.child.links

Specifies if child links will be generated in the output for all topics that have subtopics. The default value is `no`.

webhelp.show.indexterms.link

Specifies if an icon that links to the index terms page will be displayed in the output. The default value is `yes` (meaning the index terms icon is displayed). If set to `false`, the index terms icon is not displayed in the output and the index terms page is not generated.

webhelp.show.main.page.tiles

Specifies if the tiles component will be presented in the main page of the output. For a *tree* style layout, this parameter should be set to `no`.

webhelp.show.main.page.toc

Specifies if the table of contents will be presented in the main page of the output. The default value is `yes`.

webhelp.show.navigation.links

Specifies if navigation links will be presented in the output. The default value is `yes`.

webhelp.show.print.link

Specifies if a print link or icon will be presented within each topic in the output. The default value is `yes`.

webhelp.show.related.links

Specifies if the related links component will be presented in the WebHelp Responsive output. The default value is `yes`. The `webhelp.merge.nested.topics.related.links` parameter can be used in conjunction with this one to merge the related links from nested topics into the links in the parent topic.

webhelp.show.publication.toc

Specifies if a table of contents will be presented on the left side of each topic in the output. The default value is `yes`.

webhelp.show.topic.toc

Specifies if a topic table of contents will be presented on the right side of each topic in the output. This table of contents contains links to each `<section>` within the current topic that contains an `@id` attribute and the section corresponding to the current scroll position is highlighted. The default value is `yes`.

webhelp.show.top.menu

Specifies if a menu will be presented at the topic of the main page in the output. The default value is `yes`.

webhelp.skip.main.page.generation

If set to `true`, the default main page is not generated in the output. The default value is `false`.

webhelp.top.menu.activated.on.click

When this parameter is activated (set to `yes`), clicking an item in the top menu will expand the submenu (if available). You can then click on a submenu item to open the item (topic). You can click outside the menu or press **ESC** to hide the menu. When set to `no` (default), hovering over a menu item displays the menu content.

webhelp.top.menu.depth

Specifies the maximum depth level of the topics that will be included in the top menu. The default value is `3`. A value of `0` means that the menu has unlimited depth.

webhelp.topic.collapsible.elements.initial.state

Specifies the initial state of collapsible elements (tables with titles, nested topics with titles, sections with titles, index term groups). The possible values are `collapsed` or `expanded` (default value).

Parameters for Adding a Link to PDF Documentation in WebHelp Responsive Output

The following transformation parameters can be used to generate a PDF link component in the WebHelp Responsive output (for example, it could link to the PDF equivalent of the documentation):

webhelp.pdf.link.url

Specifies the target URL for the PDF link component.

webhelp.pdf.link.text

Specifies the text for the PDF link component.

webhelp.pdf.link.icon.path

Specifies the path or URL of the image icon to be used for the PDF link component. If not specified, a default icon is used.

webhelp.show.pdf.link

Specifies whether or not the PDF link component is shown in the WebHelp Responsive output. Allowed values are: **yes** (default) and **no**.

webhelp.pdf.link.anchor.enabled

Specifies whether or not the current topic ID should be appended as the name destination at the end of the PDF link. Allowed values are: **yes** (default) and **no**.

DITA Map PDF - based on HTML5 & CSS Transformation

Oxygen XML Editor Eclipse plugin includes a built-in **DITA Map PDF - based on HTML5 & CSS** transformation scenario based on a *DITA-OT CSS-based PDF Publishing plugin* that converts DITA maps to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. This transformation also includes some built-in publishing templates that you can use for the layout of your PDF output and you can create your own templates or edit existing ones.

The following CSS-based PDF processors can be used:

- **Oxygen PDF Chemistry** - A built-in processor that is bundled with Oxygen XML Editor Eclipse plugin. For more information, see the [Oxygen PDF Chemistry User Guide](#). This is the supported processor.
- **Prince Print with CSS** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from <http://www.princexml.com>.
- **Antenna House Formatter** (not included in the Oxygen XML Editor Eclipse plugin installation kit) - A third-party component that needs to be purchased from <http://www.antennahouse.com/antenna1/formatter/>.

How to Create the Transformation Scenario

To create a **DITA Map PDF - based on HTML5 & CSS** transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** (on page 2337) toolbar.
2. Select the **DITA Map PDF - based on HTML5 & CSS** transformation scenario.
3. If you want to configure the transformation, click the **Edit** button.

Step Result: This opens an **Edit scenario** configuration dialog box that allows you to configure various options in the following tabs:

- **Templates Tab** (on page 2552) - This tab contains a set of built-in publishing templates that you can use for the layout of your WebHelp system output. You can also create your own publishing templates by saving one from the gallery and changing it.

Figure 631. DITA Map to PDF Templates

- **Parameters Tab** (on page 2558) - This tab includes numerous parameters that can be set to customize the transformation.
 - **Filters Tab** (on page 2560) - This tab allows you to filter certain content elements from the generated output.
 - **Advanced Tab** (on page 2561) - This tab allows you to specify some advanced options for the transformation scenario.
 - **Output Tab** (on page 2564) - This tab allows you to configure options that are related to the location where the output is generated.
4. In the **Parameters** tab, configure any of the following parameters (if applicable):
- **args.css** - Specifies a path to a custom CSS to be used in addition to those specified in the publishing template. The files must have URL syntax and be separated using semicolons. Also, the `dita.css.list` parameter must be left empty to use these files in addition to the selection in the **Styles** drop-down menu.
 - **css.processor.type** - This is where you choose the processor type. You can select between **Oxygen PDF Chemistry**, **Prince XML**, or **Antenna House**.
 - **css.processor.path.chemistry** (if you are using the **Oxygen PDF Chemistry** processor) - Specifies the path to the **Oxygen PDF Chemistry** executable file that will be run to generate the PDF. If

this parameter is not set, the transformation will use the processor specified in the [CSS-based Processors preferences page \(on page 187\)](#).

- **css.processor.path.prince** (if you are using the **Prince Print with CSS** processor) - Specifies the path to the Prince executable file that will be run to produce the PDF. If you installed Prince using its default settings, you can leave this blank.
- **css.processor.path.antenna-house** (if you are using the **Antenna House Formatter** processor) - Specifies the path to the Antenna House executable file that will be run to produce the PDF. If you installed Antenna House using its default settings, you can leave this blank.
- **show.changes.and.comments** - When set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output. The default value is `no`.
- **figure.title.placement** - Controls the position of the figure title relative to the image. Allowed values are "top" and "bottom", "top" is the default

5. Click **OK** and run the transformation scenario.

Customizing the Output

For information about customizing the output, see [CSS-based DITA to PDF Customization \(on page 1537\)](#).

DITA Map PDF - based on XSL-FO Transformation

Oxygen XML Editor Eclipse plugin comes bundled with the DITA Open Toolkit that provides a mechanism for converting *DITA maps* ([on page 2678](#)) to PDF output.

Creating a DITA Map PDF - based on XSL-FO Transformation Scenario

To create a *DITA Map PDF - based on XSL-FO* transformation scenario, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button from the [DITA Maps Manager \(on page 2337\)](#) toolbar.
2. Select **DITA Map PDF - based on XSL-FO** and click the **Edit** button (or use the **Duplicate** button if your *framework* ([on page 2679](#)) is read-only).
3. Use the various tabs to configure the transformation scenario. In the **Parameters** tab, you can use a variety of parameters to customize the output. For example, the following parameters are just a few of the most commonly used ones:

- `show.changes.and.comments` - If set to `yes`, user comments, replies to comments, and *tracked changes* are published in the PDF output.
- `customization.dir` - Specifies the path to a customization directory.
- `editlink.present.only.path.to.topic` - When this parameter is set to "true", the DITA topic path is displayed to the right of each topic title in the PDF output.

4. Click **OK** and then the **Apply Associated** button to run the transformation scenario.

Related Information:

[XSL FO-based DITA to PDF Customization \(on page 1803\)](#)

DITA Map MS Office Word Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario that allows you to convert *DITA maps* (on page 2678) to Microsoft Office Word documents. It utilizes the **DITA to Word plugin** created by Jarno Elovirta. This *plugin* contains a Word document named **Normal.docx** (located in: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/com.elovirta.ooxml/resources`) that is used by the transformation scenario as a template to generate the final Word document.

Tip:

You can make general modifications to the **Normal.docx** template file to alter the published output. The Word application used to edit the **Normal.docx** should be configured with English locale as the style names for each Word element must be in English.

Configuring the Transformation Scenario

To configure a **DITA Map to MS Office Word** transformation scenario, follow these steps:

1. Open the DITA map in the **DITA Maps Manager** (on page 2337).
2. Click the  **Configure Transformation Scenario(s)** button from the **DITA Maps Manager** (on page 2337) toolbar.
3. Select **DITA Map MS Office Word**.
4. For advanced customizations, in the **Parameters** tab you can use any of the following parameters that are unique to this transformation scenario to specify paths to files that affect the output in various ways:
 - **dotx.file** - Specifies the path to a Word template file (`.docx`) that will be used in the transformation to generate the final Word document. Set this parameter if you want to use a different template file other than the **Normal.docx** file that is used by default.
 - **document.flat.xsl** - Specifies the path to a pre-process clean-up stylesheet.
 - **core.xsl** - Specifies the path to a core metadata stylesheet.
 - **custom.xsl** - Specifies the path to a custom metadata stylesheet.
 - **document.xsl** - Specifies the path to a main document stylesheet.
 - **comments.xsl** - Specifies the path to a comments stylesheet.
 - **numbering.xsl** - Specifies the path to a list and title numbering stylesheet.

- **footnotes.xml** - Specifies the path to a footnote stylesheet.
- **document.xml.xml** - Specifies the path to a document relations metadata stylesheet.
- **inkscape.exec** - Specifies the path to an Inkscape (open-source vector graphics editor) executable file.

5. Click **OK** and run the transformation scenario.

Result: The result of the transformation will automatically be opened in your system's default word processing application (such as Microsoft Word).

[Migrating MS Office Documents to DITA \(on page 2634\)](#)

DITA Map CHM (Compiled HTML Help) Transformation

To perform a *Compiled HTML Help (CHM)* transformation, Oxygen XML Editor Eclipse plugin needs `Microsoft HTML Help Workshop` to be installed on your computer. Oxygen XML Editor Eclipse plugin automatically detects if `HTML Help Workshop` is installed and uses it.

Note:

`HTML Help Workshop` might fail if the files used for transformation contain accents in their names, due to different encodings used when writing the `.hhp` and `.hhc` files. If the transformation fails to produce the CHM output but the `.hhp` (HTML Help Project) file is already generated, you can manually try to build the CHM output using `HTML Help Workshop`.

Changing the Output Encoding

Oxygen XML Editor Eclipse plugin uses the `htmlhelp.locale` parameter to correctly display specific characters of different languages in the output of the *Compiled HTML Help (CHM)* transformation. By default, the **DITA Map CHM** transformation scenario that comes bundled with Oxygen XML Editor Eclipse plugin has the `htmlhelp.locale` parameter set to `en-US`.

To customize this parameter, follow this procedure:

1. Use the  **Configure Transformation Scenario(s) (Alt + Shift + T, C (Command + Option + T, C on macOS))** action from the toolbar or the **XML** menu.
2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
3. In the **Parameter** tab, search for the `htmlhelp.locale` parameter and change its value to the desired language tag.

**Note:**

The format of the `htmlhelp.locale` parameter is `LL-CC`, where `LL` represents the language code (`en`, for example) and `CC` represents the country code (`us`, for example). The language codes are contained in the ISO 639-1 standard and the country codes are contained in the ISO 3166-1 standard. For further details about language tags, go to <http://www.rfc-editor.org/rfc/rfc5646.txt>.

Customizing the CHM Output

There are several possibilities available for customizing the CHM output:

- You can use a custom CSS stylesheet to customize how the HTML content is rendered in the output:
 1. Create the custom CSS.
 2. Select the **DITA Map CHM** transformation scenario and click the **Edit** button.
 3. In the **Parameter** tab, set the `args.css` parameter to point to the location of your custom CSS and make sure the `args.copy.css` parameter is set to **yes** to instruct the transformation to copy the custom CSS to the output folder.
 4. Run the transformation.
- If you are familiar with XSLT, there are two XSLT stylesheets that are used in the transformation to compile various settings and components in the CHM output. They are found in the following directory: `OXYGEN_INSTALL_DIR/frameworks/dita/DITA-OT/plugins/org.dita.htmlhelp/xsl/map2htmlhelp`. The files are as follows:
 - `map2hhcimpl.xsl` - This file is used to compile the table of contents.
 - `map2hhpimpl.xsl` - This file contains information for compiling the CHM and various settings that are read by the *HTML Help Workshop* when creating the output.

DITA Map Kindle Transformation

To produce Kindle books from DITA XML content, follow these steps:

1. Start Oxygen XML Editor Eclipse plugin and open a *DITA map* in the **DITA Maps Manager** view (*on page 2337*).
2. Click the  **Configure Transformation Scenario(s)** button.
3. Select the **DITA Map EPUB** transformation and click the **Edit** button to edit it.
4. Run the transformation scenario and produce the EPUB.
5. Install the Amazon [Kindle Previewer](#) utility and use it to produce a Kindle book from the EPUB.

DITA Map Metrics Report Transformation

A **DITA Map Metrics Report** action is available on the **DITA Maps Manager** toolbar and in the **DITA Maps** main menu. It generates an overview report that contains useful statistics for a DITA map.

As an alternate approach, to create a metrics report from a *DITA map* (on page 2678) using a transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** action from the **DITA Maps Manager** (on page 2337) toolbar.
2. Select the **DITA Map Metrics Report** scenario from the **DITA Map** section.
3. Run the transformation.

The generated HTML report contains information such as:

- The number of processed maps and topics.
- The number of `map/bookmap/topic/task/concept/reference` types in the DITA map.
- Content reuse percentage.
- Number of elements and attributes of different types used in the entire *DITA map* structure.
- Number of words and characters used in the entire *DITA map* structure.
- DITA conditional processing attributes used in the *DITA maps*.
- Processing instructions.
- External links.
- All `@outputclass` attribute values gathered from the DITA project.

Important:

If you have cross references that point to content outside the scope of the DITA map, that referenced content is not counted. For example, if you have links to topics that are not included in the DITA map hierarchy, the content in those topics is ignored when generating the statistics.

The metrics report can also be obtained in XML format, making it possible to construct a [metrics report evolution](#) between multiple versions of the same DITA project.

DITA Map Zendesk Publishing

Oxygen XML Editor Eclipse plugin includes a built-in transformation scenario that provides the ability to publish DITA topics to XHTML output and upload them directly as articles to the [Zendesk Help Center](#).

Attention:

This feature is only available in the **Enterprise** edition of Oxygen XML Editor Eclipse plugin.

To run the transformation, follow these steps:

1. Start Oxygen XML Editor Eclipse plugin and open a *DITA map* in the **DITA Maps Manager** view (on page 2337).
2. Click the  **Configure Transformation Scenario(s)** button.
3. Create a new **DITA-OT** transformation scenario and choose the **Zendesk Help Center** transformation type.

4. Go to **Parameters** tab and set the following parameters:

Host

The URL reference to the *Zendesk Help Center* (for example, `https://your-domain.zendesk.com`).

Username

The username (e-mail address) for the account used to upload the content.

API Token

An API token, generated in the *Zendesk* admin pages, necessary for authentication to the server: <https://support.zendesk.com/hc/en-us/articles/226022787-Generating-a-new-API-token>.

Article category

The name of the category where the articles are uploaded. The category needs to be created in the *Zendesk* admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_hjs_tl4_kk.

Article section

The name of the section (inside the parent category) where articles are uploaded. The section needs to be created in the *Zendesk* admin pages: https://support.zendesk.com/hc/en-us/articles/218222877-Organizing-knowledge-base-content-in-categories-and-sections#topic_ysj_wtt_zz.

Note:

When publishing to a subsection, a path of section names separated by '///' can be passed (for example: `Main section///Subsection 1///Subsection 1.1`).

Create article draft

This setting controls whether the articles should be published (if the value is `false`) or saved as drafts (if the value is `true`). The default value is `false`.

Permission group name

The name of the *Zendesk* permission group that controls who edits and publishes articles: <https://support.zendesk.com/hc/en-us/articles/203661966-Creating-managing-and-using-groups>.

5. Save the changes and run the transformation.

Important:

There may be cases when the publishing breaks, presenting an error related to **HTTPS** certificates, similar to this one:

```
Error: org.zendesk.client.v2.ZendeskException: java.net.ConnectException: PKIX path
  building failed:
  sun.security.provider.certpath.SunCertPathBuilderException: unable to find valid
  certification path
  to requested target
```

This usually occurs if an HTTPS proxy server is installed in your company's network. In this case, if running on Windows, you can edit the transformation scenario you are using to publish **DITA** to **Zendesk** and in the **Advanced** tab, go to the **JVM Arguments** field and set this value:

```
-Djavax.net.ssl.trustStoreType=Windows-ROOT -Djavax.net.ssl.trustStore=C:\\Windows\\win.ini
```

Resources

For more information about publishing content to the Zendesk Help Center, watch the following video demonstration:

Integrate/Install DITA-OT Plugins Transformation

Oxygen XML Editor Eclipse plugin comes bundled with a transformation scenario designed to integrate DITA-OT *plugins* (*on page 2681*). These DITA-OT *plugins* are used for various customizations. It is called **Integrate/Install DITA-OT Plugins** and is found in the **DITA Map** section of the  **Configure Transformation Scenario(s)** dialog box (*on page 1300*).

Attention:

The integration will be performed on the DITA-OT version specified in the **DITA Open Toolkit** section of the **DITA preferences page** (*on page 81*).

CAUTION:

Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Running the Transformation Scenario

To integrate a DITA-OT *plugin*, follow these steps:

1. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
2. Select the  **Apply Transformation Scenario(s)** or  **Configure Transformation Scenario(s)** (on page 1300) action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view (on page 1306)).
3. Select the **Integrate/Install DITA-OT Plugins** transformation scenario. If the *integrator* is not visible, select the **Show all scenarios** action that is available in the  **Settings** drop-down menu.
4. **Apply the scenario** (on page 1299).
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.
6. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

Related Information:

[Installing a DITA-OT Plugin \(on page 2611\)](#)

[Integrating a DITA Specialization \(on page 2623\)](#)

DITA Topic Transformation Scenarios

Oxygen XML Editor Eclipse plugin includes built-in transformation scenarios for transforming individual DITA Topics to HTML5, XHTML, or PDF output. They can be found in the **DITA** section in the **Configure Transformation Scenario(s)** dialog box (on page 1300).

The available transformations scenarios for individual DITA topics include:

- **DITA HTML5** - This DITA-OT transformation scenario generates HTML5 output from a single DITA topic.
- **DITA XHTML** - This DITA-OT transformation scenario generates XHTML output from a single DITA topic. This was the first transformation scenario created for the DITA Open Toolkit and it originally served as the basis for all HTML-based transformations.
- **DITA PDF - based on HTML5 & CSS** - This transformation scenario converts individual DITA topics to PDF using a CSS-based processing engine and an HTML5 intermediate format. Oxygen XML Editor Eclipse plugin comes bundled with a built-in CSS-based PDF processing engine called **Oxygen PDF Chemistry**. Oxygen XML Editor Eclipse plugin also supports some third-party processors.

For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. Another advantage of this transformation scenario is that you can use the same [customization CSS \(on page 1567\)](#) or [publishing template \(on page 1555\)](#) that you use for converting entire DITA maps.

The transformation scenario automatically detects the currently selected [context DITA map \(root map\) \(on page 2341\)](#) so that keys and references are properly resolved (the detected context map is set as the value of the `args.root.map` parameter (this can be changed in the **Parameters** tab). It also automatically detects the currently [applied profiling condition set \(on page 2588\)](#) to be used as the default filtering option in the transformation scenario (this can be changed in the **Filters** tab).

The transformation scenario also supports a parameter named `args.enable.root.map.key.processing` that can be used to specify whether or not the values for `@keyref` and `@conkeyref` attributes within the transformed topics are resolved. The possible values are:

- **no** - This means that the values for all `@keyref` and `@conkeyref` attributes are ignored in the transformation. This results in lower processing times.
- **yes** - This means that the values for any `@keyref` and `@conkeyref` attributes found in the transformed topic are processed and resolved using the value of the `args.root.map` parameter.
- **auto** - This means that the process will search for any `@keyref` and `@conkeyref` attributes within the transformed topic and if any are found, the values will be processed and resolved using the value of the `args.root.map` parameter. If none are found, the `@keyref` and `@conkeyref` attributes are ignored.
- **DITA PDF - based on XSL-FO** - This DITA-OT transformation scenario converts individual DITA topics to PDF using an `xsl:fo` processor.

[Configure Transformation Scenario\(s\) Dialog Box \(on page 1300\)](#)

[Applying Associated Transformation Scenarios \(on page 1299\)](#)

[DITA Map Transformation Scenarios \(on page 2525\)](#)

Running a DITA Transformation Scenario

To select and run a transformation scenario on your *DITA map*, follow these steps:

1. Click the  **Configure Transformation Scenario(s)** button on the **DITA Maps Manager toolbar** (on page 2339). The **Configure Transformation Scenario(s)** dialog box (on page 1300) appears. This dialog box lists all the transformation scenarios that have been configured in your project. Oxygen XML Editor Eclipse plugin provides a default set of transformation scenarios, but the people in charge of your DITA system may have provided others that are specifically configured for your needs.
2. Select the transformation scenario you want to run and click **Apply Associated**. The transformation scenario runs in the background. You can continue to work in Oxygen XML Editor Eclipse plugin while the transformation is running. If there are errors or warnings, Oxygen XML Editor Eclipse plugin displays them when the transformation is complete. If the transformation is successful, Oxygen XML Editor Eclipse plugin opens the output in the appropriate application.
3. To rerun the same scenario again, click the  **Apply Transformation Scenario(s)** button.

Creating or Editing a DITA-OT Transformation

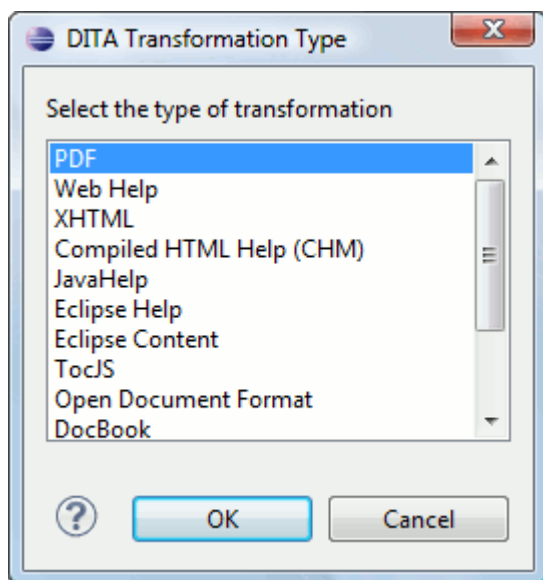

Creating a DITA-OT Transformation Scenario

To create a **DITA-OT Transformation** scenario, use one of the following methods:

- Use the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on **macOS**)) action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu. Then click the **New** button and select **DITA-OT Transformation**.
- Go to **Window > Show View** and select  **Transformation Scenarios** to display this view. Click the  **New Scenario** drop-down menu button and select **DITA-OT Transformation**.

Both methods open the **DITA Transformation Type** dialog box that presents the list of possible outputs.

Figure 632. DITA Transformation Type Dialog Box

Select the desired type of output and click **OK**. This opens the **New Scenario** dialog box.

The upper part of the dialog box allows you to specify the **Name** of the transformation scenario.

The lower part of the dialog box contains several tabs that allow you to configure the options that control the transformation.

Editing a DITA-OT Transformation Scenario

Editing a transformation scenario is useful if you need to configure some of its parameters.

To configure an existing transformation scenario, follow these steps:

1. Select the  **Configure Transformation Scenario(s)** (**Alt + Shift + T, C** (**Command + Option + T, C** on **macOS**)) action from the **DITA Maps Manager** toolbar, main toolbar, or the **XML** menu.

Step Result: The **Configure Transformation Scenario(s)** dialog box (*on page 1300*) is opened.

2. Select the particular transformation scenario and click the **Edit** button at the bottom of the dialog box or from the contextual menu.

Note:

Since transformation scenarios that are associated with built-in [frameworks \(on page 2679\)](#) are read-only, these scenarios will prompt you to use the **Duplicate** button and then edit the [duplicated scenario \(on page 1299\)](#).

Result: This will open an **Edit scenario** configuration dialog box [\(on page 1297\)](#) that contains several tabs that allow you to configure the options that control the transformation.

[DITA Open Toolkit Documentation](#)

Templates Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Templates** tab is available for DITA-OT transformations with **WebHelp Responsive** or **PDF - based on HTML5 & CSS** output types and it provides a set of built-in [publishing templates \(on page 1356\)](#). You can use one of them to publish your documentation or as a starting point for a new publishing template.

Figure 633. Templates Tab

Filtering and Previewing Templates

You can click on the tags at the top of the pane to filter the templates and narrow your search. Each built-in template also includes an  **Online preview** icon in the bottom-right corner that opens a webpage in your default browser providing a sample of how the main page will look when that particular template is used to generate the output.

Built-in Templates Locations

Oxygen XML Editor Eclipse plugin scans the following locations to find the built-in templates to display in the dialog box:

- **WebHelp Responsive Templates** - All built-in WebHelp Responsive publishing templates are stored in the following directory: `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`.
- **PDF - based on HTML5 & CSS** - All built-in PDF publishing templates are stored in the following directories:
 - `DITA-OT-DIR/plugins/com.oxygenxml.pdf.css/templates`
 - `DITA-OT-DIR/plugins/com.oxygenxml.webhelp.responsive/templates`

Custom Templates Locations

Oxygen XML Editor Eclipse plugin scans the locations specified in the [DITA > Publishing preferences page \(on page 86\)](#) to find custom templates to display in the dialog box. You can access that preferences page directly from the **Template** tab by clicking on the **Configure Publishing Templates Gallery** link.

Selecting Custom Templates

Once you are finished configuring your template, you can click the **Choose Custom Publishing Template** link to select your template.

You can also [add your custom templates \(on page 1399\)](#) to the list of templates displayed in the **Templates** tab. To do this, store them in a directory, then click the **Configure Publishing Templates Gallery** link to open the [DITA > Publishing preferences page \(on page 86\)](#) where you can add that directory to the list. All the templates contained in your template directory will be displayed in the preview pane along with all the built-in templates.

Save Template As Button

You can use the **Save template as** button (at the bottom-left of the transformation dialog box) to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template \(on page 1562\)](#). Clicking this button will open a [template package configuration dialog box \(on page 2554\)](#) that contains some options and displays the parameters that will be exported to your template package.

Template Errors

When the **Templates** tab is opened, all templates (built-in and custom) are loaded and validated. Specifically, certain elements in the template descriptor file are checked for validity. If errors are encountered that prevents the template from loading, the following message will be displayed toward the bottom of the dialog box:

A rectangular box with a thin border containing an error icon (a red circle with a white exclamation mark) on the left, followed by the text "Some templates could not be loaded." and a blue underlined link "More details" on the right.

If you click the **More details** link, a window will open with more information about the encountered error. For example, it might offer a hint that the element is missing from the expected descriptor file structure.

Also, if a template could be loaded, but certain elements could not be found in the descriptor file, a warning icon (⚠) will be displayed on the template's image (in the **Templates** tab of the transformation dialog box). For example, this happens if a valid preview-image element cannot be found.

Sharing Publishing Template

To share a publishing template with others, following these steps:

1. Copy your template in a new folder.
2. Go to **Options > Preferences > DITA > Publishing** (on page 86) and add that new folder to the list.
3. Switch the option as the bottom of that preferences page to **Project Options**.
4. Share your project file (.xpr).

Resources

For more information about customizing publishing templates, watch our video demonstration:

<https://www.youtube.com/embed/zNmXfKWwO8>

Related Information:

[Publishing Templates \(on page 1356\)](#)

[Publishing Template Package Contents for PDF Customizations \(on page 1556\)](#)

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

Template Package Configuration Dialog Box

The **Save template as** button (at the bottom-left of the transformation dialog box for **WebHelp Responsive** or **PDF - based on HTML5 & CSS** transformations) can be used to export the currently selected template into a new template package that can be used as a starting point to [create your own custom template \(on page 1562\)](#). The result will be a ZIP archive that contains a template descriptor file and other resources (such as CSS files) that were attached to the selected template.

Clicking the **Save template as** button opens a template package configuration dialog box contains the following options and components:

Name

Required field used to specify the name for the new template. This will become the text value of the `<name>` element in the template descriptor file. This information is displayed as the name of the template in the transformation scenario dialog box.

Description

Optional field used to specify a template description. This will become the text value of the `<description>` element in the template descriptor file. This information is displayed when the user hovers over the template in the transformation scenario dialog box.

Parameter Table

This table displays the parameters that will be exported. Only certain relevant parameters are exported. The parameters and their values will be inserted in the `<parameters>` section of the template descriptor file. If any of the parameter values point to a file path that references a template resource (such as CSS files, custom HTML fragments, images), those resources will automatically be copied to the new template package and their references will be changed accordingly.

Note:

Additional resources that are referenced in CSS files or other resources will not be copied to the new template package, so you will need to copy them manually and update their references in the template descriptor file.

Include WebHelp Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** *(on page 1174)* or **DITA Map to PDF - based on HTML5 & CSS** *(on page 1188)*). This option specifies that the custom template will include a WebHelp Responsive customization.

Include HTML Page Layout Files

For **WebHelp Responsive** customizations, select this option if you want to copy the default *HTML Page Layout Files* *(on page 1375)* into your template package. They are helpful if you want to change the structure of the generated HTML pages.

Include PDF Customization

The same publishing template package can contain both a WebHelp Responsive and PDF customization and you can use the same template in both types of transformations (**DITA Map WebHelp Responsive** *(on page 1174)* or **DITA Map to PDF - based on HTML5 & CSS** *(on page 1188)*). This option specifies that the custom template will include a PDF customization.

Save as

Use this field to specify the name and path of the ZIP file where the template will be saved.

Figure 634. Template Package Configuration Dialog Box

FO Processor Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **FO Processor** tab is available for DITA-OT transformations with a **PDF** output type.

This tab allows you to select an FO Processor to be used for the transformation.

Figure 635. FO Processor Configuration Tab

You can choose one of the following processors:

Apache FOP

The default processor that comes bundled with Oxygen XML Editor Eclipse plugin.

XEP

The [RenderX XEP](#) processor. If XEP is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. XEP is considered installed if it was detected in one of the following sources:

- XEP was configured as an external FO Processor in the [FO Processors](#) option page ([on page 183](#)).
- The system property `com.oxygenxml.xep.location` was set to point to the XEP executable file for the platform (for example: `xep.bat` on Windows).
- XEP was installed in the `DITA-OT-DIR/plugins/org.dita.pdf2/lib` directory of the Oxygen XML Editor Eclipse plugin installation directory.

Antenna House

The [Antenna House](#) (AH Formatter) processor. If Antenna House is already installed, Oxygen XML Editor Eclipse plugin displays the detected installation path under the drop-down menu. Antenna House is considered installed if it was detected in one of the following sources:

- Environment variable set by Antenna House installation (the newest installation version will be used).
- Antenna House was added as an external FO Processor in the Oxygen XML Editor Eclipse plugin preferences pages.

To further customize the PDF output obtained from the Antenna House processor, follow these steps:

1. **Edit** the transformation scenario.
2. Open the **Parameters** tab (*on page 2558*).
3. Add the `env.AXF_OPT` parameter and point to the Antenna House configuration file.

Related information

[FO Processors Preferences](#) (*on page 183*)

[XSL-FO \(Apache FOP\) Processor for Generating PDF Output](#) (*on page 1273*)

Parameters Tab (DITA-OT Transformations)

When you [create a new transformation scenario](#) (*on page 1206*) or [edit an existing one](#) (*on page 1297*), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Parameters** tab allows you to configure the parameters sent to the DITA-OT build file.

The table in this tab displays all the parameters that the DITA-OT documentation specifies as available for each chosen type of transformation (for example, XHTML or PDF), along with their description and current values. You can find more information about each parameter in the [DITA-OT Documentation](#). You can also add, edit, and remove parameters, and you can use the text box to filter or search for a specific term in the entire parameters collection. Note that edited parameters are displayed with their name in bold.

Depending on the type of a parameter, its value can be one of the following:

- A simple text field for simple parameter values.
- A combo box with some predefined values.
- A file chooser and an [editor variable](#) (*on page 218*) selector to simplify setting a file path as the value of a parameter.

Note:

To input parameter values at runtime, use the [ask editor variable](#) (*on page 219*) in the **Value** column.

Below the table, the following actions are available for managing parameters:

New

Opens the **Add Parameter** dialog box that allows you to add a new parameter to the list. You can specify the **Value** of the parameter by using the  **Insert Editor Variables** (*on page 218*) button or the  **Browse** button.

Unset

Resets the selected parameter to its default value. Available only for edited parameters with set values.

Edit

Opens the **Edit Parameter** dialog box that allows you to change the value of the selected parameter or its description.

Delete

Removes the selected parameter from the list. It is available only for new parameters that have been added to the list.

Parameters Contributed by an Oxygen Publishing Template

Transformation parameters that are defined in an *Oxygen Publishing Template (on page 1555)* descriptor file are displayed in italics. After [creating a publishing template \(on page 1562\)](#) and [adding it to the templates gallery \(on page 1399\)](#), when you select the template in the **Templates** tab [\(on page 2552\)](#), the **Parameters** tab will automatically be updated to include the parameters defined in the template descriptor file.

Related Information:

[DITA Open Toolkit Documentation](#)

Feedback Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Feedback** tab is for those who want to provide a way for users to offer feedback and ask questions in the published output and it is available for the **DITA Map WebHelp Responsive** transformation type. To add a comments component in the output, you need to use **Oxygen Feedback** to create a site configuration for the website where your WebHelp output is published and use this **Feedback** tab to instruct the transformation to install the comments component at the bottom of each WebHelp page.

When you create a site configuration in the **Oxygen Feedback administration interface**, an HTML fragment is generated during the final step of the creation process. You need to click the **Edit** button at the bottom-right of this tab to open a dialog box where you will paste the generated HTML fragment. The HTML fragment can also be set in an **Oxygen Publishing Template (on page 1555)**, either as an [HTML fragment extension point \(on page 1366\)](#) or as a [transformation parameter \(on page 1364\)](#) (the `webhelp.fragment.feedback` parameter). If the fragment is specified in multiple places, the order of precedence (from highest to lowest) is:

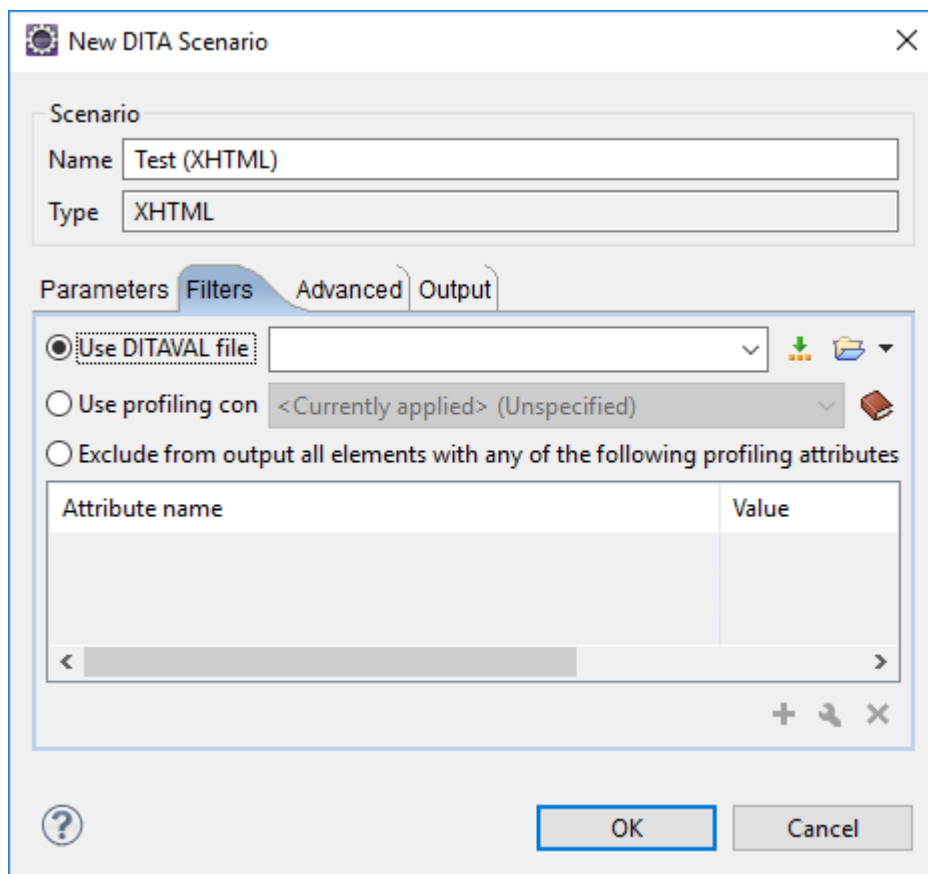

- The fragment specified directly in the **Feedback** tab.
- The fragment specified in a publishing template as an HTML fragment extension point.
- The fragment specified in a publishing template as a transformation parameter.

Filters Tab (DITA Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Filters** tab allows you to add filters to remove certain content elements from the generated output.

Figure 636. Edit Filters Tab

You can choose one of the following options to define filters:

Use DITAVAL file

If you already have a *DITAVAL* file associated with the *DITA map* (on page 2678), you can specify the file to be used when filtering content. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables** (on page 218) button, or the browsing actions in the  **Browse** drop-down list. You can find out more about constructing a *DITAVAL* file in the [DITA Documentation](#).

Note:

If a filter file is specified in the `args.filter` parameter (in [the Parameters tab](#) (on page 2558)), the filters are combined (neither file takes precedence over the other).

Use profiling condition set

Sets the [profiling condition set \(on page 2588\)](#) that will be applied to your transformation.

Exclude from output all elements with any of the following attributes

By using the **+** **New**,  **Edit**, or **x** **Delete** buttons at the bottom of the pane, you can configure a list of attributes (name and value) to exclude all elements that contain any of these attributes from the output.

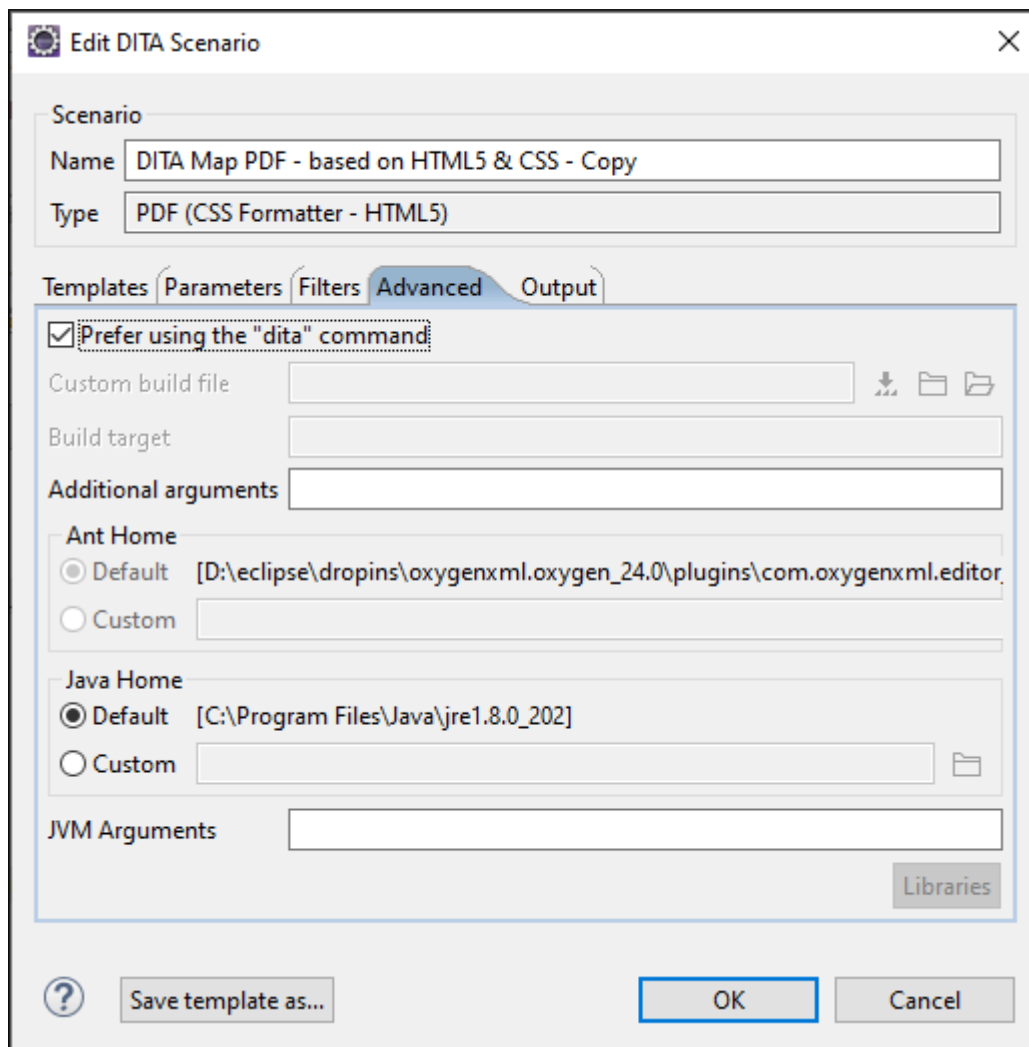

**Note:**

The [colors and styles of the profiled content \(on page 2593\)](#) settings are used for rendering it in **Author** mode but are not applied in the output.

Advanced Tab (DITA-OT Transformations)

When you [create a new transformation scenario \(on page 1206\)](#) or [edit an existing one \(on page 1297\)](#), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Advanced** tab allows you to specify advanced options for the transformation scenario.

Figure 637. Advanced Settings Tab

You can specify the following options:

Prefer using the "dita" command

When selected, Oxygen XML Editor Eclipse plugin will attempt to use the `dita.bat` executable script (`dita.sh` for macOS and Linux) that is bundled with DITA-OT to run the transformation. If not selected, the transformation will run as an ANT process. Also, when this option is selected, other options (**Custom build file**, **Build target**, **Ant Home**) become unavailable. This setting is checked by default in newly created DITA-OT transformation scenario.

Note:

Even when this option is selected, the `dita.bat` (`dita` for macOS and Linux) executable cannot be used in some cases. For example, if the DITA Map is published from a remote location or if the `fix.external.refs` parameter is enabled in the **Parameters** tab, the transformation is started as an ANT process instead of using the executable.

Custom build file

If you use a custom DITA-OT build file, you can specify the path to the customized build file. If empty, the `build.xml` file from the `dita.dir` parameter that is configured in the **Parameters** tab (on page 2558) is used. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Build target

Optionally, you can specify a build target for the build file. If no target is specified, the default `init` target is used.

Additional Ant arguments

You can specify additional **Ant-specific** command-line arguments (such as `-diagnostics`).

Ant Home

You can choose between the default or custom Ant installation to run the transformation.

Java Home

You can choose between the default or custom Java installation to run the transformation. The default path is the Java installation that is used by Oxygen XML Editor Eclipse plugin.

Note:

It may be possible that the used Java version is incompatible with the DITA Open Toolkit engine. If you encounter related errors running the transformation, consider installing a Java VM that is supported by the DITA-OT publishing engine and using it in the **Java Home** text field.

JVM Arguments

This parameter allows you to set specific parameters for the Java Virtual Machine used by Ant. When performing a large transformation, you may want to increase the memory allocated to the Java Virtual Machine. This will help avoid *Out of Memory* error messages (**OutOfMemoryError**). For example, if it is set to `-Xmx2g`, the transformation process is allowed to use a maximum 2 gigabytes of memory. If you do not specify an `-Xmx` value in this field, by default, the application will use a maximum of about a quarter of the total memory available on the machine.

Libraries

By default, Oxygen XML Editor Eclipse plugin adds libraries (as high priority) that are not transformation-dependent and also patches for certain DITA Open Toolkit bugs. You can use this button to specify additional libraries (*JAR* (on page 2679) files or additional class paths) to be used by the transformer.

Tip:

You can specify the path to the additional libraries using wildcards (for example, `${oxygenHome}/lib/*.jar`).

Output Tab (DITA-OT Transformations)

When you create a new transformation scenario (on page 1206) or edit an existing one (on page 1297), a configuration dialog box is displayed that allows you to customize the transformation with various options in several tabs.

The **Output** tab allows you to configure options that are related to the location where the output is generated.

Figure 638. Output Settings Tab

You can specify the following parameters:

Base directory

All the relative paths that appear as values in parameters are considered relative to the base directory. The default value is the directory where the transformed map is located. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Temporary files directory

This directory is used to store pre-processed temporary files until the final output is obtained. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Output directory

The folder where the content of the final output is stored. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Note:

If the *DITA map* (on page 2678) or topic is opened from a remote location or a ZIP file, the parameters must specify absolute paths.

Open in Browser/System Application

If selected, Oxygen XML Editor Eclipse plugin automatically opens the result of the transformation in a system application associated with the file type of the result (for example, in Windows *PDF* files are often opened in *Acrobat Reader*).

Note:

To set the web browser that is used for displaying HTML/XHTML pages, go to **Window > Preferences > General > Web Browser** and specify it there.

- **Output file** - When **Open in Browser/System Application** is selected, you can use this button to automatically open the default output file at the end of the transformation.
- **Other location** - When **Open in Browser/System Application** is selected, you can use this option to open the file specified in this field at the end of the transformation. You can specify the path by using the text field, the  **Insert Editor Variables** (on page 218) button, or the  **Browse** button.

Open in editor

When this is option is selected, at the end of the transformation, the default output file is opened in a new editor panel with the appropriate built-in editor type (for example, if the result is an XML file it is opened in the built-in XML editor, or if it is an XSL-FO file it is opened with the built-in FO editor).

Customizing DITA Transformations

You can customize the appearance of any of the output types by customizing the output transformations. There are several ways to do this:

- Most transformations are configurable by passing parameters to the transformation script. Oxygen XML Editor Eclipse plugin allows you to [set parameters \(on page 2558\)](#) on a transformation scenario and you can [save and share them with others \(on page 1306\)](#). You can also use the `ask` editor variable [\(on page 219\)](#) in the **Parameters** tab to instruct Oxygen XML Editor Eclipse plugin to prompt you for a particular parameter whenever a transformation scenario is run. You can set up multiple transformation scenarios for a given output type, allowing you to maintain several customized transformation scenarios for multiple types of output configurations.
- If you want to customize an output in a way not supported by the built-in customization options, you can create a modified version of the transformation code and execute it [using a custom build file \(on page 2567\)](#). Sometimes the transformation code exports specific forms of extensions or customizations. You should consult the DITA Open Toolkit for the transformation type that you are interested in to see what customization options are supported. Oxygen XML Editor Eclipse plugin provides full editing and [debugging support from XSLT and CSS stylesheets \(on page 1913\)](#), which you can use to modify transformation code.
- You can also write your own transformation code (and execute it [using a custom build file \(on page 2567\)](#)) to produce a type of output not supported by the DITA Open Toolkit. Oxygen XML Editor Eclipse plugin provides a full source editing environment for developing such transformations. You can create Oxygen XML Editor Eclipse plugin transformation scenarios to run these scripts once they are complete.

There are also many other ways to customize specific types of output generated from DITA transformations:

- **WebHelp** - For information about customizing WebHelp output, see the [WebHelp Output section \(on page 1310\)](#).
- **PDF** - For information about customizing PDF output generated from DITA content, see [XSL FO-based DITA to PDF Customization \(on page 1803\)](#).

Publishing Customizations

Some customizations (usually for HTML-based output), can be made simply by creating a custom CSS and they do not involve modifying the DITA-OT engine in any way. Instead, most customizations involve adding a new plugin to the DITA-OT. Here are some best practices to follow before beginning your customization:

1. Copy the bundled DITA-OT folder (usually `OXYGEN_INSTALL_DIR\frameworks\dita\DITA-OT`) to a location where you have full write access so that you have the ability to [install new DITA-OT plugins \(on page 2611\)](#).
2. Go to **Options > Preferences > DITA**, select **Custom** for the **DITA Open Toolkit** option and set the **Location** to be the path to the location where you copied the bundled DITA-OT folder. This will allow you to upgrade the version of Oxygen XML Editor Eclipse plugin at anytime without affecting the publishing system.
3. Share that external DITA-OT folder with the rest of the team. If you are using a repository (such as Subversion or Git), you can commit the entire modified DITA-OT publishing engine as part of your

project. This will allow everyone in your team to use the official changes that you made. This will also allow you to set up some kind of automatic publishing system using an open-source integration server (such as [Travis CI](#) or [Jenkins](#)).

Customizing XHTML-based Output

XHTML-based output can be modified by using a custom CSS stylesheet to override various styles. If you [edit an XHTML transformation scenario \(on page 2550\)](#), there is a parameter called **args.css** that can be set to point to your custom CSS and a parameter called **args.copy.css** that as long as it is set to **yes**, the CSS is copied to the output folder.

You can also create plugins to customize the XHTML-based output by adding an extra XSLT stylesheet. For for information, see: <https://blog.oxygenxml.com/topics/creating-simple-dita-open-toolkit.html>. A list with all DITA-OT XSLT extension points can be found here: <http://www.dita-ot.org/dev/extension-points/plugin-extension-points-xslt-import.html>.

Customizing WebHelp-based Output

The **DITA-OT** that comes bundled in Oxygen XML Editor Eclipse plugin includes specific plugins that provide the ability to publish DITA content to **WebHelp Responsive (on page 1311)** output.

For information about customizing **WebHelp Responsive** output, see [Customizing WebHelp Responsive Output \(on page 1395\)](#).

Customizing PDF-based Output

DITA to PDF output can be customized either by creating a PDF customization folder (in this case, the DITA-OT folder will not be modified at all) or by creating a PDF customization plugin. For information about customizing DITA to PDF output, see [XSL FO-based DITA to PDF Customization \(on page 1803\)](#).

There is also a book called [DITA For Print](#) that contains details about how to customize various aspects.

Customizing PDF Output with CSS

Oxygen XML Editor Eclipse plugin also includes a transformation scenario called **DITA Map PDF - based on HTML5 & CSS (on page 2540)** that is based on a *DITA-OT CSS-based PDF Publishing plugin* that allows you to convert *DITA maps (on page 2678)* to PDF using a CSS layout processor. For those who are familiar with CSS, this makes it very easy to style and customize the PDF output of your DITA projects without having to work with *xsl:fo* customizations. For more information about customizing PDF output using this transformation scenario, see [Customization CSS \(on page 1567\)](#).

Related Information:

[DITA Open Toolkit Documentation](#)

Using a Custom Build File

You can use a *Custom Build File* to customize transformation scenarios.

To use a custom build file in a DITA-OT transformation, follow these steps:

1. Use the  **Configure Transformation Scenario(s)** action to open the **Configure Transformation Scenario(s)** dialog box (*on page 1300*).
2. Select the transformation scenario and click **Edit**.
3. Go to the **Advanced** (*on page 2561*) tab and change the **Custom build file** path to point to the custom build file.

As an example, if you want to call a custom script before running the DITA-OT, your custom build file would have the following content:

```
<project basedir="." default="dist">
<!--The DITA-OT default build file-->
<import file="build.xml"/>
<target name="dist">
  <!-- You could run your script here -->
  <!--<exec></exec-->
  <!--Call the DITA-OT default target-->
  <antcall target="init"/>
</target>
</project>
```

Note:

If you use the built-in Ant 1.9.8 build tool that comes bundled with Oxygen XML Editor Eclipse plugin, it is located in the `[OXYGEN_INSTALL_DIR]/tools/ant` directory. Any additional libraries for Ant must be copied to the Oxygen XML Editor Eclipse plugin Ant `lib` directory.

Adding a Watermark in DITA Map to XHTML Output

To add a watermark to the XHTML output of a *DITA map* (*on page 2678*) transformation, follow these steps:

1. Create a custom CSS stylesheet that includes the watermark image, as in the following example:

```
body {
  background-image: url(MyWatermarkImage.png);
}
```

2. Edit a **DITA Map XHTML** transformation scenario and in the **Parameters** tab set the value of the `args.css` parameter as the path to your watermark image.
3. Set the value of the `args.copycss` parameter to **yes**.
4. Apply the transformation scenario.
5. Copy the watermark image in the output directory of the transformation scenario, next to the CSS file created in step 1.

Related Information:

[Adding a Watermark to PDF Output \(on page 1808\)](#)

How to Add Syntax Highlights for Codeblocks in the Output

Syntax Highlighting makes it easier to read the semantics of the structured content by displaying each type of code (language) in different colors and fonts. The application provides the ability to add syntax highlights in codeblocks for DITA to PDF or HTML-based output through the use of the `@outputclass` attribute and a variety of predefined values are available.

To provide syntax highlighting in the codeblocks that appear in the output, add the `@outputclass` attribute on the `<codeblock>` element and set its value to one of the predefined language values. The **Content Completion Assistant** offers a list of the possible values when adding the `@outputclass` attribute in **Text** mode but there are also two simple ways to set the value in **Author** mode:

- Select the `<codeblock>` element in the editor and in the **Attributes** view, click on the **Value** cell for the `@outputclass` attribute and select one of the predefined values (for example, `language-xml`).
- Select the `<codeblock>` element in the editor and use the **Alt + Enter** keyboard shortcut to open the in-place attributes editor window. Then select one of the predefined values from the **Value** drop-down menu.

The predefined values that can be selected are:

- language-json
- language-yaml
- language-xml
- language-bourne
- language-c
- language-cmd
- language-cpp
- language-csharp
- language-css
- language-dtd
- language-ini
- language-java
- language-javascript
- language-lua
- language-perl
- language-powershell
- language-php
- language-python
- language-ruby

- language-sql
- language-xquery

**Attention:**

It is recommended that you do not add inline elements in the codeblocks when using this `@outputclass` attribute, as it may lead to improper highlighting.

**Tip:**

Starting with version 24.0, the language values can also be set without using the `language-` prefix.

Example:

The following codeblock with the `@outputclass` set as `language-css`:

```
<codeblock outputclass="language-css" id="codeblock_1">@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}</codeblock>
```

would like this in WebHelp output:

```
@page preface-page {
  background-color:silver;
  @top-center{
    content: "Custom Preface Header";
  }
}
*[class ~= "topic/topic"][@topicrefclass ~= "bookmap/preface"] {
  page: preface-page;
}
```

Publishing with a DITA-OT Project File

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: <https://www.dita-ot.org/dev/topics/using-project-files.html>.

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the **Configure Transformation Scenario(s)** dialog box (*on page 1300*):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
- **additional.args** - Specifies the additional arguments used in transformation.
- **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the **Publish DITA-OT Project (select deliverable)** transformation.
- **jvm.args** - Specifies the JVM arguments used by the transformation for each deliverable. This can be used to increase the memory allocation used by the transformation.

Example: To set the JVM memory allocation to 5 GB for publishing deliverables, append the following value to the existing ones:

```
-Xmx5G
```

If the "pdf-css-html5" (based on Chemistry PDF CSS processor) deliverable publication fails with an Out Of Memory Error, try appending the `baseJVMArgLine` parameter to the "jvm.args" parameter value. For example:

```
-DbaseJVMArgLine=-Xmx5G
```

Tip:

When a DITA-OT project file is open in **Author** mode, there is a play button () next to the project file name. You can use this button to publish all deliverables specified in the file. While the transformation is running, the button turns into a stop button in case you need to terminate the process.

Related Information:

[DITA Open Toolkit Project](#) (*on page 2617*)

Dynamic Word, Excel, OpenAPI, HTML, Markdown to DITA Conversion

The publishing engine has support to dynamically convert various types of non-DITA resources to DITA while publishing. This support also enables the dynamically converted document titles for the non-DITA resources that are referenced in a DITA map to be displayed as the title of the resource in the **DITA Maps Manager**.

**Attention:**

These features are available with no restrictions when the publishing process is done using the default publishing engine that is bundled in **Oxygen XML Editor/Author** or if you have integrated the DITA-OT dynamic converter plugin into a custom DITA-OT distribution. However, if the publishing process is done from a command line, this feature requires an **Oxygen Publishing Engine license**.

To enable this support for a particular resource that is referenced in a DITA map, you must specify one of the following values for the `@format` attribute on the `<topicref>` element:

Word to DITA (`word-to-dita`)

Microsoft Word documents that are referenced in the DITA map using the `word-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing. Image references and internal links are preserved.

Example:

```
<topicref href="sample.docx" format="word-to-dita"/>
```

Excel to DITA (`excel-to-dita`)

Microsoft Excel documents that are referenced in the DITA map using the `excel-to-dita` value for the `@format` attribute get dynamically converted to DITA topics that contain one or more tables during publishing.

Example:

```
<topicref href="sample.xlsx" format="excel-to-dita"/>
```

OpenAPI to DITA (`openapi-to-dita`)

OpenAPI documents (versions 2.0, 3.0, or 3.1) in JSON or YAML format that are referenced in the DITA map using the `openapi-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing.

Example:

```
<topicref href="openapi.json" format="openapi-to-dita"/>
<topicref href="openapi.yaml" format="openapi-to-dita"/>
```

HTML to DITA (`html-to-dita`)

HTML documents that are referenced in the DITA map using the `html-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing.

Example:

```
<topicref href="sample.html" format="html-to-dita"/>
```

Markdown to DITA (`markdown`)

Markdown documents that are referenced in the DITA map using the `markdown` value for the `@format` attribute get dynamically converted to DITA topics during publishing using the support for Markdown bundled with the publishing engine by default.

Example:

```
<topicref href="sample.md" format="markdown"/>
```

Markdown to DITA (`markdown-to-dita`)

Markdown documents that are referenced in the DITA map using the `markdown-to-dita` value for the `@format` attribute get dynamically converted to DITA topics during publishing using the special conversion plugin provided by Oxygen XML Editor Eclipse plugin. The `markdown-to-dita` format conversion is more flexible than the built-in `markdown` conversion, allowing the conversion of Markdown documents that do not have consistent heading levels.

Example:

```
<topicref href="sample.md" format="markdown-to-dita"/>
```

Resources

For more information about working with DITA-compatible resources, see the following resources:

- Video: [Integrating REST-API Content into DITA Documentation in Oxygen](#)
- Webinar: [Integrating Various Document Formats \(OpenAPI, Word, Markdown, HTML, Excel\) into DITA Documentation](#)

Troubleshooting DITA Transformation Problems

This section contains some topics to help you troubleshoot DITA transformation issues.

DITA Map Transformation Fails (Cannot Connect to External Location)

Problem

DITA map (on page 2678) transformation fails because it cannot connect to an external location.

Solution

The transformation is run as an external Ant process so you can continue using the application as the transformation unfolds. All output from the process appears in the **DITA Transformation** tab.

The HTTP proxy settings are used for the Ant transformation, so if the transformation fails because it cannot connect to an external location, you can check the Network Connections.

DITA Map WebHelp Transformation Fails (Duplicate Topic References Found)

Problem

DITA Map WebHelp transformation fails with a message that indicates duplicate topic references were found.

Cause

By default the WebHelp transformation uses the `force-unique` parameter set to **true** to force the transformation to create unique output files for each instance of a resource when a map contains multiple references to a single topic. However, there are cases when this feature does not work as expected and the duplicate topic references are not handled properly.

Solution

To solve this issue, you should manually set a unique `@copy-to` attribute on any duplicate topic reference that was not handled automatically by DITA-OT:

```
<map>
...
<topicref href=" ../topics/MyTopic.dita" />
...
<topicref href=" ../topics/MyTopic.dita" copy-to=" ../topics/MyTopic-2.dita" />
</map>
```

DITA-OT Transformation Takes a Long Time to Process

Problem

A DITA transformation takes an extremely long time to process (over an hour, for example).

Cause

Large delays in DITA-OT processing are usually caused by intensive disk operations, CPU usage, or connections to remote websites. The DITA-OT processing is very disk-intensive, each stage takes the entire content from the transformation temporary files folder, reads it, modifies it, and then writes it back.

Solution

There are several things you can try to troubleshoot this problem:

- If you are using a shared or remote drive, it is recommended to specify a local drive for the output and temporary files directory (edit the transformation scenario and in the **Output** tab, select a local directory for **Temporary files directory** and **Output directory**).
- If you want to test if the publishing has a problem downloading remote resources, you could disable the network adapter on the computer and then try to publish. The purpose is to see if the publishing finishes without any reported error about obtaining a certain HTTP resource.

- Using DTDs instead of XML Schemas is faster. This is because of a default transformation parameter called `args.grammar.cache` that only works for DTD-based DITA topics.
- You can [increase the memory available to Oxygen XML Editor Eclipse plugin \(on page 2306\)](#). Sometimes, just increasing the amount of memory available to the DITA-OT process may be enough to lower the time necessary for the publishing to run.
- You can enable some logging to help you determine which stage in the process is taking a long time. Edit the transformation scenario and in the **Advanced** tab, enter **logger org.apache.tools.ant.listener.ProfileLogger** in the **Additional arguments** field. Then go to **Options > Preferences > DITA > Logging** and select **Always** for the **Show console output** option.
- You could try disabling antivirus applications since the publishing process is very disk intensive and certain antivirus application might slow down the process.
- If the published DITA map is part of a larger DITA project with lots of maps and topics, references from topics in the current map to topics in other sub-projects might result in problems resolving those references. You could look in the output folder to see if the number of HTML documents match the number of DITA topics in your map.

DITA PDF Transformation Fails

Problem

The DITA to PDF transformation fails.

Cause

To generate the PDF output, Oxygen XML Editor Eclipse plugin uses the DITA Open Toolkit. This process sometimes results in errors. For information about some of the most common errors, see [DITA PDF Processing Common Errors \(on page 2576\)](#).

Solution

If your transformation fails, you can detect some of the problems that caused the errors by running [the Validate and Check for Completeness action \(on page 2382\)](#). Depending on the options you select when you run it, this action reports errors such as topics referenced in other topics but not in the [DITA map \(on page 2678\)](#), broken links, and missing external resources.

You can analyze the **Results** tab of the DITA transformation and search for messages that contain text similar to `[fop] [ERROR]`. If you encounter this type of error message, edit the transformation scenario you are using and set the **clean.temp** parameter to **no** and the **retain.topic.fo** parameter to **yes**. Run the transformation, go to the temporary directory of the transformation, open the `topic.fo` file and go to the line indicated by the error. Depending on the XSL FO context try to find the DITA topic that contains the text that generates the error.

If none of the above methods helps you, go to **Help > About > Components > Frameworks** and check what version of the DITA Open Toolkit you are using. Copy the whole output from the DITA-OT console output and either report the problem on the DITA User List or send it to support@oxygenxml.com.

Related Information:

[How to Enable Debugging for FO Processor Transformations \(on page 1276\)](#)

DITA PDF Processing Common Errors

There are cases when the PDF processing fails when trying to publish DITA content to a PDF file. This topic lists some of the common problems and possible solutions.

Problem: Cannot Save PDF

The FO processor cannot save the PDF at the specified target. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
C:\samples\dita\temp\pdf\oxygen_dita_temp\topic.fo
<Failed to open C:\samples\dita\out\pdf\test.pdf>
Failed to open samples\dita\out\pdf\test.pdf
.....
[fop] Caused by: java.io.FileNotFoundException:
C:\Users\default\Desktop\bev\out\pdf\test.pdf
(The process cannot access the file because it is being used by another process)
```

Solution: Cannot Save PDF

Such an error message usually means that the PDF file is already opened in a PDF reader application. The solution is to close the open PDF before running the transformation.

Problem: Table Contains More Cells Than Defined in Colspec

One of the DITA tables contains more cells in a table row than the defined number of `<colspec>` elements. The console output contains messages like this:

```
[fop] [ERROR] Anttask - Error rendering fo file:
D:\projects\eXml\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo
<net.sf.saxon.trans.XPathException: org.apache.fop.fo.ValidationException:
The column-number or number of cells in the row overflows the number of
fo:table-columns specified for the table.
(See position 179:-1)>net.sf.saxon.trans.XPathException:
org.apache.fop.fo.ValidationException: The column-number or number of cells
in the row overflows the number of fo:table-columns specified for the table.
(See position 179:-1)
[fop]     at org.apache.fop.tools.anttasks.FOPTaskStarter.renderInputHandler
(Fop.java:657)
[fop]     at net.sf.saxon.event.ContentHandlerProxy.startContent
(ContentHandlerProxy.java:375)
.....
```

```
[fop] D:\projects\samples\dita\flowers\temp\pdf\oxygen_dita_temp\topic.fo ->
D:\projects\samples\dita\flowers\out\pdf\flowers.pdf
```

Solution: Table Contains More Cells Than Defined in Colspec

To resolve this issue, correct the `@colspec` attribute on the table that caused the issue. To locate the table that caused the issue:

1. Edit the transformation scenario and set the parameter `clean.temp` to `no`.
2. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and look in it at the line specified in the error message (See `position 179:-1`).
3. Look around that line in the `XSL-FO` file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager view** (on page 2337)) to find the original DITA topic where the table was generated.

Problem: Broken Link

There is a broken link in the generated `XSL-FO` file. The PDF is generated but contains a link that is not working. The console output contains messages like this:

```
[fop] 1248 WARN [ main ] org.apache.fop.apps.FOUserAgent -
Page 6: Unresolved ID reference "unique_4_Connect_42_wrongID" found.
```

Solution: Broken Link

To resolve this issue:

1. Use the  **Validate and Check for Completeness** action available in the **DITA Maps Manager view** (on page 2337) to find such problems.
2. If you publish to PDF using a `DITAVAL` filter, select the same `DITAVAL` file in the **DITA Map Completeness Check** dialog box.
3. If the  **Validate and Check for Completeness** action does not discover any issues, edit the transformation scenario and set the `clean.temp` parameter to `no`.
4. Run the transformation, open the `topic.fo` file in Oxygen XML Editor Eclipse plugin, and search for the *unresolved ID references* (for example: `unique_4_Connect_42_wrongID`).
5. Look in the `XSL-FO` file to find relevant text content that you can use (for example, with the **Find/Replace in Files** action in the **DITA Maps Manager view** (on page 2337)) to find the original DITA topic where the table was generated.

Related Information:

[How to Enable Debugging for FO Processor Transformations](#) (on page 1276)

DITA to CHM Transformation Fails - Cannot Open File

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5010: Error: Cannot open "fileName.chm". Compilation stopped.`

Cause

This error occurs when the CHM output file is opened and the transformation scenario cannot rewrite its content.

Solution

To solve this issue, close the CHM help file and run the transformation scenario again.

Tip:

It is a good practice to validate the [DITA map \(on page 2678\)](#) before executing the transformation scenario. To do so, run [the Validate and Check for Completeness action \(on page 2382\)](#). Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the *DITA map*), broken links, and missing external resources.

Related Information:

[DITA Map CHM \(Compiled HTML Help\) Transformation \(on page 2544\)](#)

DITA to CHM Transformation Fails - Compilation Failed

Problem

The DITA to CHM transformation fails with the following error: `[exec] HHC5003: Error: Compilation failed while compiling fileName.`

Cause 1

One possible cause for this error is that the processed file does not exist.

Solution 1

To solve this issue, fix the file reference before executing the transformation scenario again.

Cause 2

Another possible cause for this error is that the processed file has a name that contains space characters.

Solution 2

To solve the issue, remove any spacing from the file name and run the transformation scenario again.

**Tip:**

It is a good practice to validate the *DITA map (on page 2678)* before executing the transformation scenario. To do so, run **the [Validate and Check for Completeness action \(on page 2382\)](#)**. Depending on the selected options, it will report detected errors, such as topics referenced in other topics (but not in the *DITA map*), broken links, and missing external resources.

Related Information:

[DITA Map CHM \(Compiled HTML Help\) Transformation \(on page 2544\)](#)

Solving DITA Transformation Errors

If a DITA transformation results in errors or warnings, the information is displayed in the message panel at the bottom of the editor. The information includes the severity, description of the problem, the name of the resource, and the path of the resource.

To help prevent and solve DITA transformation problems, follow these steps:

1. [Validate the DITA map \(on page 2382\)](#) by using the  **Validate and Check for Completeness** action that is available on the **DITA Maps Manager (on page 2337)** toolbar and in the **DITA Maps** menu.
2. If this action results in validation errors, solve them prior to executing the transformation. Also, you should pay attention to the warning messages because they may identify problems in the transformation.
3. [Run the DITA transformation scenario \(on page 1233\)](#).
4. If the transformation results in errors or warnings, they are displayed in the **Results panel (on page 335)** at the bottom of the editor. The following information is presented to help you troubleshoot the problems:
 - **Severity** - The first column displays the following icons that indicate the severity of the problem:
 - **Informational** - The transformation encountered a condition of which you should be aware.
 -  **Warning** - The transformation encountered a problem that should be corrected.
 -  **Error** - The transformation encountered a more severe problem, and the output is affected or cannot be generated.
 - **Info** - Click the  **See More** icon to open a web page that contains more details about DITA-OT error messages.
 - **Description** - A description of the problem.
 - **Resource** - The name of the transformation resource.
 - **System ID** - The path of the transformation resource.
5. Use this information or other resources from the online DITA-OT community to solve the transformation problems before re-executing the transformation scenario.
6. If you need to contact the *Oxygen* technical support team, they will need you to send the entire transformation scenario execution log. To obtain it:

- a. Go to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **Always**.
- b. Execute the transformation scenario again. The console output messages are displayed in the **DITA-OT** view.
- c. Copy the entire log, save it in a text file, then send it to the *Oxygen* technical support team.
- d. After your issue has been solved, go back to the **Options > Preferences > DITA** preferences page and set the **Show console output** option to **When build fails**.

Related Information:

[Troubleshooting DITA Transformation Problems \(on page 2573\)](#)

DITA Profiling / Conditional Text

DITA offers support for conditionally profiling content by using profiling attributes. With Oxygen XML Editor Eclipse plugin, you can define values for the DITA profiling attributes and they can be easily managed to filter content in the published output. You can switch between profile sets to see how the edited content looks like before publishing.

Oxygen XML Editor Eclipse plugin includes a [Attributes and Condition Sets preferences page \(on page 146\)](#) where you can create and manage profiling attributes and condition sets. Oxygen XML Editor Eclipse plugin also offers convenient support for customizing and controlling profiling attribute values with a [subject scheme \(on page 2597\)](#) or [DITAVAL file \(on page 2602\)](#).

Profiling Attributes

You can profile content elements or map elements by adding one or more of the default DITA profiling attributes (`@product`, `@platform`, `@audience`, `@rev`, `@props`, and `@otherprops`). You can also create your own custom profiling attributes and profiling condition sets. The profiling attributes may contain one or more tokens that represent conditions to be applied to the content when a publication is built.

For example, you could define a section of a topic that would only be included for a publication related to the Windows platform by adding the `@platform` profiling attribute:

```
<section platform="windows">
```

For information about creating and editing profiling attributes, see [Creating and Editing Profiling Attributes in DITA \(on page 2581\)](#).

Profiling Conditions

DITA allows you to conditionally profile parts of a topic so that certain parts of the topic are displayed when certain profiling conditions are set. Profiling conditions can be set both within topics and in maps. When set in a topic, they allow you to suppress an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, they allow you to suppress an entire topic or group of topics. You can then create a variety of publications from a single map by applying profiling conditions to the build.

For information about creating and editing condition sets, see [Creating and Editing Profiling Condition Sets in DITA \(on page 2586\)](#).

Resources

For more information about DITA profiling, see the following resources:

- [Webinar: Working with DITA in Oxygen - Basic Profiling and Reuse Strategies](#)
- [Webinar: Working with DITA in Oxygen - Advanced Profiling and Reuse Strategies](#)

Creating and Editing Profiling Attributes in DITA

You can filter DITA content or the structure of a document by using profiling attributes or [profiling conditions sets \(on page 2586\)](#).

Defining Profiling Attributes for DITA Content

To create or edit profiling attributes for filtering DITA content, follow these steps:

1. If you are creating a new attribute, make sure the attribute is already defined in the document DTD or schema before continuing with the procedure.

**Tip:**

For less technical users who do not want to create attribute specializations in DTD/XML Schema, you may want to use [profiling attribute groups \(on page 2595\)](#) instead (use an existing profiling attribute with sub-attributes).

2. Open the **Preferences** dialog box [\(on page 70\)](#) and go to **Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition Sets**.

**Information:**

The [Profiling Attributes section \(on page 147\)](#) is used to define the attributes and their values. For DITA documents, the default attributes are included ([@audience](#), [@platform](#), [@product](#), [@props](#), [@otherprops](#), and [@rev](#)), but if a [Subject Scheme Map \(on page 2597\)](#) is used for profiling your content, you will see the attributes defined in your *subject scheme map* instead.

3. To add new attributes and values, click the **+** **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **✎** **Edit** button.

Step Result: In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

Figure 639. Profiling Attribute Dialog Box

Note: Define only profiling attributes that actually exist in your schema. This feature does not add profiling support to XML vocabularies that do not have it already.

Document type: DITA* ⓘ

Attribute name: OperatingSystem

Display name: OS

Value	Label	Description
win	Windows	MS Windows Operating Syst...
mac	Mac OS X	Macintosh Operating Systems
linux	Unix/Linux	Unix/Linux Operating Systems

Single value
 Multiple values separated by: <space>

The following options are available in this dialog box:

Document type

Select the document type (*framework (on page 2679)*).

i Tip:

You can use the * or ? wildcards in this combo box. For example, `DITA*` would match any document type that starts with "DITA". You can also specify multiple document types by using commas to separate them.

Attribute name

The name of the profiling attribute.

Display name

This optional field is used for descriptive rendering in profiling dialog boxes.

Attribute Values Table

This table displays information about the values for the profiling attribute. You can configure them by using the buttons at the bottom of the table (+ **New**, ↻ **Edit**, ✕ **Delete**).

The columns are as follows:

- **Value** - The attribute value. You can also define profiling attribute groups using the following format: `ParentAttrValue(SubAttrValue1 SubAttrValue2)`. For more information, see [Conditional Profiling Attribute Groups \(on page 2595\)](#).
- **Label** - You can specify a label for the attribute value that will be rendered as its name in various components in **Author** mode (**Edit Profiling Attributes** dialog box (on page 2584), **Condition Set** dialog box (on page 2586), **Profiling** tab in the **Edit Properties** dialog box (on page 2378), **DITA Maps Manager** (on page 2337)). If the **Label** is not specified, the **Value** will be used as its rendered name.
- **Description** - A description for the attribute value that will be displayed in this table.

Single value

Select this option if you want the attribute to only accept a single value.

Multiple values separated by

Select this option if you want the attribute to accept multiple values, and you can choose the type of delimiter to use. You can choose between *space*, *comma*, and *semicolon*, or you can enter a custom delimiter in the text field. A custom delimiter must be supported by the specified document type. For example, the DITA document type only accepts spaces as delimiters for attribute values.

4. After defining or configuring the attributes and their values according to your needs, click **OK** to confirm your selections and close the **Profiling Attributes** configuration dialog box.
5. Click **Apply** to save the changes.

Result: You should see your changes in the **Profiling Attribute** table.

You can also use the **Profiling Condition Sets** section to apply more complex filters on your DITA content.

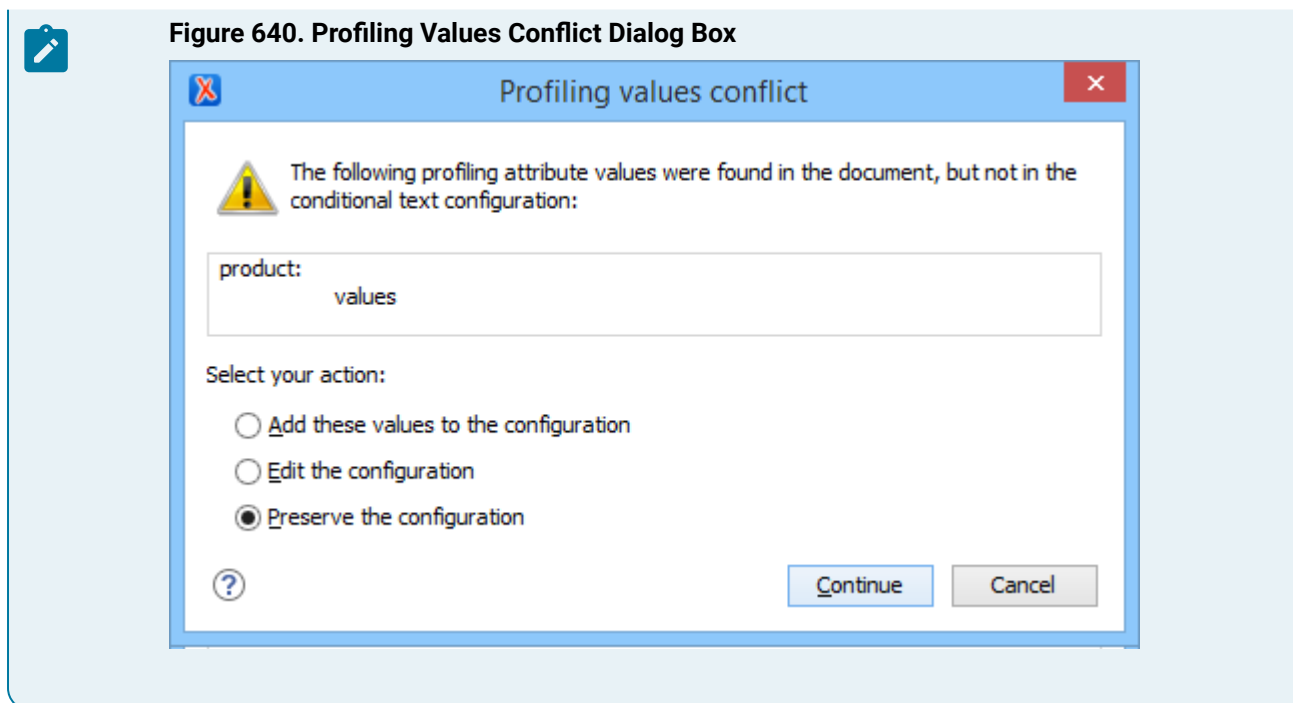

Adding Profiling Attribute Values Directly in a Document

You can add values directly to the existing profiling attributes in a document using the [In-Place Attributes Editor \(on page 386\)](#) in **Author** mode, the [Attributes view \(on page 405\)](#), or in the source code in **Text** mode. However, this just adds them to the document and does not change the conditional text configuration. If you invoke the **Edit Profiling Attributes** action (from the contextual menu in **Author** mode) on the new value, the **Profiling Values Conflict** dialog box will appear and it includes an **Add these values to the configuration** action that will automatically add the new value to the particular profiling attribute. It also includes an **Edit the configuration** action that opens the [Attributes and Condition Sets preferences page \(on page 146\)](#) where you can edit the profiling configuration.

Note:

If the [Allow contributing extra profiling attribute values option \(on page 147\)](#) is not selected in the **Attributes and Condition Sets** preferences page, the **Profiling Values Conflict** dialog box will never appear, so this automatically adding value not be possible.

**Related Information:**

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

[Conditional Profiling Attribute Groups \(on page 2595\)](#)

[Filtering Profiling Values with a DITAVALE File \(on page 2602\)](#)

Applying Profiling Attributes in DITA

Profiling attributes are applied on element nodes. You can apply profiling attributes on a text fragment (it will automatically be wrapped into a phrase-type element), on a single element, or on multiple elements at the same time. If there is no selection in your document, the profiling attributes are applied on the element at the cursor position.

You can apply [defined DITA profiling attributes \(on page 2581\)](#) as follows:

DITA Topics

To profile DITA topics, right-click a topic reference in the **DITA Maps Manager** ([on page 2337](#)), select  **Edit Properties** from the contextual menu, go to the **Profiling** tab, and select the appropriate values.

DITA Content

To profile DITA content in **Author** mode, highlight the content and select **Edit Profiling Attributes** from the contextual menu and select the appropriate values in the **Edit Profiling Attributes** dialog box.

DITA Elements

To profile specific XML elements in **Author** mode, position the cursor inside the element, right-click, select **Edit Profiling Attributes** (you can also right-click the element in the *breadcrumb* (on page 378) or *Outline* (on page 326) view), and select the appropriate values in the **Edit Profiling Attributes** dialog box. You can also use the *Attributes view* (on page 405) to set the profiling attributes on the element at the current cursor position.

Figure 641. Edit Profiling Attributes Dialog Box

The profiling attributes, and their potential values, that appear in this dialog box depend on what has been configured in Oxygen XML Editor Eclipse plugin. If you have a large list of profiling attributes, you can use the text filter field to search for attributes or values, and you can expand or collapse attributes by using the **Expand All**/**Collapse All** buttons to the right of the text filter or the arrow button to the left of the profiling attribute name.

The attributes and values that appear in the dialog box are determined as follows:

- If your *root map* (on page 2682) references a DITA *subject scheme map* (on page 2682) that defines values for the profiling attributes (on page 2597), those values are used. Oxygen XML Editor Eclipse plugin collects all the profiling values from the *subject scheme map* that is referenced in the map that is currently opened in the **DITA Maps Manager** (on page 2337) (or set as the *root map* (on page 2353)). In the image above (on page 2585) (taken from the Oxygen XML Editor Eclipse plugin documentation project), you see values for eight products. They are the only values that are defined in the *subject scheme map* and thus, are the only ones that appear in the dialog box.

- If you have [defined profiling attribute values \(on page 2581\)](#) for the DITA document type in the **Attributes and Condition Sets** preferences page ([on page 146](#)), those values are displayed in the dialog box.
- Otherwise, a generic default set of profiling attributes and values are available.

The attribute names and values selected in the **Edit Profiling Attributes** dialog box are set on the elements contained in the profiled fragment. If you only select a fragment of content (rather than the entire element), this fragment is wrapped in phrase-type elements where the profiling attributes are set.

If the **Show Profiling Attributes** option ([on page 452](#)) (available in the  **Profiling / Conditional Text** toolbar menu) is selected, a green border is painted around profiled text in the **Author** mode and all profiling attributes set on the current element are listed at the end of the highlighted block. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 642. Profiling Attribute Value Form Control Pop Up

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

Creating and Editing Profiling Condition Sets in DITA

Multiple profiling attributes can be aggregated into a profiling condition set that allows you to apply more complex filters on the document content. In DITA, profiling conditions can be set within both topics and in maps. When set in a topic, you can filter an element (such as paragraph), step in a procedure, item in a list, or even a phrase within a sentence. When set in a map, you can filter an entire topic or group of topics.

Creating Profiling Condition Sets

To create a new profiling condition set, follow these steps:

1. Open the **Preferences** dialog box (on page 70) and go to **Editor > Edit modes > Author > Profiling/Conditional Text > Attributes and Condition Sets**.

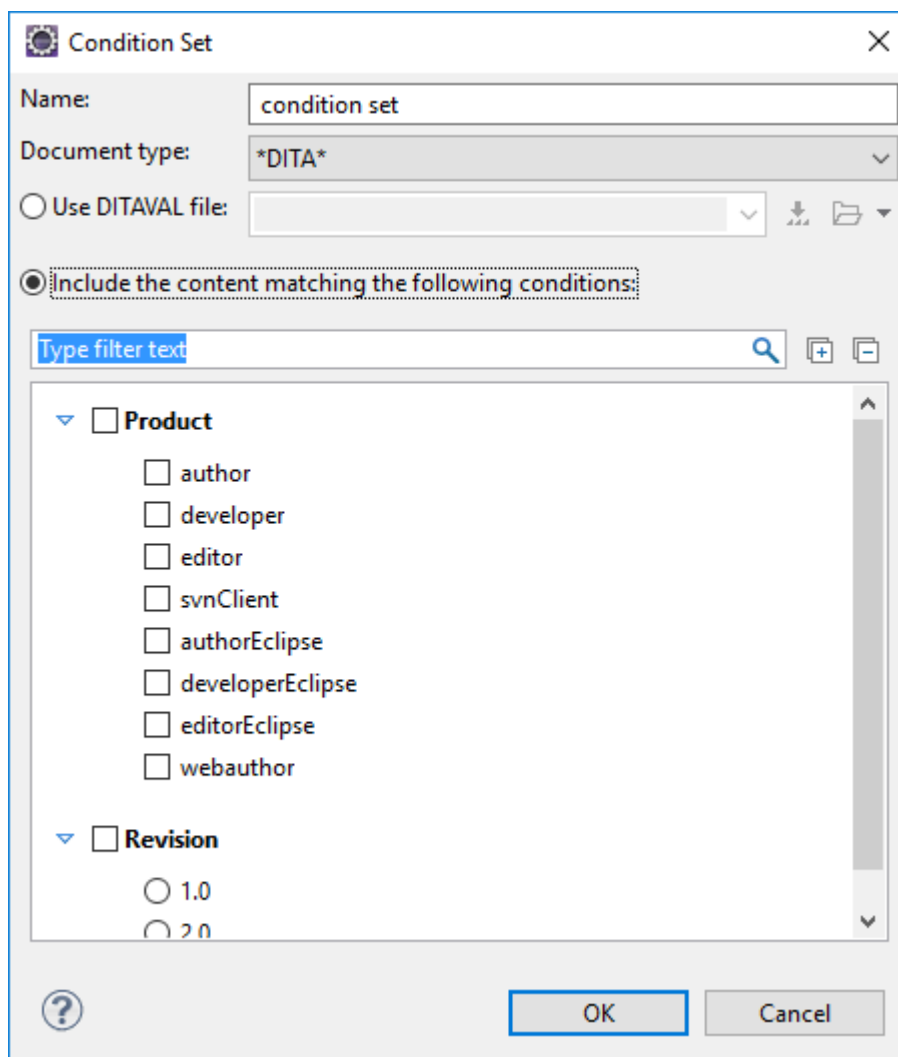

Information:

The **Profiling Condition Sets** section (on page 148) is used to define condition sets.

2. To add new condition set, click the **+ New** button at the bottom of the **Profiling Condition Sets** table. To customize existing condition sets, select an existing condition set and click the **Edit** button.

Step Result: In either case, this opens a **Condition Set** configuration dialog box where you can define attributes that exist in your schema.

Figure 643. Condition Set Configuration Dialog Box

The following options are available in this dialog box:

Name

The name of the new condition set.

Document type

Select the document type (*framework (on page 2679)*) that has profiling attributes defined.

Use DITAVAL file

For DITA projects, select this option if you want the *Profiling Condition Set* to reference a [DITAVAL file \(on page 2602\)](#). You can specify the path by using the text field, its history drop-down, the  [Insert Editor Variables \(on page 218\)](#) button, or the browsing actions in the  **Browse** drop-down list.

Include the content matching the following conditions

You can select this option to define the combination of attribute values for your condition set by selecting the appropriate checkboxes for the values you want to be included in this particular condition set. If you have defined a lot of profiling attributes, you can use the **filter** text field to search for specific conditions.

3. After defining or configuring the condition sets according to your needs, click **OK** to confirm your selections and close the **Condition Set** configuration dialog box.
4. Click **Apply** to save the condition set.

Related Information:

[Applying Profiling Condition Sets in DITA \(on page 2588\)](#)

[Creating and Editing Profiling Attributes in DITA \(on page 2581\)](#)

[Applying Profiling Attributes in DITA \(on page 2584\)](#)

[Showing and Filtering Profiled Content in DITA \(on page 2590\)](#)

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

Applying Profiling Condition Sets in DITA

All defined [Profiling Condition Sets \(on page 2586\)](#) are available as shortcuts in the  **Profiling / Conditional Text** toolbar menu ([on page 452](#)). Select a menu entry to apply the condition set. The filtered content is then grayed-out in the **Author** mode, **Outline** view ([on page 326](#)), and **DITA Maps Manager** view ([on page 2337](#)). Your selection will also be used as the [default condition set \(on page 2605\)](#) in transformation scenarios (this can be changed in the **Filters** tab). An element is filtered-out when one of its attributes is part of the condition set and its value does not match any of the values covered by the condition set.

EXAMPLE:

Suppose that you have the following document:

▼ **Spray painting**

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

▼ The garage is a good place to spray paint.

Step 1
Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2
Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3
Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4
Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5
Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

If you apply the following condition set, it means that you want to filter out the content to only include content profiled with the `expert` value for the `@audience` attribute and content that has the `prop1` value for the `@other` attribute.

Condition Set

Name:

Document type:

Use DITAVAL file:  

Include the content matching the following conditions:

Type filter text

Audience:

- expert
- novice

Product:

- product1
- product2

Other:

- prop1
- prop2

This is how the document looks in **Author** mode after you apply the condition set:

▽ **Spray painting**

Short Description: When paint is applied using a spray nozzle, it is referred to as spray painting.

Context:

▽ The garage is a good place to spray paint.

Step 1

Move the car out of the garage to avoid getting paint on it. Audience [novice]

Step 2

Place newspaper, cardboard, or a drop-cloth on the garage floor. Audience [expert]

Step 3

Place the object to be painted on the covered area. Audience [expert] Other [prop2]

Step 4

Follow the directions on the paint can to paint the object. Audience [expert] Other [prop1]

Step 5

Let the paint dry thoroughly before you move the object. Audience [novice] Other [prop1]

[Showing and Filtering Profiled Content in DITA \(on page 2590\)](#)

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

Showing and Filtering Profiled Content in DITA

You can visualize the effect of profiling content by using the profiling tools in the  **Profiling/Conditional Text** drop-down menu that is located on the **DITA Maps Manager** (on page 2337) toolbar and on the main toolbar. This drop-down menu includes the following filtering options:

Show Profiling Colors and Styles

Select this option to show colors and styles for profiled content in **Author** mode and the **DITA Maps Manager** (on page 2337). You can configure the colors and styles or specify whether or not this option is selected by default in the **Profiling/Conditional Text > Colors and Styles preferences page** (on page 148).

Show Profiling Attributes

Select this option to display the values of the profiling attributes at the end of profiled content in **Author** mode and next to the nodes in the **DITA Maps Manager** (on page 2337). You can specify

whether or not this option is selected by default in the **Profiling/Conditional Text** preferences page (on page 146).

Show Excluded Content

Controls whether the content filtered out by a particular condition set is hidden or grayed-out in **Author** mode, the **DITA Maps Manager** (on page 2337), and the **Outline** (on page 326) view. When this option is selected and a condition set is selected in this drop-down menu (on page 2591), the filtered content is grayed-out. If this option is not selected and a condition set is selected in this drop-down menu (on page 2591), the filtered content is hidden. You can specify whether or not this option is selected by default in the **Profiling/Conditional Text** preferences page (on page 146).

Choose Condition Set (Available if more than 15 condition sets are defined)

This option is available if you have more than 15 conditions sets defined. It opens a dialog box that makes it easier to find and select condition sets that are not displayed in this drop-down menu.

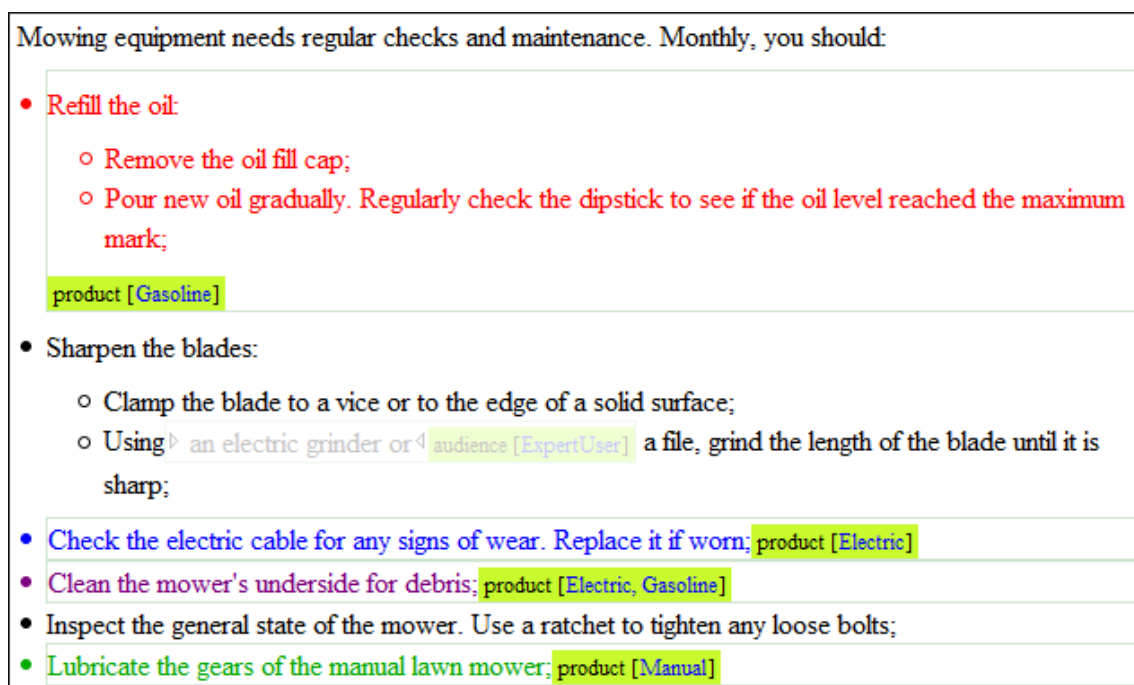

List of Defined Condition Sets

Up to 15 defined condition sets are listed and you can toggle each one of them on to filter the content in **Author** mode and the **DITA Maps Manager** (on page 2337) to only show content that will appear in the output for that particular condition set. If there are more than 15 defined condition sets, the rest of them can be accessed in the **More** submenu or by using the **Choose Condition Set** option (on page 2591) to access a dialog box that presents all of them.

Profiling Settings

Opens the **Attributes and Condition Sets** preferences page (on page 146) where you can add and edit profiling attributes and condition sets.

Figure 644. Example: Profiling Controls in Author Mode

Mowing equipment needs regular checks and maintenance. Monthly, you should:

- Refill the oil:
 - Remove the oil fill cap;
 - Pour new oil gradually. Regularly check the dipstick to see if the oil level reached the maximum mark;
 product [Gasoline]
- Sharpen the blades:
 - Clamp the blade to a vice or to the edge of a solid surface;
 - Using an electric grinder or audience [ExpertUser] a file, grind the length of the blade until it is sharp;
- Check the electric cable for any signs of wear. Replace it if worn; product [Electric]
- Clean the mower's underside for debris; product [Electric, Gasoline]
- Inspect the general state of the mower. Use a ratchet to tighten any loose bolts;
- Lubricate the gears of the manual lawn mower; product [Manual]

If the **Show Profiling Attributes** option is selected, a green border is painted around profiled text in the **Author** mode. Also, all profiling attributes set on the current element are listed at the end of the highlighted block and in its tooltip message. To edit the attributes of a profiled fragment, click one of the listed attribute values. A form control pops up and allows you to add or remove attribute values.

Figure 645. Profiling Attribute Value Form Control Pop Up

Profiling Attribute Icons in the DITA Maps Manager

The following icons are used to mark profiled and non-profiled topics in the **DITA Maps Manager**:

- ■ - The topic reference contains profiling attributes.
- □ - The topic reference inherits profiling attributes from an ancestor.
- ▣ - The topic reference contains a profiling attribute and inherits profiling from an ancestor.
- - (hyphen) - The topic reference neither contains nor inherits profiling attributes.

Figure 646. Rendering Profiled Topics in DITA Maps Manager

**Related Information:**

[Creating and Editing Profiling Condition Sets in DITA \(on page 2586\)](#)

[Applying Profiling Attributes in DITA \(on page 2584\)](#)

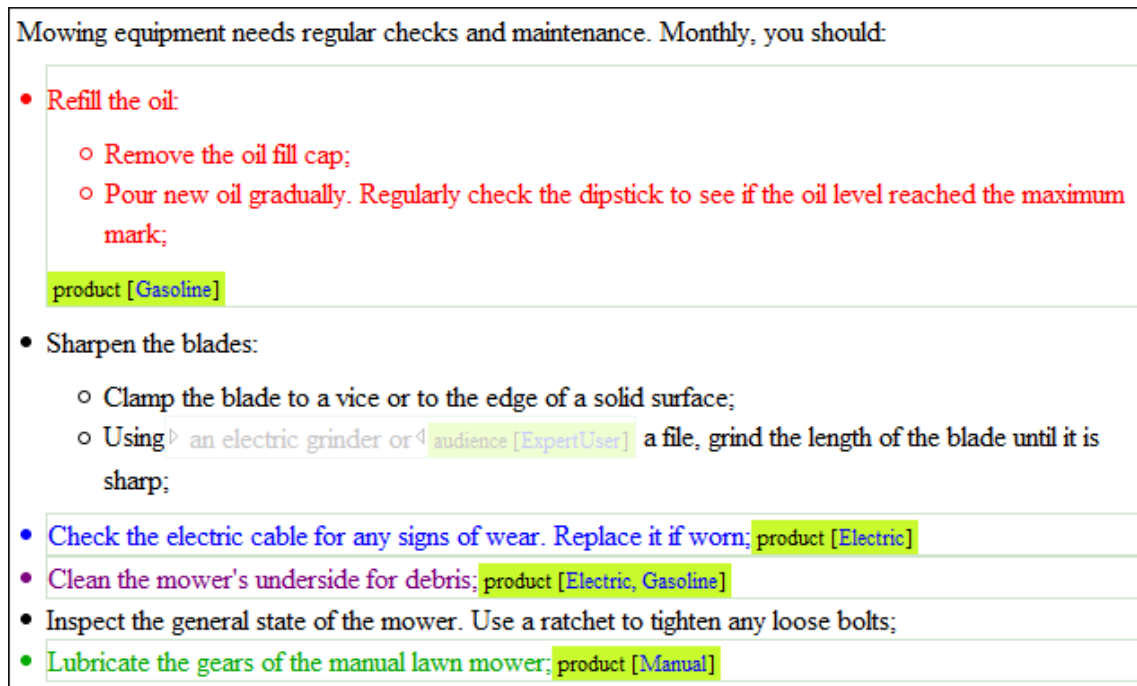

[Creating and Editing Profiling Attributes in DITA \(on page 2581\)](#)

[Applying Profiling Condition Sets in DITA \(on page 2588\)](#)

[Customizing Colors and Styles for Rendering Profiling in Author Mode \(on page 2593\)](#)

Customizing Colors and Styles for Rendering Profiling in Author Mode

By applying profiling colors and styles, you can mark profiled content in **Author** mode and the **DITA Maps Manager** (on page 2337) so that you can instantly spot differences between multiple variants of the output. This allows you to preview the content that will go into the published output. The excluded text is grayed-out or hidden in **Author** mode and excluded nodes are grayed-out or hidden in the **DITA Maps Manager** (on page 2337).

Figure 647. Example: Profiling Colors and Styles in Author Mode

Choosing the right style for a specific profiling attribute is a matter of personal taste, but be aware of the following:

- If the same block of text is profiled with two or more profiling attributes, their associated styles combine. Depending on the styling, this might result in an excessively styled content that may prove difficult to read or work with.
- It is recommended that you only profile the differences. There is no need to profile common content, since excessive profiling can visually pollute the document.
- A mnemonic associated with a style will help you instantly spot differences in the types of content.

Styling Profiling Attribute Values

To set colors and styles for profiling attribute values, follow these steps:

1. Select the **Show Profiling Colors and Styles** option (on page 452) from the  **Profiling / Conditional Text** toolbar drop-down menu.
2. Select  **Profiling Settings** (on page 453) from the  **Profiling / Conditional Text** toolbar drop-down menu. This is a shortcut to the **Attributes and Condition Sets** preferences page (on page 146).
3. Go to the **Colors and Styles** preferences page (on page 148) to configure the colors and styling for the profiling attributes.
4. Go to the **Attributes** preferences page (on page 150) to configure how you want the profiling attributes to appear in Oxygen XML Editor Eclipse plugin.

Result: The styling is now applied in the **Author** editing mode, the **Outline view** (on page 326), and in the **DITA Maps Manager view** (on page 2337). Also, to help you more easily identify the profiling you want to apply in

the current context, the styling is applied in the **Edit Profiling Attributes** dialog box (on page 443) and in the inline form control pop-up that allows you to quickly set the profiling attributes.

Figure 648. Profiling Attribute Value Form Control Pop Up

Alternate Method with a DITAVAL File: If you are using a DITAVAL filter file to control the filtering of profiled content in DITA topics, you can use a flag filter to define the colors and styles that will be used when rendering the profiling. For detailed information about this alternate method, see the procedure in the [Styling the Rendering of Profiled Content Using a DITAVAL File \(on page 2604\)](#) topic.

Conditional Profiling Attribute Groups

Overview

Conditional processing attributes can be specified using [grouped values](#). Groups organize the attributes into subcategories. This is intended to support situations where an attribute applies to multiple specialized subcategories. For example, suppose a company needs to filter content for several internal teams (*operations* and *support*) and they use the `@audience` attribute with the values `ops` and `support`, but the Support team has several levels of personnel (L1, L2, and L3). They could use a group to define the levels (*L1*, *L2*, and *L3*) as subcategories for the `support` value. Using groups for these subcategories allows each category to be processed independently.

A major advantage is that you do not need to add new profiling attributes using a DTD specialization. You can re-use existing DITA profiling attributes (such as `@product`, `@audience`, `@otherprops`) and specify multiple attribute subcategories.

Creating a Conditional Profiling Attribute Group

To create a group in Oxygen XML Editor Eclipse plugin:

1. Open the **Preferences** dialog box (*on page 70*) and go to **Editor > Edit modes > Author > Profiling / Conditional Text > Attributes and Condition sets**.
2. To add new attributes and values, click the **+** **New** button at the bottom of the **Profiling Attributes** table. To customize existing attributes and their values, select an attribute and click the **Edit** button.

Step Result: In either case, this opens a **Profiling Attribute** configuration dialog box where you can define attributes that exist in your schema.

3. Specify the appropriate values for the **Document type**, **Attribute name**, and **Display name**.

For information about the **Profiling Attribute** configuration dialog box, see [Defining Profiling Attributes for DITA Content \(on page 2581\)](#).

4. Click the **+** **New** button at the bottom of the attribute values table.
5. In the **Value** field of the resulting dialog box, define groups using the following format:

ParentAttrValue(SubAttrValue1 SubAttrValue2). For example:

```
support(L1 L2 L3)
```

6. Click **OK** and **Apply** to save and apply the changes.

Using Conditional Profiling Attribute Groups in Conjunction with a DITAVAL File

You can use groups to customize a hierarchy of profiling attribute values and then use it in conjunction with a [DITAVAL file to filter or flag \(on page 2602\)](#) the values. For example, suppose the company described in the example in the [Overview section \(on page 2595\)](#) needed to generate content for the Support team, but only for L1 and L2 support personnel. The DITAVAL file could look like this:

```
<val>
  <prop action="include" att="support" val="L1" />
  <prop action="include" att="support" val="L2" />
  <prop action="exclude" att="support" val="L3" />
</val>
```

That DITAVAL file could then be used for a [condition set \(on page 2586\)](#) to filter content in **Author** mode or during the transformation stage to [filter content in the output \(on page 2605\)](#) and content profiled with the `L1` and `L2` values would be included while content with the `L3` value would be excluded.

This example company could also have another DITAVAL file for filtering out all content profiled for any of the three subcategories (`L1`, `L2`, `L3`) by simply excluding the `support` value (since `L1`, `L2`, and `L3` are subcategories of it).

```
<val>
  <prop action="exclude" att="support" />
</val>
```

Defining Conditional Profiling Attribute Groups in a Subject Scheme Map

You can define conditional profiling attribute groups in a [subject scheme map \(on page 2597\)](#) as in the following example:

```
<?xml version="1.0" encoding="UTF-8"?>
<!DOCTYPE subjectScheme PUBLIC "-//OASIS//DTD DITA Subject Scheme Map//EN" "subjectScheme.dtd">
<subjectScheme>
  <enumerationdef>
    <attributedef name="product" />
    <subjectdef keys="productKeys">
      <subjectdef keys="myGroup1(gr1v1)" />
      <subjectdef keys="myGroup1(gr1v2)" />
      <subjectdef keys="product1" />
    </subjectdef>
  </enumerationdef>
</subjectScheme>
```

In the above example, **myGroup1** is the profiling attribute group for the `@product` attribute and **gr1v1** and **gr1v2** in parentheses are the values.

[DITA 1.3 Specifications: Conditional Processing Values and Groups](#)

Customizing Profiling Values with a Subject Scheme Map

Overview

A *subject scheme map (on page 2682)* allows you to create and manage custom profiling values in DITA documents without having to write a DITA specialization. Ultimately, this allows you to filter and flag content in **Author** mode or in transformed output.

Subject scheme maps use key definitions to define a collection of profiling values. You can also use *subject scheme maps* to filter out (reject) the values for certain attributes so that you only see the attributes or values that you want to use in **Author** mode or the transformed output.

The highest level of map (*main DITA map (on page 2682)*) that uses the set of profiling values must reference the *subject scheme map* where the profiling values are defined and the `@type` attribute needs to be set to `subjectScheme` for the reference, as in the following example:

```
<topicref href="test.ditamap" format="ditamap" type="subjectScheme" />
```

Advantages of Using a Subject Scheme Map

The advantages of using a subject scheme to control profiling attribute values include:

- You can create a hierarchy of profiling attribute values and use a DITAVAL file to filter or flag the tree of values.
- You can share the subject scheme files with others without having to share preferences or the entire project.
- The subject scheme offers validation support so you are notified if an undefined value is used.

Creating a Subject Scheme Map

To create and configure a *subject scheme map*, follow this procedure:

1. Use the **New Document wizard (on page 246)** to create a new **Subject Scheme** document (**New from Templates > Framework templates > DITA Map > map >  Subject Scheme**).
2. Use the controls in **Author** mode to define the hierarchical tree of values for your *subject scheme* (see the **Author mode example below (on page 2600)**) or switch to **Text** mode and define it there if you prefer (see the **Text mode example below (on page 2600)**).

Note:

The pre-defined subject scheme template includes Navigation Titles (`<navtitle>` element). This element is not required, but if you use it, the text that you enter for the `<navtitle>` will be used (instead of the name of the value) in the various places where **profiling attributes are presented in Oxygen XML Editor Eclipse plugin (on page 2601)**. An example of when this might be helpful is if you want to use abbreviations for the name of a value, but you want to see its full name in Oxygen XML Editor Eclipse plugin.

3. Bind the particular attribute to the key you define for the tree of values using the `<attributedef>` and `<subjectdef>` elements inside the `<enumerationdef>` element. Notice that in the **examples below (on page 2600)**, the *audience* attribute is bound to the *audienceKey* value.

Tip:

By default, attributes can accept multiple values, but you can use `outputclass="single_value"` to specify that a certain attribute only accepts a single value at a time and the attribute will be presented in Oxygen XML Editor Eclipse plugin with radio buttons instead of checkboxes. For example:

```
<enumerationdef outputclass="single_value">
  <attributedef name="audience"/>
  <subjectdef keyref="audienceKey"/>
</enumerationdef>
```

You can also define a specific set of possible attribute values for a specific attribute name that is set on a specific element name. For example, you can define a specific set of `@outputclass` attribute values only for the `<image>` element:

```
<enumerationdef>
  <elementdef name="image"/>
  <attributedef name="outputclass"/>
  <subjectdef keyref="imgOutputClassValuesKey"/>
</enumerationdef>
```

4. If you want to filter out (reject) values for certain attributes, bind the attributes to a blank value (as you see for the `props` and `otherprops` attributes in the [examples below \(on page 2600\)](#)). This means that those attributes will not appear in the various places where [profiling attributes are presented in Oxygen XML Editor Eclipse plugin \(on page 2601\)](#).
5. Save your *subject scheme* file.
6. Reference your *subject scheme* in the highest level of map ([main DITA map \(on page 2682\)](#)) that will use the set of profiling values and set its type to `subjectScheme`. The easiest way to do this is:
 - a. With your *subject scheme* file opened in the editor, go to the **DITA Maps Manager** view, right-click the *main DITA map*, and select **Append Child > Reference to the currently edited file**.
 - b. In the **Insert Topic Reference** dialog box, go to the **Attributes** tab and in the **Type** field, enter or select **subjectScheme**.
 - c. Click the **Insert and Close** button and save your main DITA map.

Using a Subject Scheme in Conjunction with a DITAVAL File

You can use a subject scheme to customize a hierarchy of profiling attribute values and then use it in conjunction with a [DITAVAL file to filter or flag \(on page 2602\)](#) the entire tree of values. For example, suppose one of the values for the `audience` attribute in a hierarchical subject scheme is `surgeon` and it has two subordinate values of `neuro-surgeon` and `plastic-surgeon` (see the [examples below \(on page 2600\)](#)). You could create a DITAVAL file with the following content:

```
<val>
  <prop action="exclude" att="audience" val="surgeon"/>
</val>
```

That DITAVAL file could then be used for a [condition set \(on page 2586\)](#) to filter content in **Author** mode or during the transformation stage to [filter content in the output \(on page 2605\)](#) and the `neuro-surgeon` and `plastic-surgeon` values would be excluded by the filter since the subject scheme defines them as subordinate values of the `surgeon` value.

Example: Subject Scheme Map that Defines Custom Values for the Audience Attribute

This example uses typical audience values for medical personnel (`therapist`, `oncologist`, `physicist`, `radiologist`, `surgeon`, and so on). The `audience` attribute is bound to the `audienceKey` value (which defines the tree of values). You can also see that it filters out all possible values for other attributes (`props` and `otherprops`) so that they won't be available in the various places where [profiling attributes are presented in Oxygen XML Editor Eclipse plugin \(on page 2601\)](#).

Example using Author mode controls:

Figure 649. Subject Scheme Author Mode Controls

Subject Scheme

A scheme that defines audience user values

▼ audienceKey

therapist	+	-
oncologist	+	-
physicist	+	-
radiologist	+	-

▼ surgeon

neuro-surgeon	+	-
plastic-surgeon	+	-

+ -

+ -

Binding the audience attribute to the values defined in the key

Binding

bind attribute **to** + -

Reject all possible values for other profiling attributes

Binding

bind attribute **to** + -

Binding

bind attribute **to** + -

Example code in Text mode:

```

<subjectScheme>
  <!-- A scheme that defines audience user values -->
  <subjectdef keys="audienceKey">
    <subjectdef keys="therapist"/>
    <subjectdef keys="oncologist"/>
    <subjectdef keys="physicist"/>
    <subjectdef keys="radiologist"/>
    <subjectdef keys="surgeon">
      <subjectdef keys="neuro-surgeon"/>
      <subjectdef keys="plastic-surgeon"/>
    </subjectdef>
  </subjectdef>
  <!-- Binding the audience attribute to the values defined in the key -->
  <enumerationdef>
    <attributedef name="audience"/>
    <subjectdef keyref="audienceKey"/>
  </enumerationdef>

  <!--Reject all possible values for other profiling attributes-->
  <enumerationdef>
    <attributedef name="props"/>
    <subjectdef/>
  </enumerationdef>
  <enumerationdef>
    <attributedef name="otherprops"/>
    <subjectdef/>
  </enumerationdef>
</subjectScheme>

```

Where the Profiling Attributes are Available in Oxygen XML Editor Eclipse plugin

When you edit a DITA topic in the **Text** or **Author** mode, Oxygen XML Editor Eclipse plugin collects all the profiling values from the *subject scheme map* (on page 2682) that is referenced in the map that is currently opened in the **DITA Maps Manager** (on page 2337) (or set as the *root map* (on page 2353)). The values of profiling attributes defined in a *Subject Scheme Map* are available in the following places in Oxygen XML Editor Eclipse plugin (regardless of their mapping in the **Profiling/Conditional Text** preferences page (on page 145)):

- The **Profiling** tab of the **Edit Properties** dialog box (on page 2378).
- The **Edit Profiling Attribute** dialog box (on page 2585).
- The inline profiling controls in **Author** mode (on page 2591).
- The proposals for the attribute values in the *Content Completion Assistant* (on page 2677).

Resources

For more information about using a DITA subject scheme map, watch our video demonstration:

<https://www.youtube.com/embed/RgkVRg6k6zo>

Related Information:

[Filtering Profiling Values with a DITAVAL File \(on page 2602\)](#)

[DITA 1.3 Specifications: Subject Scheme Maps](#)

Filtering Profiling Values with a DITAVAL File

You can use a DITAVAL filter file to control the filtering or flagging of profiled content or to identify which values are to be used for conditional processing during a particular output.

DITAVAL Filtering Use-Case

Suppose that a medical publication uses the *audience* profiling attribute to profile the content for the following types of users: *therapist*, *physician*, and *surgeon*. Suppose that in the output, you want to exclude any content that is profiled as `surgeon` value for the `@audience` attribute.

You could use a DITAVAL filter file to exclude anything that is profiled as `surgeon`:

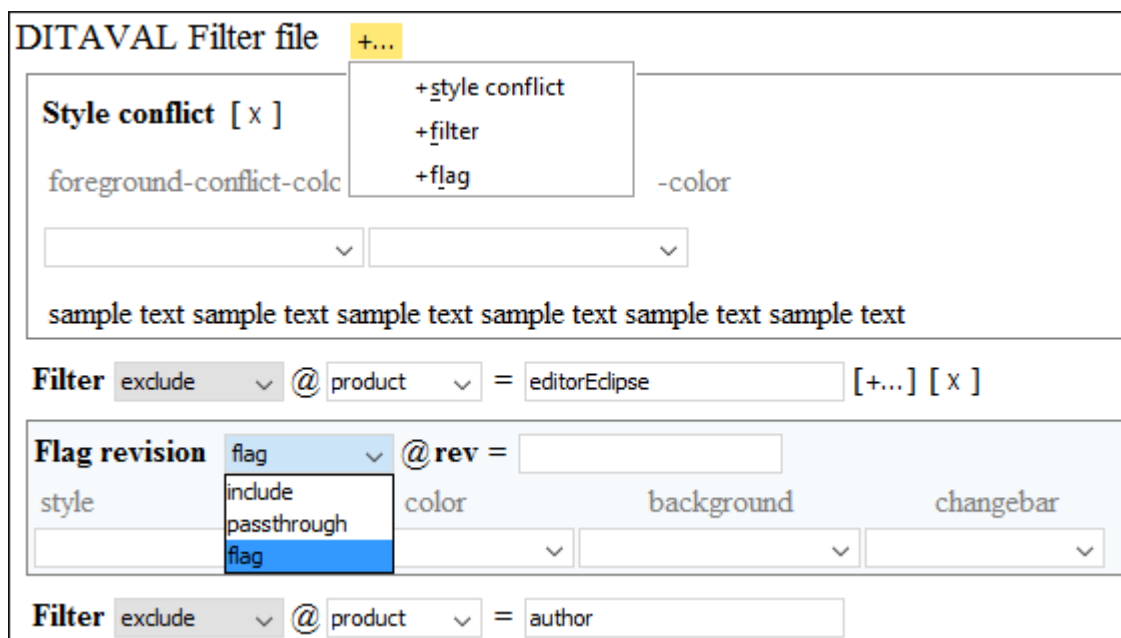

```
<val>
  <prop action="exclude" att="audience" val="surgeon" />
</val>
```

If you then transform the main *DITA map* (on page 2678) and specify the DITAVAL filter file in the transformation scenario, the output will exclude anything that is profiled as `surgeon`).

DITAVAL Filter File Editor in Author Mode

The **Author** editing mode in Oxygen XML Editor Eclipse plugin offer a simple and intuitive editor for creating or modifying DITAVAL files. It provides a series of drop-down menus and text fields that allow you to easily define the filters.

Figure 650. DITAVAL File Editor in Author Mode

Use the **+...** button to display a drop-down list that contains elements that you can add at that particular location in the DITAVAL file. Clicking this button at the top (next to the **DITAVAL FILTER File** title, allows you to insert the following elements:

- **Style Conflict** - Inserts a `<style-conflict>` element that declares behavior to be used when one or more flagging methods collide on a single content element. You can use the simple drop-down menus to select values for the `@foreground-conflict-color` and `@background-conflict-color` attributes.
- **Filter** - Inserts a `<prop>` element that identifies an attribute to apply a filtering action on. The possible actions that you can select are **include**, **exclude**, **passthrough**, and **flag**. If you select the **flag** action, you can use the drop-down menus to select values for the `@style`, `@color`, and `@background` attributes.
- **Flag** - Inserts a `<revprop>` element that identifies a value in the `@rev` attribute that should be flagged in some manner. The allowed actions are **include**, **passthrough**, and **flag**. If you select the **flag** action, you can use the drop-down menus to select values for the `@style`, `@color`, `@background`, and `@changebar` attributes.

See the [DITAVAL Element Specifications](#) for more details about the allowed filters and flags.

How to Create a DITAVAL Filter File

To create a DITAVAL filter file, follow these steps:

1. Go to **File > New**.
2. Scroll to the **Framework templates > DITA** folder.
3. Select the **Filter** template file and click **Create**.
4. Define your filters in the DITAVAL file (in **Text** or **Author** mode).
5. Save the DITAVAL file.

Result: The DITAVAL filter file can now be used for all of the following:

- To apply a reference to the DITAVAL file in a *Profiling Condition Set* using the **Use DITAVAL File** option in the **Condition Set** configuration dialog box (*on page 2586*).
- You can use the **Import from DITAVAL** option in the **Attributes and Condition Sets** preferences page (*on page 146*) to use the DITAVAL file to define profiling attributes.
- You can use the DITAVAL file to apply the filters to the output by specifying the DITAVAL file in the **transformation scenario** (*on page 2560*).
- You can use the filter file in the **DITA Map Completeness Check** dialog box (*on page 2383*) when validating your *DITA map* (*on page 2678*).
- DITAVAL files are also used when working with the DITA 1.3 *Branch Filtering* mechanism. For more details, see: *Working with DITA 1.3 Branch Filtering* (*on page 2505*).
- You can define the colors and styles to be used for rendering profiled condition sets (*on page 2604*) in **Author** mode and the **DITA Maps Manager** (*on page 2337*) view by using a **Flag** filter in the DITAVAL file.

Related information

[DITAVAL Element Specifications](#)

[Working with DITA 1.3 Branch Filtering](#) (*on page 2505*)

[Customizing Profiling Values with a Subject Scheme Map](#) (*on page 2597*)

[Styling the Rendering of Profiled Content Using a DITAVAL File](#) (*on page 2604*)

[Conditional Profiling Attribute Groups](#) (*on page 2595*)

Styling the Rendering of Profiled Content Using a DITAVAL File

If you are using a DITAVAL filter file to control the filtering of profiled content, you can define the colors and styles to be used for rendering profiled condition sets in **Author** mode and the **DITA Maps Manager** (*on page 2337*) by defining the styles in a flag filter that is set in a DITAVAL filter file.

How to Define a Flag for a Condition Set in a DITAVAL Filter File

To define the colors and styles to be used for rendering profiled condition sets by using a flag filter in a DITAVAL filter file, follow these steps:

1. Create or edit your DITAVAL file (*on page 2603*) to define your profiling condition set (*on page 2586*).
2. In **Author** mode, define the filters for your condition set (*on page 2602*).
3. Select **Flag** from the drop-down menu on in a particular **Filter** or **Flag Revision** to present additional drop-down menus that allow you to configure the colors and styles for the particular condition set.
4. Save the DITAVAL file.

Result: Test your changes by opening profiled content in **Author** mode or the **DITA Maps Manager** (*on page 2337*) and use the options in the  **Profiling / Conditional Text** drop-down menu to see how the changes in your DITAVAL flag are rendered.

EXAMPLE:

Using a **Flag** on a **Filter** to define the styling for a condition set like this:

DITAVAL Filter file +...

Filter **exclude** @ **product** = editorEclipse

Filter **flag** @ **product** = editor

style color background

bold maroon silver

will render the styling of the profiled content in **Author** mode to look like this:

▶ **Shortcut Keys** - Many of the  ▶ shortcut keys
Markdown editor. product [editor]

and will render the styling in the **DITA Maps Manager** view (on page 2337) to look like this:

[Filtering Profiling Values with a DITAVAL File \(on page 2602\)](#)

Publishing Profiled DITA Content

You can create a variety of publications or versions of your documentation from a single map by applying profiling conditions to the build.

Oxygen XML Editor Eclipse plugin includes preconfigured transformation scenarios for DITA. By default, these scenarios take the current [profiling condition set \(on page 2588\)](#) into account during the transformation, as defined in the [Filters](#) tab (on page 2560) when [creating a DITA transformation \(on page 1233\)](#). You can also specify a [DITAVAL file \(on page 2602\)](#) that defines filters for your profiled content.

Figure 651. Profiling Option in the Filters Tab (DITA-OT Transformations)

Name: DITA Map PDF

Type: PDF

FO Processor Parameters **Filters** Advanced Output

Use DITAVAL file:  

Use current profiling condition set : "For experts" 

Exclude from output all elements with any of the following attributes:

Conditional Processing to Generate Multiple Deliverables

By default, the content of most elements is included in all output media. Within maps and topics, elements can specify the delivery targets to which they apply.

Within maps, topic references can use the `@deliveryTarget` attribute to indicate the delivery targets to which they apply. Within topics, most elements can use the `@deliveryTarget` attribute to indicate the delivery targets.

If a referenced topic should be excluded from all output formats, set the `@processing-role` attribute to **resource-only** instead of using the `@deliveryTarget` attribute. Content within that topic can still be referenced for display in other locations.

`@deliveryTarget`

The intended delivery target of the content, for example **html**, **pdf**, or **epub**. This attribute is a replacement for the now deprecated `@print` attribute.

The `@deliveryTarget` attribute is specialized from the `@props` attribute. It is defined in the *deliveryTargetAttDomain*, which is integrated into all OASIS-provided document-type shells. If this domain is not integrated into a given document-type shell, the `@deliveryTarget` attribute will not be available.

The `@deliveryTarget` attribute is processed the same way as any other conditional processing attribute. For example, `<topicref deliveryTarget="html5 epub" href="example.dita"/>` uses two values for `@deliveryTarget`. A conditional processing profile can then set rules for `@deliveryTarget` that determine whether the topic is included or excluded when the map is rendered as HTML5 or EPUB.

DITA Open Toolkit Support

The *DITA Open Toolkit* is an open-source publishing engine that can generate various output formats (for example, HTML, PDF, CHM) from DITA content. Oxygen XML Editor Eclipse plugin includes support for the DITA Open Toolkit. This section includes information about how to install and create a DITA-OT *plugin (on page 2681)*, and how to use an external instance of the DITA Open Toolkit.

Related Information:

[DITA Open Toolkit Documentation](#)

DITA-OT Plugins

The architecture of the DITA Open Toolkit publishing engine is plugin-based. A plugin can add support for publishing DITA content as a new format or for customizing an existing output format. The DITA Open Toolkit bundled with Oxygen XML Editor Eclipse plugin already has lots of plugins pre-installed but you can also install additional *plugins (on page 2681)* or create your own.

Creating a DITA-OT Plugin

Oxygen XML Editor Eclipse plugin provides the ability to [install additional DITA Open Toolkit plugins \(on page 2611\)](#) that can be found from various sources (for example, [Oxygen's public GitHub repository](#) includes some DITA-OT plugins). It is also possible to create your own *plugin*.

CAUTION:

Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

To create a DITA-OT *plugin*, follow these steps:

1. Create a new folder in the **plugins** folder located in your DITA-OT directory (for example, if you are using DITA 4.1.2, the path would look like this: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT/plugins/MyNewPlugin`).
2. Create a **plugin.xml** file in that same folder. This file will contain the extension points for the *plugin*. For example, references to the XSLT stylesheets that will be used to style the output.

Note:

You can easily create this file by using the **DITA-OT Plugin** new document template that is included in Oxygen XML Editor Eclipse plugin (from the [New from templates wizard \(on page 253\)](#) you can find this template in **Framework templates > DITA > plugin**).

Example:

```
<plugin id="org.metadita.specialization.music">
  <feature extension="dita.specialization.catalog.relative"
    file="catalog-dita.xml" />
  <feature extension="dita.xsl.xhtml" file="xsl/music2xhtml.xsl" />
  <feature extension="dita.xsl.html5" file="xsl/music2xhtml.xsl" />
</plugin>
```

Tip:

Oxygen XML Editor Eclipse plugin includes special editing support when adding extension points in the **plugin.xml** file. If you place the cursor in the value of the `@extension` attribute and press **Ctrl+Space**, a list of possible extension points is presented with links to the DITA-OT documentation. For more information about extension points that are available to use in the *plugin.xml* file, see: <http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html>.

3. Install the newly created DITA-OT *plugin* (on page 2611) by running the built-in transformation scenario called **Integrate/Install DITA-OT Plugins** (on page 2548) from the  **Apply Transformation Scenario(s)** (on page 1173) or  **Configure Transformation Scenario(s)** dialog box (on page 1300).

**Note:**

If the *integrator* is not visible, select the **Show all scenarios** option in the  **Settings** drop-down menu.

You can share your new plugin with other users who have the same DITA-OT distribution by sending them your newly created folder along with the [installation instructions](#) (on page 2611).

Related Information:

[DITA Open Toolkit Documentation](#)

[Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin](#) (on page 2612)

Example: Creating a DITA-OT Plugin for Embedding Video Resources

To offer a detailed example of the steps required to create a new **DITA Open Toolkit** *plugin* (on page 2681), this topic uses an example of creating an **XSLT** customization *plugin* that provides support for referencing video and audio content using the DITA `<object>` element and then publishing to **HTML** and **PDF** output formats. This *plugin* (**com.oxygenxml.media**) is available in the **DITA Open Toolkit** distribution that comes bundled with the latest version of Oxygen XML Editor Eclipse plugin, but these instructions show you how you could create it if it were not included.

The following procedure is meant to help you with creating the *plugin*:

1. Create a folder for your *plugin* in the DITA-OT **plugins** folder (`DITA-OT-DIR/plugins/`).
2. Create a **plugin.xml** file (in the same *plugin* folder) that contains the extension points of the *plugin*.

**Note:**

You can easily create this file by using the **DITA-OT Plugin** template that is included in Oxygen XML Editor Eclipse plugin (from the **New from templates** wizard (on page 253) you can find this template in **Framework templates > DITA > plugin**).

Example: Media Plugin File

```
<plugin id="com.oxygenxml.media">
  <feature extension="package.support.name" value="Oxygen XML Editor Support"/>
  <feature extension="package.support.email" value="support@oxygenxml.com"/>
  <feature extension="package.version" value="21.0"/>
  <feature extension="dita.xsl.xhtml" value="xhtmlMedia.xsl" type="file"/>
  <feature extension="dita.xsl.xslfo" value="pdfMedia.xsl" type="file"/>
</plugin>
```

The most important extensions in it are the references to the XSLT stylesheets that will be used to style the HTML and PDF outputs.

You can find other **DITA-OT** *plugin* extension points here: <http://www.dita-ot.org/dev/extension-points/extension-points-by-plugin.html>.

3. Create an XSLT stylesheet to customize the output types. In this example, to customize the HTML output, it is necessary to create an XSLT stylesheet called **xhtmlMedia.xsl** (in the same *plugin* folder).

Tip:

You can find an XSLT stylesheet with content that is similar to the desired output and use it as a template to overwrite parts of your stylesheet. For example, suppose you want to overwrite HTML content produced from a DITA **codeblock** element. Since a DITA `<object>` element has the `@class` attribute value `topic/object`, you can take part of the class attribute value (**topic/object**) and search the **DITA-OT** resources for a similar stylesheet. The search might find the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/xslhtml/xsl/xslhtml/dita2htmlImpl.xsl`.

You can use it as a starting point to overwrite the **xhtmlMedia.xsl** stylesheet. For example, the results might be:

```
<xsl:template
  match="*[contains(@class, ' topic/object ')] [contains(@outputclass, 'video')]">
  <video class="embed-responsive-item">
    <xsl:call-template name="commonattributes" />
    <xsl:call-template name="setidaname" />
    <xsl:call-template name="copySource" />
  </video>
</xsl:template>
```

4. Create additional XSLT stylesheets to customize all other desired output types. In this example, to customize the PDF output it is necessary to create an XSLT stylesheet called **pdfMedia.xsl** (in the same *plugin* folder).

In this case, you might find an appropriate XSLT stylesheet called `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic.xsl` to use as a starting point to overwrite the **pdfMedia.xsl** stylesheet, with results looking something like this:

```
<!--Treat video, audio or iframe objects as links-->
<xsl:template
  match="*[contains(@class,' topic/object ')][@outputclass = 'video']">
  <xsl:variable name="target" select="@data" />
  <xsl:variable name="baseDir">
    <xsl:call-template name="substring-before-last">
      <xsl:with-param name="text" select="@xtrf" />
```

```

    <xsl:with-param name="delim" select="'/'"/>
  </xsl:call-template>
</xsl:variable>

<fo:inline xsl:use-attribute-sets="object">
  <xsl:call-template name="commonattributes"/>
  <xsl:if test="exists($target)">
    <fo:basic-link external-destination="url({$target})"
                  xsl:use-attribute-sets="xref">
      <xsl:value-of select="$target"/>
    </fo:basic-link>
  </xsl:if>
</fo:inline>
</xsl:template>

```

5. To install the created *plugin* in the **DITA-OT**, run the built-in transformation scenario called **Integrate/Install DITA-OT Plugins** (on page 2548) by executing it from the  **Apply Transformation Scenario(s)** dialog box (on page 1173). If the integrator is not visible, select the **Show all scenarios** option that is available in the  **Settings** drop-down menu. For more information, see [Installing a DITA-OT Plugin](#) (on page 2611).

Results of running the integrator using the media plugin example:

XSLT content is applied with priority when publishing to both HTML and PDF outputs.

- a. For the HTML output, in the XSLT stylesheet `DITA-OT-DIR/plugins/org.dita.xhtml/xsl/dita2html-base.xsl`, a new import automatically appeared:

```
<xsl:import href="../../plugins/com.oxygenxml.media/xhtmlMedia.xsl"/>
```

This import is placed after all base imports and thus has a higher priority. For more information about imported template precedence, see: <http://www.w3.org/TR/xslt#import>.

- b. Likewise, for the PDF output, in the top-level stylesheet `DITA-OT-DIR/plugins/org.dita.pdf2/xsl/fo/topic2fo_shell_fop.xsl`, a new import statement appeared:

```
<xsl:import href="../../../com.oxygenxml.media/pdfMedia.xsl"/>
```

Now, you can distribute your *plugin* folder to anyone that has a DITA-OT installation along with some simple installation notes. Your customization will work provided the templates you are overwriting have not changed from one DITA-OT distribution to the other.

Related Information:

[DITA Open Toolkit Documentation](#)

Installing a DITA-OT Plugin

Oxygen XML Editor Eclipse plugin comes bundled with various DITA-OT *plugins* (on page 2681), but the architecture of the **DITA Open Toolkit** also allows you to install additional *plugins* that can be found from various sources (for example, [Oxygen's public GitHub repository includes some DITA-OT plugins](#)).

CAUTION:

Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

Installing a DITA-OT Plugin

To install a DITA-OT plugin, following this procedure:

1. Copy the additional *plugin* to the location of the DITA-OT version you are using (by default, `DITA-OT-DIR\plugins` directory).
2. Select the  **Configure Transformation Scenario(s)** (on page 1300) action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view (on page 1306)).
3. Select the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 2548). If the *integrator* is not visible, select the **Show all scenarios** option that is available in the  **Settings** drop-down menu.

Important:

The folder where the **DITA-OT** is located needs to have full write access permissions set to it. For example, in **Windows**, if you are integrating *plugins* in the **DITA-OT** folder bundled with Oxygen XML Editor Eclipse plugin and your application is installed in the **Program Files** folder, you can start the Oxygen XML Editor Eclipse plugin main executable with administrative rights for the integrator process to be able to modify resources in the **DITA-OT** folder.

4. Apply the scenario (on page 1299).
5. Check the **Results** panel at the bottom of the application to make sure the build was successful.

After the installation, you can open a DITA map and use the **Configure Transformation Scenarios** dialog box to create a new **DITA-OT** transformation scenario. Oxygen XML Editor Eclipse plugin detects that transformation type declaration from the **DITA-OT** *plugin* and presents descriptions in the **DITA Transformation Type dialog box** (on page 1233). Oxygen XML Editor Eclipse plugin also shows the contributed parameters from the plugin in the transformation scenario's **Parameters** tab (on page 2558).

**Tip:**

You can declare the transformation type and allowed parameters by following the procedure found in: [Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin \(on page 2612\)](#).

Related Information:

[Creating a DITA-OT Plugin \(on page 2607\)](#)

[Installing the DITA For Publishers Package](#)

[DITA Open Toolkit Documentation](#)

[Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin \(on page 2612\)](#)

Defining the Transformation Type and Allowed Parameters in a DITA-OT Plugin

Custom **DITA-OT** *plugins* may contribute new transformation types (transtypes) and each transtype may have a set of allowed configuration parameters. If a DITA-OT plugin declares a **transtype**, Oxygen XML Editor Eclipse plugin detects that transformation type declaration and presents descriptions in the **DITA Transformation Type** dialog box (on page 1233) and the contributed parameters in the transformation scenario's **Parameters** tab (on page 2558).

To define a transformation type and its contributed parameters in a DITA-OT plugin, follow this procedure:

1. If you have not already done so, [create a DITA-OT plugin.xml file \(on page 2607\)](#) (you can easily create this file by using the **DITA-OT Plugin** new document template in the **New from templates** wizard (on page 253)).
2. In the **plugin.xml** file, define the transformation type details by using the `<transtype>` element to specify a name, description, and the transtype it extends.

```
<transtype name="xhtml" extends="base-html" desc="HTML">
```

3. Define allowed parameters by using the `<param>` element to specify the name, description, and information about the default and allowed set of values. For more information, see: <https://www.dita-ot.org/3.1/topics/plugin-configfile.html>.

```
<param name="args.indexshow" desc="Specifies whether to show the index" type="enum">
  <val>yes</val>
  <val default="true">no</val>
</param>
```

Depending on the type declared for a parameter, Oxygen XML Editor Eclipse plugin will help you pick values for each parameter edited in the **Parameters** tab of the transformation scenario configuration dialog box. For example, for parameters of type **"enum"**, Oxygen XML Editor Eclipse plugin will present a combo box for choosing the proper value for the parameter.

4. You can also extend various extension points in your **plugin.xml**. For more information, see: <https://www.dita-ot.org/3.1/extension-points/plugin-extension-points.html>.

Plugin Extension Example - Promote Parameters:

It is possible to promote certain transformation parameters so that they appear above the table of allowed parameters and values in the **Parameters** tab of the transformation scenario configuration dialog box. To do this, you could create a `pluginExtension.xml` file in the root folder of the DITA-OT plugin and use the `<promotedParams>` element to define the promoted parameters. Here is an example:

```
<extensionPlugin>
  <transtype name="pdf-css-html5">
    <promotedParams>
      <param name="args.css" promotedName="CSS" />
      <param name="args.css.param.numbering" promotedName="Numbering" />
      <param name="args.chapter.layout" promotedName="Chapter layout" />
    </promotedParams>
  </transtype>
</extensionPlugin>
```

The example above results in the **Parameters** tab looking like this:

Figure 652. Promoted Parameters

Name	Value	Description
args.css	C:\Users\dan\Desktop\test.css	You can use this to specify a list of CSS URLs to be us...
args.input	{cf}	Specifies the master file for your documentation project.
css.processor.type	chemistry	Choose the formatting processor. Allowed values: "ch...
dita.dir	{configured.ditaot.dir}	Specifies where DITA-OT is installed.
args.chapter.layout	BASIC	Specifies whether chapter level TOCs are generated f...
args.css.param.numbering	shallow	When set to 'shallow', only the first level topics (the c...
args.css.param.title-layout	normal	Specifies the layout used for the titles. Allowed values...

5. Install the plugin (on page 2611).

Note:

If the plugin is installed using an external command line, you may need to restart Oxygen XML Editor Eclipse plugin to properly re-detect the newly contributed transtypes and parameters.

Example of a `plugin.xml` File:

```
<plugin id="com.oxygenxml.pdf.prince">
  <!-- extensions -->
```

```

<feature extension="dita.conductor.transtype.check" value="pdf-prince" type="txt" />
<feature extension="dita.conductor.target.relative" value="integrator.xml"
  type="file" />
<feature extension="dita.transtype.print" value="pdf-prince" />
<transtype name="pdf-prince" extends="commons" desc="PDF (Prince XML)">
  <param name="princeExecPath" type="file" desc="Path to the Prince executable" />
</transtype>
</plugin>

```

Built-in Third-Party DITA Open Toolkit Plugins

The DITA Open Toolkit 4.1.2 distribution that is bundled with Oxygen XML Editor Eclipse plugin includes some pre-installed third-party open-source *plugins (on page 2681)* that add extra publishing formats and functionality.

The *plugins* that come bundled with Oxygen XML Editor Eclipse plugin include:

- **DITA For Publishers** - These *plugins* allow DITA content to be published to additional formats, such as EPUB 2.0 and Kindle.
- **DITA to Word** - This *plugin* allows users to publish DITA content to MS Word.
- **DITA Community** - These *plugins* allow support for DITA 1.3 with embedded or referenced MathML and SVG images.

Extra Free Publishing Plugins

The DITA Open Toolkit publishing engine comes with support for predefined output formats such as HTML5, PDF, and Eclipse Help. Since the architecture of the publishing engine is plugin-based, over time, [lots of useful plugins](#) were developed in the **Oxygen XML GitHub** account that enhance the publishing and some of them are listed below. The plugins that are already installed within the DITA-OT engine that comes bundled with Oxygen XML Editor Eclipse plugin are listed with a **[Bundled]** marker.

Plugin that Converts DITA Maps to PDF Using CSS 3 [Bundled]

You can use [this very popular plugin](#) to publish DITA to PDF output using CSS. As the publishing engine, it can use the **Oxygen XML Chemistry** processor (freely bundled with **Oxygen XML Editor**), the Antenna House engine, or the Prince XML engine.

DITA Metrics Report [Bundled]

This is a very useful [open-source plugin](#) can be used to generate an HTML report from an existing DITA project and contains a lot of useful information, including:

- Total number of maps and topics that are part of the project.
- Total number of elements used in topics and maps along with a table presenting all element names and their usage counter.
- The used elements for each DITA domain.
- Total number of attributes used in topics and maps along with a table presenting all attribute names and their usage counter.
- Statistics about the conditional attributes used in the project.
- Information about content reuse.
- Text and content statistics, including both total words (word count) and unique words (vocabulary).
- List of largest and smallest topics and the number of words each one uses.
- Listing of all links to resources outside of the project.
- A [metrics evolution report](#) between different versions of your documentation.

Export DITA Map Plugin [Bundled]

You can use [this free plugin](#) to create a ZIP file from your entire DITA project. The plugin also takes filters/profiling into account when including topics.

Publish DITA Content with References to Video and Audio Resources. [Bundled]

A [DITA Open Toolkit plugin](#) can be used to convert the DITA `<object>` element to various HTML 5 structures (such as `<video>`, `<audio>`, or `<iframe>`).

Show Consecutive *Codeblocks* in Multiple Tabs for WebHelp Output

This [open-source plugin](#) can be used to display consecutive DITA `<codeblock>` elements in separate tabs.

Add Edit Links in HTML or PDF-based Output [Bundled]

This [plugin](#) can be used to add edit links in HTML or PDF-based output that allows subject matter experts to offer feedback for the published content directly in the source using a DITA web editing tool (such as **Oxygen XML Web Author**).

Create a Single Merged XML Document From an Entire DITA Project [Bundled]

This [plugin](#) can be used to produce a merged output from the entire DITA map structure without further processing. It is useful if you want to further process the merged XML document for producing various reports.

Dynamically Publish Excel Content as DITA

A [DITA Open Toolkit plugin](#) that can be used to dynamically convert Excel files to DITA (Excel files referenced with `format="excel"` in DITA maps).

Dynamically Use JSON Content in DITA Topics

A [DITA Open Toolkit plugin](#) that can be used to dynamically convert JSON content to DITA (JSON files referenced with `format="json"` in DITA maps).

Dynamically Publish ASCIIDoc Content as DITA

A [DITA Open Toolkit plugin](#) that can be used to dynamically convert *ASCIIDoc* content to DITA (*ASCIIDoc* files referenced with `format="ant-parser"` in DITA maps).

Embed HTML Content in DITA Topics [Bundled]

A [plugin](#) that can be used to embed well-formed HTML content in a DITA topic inside a special element.

Embed *LateX* Equations in DITA Content

A [DITA Open Toolkit plugin](#) that can be used to publish embedded *LateX* mathematical equations to HTML and PDF.

Embed UML Diagrams in DITA Content

A [DITA Open Toolkit plugin](#) that can be used to publish embedded UML diagrams equations to HTML and PDF.

Float Images in HTML and PDF Outputs

A [plugin](#) that can be used to float an image referenced in a DITA topic left or right depending on the specified `@outputclass` attribute value.

Embed Referenced MathML and SVGZ Images in HTML Output

A [DITA Open Toolkit plugin](#) that can be used to embed referenced MathML and SVG images in the HTML5 and XHTML output.

Dynamically Convert DITA Tables to Graphs

A [DITA Open Toolkit plugin](#) that converts DITA tables having a certain structure to SVG graphs.

Show Oxygen Change Tracking Information in the PDF Output [Bundled]

This [plugin](#) can be used to display **Oxygen XML Editor** tracked changes (insertions, deletions, or comments) in the PDF output.

Sample Customization Plugin for Classic PDF (XSL-FO) Output

This sample DITA Open Toolkit PDF [customization plugin](#) is a good starting point if you want to:

- Customize fonts.
- Customize a cover page to provide custom logos and coloring.
- Customize page headers and footers.

PDF (XSL-FO) - Generate Numbers Before a Topic's Title

A DITA-OT PDF2 [customization plugin](#) that can be installed to generate numbers before each topic's title.

Presents Chapters With Landscape Orientation in PDF (XSL-FO) output

A PDF [customization folder](#) that can be used to define landscape orientation for a certain chapter.

Using an External DITA Open Toolkit in Oxygen XML Editor Eclipse plugin

Oxygen XML Editor Eclipse plugin comes bundled with a DITA Open Toolkit, located in the [DITA-OT-DIR](#) directory. If you want to use an external DITA-OT for all transformations and validations, you can [open the Preferences dialog box \(on page 70\)](#) and go to [the DITA page \(on page 81\)](#), where you can specify the DITA-OT to be used.

Related Information:

[Editing a Transformation Scenario \(on page 1297\)](#)

[Creating New Transformation Scenarios \(on page 1206\)](#)

[DITA Open Toolkit Documentation](#)

DITA Open Toolkit Project

The *DITA Open Toolkit* project file allows you to define all your DITA map input and filter pairs and to produce the desired output formats by applying the publishing engine over this single project file: <https://www.dita-ot.org/dev/topics/using-project-files.html>.

Oxygen XML Editor Eclipse plugin has special support for creating, editing, validating, and publishing DITA Open Toolkit project files represented in XML format. It can also use such files to detect connections between DITA resources in the entire project and to apply root map and filter pairs when editing.

Editing DITA Open Toolkit Project Files

The **New Document wizard** ([on page 246](#)) includes a template to help you create DITA Open Toolkit project files (with an `.xml` file extension). The template is located in the **Framework templates > DITA-OT** folder. There is also a sample project file that can be found in the application samples folder: `OXYGEN_INSTALL_DIR/samples/dita/mobile-phone/mobilePhoneProjectFile.xml`.

When working with a DITA-OT project file in the **Author** visual editing mode, you can see a compact representation of the file by default. You can switch to the **Edit** style in the **Styles** toolbar drop-down menu to edit the file using form controls and inline buttons. The additional **View as YAML** style can be selected to see a visual representation of the same document in YAML. Content for all additional project files included in

the current edited file will appear expanded in place. The included content is read-only by default but can be directly edited if the **Allow referenced content to be edited** checkbox is selected in the **Options > Preferences > Editor > Edit Modes > Author** preferences page.

DITA-OT Project File Content Completion

Content completion is available according to the associated schema and it is enhanced with proposals for ID references, available transformation types, parameter names, and values.

DITA-OT Project File Validation

The default automatic validation support for DITA-OT project files has enhanced Schematron rules that report invalid references to non-existing contexts. The default validation is based on a validation scenario named **DITA-OT Project** that is included in the DITA-OT project framework.

The DITA-OT Project framework also includes a *validation scenario* named **DITA-OT Project Validation and Completeness Check**. It contains validation units that automatically validate the project file based on the **DITA-OT Project** scenario and also a manual validation unit based on the **DITA-OT Project Validation and Completeness Check validation engine** that validates all contexts recursively.

When [creating a validation scenario \(on page 558\)](#), or [editing an existing scenario \(on page 568\)](#) for a DITA-OT project file, you can select **DITA-OT Project Validation and Completeness Check** engine in the **Validation engine** column and clicking the  **Settings** button for that engine opens the **Configure validation engine** dialog box where you can configure options for validating the DITA-OT project.

Figure 653. Configure Validation Engine Dialog Box for DITA-OT Project Validation

The options available in this dialog box include:

Batch validate referenced DITA resources

This option specifies the level of validation that applies to referenced DITA files:

- If the checkbox is left unchecked (default setting), the DITA files will be validated using the rules defined in the DTD or XML Schema declared in the document.
- If the checkbox is selected, the DITA files will be validated using rules defined in their associated *validation scenario* (on page 557).

Check the existence of non-DITA references resources

Extends the validation of referenced resources to non-DITA files.

Include remote resources

Select this option if you want to check that remote referenced binary resources (such as images, movie clips, ZIP archives) exist at the specified location.

Report references to resources outside of the DITA map folder

If selected, it will report any references to DITA resources that are located outside the *main DITA map* (on page 2682) folder.

Report links to topics not referenced in DITA maps

Checks that all the topics referenced by other topics are also linked in the *DITA map*. Also reports related links defined in relationship tables whose target topics are not referenced in the DITA Map.

Report multiple references to the same topic

If selected, it will report warnings when a topic is referenced multiple times in the *DITA map*, unless a unique `@copy-to` attribute is used on the `<topicref>` element for any topic that is referenced multiple times.

For example, it will **not** report a warning if there is a topic referenced twice, but the second `<topicref>` has a `@copy-to` attribute set:

```
<topicref href="topic.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

On the other hand, it **will** report a warning if there is a topic referenced twice and none of the reference-type elements has a `@copy-to` attribute set or both of them have the `@copy-to` attribute set to the same value:

```
<topicref href="topic.dita" copy-to="topic2.dita" />
.....
<topicref href="topic.dita" copy-to="topic2.dita" />
```

Check for duplicate topic IDs within the DITA map context

Checks for multiple topics with the same ID in the context of the entire map.

Report duplicate key definitions

Checks the *DITA map* for multiple key references with the same key defined for them. This is helpful because if you have two different resources with the same value for the `@keys` attribute, all references will point to the first one encountered and the other will be ignored.

Note:

This option takes [key scopes \(on page 2503\)](#) into account. For example, if you have something like this:

```
<topicref href="t2.dita" keys="k2" />
<topicgroup keyscope="ks">
  <topicref href="t2.dita" keys="k2" />
</topicgroup>
```

it will not report the "k2" key as a duplicate because it is defined in a [key scope \(on page 2503\)](#) on the second occurrence.

Report unreferenced key definitions

Checks the entire *DITA map* and reports any key definitions that are not referenced anywhere. Note that if the **Use DITaval filters** option is selected, this check will search for unreferenced key definitions based upon your selected filter.

Report unreferenced reusable elements

Checks the entire *DITA map* and reports any detected reusable elements that are not referenced anywhere. It looks for elements that have an *ID* specified in the following types of topic references:

- Any `<topicref>` that contains a `@processing-role` attribute set to **resource-only**.
- Any other referenced topic that contains elements that are reused elsewhere through a `@conref` or `@conkeyref`.

Report table layout problems

Looks for table layout problems. The types of errors that may be reported include:

- If a row has fewer cells than the number of columns detected.
- For a *CALS* table, if a cell has a vertical span greater than the available rows count.
- For a *CALS* table, if the number of `<colspecs>` is different than the number of columns detected from the table `@cols` attribute.
- For a *CALS* table, if the number of columns detected from the table `@cols` attribute is different than the number of columns detected in the table structure.
- For a *CALS* table, if the value of the `@cols`, `@rowsep`, or `@colsep` attributes are not numeric.
- For a *CALS* table, if the `@namest`, `@nameend`, or `@colname` attributes point to an incorrect column name.

Identify possible conflicts in profile attribute values

When the profiling attributes of a topic contain values that are not found in parent topic profiling attributes, the content of the topic is overshadowed when generating profiled output. This option reports these possible conflicts.

Report attributes and values that conflict with profiling preferences

Looks for profiling attributes and values that are not defined in the [Profiling / Conditional Text preferences page \(on page 145\)](#) (you can click the  **Profiling Preferences** button to open this preferences page). It also checks if profiling attributes defined as *single-value* have multiple values set in the searched topics.

Additional Schematron checks

Allows you to select a Schematron file that Oxygen XML Editor Eclipse plugin will use for the validation of DITA resources. You can specify the path by using the text field, its history drop-down, the  **Insert Editor Variables (on page 218)** button, or the browsing actions in the  **Browse** drop-down list.

**Advanced Tip:**

Some APIs are available that retrieve information about DITA keys that are referenced within a topic. The APIs can be called from XSLT Stylesheets (including XML Refactoring operations) or Schematron schemas. For details, see [API Documentation: DITAXSLTExtensionFunctionUtil](#).

Publishing DITA Open Toolkit Project Files

Once a DITA-OT project file is opened in the application, two predefined publishing scenarios become available in the **Configure Transformation Scenario(s)** dialog box (*on page 1300*):

- **Publish DITA-OT Project (all deliverables)** - Runs the publishing engine and produces output for all deliverables defined in the project file.
- **Publish DITA-OT Project (select deliverable)** - Runs the publishing engine and produces output for only one deliverable specified by the end-user.

Some of the allowed transformation parameters that are relevant to the DITA-OT project file include:

- **project.file** - Specifies the path to the project file.
- **dita-ot.dir** - Specifies the directory where DITA-OT, used in transformation is installed.
- **additional.args** - Specifies the additional arguments used in transformation.
- **deliverable.id** - Specifies the id of the deliverable. This parameter is only available in the **Publish DITA-OT Project (select deliverable)** transformation.
- **jvm.args** - Specifies the JVM arguments used by the transformation for each deliverable. This can be used to increase the memory allocation used by the transformation.

Example: To set the JVM memory allocation to 5 GB for publishing deliverables, append the following value to the existing ones:

```
-Xmx5G
```

If the "pdf-css-html5" (based on Chemistry PDF CSS processor) deliverable publication fails with an Out Of Memory Error, try appending the `baseJVMArgLine` parameter to the "jvm.args" parameter value. For example:

```
-DbaseJVMArgLine=-Xmx5G
```

When editing DITA OT project files in the **Author** visual editing mode, each presented deliverable has an inline button that can be used to individually publish it.

Main Files Support for DITA Open Toolkit Project Files

If you enable [main files support at project level](#) (*on page 2628*), you can choose to detect all top-level DITA Open Toolkit project files and to add them to the Main Files folder. You could also manually add the top-level

files for your DITA-OT project in the Main Files folder. The benefit of this is that whenever you rename or move files in the **Project Explorer** view, the references to those resources will automatically be updated.

**Tip:**

The [Referenced/Dependent Resources view \(on page 2630\)](#) also works for DITA-OT project files.

Editing Contexts Detected from DITA Open Toolkit Project Files

Once a DITA-OT project file is added to the Main Files folder, the **Context** drop-down menu on the **DITA Maps Manager** toolbar will contain context DITA maps defined in the project file and the  **Profiling/Conditional Text** menu will contain filter pairs gathered from the project file. When you select one of them in the drop-down menu, the application gathers the keys from the context DITA map and applies the filters specified in that context.

DITA Specialization Support

DITA is designed to let you design new markup and new document types that allow any general-purpose DITA processor to process documents that use the new markup. This in turn enables blind interchange of DITA documents from any source. In particular, in the context of a map, you can combine topics of any type and get usable results from any general-purpose DITA processor. Specialization is the one truly unique and distinguishing aspect of DITA. Even if you have no use for any aspect of DITA modularity or reuse, you still have a use for specialization simply because it enables reliable interchange in a way that no other XML application does.

For detailed information and step-by-step tutorials about DITA specializations, see [DITA 4 Practitioners: DITA Configuration and Specialization Tutorials](#).

In addition, the topics in this section contain information about using DITA specializations in Oxygen XML Editor Eclipse plugin.

Integrating a DITA Specialization

A DITA specialization can have its document type defined with any of the following::

- **DTD** - For configuration and specialization tutorials, see <http://dita4practitioners.github.io/dita-specialization-tutorials/>. A small sample plugin is also available here: <https://github.com/oxygenxml-incubator/dita-ot-specialization-plugin-sample/>.
- **XSD** - For configuration and specialization tutorials, see <http://dita4practitioners.github.io/dita-specialization-tutorials/>.
- **Relax NG** - For more information, see the following presentation: [Creating DITA-OT Constraint/Specialization Plugins](#). For Relax NG coding requirements, see <https://www.oxygenxml.com/dita/1.3/specs/archSpec/base/relax-ng-requirements.html>.

A DITA specialization may optionally include specialized processing, that is new XSLT template rules that match the extension part of the `@class` attribute values of the new elements, and thus extend the default processing available in the DITA Open Toolkit.

To integrate a DITA specialization into Oxygen XML Editor Eclipse plugin, use one of the following methods:

DITA-OT Plugin Method

CAUTION:

Oxygen XML Editor Eclipse plugin support engineers do not officially offer support and troubleshooting assistance for custom DITA-OT distributions or custom installed DITA-OT plugins. If you discover any issues or inconsistent behavior while using a custom DITA-OT or a DITA-OT that contains custom DITA-OT plugins, you should revert to the default built-in DITA-OT.

If the DITA specialization is available as a DITA Open Toolkit plugin, follow this procedure:

1. Copy the additional *plugin* to the location of the DITA-OT version you are using (by default, *DITA-OT-
DIR\plugins* directory).

Important:

The application needs to have full write access permissions to the DITA-OT directory.

2. If Oxygen XML Editor Eclipse plugin was installed in the default location, you may need to restart and run it as an administrator.
3. Select the  **Configure Transformation Scenario(s)** (on page 1300) action from the **DITA Maps Manager** toolbar (you could also use the same action on the main toolbar or open the **Transformation Scenarios** view (on page 1306)).
4. Select the **Integrate/Install DITA-OT Plugins** transformation scenario (on page 2548).

Tip:

If you don't see that scenario in the  **Configure Transformation Scenario(s)** (on page 1300) dialog box or **Transformation Scenarios** view (on page 1306), click the  **Settings** button and select the **Show all scenarios** option, but don't forget to change it back to **Show only the scenarios available for the editor** after you are finished with this procedure.

5. Apply the scenario (on page 1299).
6. Check the **Results** panel at the bottom of the application to make sure the build was successful.
7. Restart Oxygen XML Editor Eclipse plugin with your normal permissions.

Tip:

Oxygen XML Editor Eclipse plugin detects [new document templates](#) (on page 253) contributed by the DITA-OT plugin as long as you do the following:

1. Create a new folder called **template_folders** inside your DITA OT plugin's folder. For example: `DITA-OT-DIR\plugins\my_custom_plugin\template_folders`.
2. Create one or more subfolders inside the **template_folders** directory that contain the new document templates. The new document templates found in those subfolders will be available in the **New** document wizard.

Alternative Methods

If the DITA specialization is not available as a DITA-OT plugin, you have the following options:

- If the DTDs that define the extension elements are located in a folder outside the DITA Open Toolkit folder, add new rules to the DITA-OT catalog file. These rules are meant for resolving the DTD references from the DITA files that use the specialized elements to that folder. This allows for correct resolution of DTD references to your local DTD files and is needed for both validation and transformation of the *DITA maps* or topics. The DITA-OT catalog file is called `catalog-dita.xml` and is located in the root folder of the DITA Open Toolkit.
- If there is specialized processing provided by XSLT stylesheets that override the default stylesheets from DITA-OT, these new stylesheets must be called from the DITA-OT Ant build scripts.

Important:

If you are using DITA specialization elements in your DITA files, it is recommended that you activate the **Enable DTD/XML Schema processing in document type detection** option in the **Document Type Association** preferences page (*on page 88*).

- You could [create your own document templates \(on page 253\)](#), store them in a custom directory, then add that directory to the list of template directories that Oxygen XML Editor Eclipse plugin uses by adding the directory to the list in the [Document Templates Preferences \(on page 87\)](#) page.

Related Information:

[DITA Configuration and Specialization Tutorials](#)

Editing DITA Map Specializations

In addition to recognizing the default *DITA map* (*on page 2678*) formats (`<map>` and `<bookmap>`), the **DITA Maps Manager view** (*on page 2337*) can also be used to open and edit specializations of *DITA maps*.

All advanced editing actions available for the map (such as insertion actions or editing properties) allow you to specify the element in an editable combo box. The elements that initially appear in the combo box are all the elements that are allowed to appear at the insert position for the given specialization.

The topic titles rendered in the **DITA Maps Manager view** (*on page 2337*) are collected from the target files by matching the `@class` attribute and not a specific element name.

When editing DITA specializations of maps in the main editor, the insertions of topic reference, topic heading, topic group and conref actions should work without modification. For the table actions, you have to modify each action manually to insert the correct element name at the cursor position. You can go to the **DITA Map** document type from the **Document Type Association** preferences page (*on page 88*) and edit the table actions to insert the element names as specified in your specialization. See [Creating a Framework through the Configuration Dialog](#) (*on page 1941*) for more details.

Related Information:

[DITA Configuration and Specialization Tutorials](#)
[Integrating a DITA Specialization](#) (*on page 2623*)

Editing DITA Topic Specializations

In addition to recognizing the default DITA topic formats, topic specializations can also be edited in **Author** mode.

The content completion should work without additional modifications and you can choose the tags that are allowed at the cursor position.

The CSS styles used for rendering the elements should also work on the specialized topics without additional modifications.

The toolbar/menu actions should be customized to insert the correct element names. You can go to the DITA document type from the **Document Type Association** preferences page (*on page 88*) and edit the actions to insert the element names, as specified in your specialization. See [Creating a Framework through the Configuration Dialog](#) (*on page 1941*) for more details.

[DITA Configuration and Specialization Tutorials](#)
[Integrating a DITA Specialization](#) (*on page 2623*)

Translating DITA Projects Overview

This topic contains some general information about translating DITA content and is meant to help those who do not store their DITA projects through a **Content Management System (CMS)** or other type of service that already includes their own translation support.

Choosing a Translation Agency

To minimize translation costs, it is recommended to choose a translation agency that is able to handle DITA content directly, without requiring you to convert the content to some intermediary format. This means that you benefit from the [DITA reusable content features](#) (*on page 2475*).

If you plan to translate your DITA project, it is also recommended that you contact a DITA-aware translation agency as early in your process as possible because translation agencies who translate DITA content directly usually need to have a preliminary discussion about how your project is structured, which terms need to be

skipped when translating, how various measuring units are translated, how content is reused, your metadata strategy, and how screenshots are handled. Those discussions may influence the way that you organize and write your DITA content.

**Note:**

If your translation agency does not directly handle DITA content, there are commercial tools that can be used to convert DITA to XLIFF (for example, <https://www.maxprograms.com/products/fluenta.html>).

Optimizing Content for Translation

In general, there are three main principles to take into account when writing DITA content that will be translated:

1. Use a controlled vocabulary (for example, the [Simplified Technical English vocabulary](#)).
2. Avoid reusing inline elements other than product names. The following *DITA Users List* discussion describes the reasons for this: <https://lists.oasis-open.org/archives/dita/201301/msg00029.html>.
3. Avoid profiling/filtering content at inline level, for similar reasons.

General DITA Project Structure

It is usually considered best practice to organize your DITA maps/topics in a separate folder for each language. One folder that contains the English version of all of your DITA resources and a separate folder for each of the other languages you will translate with equivalent DITA resources translated in that specific language.

General Translation Workflow

When translating DITA content, the most common workflow involves these steps:

1. Create your content in the primary language.
2. Before each release, you gather all the DITA files that have been changed and need to be translated. The [Oxygen Translation Package Builder Add-on](#) could be handy for this.
3. Send a copy of the relevant DITA files to the translation agency (known also as "localization service provider").
4. Receive translated DITA content back from the translation agency and integrate it in each [language-specific project folder](#) (*on page 2627*).

Publishing Translated Content

All of your translated DITA maps and topics should have the **xml:lang** attribute set with the appropriate value on the root element. Along with the actual translated content, the published output may also contain static text (such as the word **Table** followed by the table number, **Figure** following by the number, or **Note** appearing before the content of each DITA `<note>` element). The **DITA Open Toolkit** includes support for various languages for [HTML-based output](#) and [PDF-based output](#). You can also add support for other languages:

Globalizing DITA Content: Customizing Generated Text. For information about how to add a new language to the **Oxygen WebHelp Responsive** output, see [Adding a New Language \(on page 1447\)](#).

Liability

Translation agencies usually do not assume any liability for incorrectly translated content. If possible, it is recommended to have someone who is familiar with the particular language be responsible for reviewing and accepting the translated content. For example, if your company has regional headquarters located in various countries, perhaps someone from each headquarters could review the translated content.

Other Resources

Here are some links to other resources that might help you with translating DITA projects:

- [DITA Translation: Organizing Your DITA Files](#)
- [DITA Translation: Using XLIFF to Translate DITA Projects](#)
- [WhP Localization Services Blog Page](#)
- Webinar: [DITA Project Management, Validation, and Translation in a Docs as Code Environment](#)

Main Files Support in DITA

Oxygen XML Editor Eclipse plugin includes a feature that allows you to define *Main Files* (on page 2680) at project level. This feature is typically used in Oxygen XML Editor Eclipse plugin for XML documents to determine the context for operations such as validation, content completion, refactoring, searches, or displaying components collected from various modules. For DITA projects, this feature has a more limited purpose in Oxygen XML Editor Eclipse plugin since it is mainly used to provide the means for updating references to moved or renamed resources.

Since you can move or rename DITA resources (such as topics and maps) in the **DITA Maps Manager** (on page 2337), the *root map* (on page 2682) is used as the scope to update all the references to the moved or renamed resources. However, you do not have this option for non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) since they do not appear in the **DITA Maps Manager**. Also, when moving DITA resources in the **DITA Maps Manager**, you have to do it one at a time.

You can use the *Main Files* support in DITA to update all the references to moved or renamed resources in the scope of the *Main Files*, and since the *root map* (on page 2682) will be set as the *Main File*, you achieve the same result as if you were moving or renaming them in the **DITA Maps Manager**. It also allows you to move multiple DITA resources (or entire folders) at once in the **Project Explorer view** (on page 269), instead of the **DITA Maps Manager**, while still giving you the option of updating all the references.

How to Enable Main Files Support in DITA

To use the *Main Files* support in DITA, follow these steps:

1. Go to the **Project Explorer** view ([on page 269](#)) and select **Enable Main Files Support** from the contextual menu of the project root folder.
2. Add the **main DITA map (root map)** ([on page 2682](#)) to the Main Files folder by doing one of the following:
 - Right-click the project root folder or the *Main Files* folder and select  **Detect Main Files from Project**.
 - Manually add the **root map** ([on page 2682](#)) to the *Main Files* folder by right-clicking a file from your project and selecting  **Add to Main Files** from the contextual menu (or simply drag and drop it into the *Main Files* folder).

**Tip:**

You can set multiple maps in the *Main Files* folder and all of them will automatically be added to the list of root maps you can select from the [drop-down menu in the DITA Maps Manager toolbar \(on page 2341\)](#).

3. [Alternative] If you have a defined **DITA Open Toolkit project XML file** ([on page 2622](#)) you can add it to the *Main Files* folder. Once you do that the application will know the dependencies between all resources directly and indirectly referenced from the project file, including DITA maps, topics, binary resources and DITAVAL filter files.

Moving or Renaming Non-DITA Resources and Updating the References to Them

With the *Main Files* support enabled, you can move or rename non-DITA resources (such as folders, images, HTML files, audio, video, text files, Markdown documents) or move multiple normal DITA resources (or entire folders) in the **Project Explorer** view ([on page 269](#)) and Oxygen XML Editor Eclipse plugin will offer the option of updating all the references to the moved or renamed resources in the scope of the *Main Files* (in this case, the **main DITA map (root map)** ([on page 2682](#))).

To move or rename non-DITA resources (or move multiple DITA resources) and update the references to them, follow these steps:

1. Enable *Main Files* support and add your **root DITA map** ([on page 2682](#)) to the *Main Files* folder as described in the [How to Enable Main Files Support in DITA \(on page 2628\)](#) section above.
2. Go to the **Project Explorer** view ([on page 269](#)), and use one of the following methods to move or rename the resources:

Moving Resources

To move resources in the **Project Explorer** view ([on page 269](#)), do one of the following:

- Simply drag and drop the resource to the new location in the tree structure.
- Use the **Move** action (or  **Copy** and  **Paste** actions) from the contextual menu.
- Right-click the resource and select **Refactoring > Move resource** action from the contextual menu. Note that this method also allows you to specify a new name and destination path in the **Move resource** dialog box.

Result: In all cases, a **Move resource** dialog box will be presented.

Renaming Resources

To rename resources in the **Project Explorer view** (*on page 269*), do one of the following:

- Select the resource and press **F2**, or simply left-click again, until the in-place editor allows you to change the file name.
- Right-click the resource and select **Rename** or **Refactoring > Rename resource** .

Result: In all cases, a **Rename resource** dialog box will be presented.

3. Make sure the **Update references of the moved resource(s)** option is selected in the resulting **Move** or **Rename** dialog box and keep the scope as **main files** to make sure all the references to the moved or renamed resource are updated.

DITA Referenced/Dependent Resources View

The **Referenced/Dependent Resources** view displays the *hierarchy* or *dependencies* for resources included in an XML document. For DITA resources, it will only show direct references, so resources that are indirectly referenced through keys are not presented in the hierarchy or dependencies tree.

To see the references or dependencies for a DITA resource (maps or topics), right-click a resource in the **Project Explorer view** (*on page 269*) and either select **Show referenced resources** or **Show dependent resources**.

If you want to view the dependencies for a media resource (such as images) directly referenced in a DITA topic, click the  **Show dependencies for** button on the toolbar of the **Referenced/Dependent Resources** view, select the **All files** filter in the file browser, find the particular resource, and double-click it.

Figure 654. Referenced/Dependent Resources View

The following actions are available on the toolbar of the **Referenced/Dependent Resources** view:

Refresh

Refreshes the hierarchical structure.

Stop

Stops the computing.

Show hierarchy for

Computes the hierarchical structure of the references for a resource.

Show dependencies for

Computes the structure of the dependencies for a resource.

Configure dependencies search scope

Allows you to configure a scope to compute the dependencies structure. You can restrict the scope to the current project or to one or multiple *working sets* (on page 2683). If the **Use only Main Files, if enabled** checkbox is selected, the scope of the search is restricted to the **Main Files** directory (on page 2628).

History

Provides access to the list of previously computed dependencies. Use the  **Clear history** button to remove all items from this list.

The contextual menu for a resource listed in the **Referenced/Dependent Resources** view contains the following actions:

Open

Opens the resource. You can also double-click a resource in the hierarchical structure to open it.

Go to reference

Opens the source document where the resource is referenced.

Copy location

Copies the location of the resource.

Move resource

Opens the **Move resource** dialog box where the following fields are available:

- **Destination** - Presents the path to the current location of the resource you want to move and gives you the option to introduce a new location.
- **New name** - Presents the current name of the moved resource and gives you the option to change it.
- **Update references of the moved resource(s)** - As long as **Main Files support is enabled** ([on page 2628](#)), you can select this option to update the references to the resource you are moving, in accordance with the new location and name. A **Preview** option is available that allows you to see what will be updated before selecting **Move** to process the operation.

Rename resource

Opens the **Rename resource** dialog box where the following fields are available:

- **New name** - Presents the current name of the edited resource and allows you to modify it.
- **Update references of the renamed resource(s)** - As long as **Main Files support is enabled** ([on page 2628](#)), you can select this option to update the references to the resource you are renaming. A **Preview** option is available that allows you to see what will be updated before selecting **Rename** to process the operation.

Show referenced resources

Shows the references for the selected resource.

Show dependent resources

Shows the dependencies for the selected resource.

Add to Main Files

Adds the currently selected resource in the **Main Files** directory.

Expand More

Expands more of the children of the selected resource from the structure.

Collapse All

Collapses all children of the selected resource from the structure.

**Tip:**

When a recursive reference is encountered in the view, the reference is marked with a special icon .

Search and Rename Actions for IDs in DITA

Oxygen XML Editor Eclipse plugin allows you to search references to ID attributes (either direct references using the `@href` and `@conref` attributes or indirect references using `@keyref` or `@conkeyref` attributes) or to rename the id attribute in all the declared and referenced locations. The main benefit of this feature is the fact that it allows you to rename `@id` attributes (or search for their references) in the scope of the entire project. It also works for IDs defined inside DITA maps and then referenced in maps and topics.

In **Author** mode, these operations are available for DITA documents in the contextual menu (grouped in the **Manage IDs** submenu). In **Text** mode, these actions are also available in the **Quick Assist** menu. To access it, place the cursor inside the value of an `@id` attribute and click the yellow light bulb icon.

The possible actions include:

**Rename in**

Renames the ID and all of its occurrences. Selecting this action opens a dialog box where you insert the new ID value and choose the scope of the rename operation. For a preview of the changes you are about to make, click **Preview**. This opens the **Preview** dialog box, which presents a list with the files that contain changes and a preview zone of these changes.

Rename in File (Available in the Text mode only)

Renames the ID you are editing and all its occurrences in the current file.

**Search References**

Searches for the references of the ID. By default, the scope of this action is the current project.

Search References in

Searches for the references of the ID and you can choose the scope of the operation or configure working sets to use for the scope.

**Search Declarations (Available in the Text mode only)**

Searches for the declaration of the ID reference. By default, the scope of this action is the current project.

Search Declarations in (Available in the Text mode only)

Searches for the declaration of the ID reference and you can choose the scope of the operation or configure working sets to use for the scope.

**Search Occurrences in file**

Searches for the declaration and references of the ID in the current document and presents the results in the message panel at the bottom of the application.

**Change scope (Available in the Quick Assist menu in Text mode only)**

Opens a dialog box where you can choose the scope of the operation or configure working sets to use for the scope.

**Tip:**

A quick way to go to the declaration of an ID in **Text** mode is to move the cursor over an ID reference and use the **Ctrl + Single-Click (Command + Single-Click on macOS)** navigation.

Selecting an ID that you use for search or refactor operations differs between the **Text** and **Author** modes. In the **Text** mode, you position the cursor inside the declaration or reference of an ID. In the **Author** mode, Oxygen XML Editor Eclipse plugin collects all the IDs by analyzing each element from the path to the root. If more IDs are available, you are prompted to choose one of them.

[Main Files Support in DITA \(on page 2628\)](#)

Metadata

Metadata is a broad concept that describes data that explains or identifies other data. Metadata can be used for many purposes, from driving automation of document builds to enabling authors and readers to find content more easily. DITA provides numerous types of metadata, each of which is used and created differently. Some of the most important forms of metadata in DITA are topic and taxonomy.

Topic Metadata

Topic metadata describes the topic and what it is about. Topic metadata can be inserted in the `<prolog>` element of a topic or inside the `<topicref>` element that points to a topic from a map. In other words, metadata about the topic can be asserted by the topic itself, or can be assigned to it by the map that includes it in the build. This allows multiple maps to assign different metadata to the same topic. This may be appropriate when you want to describe a topic differently in various documents.

Taxonomy and Subject Scheme

A taxonomy is a controlled vocabulary. It can be used to standardize how many things in your content and metadata are named. This consistency in naming can help ensure that automated processes work correctly, and that consistent terminology is used in content, and in metadata. In DITA, taxonomies are created using [subject scheme maps \(on page 2682\)](#). When you are authoring, many of the values you choose from have been defined in *subject scheme maps*.

Migrating MS Office Documents to DITA

Oxygen XML Editor Eclipse plugin integrates the entire [DITA for Publishers plugins suite](#) and provides some possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. There are also possibilities for migrating various other types of formats. For more information, see [Migrating Various Document Formats to and from DITA \(on page 2636\)](#).

Migration from Office-type formats to XML is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Smart Paste (Single Document)

1. Open the document in MS Office (or other similar application), select all the content, and copy it.
2. Open Oxygen XML Editor Eclipse plugin and create a new DITA topic.
3. Paste the selected content in **Author** mode. The *Smart Paste functionality (on page 390)* will attempt to convert the content to DITA structure.

HTML to DITA (Single Document)

1. Save your document as HTML.
2. Once you have converted it to HTML, you have several possibilities:
 - In Oxygen XML Editor Eclipse plugin, select **File > Import/Convert > HTML File to XHTML** to import it as XHTML. Then, open the XHTML in Oxygen XML Editor Eclipse plugin and use one of the **XHTML to DITA transformation scenarios (on page 1113)** to convert the content to DITA structure.
 - Open the HTML file in any web browser, select all of its content, and copy it. Then, open Oxygen XML Editor Eclipse plugin, create a new **DITA** topic, and paste the selected content in **Author** mode. The *Smart Paste functionality (on page 390)* will attempt to convert the HTML content to DITA structure.

Word to LibreOffice to DITA (Single Document)

1. Open the document in the *LibreOffice* application and save it as **DocBook**.
2. Open the **DocBook** document in Oxygen XML Editor Eclipse plugin.
3. Run the built-in **DocBook to DITA transformation scenario (on page 1203)**.
4. You may need to make some manual adjustments for elements that could not be mapped.

Word to DITA using DITA For Publishers (Single Document)

1. Save the document in the MS Word DOCX format.
2. Open it in the **Archive Browser view (on page 1825)** in Oxygen XML Editor Eclipse plugin and then open the **document.xml** file contained in the archive.
3. Run the built-in **DOCX DITA** transformation scenario. This scenario runs a build file over the DOCX archive and should produce a DITA project that contains a *DITA map* and multiple topics.
4. You may need to do some manual reconfiguration to map DOCX styles to DITA content. The XSLT conversion is part of the **DITA For Publishers** plugin and there is documentation for it available here: http://www.dita4publishers.org/d4p-users-guide/user_docs/d4p-users-guide/word2dita/word2dita-intro.html.

Word to DocBook to DITA (Multiple Documents)

1. Use a tool to convert the documents to **DocBook**. For example, [Pandoc is a free document converter engine](#) that can convert **DOCX** documents to **DocBook** and according to [Pandoc's manual](#), you can specify multiple input files and use wildcards in the commands.
2. Save the newly converted **DocBook** documents somewhere in your project.
3. Perform a [batch transformation \(on page 1305\)](#) on all the newly converted **DocBook** documents:
 - a. Select all the **DocBook** documents in the [Project Explorer view \(on page 269\)](#).
 - b. Right-click the selected files and choose **Transform** >  **Configure Transformation Scenario(s)**.
 - c. Apply the built-in **DocBook to DITA transformation scenario (on page 1203)**.
4. You may need to make some manual adjustments in the resulting documents for elements that could not be mapped.

Migrating Excel and Other Types of Spreadsheets to DITA

It is possible to convert Microsoft Excel (or other similar types of documents) to DITA. To do this, copy the spreadsheet content and paste it in an open DITA topic in **Author** mode. The [Smart Paste functionality \(on page 390\)](#) will attempt to convert the content to DITA structure.

Resources

For more information about migrating to DITA, see the following resources:

- [Webinar: Integrating Various Document Formats \(OpenAPI, Word, Markdown, HTML, Excel\) into DITA Documentation](#)
- [Webinar: Working with DITA in Oxygen - Migrating to DITA and Refactoring](#)

Related information

[Migrating Various Document Formats to and from DITA \(on page 2636\)](#)

[Smart Paste in Author Mode \(on page 390\)](#)

[Importing Data \(on page 1901\)](#)

[Working with Archives \(on page 1825\)](#)

Migrating Various Document Formats to and from DITA

When organizations decide to use DITA for structuring, developing, managing, or publishing content, they usually already have content written in other formats and need to convert it to DITA. There are a variety of possibilities for a conversion to DITA, depending on the original format of the content.

Migration from other formats to DITA is rarely perfect and manual changes may need to be made to the converted content, but the methods described below should help you find the best approach for your particular case.

Migrating Microsoft Office and Other Similar Types of Documents to DITA

There are various possibilities for migrating content from Microsoft Office® (and other Office-type formats) to DITA. For details, see [Migrating MS Office Documents to DITA \(on page 2634\)](#).

Migrating Google Docs to DITA

There are several possibilities to convert Google Docs to DITA:

- Copy the content from Google Docs and paste it in an open DITA topic in **Author** mode. The [Smart Paste functionality \(on page 390\)](#) will attempt to convert the content to DITA.
- Save the Google document as OpenDocumentFormat (**ODF**), then open it in the free *LibreOffice* application and save it as **DocBook**. Next, open the **DocBook** document in Oxygen XML Editor Eclipse plugin and run the built-in [transformation scenario called DocBook to DITA \(on page 1203\)](#).

In all cases, you may need to make some manual adjustments in the resulting documents for elements that couldn't be mapped.

Migrating HTML Content to DITA

There are several possibilities to convert HTML content to DITA:

- Copy the HTML content and paste it in an open DITA topic in **Author** mode. The [Smart Paste functionality \(on page 390\)](#) will attempt to convert the content to DITA.
- Convert the HTML file to XHTML by selecting **File > Import/Convert > HTML File to XHTML**. Then, open the XHTML file and use one of the [XHTML to DITA Transformation Scenarios \(on page 1113\)](#) to convert the content to DITA.

Migrating Unstructured FrameMaker to DITA

There is a blog post that details various possibilities for converting Unstructured FrameMaker content to DITA: [Migrating Unstructured FrameMaker to DITA](#).

Migrating MadCap Content to DITA

This [open-source project](#) contains such a stylesheet that attempts to convert a Flare project to DITA XML along with instructions on how to use it. As an alternative, some recent MadCap versions seem to have facilities to export content directly to DITA.

Migrating Other Formats to DITA

You may find third-party applications (such as [Pandoc](#)) that can convert your content to HTML or to some kind of XML format like DocBook. Once you have HTML or DocBook content, you can convert them to DITA using one of the methods described above.

Migrate from DITA to Confluence and Other Formats

There are various possible methods available for converting DITA content to Confluence and other formats (such as Microsoft Word or HTML). For details and ideas for some of the possible methods, see the [DITA to Confluence blog post](#).

Resources

For more information about migrating to DITA, see the following resources:

- Webinar: [Integrating Various Document Formats \(OpenAPI, Word, Markdown, HTML, Excel\) into DITA Documentation](#)
- Webinar: [Working with DITA in Oxygen - Migrating to DITA and Refactoring](#)
- Video: [Integrating REST-API Content into DITA Documentation in Oxygen](#)

How to Count Words in DITA Topics or Maps

There are various ways to count words in Oxygen XML Editor Eclipse plugin:

- Open a DITA topic in the **Author** visual editing mode, right-click anywhere in the editor, and select **Text > Count Words**.
- Open a DITA map in the **DITA Maps Manager** view. Click the  **Open map in editor with resolved topics** toolbar button. In the newly opened DITA map, right-click anywhere in the editor and select **Text > Count Words**.
- Open a DITA map in the **DITA Maps Manager** view. Click the  **Configure Transformation Scenarios** toolbar button and choose the **DITA Map Metrics Report** transformation scenario.

Tip:

Along with the word count, the [DITA Map Metrics Report Transformation \(on page 2545\)](#) provides additional information (such as the number of processed maps and topics, content reuse percentage, the number of elements, attributes, words, and characters used, and more).

DITA 1.3 Support

Starting with version 17.1, Oxygen XML Editor Eclipse plugin includes support for some DITA 1.3 features.

The Oxygen XML Editor Eclipse plugin publication of the full DITA 1.3 specifications can be found at <https://www.oxygenxml.com/dita/1.3/specs/index.html#introduction/dita-release-overview.html>.

The following table is a list of DITA 1.3 features and their implementation status in Oxygen XML Editor Eclipse plugin:

Table 51. DITA 1.3 Features Implementation Status

Feature	Editing	Publishing [DITA Open Toolkit 4.1.2 is used]
DITA 1.3 DTD, XML Schema, and Relax NG-based maps/topics/tasks/references, etc.	<p>New DITA 1.3 document templates. By default, DITA topics and maps that do not specify version in the DOCTYPE declaration are also considered to be DITA 1.3</p> <p>Specific annotations presented in the content completion assistance window and documentation tooltips for all new DITA 1.3 elements</p>	N/A
Learning Object and Group maps	New document templates	No specific support implemented
Troubleshooting specialization	Create and edit new troubleshooting topics	No specific support implemented
XML markup domain	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Equation and MathML domain	<p>Validation and content completion</p> <p>Display and Insert equations</p>	Special rendering in PDF and XHTML-based outputs
SVG domain	<p>Validation and content completion</p> <p>Display referenced SVG content</p>	Special rendering in PDF and XHTML-based outputs
Other new DITA 1.3 elements (div , strike-through , underline , etc.)	Validation and Content Completion	Special rendering in PDF and XHTML-based outputs
Release management domain	Validation and Content Completion	No specific support implemented
Scoped keys (on page 2503)	<p>Define key scopes</p> <p>Validate and check for completeness</p> <p>Resolve keyrefs and conkeyrefs taking key scopes into account</p>	Partially implemented (Various issues may still be encountered)

Table 51. DITA 1.3 Features Implementation Status (continued)

Feature	Editing	Publishing [DITA Open Toolkit 4.1.2 is used]
	Key scope information is displayed in a tooltip when hovering over an item in the DITA Maps Manager	
Branch filtering (<i>on page 2505</i>)	Display, create, and edit <code><ditavalref></code> elements	Partially implemented (Various issues may still be encountered)
Key-based cross deliverable addressing	Special display for references to <i>DITA maps</i> with <code>scope="peer"</code> and a defined <i>keyscope</i> Gather and present keys from peer maps	Not implemented.
Shorthand to address syntax that identifies elements in the same topic	Properly resolved for validation, links, and conrefs	Implemented
Various table attributes (orientation , rotation , scope , and headers on cells)	Not implemented in the Table Properties action support. However, attributes can be changed from the Attributes view	Not implemented
New Map topicref attributes (cascade , deliveryTarget)	Allow setting new attributes, propose proper values for them	Implemented

Related information

[Watch our DITA 1.3 video tutorial for more information about key scopes and branch filtering.](#)

DITA 2.0 Support

Starting with version 23, Oxygen XML Editor Eclipse plugin includes support for some DITA 2.0 features. To enable this support, go to the **Options > Preferences > DITA** page and select the **Enable DITA 2.0 Editing Support (Experimental)** checkbox. Enabling it results in DITA 2.0 topic and map templates being available in the **New from templates wizard** (*on page 253*).

The following table is a list of DITA 2.0 features and their implementation status in Oxygen XML Editor Eclipse plugin. The list of proposed DITA 2.0 changes is published here: <https://www.oasis-open.org/committees/download.php/65626/DITA-2.0-proposals.pdf>.

Table 52. DITA 2.0 Features Implementation Status

Feature	Editing	Publishing [DITA Open Toolkit 4.1.2 is used]
DITA 2.0 DTD, and Relax NG-based maps/topics/tasks/references, etc.	New DITA 2.0 document templates.	Also supported by the publishing engine.
Other new DITA 2.0 elements (include, etc.)	Validation and Content Completion.	Special rendering in PDF and XHTML-based outputs: https://www.dita-ot.org/dev/reference/dita-v2-0-support.html .
Profiling attributes defined using the new <code>@specializations</code> attribute.	Profiling attributes defined using the new <code>@specializations</code> attribute are recognized by the application.	Also supported by the publishing engine.

22.

Scripting Oxygen

Although Oxygen XML Editor Eclipse plugin is mostly intended to be a visual editing tool, the [all platforms distribution](#) is bundled with a `scripts` subfolder that contains scripts to automate and run various utilities from a command line.

To run any of these scripts, you are required to purchase a special [scripting commercial license](#). Trial scripting licenses are also available, by request, for clients who are interested in testing the scripts for their particular workflows. Once you have a scripting license key available, you should copy the license key to a file named `scriptinglicensekey.txt` and save it in the main application directory (the parent directory of the "scripts" directory).

For more information about the **Oxygen Scripting** support, watch our Webinar: [Automate XML processing with Oxygen XML Scripting](#).

DITA Validate and Check For Completeness

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Validate and Check For Completeness** (*on page 2382*) action that is available on the toolbar of the **DITA Maps Manager** view provides the ability to validate a DITA map or a DITA Open Toolkit project file with a large array of settings. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `validateCheckDITA.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to run a validation on a DITA map or DITA Open Toolkit project file and report the results in a separate XML document.

Sample Command-Line Arguments for the Validate and Check for Completeness Script:

```
sh scripts/validateCheckDITA.sh -i inputFile [-c contextId] [-s settingsFile] [-r reportFile]
```

A public example of using such a script as a GitHub action for reporting errors in pull requests on DITA project can be found here: <https://github.com/oxygenxml/blog/blob/master/.github/workflows/validate-check-completion.yml>. The GitHub action calls a Gradle script target named `runValidation`: <https://github.com/oxygenxml/blog/blob/master/build/build.gradle>.

Transform

Attention:

- This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).
- To execute a scenario based on WebHelp using this script, in addition to the [scripting commercial license](#), you are required to purchase an [Oxygen XML WebHelp license](#) or a [Oxygen Publishing Engine license](#).
- To execute a scenario based on Chemistry using this script, in addition to the [scripting commercial license](#), you are required to purchase an [Oxygen PDF Chemistry license](#) or a [Oxygen Publishing Engine license](#).

The **Transform** script (`transform.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) helps you to execute a transformation scenario. You can run the scenarios for the existing [document types \(frameworks\)](#) (*on page 2679*) without setting a scenarios file, but for others, you have to specify a specialized scenarios file or a project file that contains scenarios.

You can export transformation scenarios from Oxygen XML Editor Eclipse plugin into a specialized scenarios file by using the **Export selected scenarios** action from the **Transformation Scenarios** view or using the **Export Global Transformation Scenarios** action from the **Options** menu.

Arguments for the Transform Script

```
sh scripts/transform.sh -i inputFile -sn scenarioName [-s scenariosFile] [-v]
```

-i inputFile

The input file that the transformation scenario is applied to.

-sn scenarioName

The name of the transformation scenario to be executed.

-s scenariosFile

The name of a file that contains additional scenarios. It can be a specialized scenarios file or a project file that contains project transformation scenarios.

The scenarios from this file are merged with the scenarios from the [document types \(frameworks\)](#) (*on page 2679*).

-v

This argument can be specified to activate verbose logging for DITA-OT and ANT scenarios. It is useful for debugging.

**Tip:**

For a GitHub use case sample of this script, see [Oxygen Transformation Template](#).

Validate

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

All the validations possible in Oxygen XML Editor Eclipse plugin can also be performed from scripting. This includes validating various types of XML schemas, such as XSD, RNG, RNC, DTD, and NVDL, as well as JSON Schema, XProc, ANT, XSLT, XQuery, CSS, LESS, HTML, WSDL, OpenAPI, and of course, XML with XML schema, and JSON/YAML with JSON Schema.

The **Validate** script (`validate.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to validate a file or a directory and get the validation results in various formats.

Arguments for the Transform Script

```
sh scripts/validate.sh fileOrDirPath [-s schemaFilePath | -sn scenarioName] [-sf scenariosFilePath]
[-if includeFilesFilter] [-ef excludeFilesFilter] [-ed excludeSubdirsFilter] [-rf reportFile]
[-rft reportFormat] [-v] [-help | --help | -h | --h]
```

fileOrDirPath

Mandatory argument that specifies the path of the file or directory to validate (it can also be provided as a URL, but if you are validating directories, the only protocol considered is `'file://'`).

-s schemaFilePath

Optional argument that specifies the file path of the schema to validate against (it can also be provided as a URL).

-sn scenarioName

Optional argument that specifies the name of the validation scenario to be applied.

-sf scenariosFilePath

Optional argument that specifies the path of the file that stores the validation scenarios (either an **Oxygen** scenarios file or an **Oxygen** project file). It can also be provided as a URL.

**Notes:**

- The file that stores the validation scenarios must have a similar format to that generated from **Oxygen** by invoking **Export Global Validation Scenarios** from the **Options** menu. This type of **Oxygen**-generated scenarios files has a `.scenarios`

file extension by default and contains all the necessary information about custom validation scenarios created in **Oxygen**.

- **Oxygen** also saves the custom validation scenarios (as well as the scenario associations made explicitly for the files you work with) in special formatted **Oxygen** project files (usually with the `.xpr` file extension). Therefore, by using the arguments provided through `-sn` and `-sf` options, you can apply any scenario that was previously stored in either a scenarios file or an **Oxygen** project file.
- The `-s` and `-sn` options are mutually exclusive. Specifying both in the same command line is not allowed.

-if includeFilesFilter

Use this argument to only validate the files that match the specified pattern (e.g. `.xml,.json`). The default value is `*`.

-ef excludeFilesFilter

Excludes the files that match the specified pattern (e.g. `test.wsdl,draft.xsl`) from the validation.

-ed excludeSubdirsFilter

Excludes the sub-directories that match the specified pattern (e.g. `.svn,_svn,.git`).

-rf reportFile

Specifies the path for the report file to save the validation results, instead of presenting them in the console. The content of the report file is formatted according to the `-rft` argument. The report file path can also be provided as a URL.

-rft reportFormat

Specifies the format of the validation report. Possible values: `txt, text, xml, json, html, htm`.
Default values: `txt, text`.

-v

Prints additional information to the console (Verbose mode).

-help | --help | -h | --h

Displays help text.

Additional Notes:

- Avoid activating the Verbose mode (`-v` option) when opting to redirect the console (and the validation report implicitly) to a specific file. That is done using the `>` operator instead of the `-rf` option. The additional information provided through verbose mode is also saved to the report file, making it to be reported as invalid when inspected in specialized editors. However, that information is placed at the beginning of the report, as plain text. If removed, the report should become valid.

- If the validation uses the **Saxon** engine and you do not have a commercial license, then the script automatically uses the **Saxon Home Edition** distribution that does not require a license. However, if the validation involves specific **Saxon Personal / Enterprise Edition** advanced features, then the validation report clearly signals that an appropriate **Saxon** license was not found. Placing a valid **Saxon** license file in the `lib` directory from the **Oxygen** installation folder solves the problem and the validation operation works as expected.

Examples of the Validate Script

Example 1: Validate a File by Applying a Custom Validation Scenario

```
sh scripts/validate.sh "workspace/xmlFolder/xmlFile.xml" -sn "xmlValScn"
-sf "workspace/scn/valScn.scenarios"
```

This command implies validating `xmlFile.xml` by applying the validation scenario named `xmlValScn`, described in the `valScn.scenarios` file. If you want to apply more than one validation scenario, you can use the `-sn scenarioName` construct multiple times.

Example 2: Validate a Directory by Applying an Oxygen Default Validation Scenario

```
sh scripts/validate.sh "workspace/DITAFolder" -sn "DITA"
```

A scenario name is provided, but without specifying a scenarios file. This command implies validating all files from `DITAFolder` by applying the **Oxygen** default validation scenario named `DITA` (in accordance with the association made in the **Document Type Configuration Dialog Box** (on page 90)).

Example 3: Validate a File by Applying Associated Scenarios Stored in an Oxygen Project File

```
sh scripts/validate.sh "workspace/mainFolder/main.xml" -sf "worksapce/proj/proj-1.xpr"
```

A scenarios file is provided, but without specifying a scenario name. In this case, the argument provided through the `-sf` option is assumed to be an **Oxygen** project file and it is used to search for validation scenario associations made for the `main.xml` file. This command line implies that if validation scenario associations for `main.xml` are found in `proj-1.xpr`, then those scenarios are identified and applied. Otherwise, the validation first considers the schema associations declared in `main.xml` (if any), or default **Oxygen** validation scenarios are applied in accordance with the type of the file to validate (e.g. XML in this example).

Example 4: Directory Default Validation and Custom Formatted Report Saved to a Specific Location

```
sh scripts/validate.sh ../important/xmlFolder -rft html
-rf "../important/reports/validation rep.html"
```

No validation scenario name, no scenario file, and no schema provided. This command line involves validating all files from the `xmlFolder`. Each file is validated against the schema(s) internally associated (if any). Otherwise, the default **Oxygen** validation scenarios for the

respective file type are applied. Also, the validation report is formatted in HTML and is saved to the `validation_rep.html` file at the specified location.

Figure 655. Example of an HTML Validation Report

SUMMARY	
5 files verified in total	
3 files reported with validation problems	
6 problems found on aggregate	
FILES WITH VALIDATION PROBLEMS	
D:\workspace\library\lib-dir-final\library.json (4 problems)	
Description	#/books/0/authors/0/short_bio: expected maxLength: 200, actual: 250
Severity	Error
Engine name	JSON Validator
System ID	D:\workspace\library\lib-dir-final\library.json
Main validation file	D:\workspace\library\lib-dir-final\library.json
Schema	D:\workspace\library\test-dir\lib.jschema
Start location	line: 10, column: 21
End location	line: 10, column: 32
Description	#/books/1/genre: ["Prose","Fiction"] is not a valid value. Expected: [Prose, Drama, Science, Romance, Poetry]
Severity	Error
Engine name	JSON Validator
System ID	D:\workspace\library\lib-dir-final\library.json
Main validation file	D:\workspace\library\lib-dir-final\library.json
Schema	D:\workspace\library\test-dir\lib.jschema
Start location	line: 20, column: 13
End location	line: 20, column: 20

Resources

For more information about the validation script, see the following resources:

- Video: [Validating XML and JSON Using Oxygen Command Line Scripts](#)
- Webinar: [Validating XML and JSON Documents Using Oxygen Scripting](#)

Tip:

For some GitHub use case samples of this script, see [Oxygen Validation Template](#) and [Oxygen Validation Action](#).

XML Refactoring

Attention:

- This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).
- To execute an XQuery refactoring operation using this script, in addition to the [scripting commercial license](#), you are required to purchase a [Saxon EE license](#).

The **XML Refactoring** script (`xmlRefactoring.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to execute [XML refactoring operations \(on page 608\)](#). You can run a refactoring operation by specifying the operation id of the operation. If, in addition to the refactoring operations provided by Oxygen XML Editor Eclipse plugin in the `OXYGEN_INSTALL_DIR/refactoring` folder and in framework configurations, you want to run a custom refactoring operation, you have to specify the directory that contains it, using the `od` (operations directory) argument.

Arguments for the XML Refactoring Script

```
sh scripts/xmlRefactoring.sh -id operationId -i inputFilesOrDirectories [-f filesFilter]
[-od operationsDirectory] [-p param1=value1...] [-v]
```

-id operationId

The ID of the refactoring operation to be executed.

-i inputFilesOrDirectories

A list of space-separated input files or directories that the refactoring operation is applied to.

-f filesFilter

Specifies a filter for the input files by using a file pattern. For example, to restrict the operation to only analyze build files, you could use `build*.xml` for the file pattern.

-od operationsDirectory

A directory that contains additional refactoring operations.

-p param1=value1...

A list of space-separated pairs of a parameter's name and value used by the refactoring operation.

-v

This argument can be specified to activate verbose logging.

DITA Translation Package Builder

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **DITA Translation Package Builder** (`translationPackageBuilder.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) script helps you to build a translation package for DITA files that can be sent to translators. You can also extract the changed files back into your project once you receive the package back from the translators.

This script requires the **DITA Translation Package Builder** add-on to be installed in the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To install it the add-on, follow these instructions:

1. Go on the **DITA Translation Package Builder** plugin **Releases** page and download the latest [translation-package-builder-{version}-plugin.jar](#) package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

Note:

Do not create any intermediate folders. Afterwards, the file system should look like this:

```
{oxygenInstallDir}/plugins/translation-package-builder-{version}/
plugin.xml
```

Examples for the DITA Translation Package Builder Script

Example: Generating a Milestone File

```
sh scripts/translationPackageBuilder.sh -gm -i ditamapFile [-m milestoneFile] [-verbose]
```

This action is the first one to use. It will generate a unique hash for each documentation resource. This information will be used by the second action to detect which files have been modified. A milestone file should be generated the first time you install this plugin and henceforth, after each package is sent to translators.

-gm

Requests the generation of a milestone file.

-i ditamapFile

The main DITA map file.

-m milestoneFile

The path to the milestone file. If missing, it is assumed that the milestone will be saved in the DITA map parent folder with the following name:

```
{ditamapName}_translation_milestone.xml.
```

-verbose

Generates a console log about the performed steps. It is useful for debugging.

Example: Creating a Package with the Modified Files to Send to Translation

```
sh scripts/translationPackageBuilder.sh -gp -i ditamapFile [-m milestoneFile] -p package.zip
[-verbose]
```

This action detects which files have been changed since the last generated milestone. These files are packed inside a ZIP file that can be sent to translators. After doing this, you can also generate a new milestone so that the next package will only contain new changes.

-gp

Requests the generation of a package with the modified files.

-i ditamapFile

The main DITA map file.

-m milestoneFile

The path to the milestone file. If missing, it is assumed that the milestone will be located in the DITA map parent folder with the following name:

```
{ditamapName}_translation_milestone.xml.
```

-p package.zip

The path to the zip archive where all the modified files are collected.

-verbose

Generates a console log about the performed steps. It is useful for debugging.

Example: Applying a Translation Package Over a DITA Map

```
sh scripts/translationPackageBuilder.sh -ap -i ditamapFile -p package.zip [-verbose]
```

When the translated files arrive from the translator, you should open the DITA map that corresponds to the received language (e.g. open **dita-map-french.ditamap** if the package contains the french translation).

Invoking this action will extract the changed files inside the map's directory.

-ap

Requests the application of a translation package over a DITA map.

-i ditamapFile

The main DITA map file that matches the received package language. For example, if the package contains topics translated into French, then this map is the French version of your DITA map.

-p package.zip

The path to the archive with all the translated files.

-verbose

Generates a console log about the performed steps. It is useful for debugging.

Batch Converter

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Batch Converter** script (`batchConverter.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) helps you to convert between the following formats:

- HTML to XHTML
- HTML to DITA
- HTML to DocBook4 / DocBook5
- Markdown to XHTML
- Markdown to DITA
- Markdown to DocBook4 / DocBook5
- Word to XHTML
- Word to DITA
- Word to DocBook4 / DocBook5
- Excel to DITA
- Confluence to DITA
- DocBook to DITA
- OpenAPI to DITA
- JSON to XML
- JSON to YAML
- XML to JSON
- YAML to JSON

This script requires the **Oxygen Batch Documents Converter** add-on to be installed in the [all platforms distribution](#) of an **Enterprise** edition of Oxygen XML Editor Eclipse plugin.

To install the add-on, follow these instructions:

1. Go on the **Oxygen Batch Documents Converter** plugin **Releases** page and download the latest `oxygen-batch-converter-{version}-plugin.jar` package.
2. Unzip it inside `{oxygenInstallDir}/plugins`.

Note:

Do not create any intermediate folders. Afterwards, the file system should look like this:

```
{oxygenInstallDir}/plugins/oxygen-batch-converter-{version}/plugin.xml
```

Arguments for the Batch Converter Script

```
sh scripts/batchConverter.sh -i inputFiles -if inputFormat -o outputDirectory
-of outputFormat [-ss (true|false)] [-csd (true|false)] [-cs converterSettingsFile]
```

-i inputFiles

A list of space-separated input files or directories in file syntax form.

-if inputFormat

The format of the input files. The possible values are: **html**, **markdown**, **word**, **confluence**, **docbook**, **excel**, **openapi**, **json**, **yaml**, or **xml**.

-o outputDirectory

The output directory in file syntax form.

-of outputFormat

The format of the output files. The possible values are: **xhtml**, **dita**, **docbook4**, **docbook5**, **json**, **yaml**, or **xml**.

-ss (true|false) [only for Word to DITA, HTML to DITA, Markdown to DITA, DocBook to DITA, and OpenAPI to DITA conversions]

Splits sections marked by titles or headings to separate files and create a DITA map. The possible values are **true** or **false** (default).

-csd (true|false) [only for Markdown to DITA conversions]

Creates short description elements from the first paragraph before the headings. Possible values are **true** or **false** (default).

-cs converterSettingsFile

A file that contains the Batch Documents Converter add-on preferences settings. It can be an xpr file that contains project options or an xml file that contains global options. If not specified, the operation uses the application's default settings.

Confluence to DITA

The **Confluence to DITA** conversion processes the HTML content generated by the Confluence export process. For exporting, login to your Confluence account and navigate to the specific space that you want to export. Go to **Space Settings > Export space** and choose to export it as HTML. The `index.html` file resulting from this process has to be provided in the **inputFiles** argument.

Compile Framework Script

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin.

A custom *framework* ([on page 2679](#)) (document type) can be created using a [special XML descriptor file](#) ([on page 1942](#)), either from scratch or by extending an existing built-in framework (such as DITA or DocBook) and then making modifications to it.

The **Compile Framework Script** (`compileFrameworkScript.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) helps you to compile the script into the `*.framework` file that represents the framework configuration. Although Oxygen XML Editor Eclipse plugin is now able to automatically compile and load scripts, you might want to compile it yourself to obtain the resulting `*.framework` file if your framework runs on a different version of Oxygen XML Editor Eclipse plugin.

Arguments for the Compile Framework Script

```
sh scripts/compileFrameworkScript.sh -i "script1.exf" "script2.exf" "frameworksDir"
```

-i inputFiles

A list of space-separated [Framework Extension Script Files](#) ([on page 1944](#)) (*.exf) or directories in file syntax form. If a directory is specified, the [Framework Extension Script Files](#) ([on page 1944](#)) are searched for inside it and in its child directories.

XSLT Stylesheets Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for XSLT Stylesheets from Oxygen XML Editor Eclipse plugin by using the **Tools > Generate Documentation > XSLT Stylesheet Documentation** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `stylesheetDocumentation.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate XSLT stylesheets documentation from the command line.

Sample Command-Line Arguments for the Generate XSLT Stylesheet Documentation Script

```
sh scripts/stylesheetDocumentation.sh xslFile [-cfg:configFile] | [-out:outputFile]
```

Tip:

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Related information

[XML Schema Documentation](#) ([on page 2654](#))

[WSDL Documentation \(Deprecated\)](#) ([on page 2658](#))

XML Schema Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for XML Schemas from Oxygen XML Editor Eclipse plugin by using the **Tools > Generate Documentation > XML Schema Documentation** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `schemaDocumentation.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate XML Schema Documentation Script

```
sh scripts/schemaDocumentation.sh schemaFile [-cfg:configFile] [-out:outputFile]
[-format:<value>] [-xsl:xslFile] [-split:<value>] [-openInBrowser:<value>]
```

Tip:

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Related information

JSON Schema Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for a JSON Schema file from Oxygen XML Editor Eclipse plugin by using the **Tools > Generate Documentation > JSON Schema Documentation** main menu action. This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor Eclipse plugin presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor Eclipse plugin and the **JSON Schema Documentation** action will invoke the tool.

You can use the `jsonSchemaDocGen.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate documentation from a JSON schema file using the command line.

**Tip:**

For some GitHub use-case samples for this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Arguments for the JSON Schema Documentation Script

```
sh scripts/jsonSchemaDocGen.sh filePath [-ofp outputFilePath] [-sb split by (location, components)]
[-ea exclude annotations] [-ec exclude constraints] [-ep exclude properties] [-epp exclude pattern
properties] [-ee exclude enumerations] [-es exclude source] [-eub exclude used by] [-ecp exclude
compositions] [-ed exclude diagram] [-eim exclude image map] [-il include location] [-help |
--help | -h | --h]
```

filePath

Mandatory argument specifying the path of the file that needs to generate documentation (it can also be provided as a URL).

-ofp output file path

Optional argument that specifies the path of the output file.

-sb split by (location, components)

Optional argument that specifies what type of split scenario is used (location, components). By default, one file scenario is used.

-ea exclude annotations

Optional argument that specifies if the JSON schema annotations should be present. Default value is true.

-ec exclude constraints

Optional argument that specifies if the JSON schema constraints should be present. Default value is true.

-ep exclude properties

Optional argument that specifies if the JSON schema properties should be present. Default value is true.

-epp exclude pattern properties

Optional argument that specifies if the JSON schema pattern properties should be present. Default value is true.

-ee exclude enumerations

Optional argument that specifies if the JSON schema enumerations should be present. Default value is true.

-es exclude source

Optional argument that specifies if the JSON schema source should be present. Default value is true.

-eub exclude used by

Optional argument that specifies if the JSON schema *used by* should be present. Default value is true.

-ecp exclude compositions

Optional argument that specifies if the JSON schema compositions should be present. Default value is true.

-ed exclude diagram

Optional argument that specifies if the JSON schema diagram should be present. Default value is true.

-eim exclude image map

Optional argument that specifies if the JSON schema image map should be present. Default value is true.

-il include location

Optional argument that specifies if the JSON schema location should be present. Default value is false.

-help | --help | -h | --h

Displays help text.

OpenAPI Documentation

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for an OpenAPI file from Oxygen XML Editor Eclipse plugin by using the **Tools > Generate Documentation > OpenAPI Documentation** main menu action. This tool requires an additional add-on to be installed, so the first time you invoke the action, Oxygen XML Editor Eclipse plugin presents a dialog box asking if you want to install it. Once installed, you need to restart Oxygen XML Editor Eclipse plugin and the **OpenAPI Documentation** action will invoke the tool.

You can use the `openApiDocGen.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate documentation from an OpenAPI file using the command line.

Tip:

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

Arguments for the OpenAPI Documentation Script

```
sh scripts/openApiDocGen.sh filePath [-ofp outputFilePath] [-sb split by (location, components)]
[-ea exclude annotations] [-ec exclude constraints] [-ep exclude properties] [-epp exclude pattern
properties] [-ee exclude enumerations] [-es exclude source] [-eub exclude used by] [-ecp exclude
compositions] [-ed exclude diagram] [-eim exclude image map] [-il include location] [-help |
--help | -h | --h]
```

filePath

Mandatory argument specifying the path of the file that needs to generate documentation (it can also be provided as a URL).

-ofp output file path

Optional argument that specifies the path of the output file.

-sb split by (location, components)

Optional argument that specifies what type of split scenario is used (location, components). By default, one file scenario is used.

-ea exclude annotations

Optional argument that specifies if the JSON schema annotations should be present. Default value is true.

-ec exclude constraints

Optional argument that specifies if the JSON schema constraints should be present. Default value is true.

-ep exclude properties

Optional argument that specifies if the JSON schema properties should be present. Default value is true.

-epp exclude pattern properties

Optional argument that specifies if the JSON schema pattern properties should be present. Default value is true.

-ee exclude enumerations

Optional argument that specifies if the JSON schema enumerations should be present. Default value is true.

-es exclude source

Optional argument that specifies if the JSON schema source should be present. Default value is true.

-eub exclude used by

Optional argument that specifies if the JSON schema *used by* should be present. Default value is true.

-ecp exclude compositions

Optional argument that specifies if the JSON schema compositions should be present. Default value is true.

-ed exclude diagram

Optional argument that specifies if the JSON schema diagram should be present. Default value is true.

-eim exclude image map

Optional argument that specifies if the JSON schema image map should be present. Default value is true.

-il include location

Optional argument that specifies if the JSON schema location should be present. Default value is false.

-help | --help | -h | --h

Displays help text.

WSDL Documentation (Deprecated)

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate documentation for WSDL documents from Oxygen XML Editor Eclipse plugin by using the **Tools > Generate Documentation > WSDL Documentation** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `wSDLDocumentation.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate XML Schema documentation from the command line.

Sample Command-Line Arguments for the Generate WSDL Documentation Script

```
sh scripts/wSDLDocumentation.sh wSDLFile [-cfg:configFile] | [-out:outputFile]
```

**Tip:**

For some GitHub use case samples of this script, see [Oxygen Documentation Template](#) and [Oxygen Documentation Action](#).

XML Instance Generator

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can generate multiple XML documents from an XML Schema from Oxygen XML Editor Eclipse plugin by using the **Tools > Generate Sample XML Files** main menu action. The settings dialog box has an **Export settings** option that can be used to export the settings to an XML configuration file. Once the settings are exported, you can use the `xmlGenerator.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to generate multiple XML instance files from the command line.

Sample Command-Line Arguments for the Generate Sample XML Files Script

```
sh scripts/xmlGenerator.sh path/to/config/file [-verbose]
```

Extended Version of the Script and its Arguments

```
sh scripts/xmlGenerator.sh [[path_to_config_file] [-s XML_schema_path -r root [-n ns] [-o
output_dir]
[-f instance_name] [-i num_of_instances]] [-verbose]]
```

path_to_config_file

The path to the file that contains the configuration to be used.

-s XML_schema_path

The path to the XML schema to be used for generating the XML file(s). This argument can also be provided as a URL.

-n ns

The namespace used for the XML namespace declaration.

-r root

The root element for the generated file(s).

-o output_dir

The output directory to be used for storing the generated file(s).

-f instance_name

The pattern name to be used for the generated file(s). It is usually the name plus extension.

-i num_of_instances

The number of XML files to be generated.

-verbose

This argument can be specified to activate verbose logging.

**Note:**

Any value specified by the **-s**, **-n**, **-r**, **-o**, **-f**, or **-i** arguments overrides the corresponding value from the configuration file, if that file is specified in the **path_to_config_file** argument.

Flatten XML Schema

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

You can flatten an XML schema that contains multiple includes and redefines to a single schema file from Oxygen XML Editor Eclipse plugin by using the **Tools > Flatten Schema** main menu action. You can use the equivalent `flattenSchema.sh` script (found in the `scripts` subfolder inside **Oxygen's** installation directory) to flatten an XML schema from the command line.

Sample Command-Line Arguments for the Flatten Schema Script

```
sh scripts/flattenSchema.sh [-in:inputSchemaURL -outDir:outputDirectory
                             [-flattenImports:<boolean_value>]
                             | [-useCatalogs:<boolean_value>]
                             [-flattenCatalogResolvedImports:<boolean_value>] [-verbose]]
```

Compare Directories

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Compare Directories** script (`compareDirs.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to compare two directories and get the comparison results in various formats.

Arguments for the Compare Directories Script

```
sh scripts/compareDirs.sh firstDirPath secondDirPath [[baseDirPath] [-if includeFilesFilter]
[-ia includeArchives] [-ef excludeFilesFilter] [-ed excludeSubdirsFilter] [-cm comparisonMode]
[-alg comparisonAlg] [-als algStrength] [-iws ignoreWS] [-ipi ignorePI] [-icm ignoreComments]
[-idt ignoreDocType] [-itn ignoreText] [-ins ignoreNS] [-ind ignoreNSDecl] [-inp ignorePrefixes]
[-iao ignoreAttrOrder] [-iee ignoreExpStateForEmptyElems] [-enx XPathExprToExcludeNodes] [-out
outputFormat] [-outfile outputFile] [-merge mergeOperation] [-mergeout outputDirPathForMerge]]
[-help | --help | -h | --h]
```

firstDirPath

Mandatory argument that specifies the first directory path (it can also be provided as a URL using `'file://'` protocol).

secondDirPath

Mandatory argument that specifies the second directory path (it can also be provided as a URL using `'file://'` protocol).

baseDirPath

Optional argument that specifies the path of the base directory that the other two directories will be compared against in a 3-way comparison (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments.

-if includeFilesFilter

Use this argument to only include files that match the specified pattern in the comparison (e.g. `.xml`, `.json`). Default value = `*`.

-ia includeArchives

If set to **true**, files from archives are included in the comparison. Default value = **false**.

-ef excludeFilesFilter

Use this argument to exclude files that match the specified pattern from the comparison (e.g. `*.jpg`).

-ed excludeSubdirsFilter

Use this argument to exclude sub-directories that match the specified pattern from the comparison (e.g. `.svn`, `_svn`, `.git`).

-cm comparisonMode

Specifies the comparison mode. There are three modes available: **content**, **binary**, and **timestamp**. Default value = **content**.

-alg comparisonAlg

Specifies the algorithm to be used for the comparison. Possible values: **auto**, **chars**, **words**, **lines**, **syntax_aware**, **xml_fast**, and **xml_accurate**. Default value = **auto**.

-als algStrength

Specifies the strength of the algorithm to be used for the comparison. Possible values: **low**, **medium**, **high**, and **very_high**. Default value = **medium**.

-iws ignoreWS

If set to **true**, whitespaces are ignored if differences consist only of whitespaces. Default value = **false**.

-ipi ignorePI (only for the XML-aware algorithms)

If set to **true**, processing instructions are ignored in the comparison. Default value = **false**.

-icm ignoreComments (only for the XML-aware algorithms)

If set to **true**, comments are ignored in the comparison. Default value = **false**.

-idt ignoreDocType (only for the XML-aware algorithms)

If set to **true**, DOCTYPE sections are ignored in the comparison. Default value = **false**.

-itn ignoreText (only for the XML-aware algorithms)

If set to **true**, text content is ignored in the comparison. Default value = **false**.

-ins ignoreNS (only for the XML-aware algorithms)

If set to **true**, namespaces are ignored in the comparison. Default value = **false**.

-ind ignoreNSDecl (only for the XML-aware algorithms)

If set to **true**, namespace declarations are ignored in the comparison. Default value = **false**.

-inp ignorePrefixes (only for the XML-aware algorithms)

If set to **true**, prefixes are ignored in the comparison. Default value = **false**.

-iao ignoreAttrOrder (only for the XML-aware algorithms)

If set to **true**, the order of attributes is ignored in the comparison. Default value = **false**.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)

If set to **true**, the expansion state for empty elements is ignored in the comparison. Default value = **false**.

-enx XPathExprToExcludeNodes

Specifies an XPath expression to exclude certain nodes from the comparison.

Note:

The argument is only considered if you specify either `html/ifcr` or `htm/ifcr` as an option for the **-out** argument. These are the only script options that involve additional file comparisons, where exclusion of certain nodes from the comparison via XPath expressions can be applied.

-merge mergeOperation

If set to **true**, a merge operation is invoked after the comparison. Default value = **false**.

Notes:

- This argument is considered only for 3-way comparisons (i.e. only if the `baseDirPath` argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second directories (relative to the base folder), all the differences of the type **incoming** are considered and the content of the first directory is updated accordingly.

- Conflicting changes are not addressed.
- After the comparison, a report is created that provides details about the changes that were made.

-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merge operation. For example, it allows you to specify a specific existing or new directory where the results of the merge operation is saved, other than the first directory path for the comparison (which is what happens when using only the `-merge` argument). The path of the directory can also be provided as a URL using `file://` protocol. This argument and the `-merge` argument are not dependent on each other.

-out outputFormat

Specifies the format of the output. Possible values: **yaml/grouped**, **yaml/raw**, **json/grouped**, **json/raw**, **xml/grouped**, **xml/raw**, **html**, **html/ifcr**, **htm**, or **htm/ifcr**. Default value = **yaml/grouped**.

Notes:

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly. If you skip specifying the **"/grouped"** or the **"/raw"** qualifiers, **"/grouped"** takes precedence.
- If you choose the **html** or **htm** output format, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The **"/ifcr"** qualifier for the **html** or **htm** values is considered only if the `-outfile` argument is also present. *IFCR* is an acronym for *Include File Comparison Reports* and it means that, along with generating the directory comparison report, separate file comparison reports will be generated for all modified file pairs. These reports are available through links from the main report and are saved to a specific directory based on the value provided by the `outfile` argument. It will have the same parent directory and the same name as the **outputFile** plus **-OXY-FC-REPORTS** added to the end of its name.
- The **html** value, as well as the **grouped**, **raw**, or **ifcr** qualifiers, are not considered if the `-merge` argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the `-out` argument. The output file path can also be provided as a URL using `file://` protocol.

-help | --help | -h | --h

Displays help text.

Notes:

- For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.
- File markers used in reports are as follows: M = modified, O1 = only found in 1st directory, O2 = only found in 2nd directory.

Examples of Compare Directories Script

Example 1: Compare Directories and Include Archives While Excluding JPEGs

The following command results in archives being included in the comparison, while JPEGs are excluded:

```
sh scripts/compareDirs.sh dir1 dir2 -ia true -ef *.jpg
```

Example 2: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order

The following command only includes XML files (even from archives) in the comparison, while ignoring the comments and attribute order:

```
sh scripts/compareDirs.sh dir1 dir2 -if *.xml -ia -iao -icm
```

Example 3: Compare Directories Only Including XML Files While Excluding Comments and the Attribute Order

The following command redirects the comparison results to a JSON file named "**results.json**", with "**raw**" mode formatting:

```
sh scripts/compareDirs.sh dir1 dir2 -out json/raw > results.json
```

Example 4: Compare Directories and Generate Comparison Report

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the directories and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareDirs.sh dir1 dir2 -out html -outfile results.html
```

Tip:

For some GitHub use case samples of this script, see [Oxygen Comparison Template](#) and [Oxygen Comparison Action](#).

Related information

[Compare Files Script \(on page 2665\)](#)

Compare Files

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Compare Files** script (`compareFiles.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to compare files (2-way or 3-way) and get the comparison results in various formats.

Arguments for the Compare Files Script

```
sh scripts/compareFiles.sh firstFilePath secondFilePath [[baseFilePath] [-ct contentType]
[-alg comparisonAlg] [-als algStrength] [-iws ignoreWS] [-ipi ignorePI] [-icm ignoreComments]
[-icd ignoreCDATA] [-idt ignoreDocType] [-itn ignoreText] [-ins ignoreNS] [-ind ignoreNSDecl]
```

```
[-inp ignorePrefixes] [-iao ignoreAttrOrder] [-iee ignoreExpStateForEmptyElems] [-enx
XPathExprToExcludeNodes] [-out outputFormat]] [-help | --help | -h | --h]
```

firstFilePath

Mandatory argument that specifies the first file path (it can also be provided as a URL).

secondFilePath

Mandatory argument that specifies the second file path (it can also be provided as a URL).

baseFilePath

Optional argument that specifies the path of the base file that the other two files will be compared against in a 3-way comparison (it can also be provided as a URL).

-ct contentType

Specifies the content type of the files to be compared. Possible values (based on known extensions of some of the most common file types): `.xml`, `.dtd`, `.css`, `.rnc`, `.xquery`, `.json`, `.yaml`, `.java`, `.js`, `.c`, `.cpp`, `.pl`, `.py`, `.php`, `.sql`, `.bat`, `.sh`, `.properties`, `.txt`. The option is used to force the file handling to the specific type of file. Otherwise, the file extension is auto-detected.

-alg comparisonAlg

Specifies the algorithm to be used for the comparison. Possible values: **auto**, **chars**, **words**, **lines**, **syntax_aware**, **xml_fast**, and **xml_accurate**. Default value = **auto**.

-als algStrength

Specifies the strength of the algorithm to be used for the comparison. Possible values: **low**, **medium**, **high**, and **very_high**. Default value = **medium**.

-iws ignoreWS

If set to **true**, whitespaces are ignored if differences consist only of whitespaces. Default value = **false**.

-ipi ignorePI (only for the XML-aware algorithms)

If set to **true**, processing instructions are ignored in the comparison. Default value = **false**.

-icm ignoreComments (only for the XML-aware algorithms)

If set to **true**, comments are ignored in the comparison. Default value = **false**.

-idt ignoreDocType (only for the XML-aware algorithms)

If set to **true**, DOCTYPE sections are ignored in the comparison. Default value = **false**.

-itn ignoreText (only for the XML-aware algorithms)

If set to **true**, text content is ignored in the comparison. Default value = **false**.

-ins ignoreNS (only for the XML-aware algorithms)

If set to **true**, namespaces are ignored in the comparison. Default value = **false**.

-ind ignoreNSDecl (only for the XML-aware algorithms)

If set to **true**, namespace declarations are ignored in the comparison. Default value = **false**.

-inp ignorePrefixes (only for the XML-aware algorithms)

If set to **true**, prefixes are ignored in the comparison. Default value = **false**.

-iao ignoreAttrOrder (only for the XML-aware algorithms)

If set to **true**, the order of attributes is ignored in the comparison. Default value = **false**.

-iee ignoreExpStateForEmptyElems (only for the XML-aware algorithms)

If set to **true**, the expansion state for empty elements is ignored in the comparison. Default value = **false**.

-enx XPathExprToExcludeNodes

Specifies an XPath expression to exclude certain nodes from the comparison.

-merge mergeOperation

If set to **true**, a merge operation is invoked after the comparison. Default value = **false**.

Notes:

- This argument is considered only for 3-way comparisons (i.e. only if the `baseFilePath` argument is provided).
- The merge operation is similar to the same process in any versioning system. Following the comparison between the first and second files (relative to the base file), all the differences of the type **incoming** are considered and the content of the first file is updated accordingly.
- If conflicting changes are detected, the merge operation is aborted and the first file remains unchanged.
- After the comparison and merge, a report is created that provides some details about the changes that were made.

-mergeout outputDirPathForMerge

Invokes a merge operation after the comparison and also allows you to specify the output directory path for the merged file. Instead of directly affecting the first compared file (which is what happens when using only the `-merge` argument), a new file is created with the same name as the first file and it is saved in the specified directory. The path of the output directory can also be provided as a URL. This argument and the `-merge` argument are not dependent on each other.

-out outputFormat

Specifies the format of the output. Possible values: **yaml**, **json**, **xml**, **html**, **htm**, **html/inlineCSS**, or **htm/inlineCSS**. Default value = **yaml**.

**Notes:**

- If you choose to save/redirect the console output to a file, this argument establishes the type of the output file and its content is formatted accordingly.
- If you choose any of the **html**, **html/inlineCSS**, **htm**, or **htm/inlineCSS** output formats, it is recommended that you also choose to save/redirect the console to the specified HTML file to view the comparison result in your preferred browser.
- The **inlineCSS** qualifier for the **html** and **htm** values implies that the CSS-based generated HTML code is more suitable to be directly inserted in emails (as most email clients only accept inline CSS styling for HTML emails).
- The **html** and **htm** values (with or without the **inlineCSS** qualifier) are not considered if the `-merge` argument is present.

-outfile outputFile

Specifies the path for an output file to save the comparison results, instead of presenting them in the console. The content of the output file is formatted according to the `-out` argument. The output file path can also be provided as a URL.

-help | --help | -h | --h

Displays help text.

**Note:**

For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly

Examples of Compare Files Script**Example 1: Compare Files and View Results in XML Format**

The following command compares the files (ignoring the namespaces and prefixes) and redirects the console output to the `results.xml` file (XML-formatted):

```
sh scripts/compareFiles file1 file2 -ins -inp -ind -out xml > results.xml
```

Example 2: Compare Files with Line by Line Algorithm

The following command compares the files using the **lines** algorithm and ignores whitespaces:

```
sh scripts/compareFiles.sh file1 file2 -alg lines -iws
```

Example 3: Compare Files and Generate Comparison Report

It is possible to generate a report in the form of an HTML file that contains the results of the comparison. The following command compares the files and redirects the console to the specified HTML file to view the comparison results:

```
sh scripts/compareFiles.sh file1 file2 -out html -outfile outFile.html
```

[Compare Directories Script](#) (on page 2660)

Merge Files with Change Tracking Highlights

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Merge Files with Change Tracking Highlights** script (`mergeFilesTrackChanges.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to merge 2 XML files (based on a 2-way

comparison). The **Author** mode comparison results are saved as documents with highlighted tracked changes that can later be reviewed and accepted or rejected.

**Notice:**

This script is intended to be used for merging XML documents (Oxygen XML Editor Eclipse plugin creates change tracking markers only for XML file types. Using this script for document types other than XML, or for documents that are not XML well-formed, causes document parsing errors and the merge operation fails.

Arguments for the Merge Files with Change Tracking Highlights Script

```
sh mergeFilesTrackChanges.sh pathOfBaseFile pathOfFileToMergeWith [[pathOfOutFile] [-nb  
noBackupOfBaseFile]] [-help | --help | -h | --h]
```

pathOfBaseFile

Mandatory argument that specifies the path of the base file (it can also be provided as a URL).

pathOfFileToMergeWith

Mandatory argument that specifies the file to merge with (it can also be provided as a URL).

pathOfOutFile

Optional argument that specifies the path of the file where the merge operation results are saved to (it can also be provided as a URL). If present, it must appear immediately after the first two mandatory arguments. If absent, the merge results are saved to the base file, by overwriting it. You cannot choose the same file specified as the file to merge with as the output file (the merge process is aborted in this case). Also, if the output is a remote resource, its entire parent directory structure must already exist. Otherwise, an I/O exception is thrown and the merge results cannot be saved.

-nb noBackupOfBaseFile

Set to **true** if you do not want a backup copy of the base file on the hard disk. There are 2 situations when a backup of the base file is performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted if the output file is not specified (i.e. the `pathOfOutFile` argument is not present) or the specified output file is the base file itself.

The backup copy will have the same parent directory as the base directory and its name will be the name of the base file suffixed by ".OXY.BAK". The default value is **false**, which means that for either of the 2 previously mentioned situations, a backup copy of the base file will be kept on the hard disk.

**Note:**

The backup copy can be deleted only if the base file and, implicitly, its backup copy are local resources (not remote).

-help | --help | -h | --h

Displays help text.

**Note:**

For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly

Examples of Compare Files Script

Example 1: Compare Files and View Results in XML Format

The following command results in merging `file1` and `file2` into `outfile` with changes highlighted:

```
sh scripts/mergeFilesTrackChanges.sh file1 file2 outfile
```

Example 2: Compare Files with Line by Line Algorithm

The following command results in merging `file1` and `file2` by overwriting `file1`. However, the `file1` is backed up first:

```
sh scripts/mergeFilesTrackChanges.sh file1 file2
```

Example 3: Compare Files and Generate Comparison Report

The following command results in merging `file1` and `file2` by overwriting `file1`. Although `file1` is initially backed up, the backup is eventually removed:

```
sh scripts/mergeFilesTrackChanges.sh file1 file2 -nb
```

Merge Directories with Change Tracking Highlights

**Attention:**

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Merge Directories with Change Tracking Highlights** script (`mergeDirsTrackChanges.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to merge 2 directories (based on a 2-way comparison). All pairs of modified XML files involved in the process are merged by saving the **Author**

mode comparison results as documents with highlighted tracked changes that can be later reviewed and accepted or rejected.

Arguments for the Merge Directories with Change Tracking Highlights Script

```
sh mergeDirsTrackChanges.sh pathOfBaseDir pathOfDirToMergeWith [[pathOfOutDir] [-nb
noBackupOfBaseDir] [-nu noUpdateOfModifNonXMLFiles] [-na noAddingFilesOnlyPresentInDirToMergeWith]
[-nd noDeletionOfFilesOnlyPresentInBaseDir] [-cm createChangeTrackingMarkersForAddedXMLFiles]]
[-help | --help | -h | --h]
```

pathOfBaseDir

Mandatory argument that specifies the path of the base directory (it can also be provided as a URL using `file://` protocol).

pathOfDirToMergeWith

Mandatory argument that specifies the path of the directory to merge with (it can also be provided as a URL using `file://` protocol).

pathOfOutDir

Optional argument that specifies the path of the directory where the merge operation results are saved to (it can also be provided as a URL using `file://` protocol). If present, it must appear immediately after the first two mandatory arguments. If absent, the merge results are saved to the base directory, by overwriting it. You cannot choose the same directory specified as the directory to merge with as the output directory (the merge process is aborted in this case).

-nb noBackupOfBaseDir

Set to **true** if you do not want a backup copy of the base directory on the hard disk. There are 2 situations when a backup of the base directory is performed automatically and the backup operation must succeed to proceed with the merge. Otherwise, the merge process is aborted if the output directory is not specified (i.e. the `pathOfOutDir` argument is not present) or the specified output directory is the base directory itself.

The backup copy will have the same parent directory as the base directory and its name will be the name of the base directory suffixed by ".OXY.BAK". The default value is **false**, which means that for either of the 2 previously mentioned situations, a backup copy of the base directory will be kept on the hard disk.

-nu noUpdateOfModifNonXMLFiles

Set to **true** if you want to keep the non-XML files at their versions from the base directory. The default value is **false**, which means that all files in the output directory that are copies of non-XML files in the base directory will be replaced by their corresponding files in the directory to merge with.

-na noAddingFilesOnlyPresentInDirToMergeWith

Set to **true** if you want to skip adding the files that are only present in the directory to merge with to the output directory as well. The default value is **false**, which means that all files that are only present in the directory to merge with are also added to the output directory.

-nd noDeletionOfFilesOnlyPresentInBaseDir

Set to **true** if you want to preserve the files that are only present in the base directory. The default value is **false**, which means that all files that are only present in the base directory and initially copied to the output directory are deleted.

-cm createChangeTrackingMarkersForAddedXMLFiles

Set to **true** if you want to create change tracking markers for the XML files only present in the directory to merge with (that will be added to the output directory). Although these files have no counterparts in the base directory, change tracking markers of the type "entire content added/inserted" will be created. The option is not necessarily intended for the merge process itself, but it might prove a useful addition when you want to apply various *Oxygen* transformation scenarios to the resulting output directory. For example, if you merge 2 versions of a DITA project and then want a PDF to highlight the changes between those versions, you can apply a transformation on the resulting `ditamap` file. The `-am` option presents the new DITA files as "added content" in the resulting PDF. Note that the option is only considered if the `-na` argument is absent or is explicitly set to **false** (default value).

-help | --help | -h | --h

Displays help text.

Notes:

- The merge process has a preliminary phase where the entire structure and content of the base directory is copied to the output directory.
- For boolean arguments, it is not necessary to provide the "true" value. Their presence in the argument list is equivalent to setting their value to "true" (and their absence from the argument list is equivalent to setting their value to "false"). However, constructs of the form `bool_option true|false` are accepted and interpreted accordingly.
- Once the merge operation is complete, a report file is created and saved in the output directory (in a separate subdirectory named `.__OXY__MERGE__REPORT`). Loading the report file in Oxygen XML Editor Eclipse plugin provides additional functionality. Aside from the fact that the report provides an overview of the merge process, it also provides links to all the files in the resulting output directory. You can use the respective links to load the XML files in the editor, then switch to **Author** mode to review the tracked changes and accept or reject them.

Examples of Compare Directories Script

Example 1: Compare Directories Without Updating non-XML Files

The following command results in merging `dir1` and `dir2` into `outdir`, but without updating the non-XML files in `dir1` detected with changes to their version in `dir2`:

```
sh scripts/mergeDirsTrackChanges.sh dir1 dir2 outdir -nu
```

Example 2: Compare Two Directories and Overwrite the First One

The following command results in merging `dir1` and `dir2` by overwriting `dir1`. However, the `dir1` is backed up first:

```
sh scripts/mergeDirsTrackChanges.sh dir1 dir2
```

Example 3: Compare Directories and Create Change Tracking Markers

The following command results in merging `dir1` and `dir2` into `outdir` and creating change tracking markers (of the type "entire content added/inserted") for all XML files that are only present in `dir2` (to be added to the `outdir`):

```
sh scripts/mergeDirsTrackChanges.sh dir1 dir2 outdir -cm
```

Figure 658. Example of a Merged File with Change Tracking Markers Opened in Author Mode

Format and Indent Files

Attention:

This script is bundled with the [all platforms distribution](#) of Oxygen XML Editor Eclipse plugin. To run the script, you are required to purchase a special [scripting commercial license](#).

The **Format and Indent Files** script (`batchFormatAndIndent.bat/batchFormatAndIndent.sh`, found in the `scripts` subfolder inside **Oxygen's** installation directory) can be used to format and indent multiple files at once.

Arguments for the Format and Indent Files Script

```
batchFormatAndIndent -i inputFilesAndDirs [-f filesFilter] [-s formattingSettingsFile] [-r] [-ih]
[-v]
```

-i inputFilesAndDirs

The input files and directories.

-f filesFilter

A filter for the input files, specified by using a file pattern (e.g. `*.xml`, `t_*.dita`).

-s formattingSettingsFile

A file that contains formatting settings. It can be an `.xpr` file that contains project options or an `.xml` file that contains global options. If not specified, the operation uses the application's default settings.

-r

Use this argument if the operation should be performed recursively for the specified input directories.

-ih

Use this argument if you want the operation to also format and indent hidden files.

-v

Activates verbose logging. It is useful for debugging purposes.

23.

Glossary

Active Cell

Active cell refers to the selected cell where data is entered when you begin typing. Only one cell is active at a time. The *active cell* is bounded by a heavy border.

Alternate CSS Style

The **Alternate CSS Style** refers to the choices in the bottom half of **Styles** drop-down menu (on the toolbar) that makes it easy to apply style changes to your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. By default, the *alternate styles* are applied like layers, they are merged sequentially with the *main CSS style* (on page 2680), and you can activate any number of them. However, if you deselect the **Enable multiple selection of alternate CSSs** option (on page 96) in the **CSS** subtab of the **Document Type** configuration dialog box (on page 90), the *alternate styles* are treated like *main CSS styles* (on page 2680) and you can only select one at a time.

For more information, see [Configuring and Managing Multiple CSS Styles for a Framework](#) (on page 1955).

Anchor

An **Anchor** is used in various types of links to take the user to a specific location within the target document. It is designated in a URL or in the value of the `@href` attribute with a `#` symbol followed by the anchor that is defined in a target ID (for example `href="MyTopic.dita#anchor"`).

Apache Ant

Apache Ant (Another Neat Tool) is a software tool for automating software build processes.

Block Element

A **block element** is intended to be visually separated from its siblings, usually vertically. For instance, paragraphs and list items are *block elements*. It is distinct from a *inline element*, which has no such separation.

Bookmap

A **bookmap** is a specialized *DITA map* used for creating books. A *bookmap* supports book divisions such as chapters and book lists such as indexes.

Callout

A **callout** is a string of text inside a graphic and is connected to a specific location in a document by a line. Oxygen XML Editor Eclipse plugin uses callouts to present comments and other types of review modifications.

Canonicalize

To **canonicalize** something means to convert it to a standard format that everyone generally uses. When using the term with regard to XML, it refers to the process of converting data that has more than one possible representations into a standardization that conforms to the specification of an XML document or document subset. It is helpful for applications that require the ability to test whether or not the content of an XML document or subset has been changed.

Content Completion Assistant

The **Content Completion Assistant** refers to a very helpful mechanism in Oxygen XML Editor Eclipse plugin that offers a list of proposed items that could be inserted at the current location, depending on the current context, editing mode, and type of document. It also tries to determine the most logical choice in the current editing context and displays that proposal at the beginning of the list.

For more information about this feature and how to invoke it, depending on your editing context, see the following:

- [Content Completion Assistant in Author Mode \(on page 393\)](#)
- [Content Completion Assistant in Text Mode \(on page 319\)](#)

Dockable

A **Dockable** window is one that can be moved and resized, and either floated or pinned to a location, allowing you to configure the workspace according to your preferences.

Document Fragment

A **document fragment** represents a portion of an XML document's tree of nodes or content.

Document Type Association

In general terms, a **Document Type Association** is a set of rules that associate a document type with a *framework* (on page 2679). In Oxygen XML Editor Eclipse plugin, **Document Type Association** also specifically refers to a [preferences page](#) (on page 88) where you can create new custom *frameworks* or edit existing ones. Note that *frameworks* (document types) that come built-in with Oxygen XML Editor Eclipse plugin are read-only, but you can **Extend** (on page 89) or **Duplicate** (on page 89) them to configure them as custom *frameworks*.

DITA Map

A **DITA map** is a component of the DITA *framework* (on page 2679) that provides the means for a hierarchical collection of DITA topics that can be processed to form an output. Maps do not contain the content of topics, but only references to them. These are known as topic references. Usually, the maps are saved on disk or in a CMS with the extension `.ditamap`.

Maps can also contain relationship tables that establish relationships between the topics contained within the map. Relationship tables are also used to generate links in your published document.

You can use your map or *bookmap* (on page 2676) to generate a deliverable using an output type such as XHTML, PDF, HTML Help, or Eclipse Help.

DITA Open Toolkit

DITA Open Toolkit is an open-source publishing engine for content authored in the Darwin Information Typing Architecture. It is a vendor-independent, open-source implementation of the DITA standard, released under the [Apache License, Version 2.0](#).

The toolkit supports all versions of the [OASIS DITA specification](#), including 1.0, 1.1, 1.2, and 1.3.

DITA-OT

Related information

<http://www.dita-ot.org/>

DITA-OT-DIR

DITA_OT_DIR refers to the default directory that is specified for your DITA Open Toolkit distribution in the **Window > Preferences > Oxygen XML Editor Eclipse plugin > DITA preferences page** (on page 81).

For example, if you are using DITA-OT 4.1.2 that comes bundled with Oxygen XML Editor Eclipse plugin, the default directory is: `[OXYGEN_INSTALL_DIR]/frameworks/dita/DITA-OT`. You can also specify a custom directory.

Foldable Element

A **foldable element** refers to elements that can be collapsed and expanded in Oxygen XML Editor Eclipse plugin. *Foldable elements* are marked with a small triangle (▾ / ▸) on the left side of the editor panel and you can use that triangle to quickly collapse or expand them. This feature is helpful when you are working with large documents and you want to temporarily hide blocks of content. You can right-click the triangle to access additional collapse and expand actions (**Collapse Other Folds**, **Collapse Child Folds**, **Expand Child Folds**, **Expand All**).

Framework

A **framework** refers to a package that contains resources and configuration information to provide ready-to-use support for a vocabulary or document type. A *framework* is associated to a document type according to a set of rules. It also includes a variety of settings that improve editing capabilities for its particular file type. Oxygen XML Editor Eclipse plugin includes a **Document Type Configuration Dialog Box** (on page 90) that allows you to define the set of rules and customize various authoring mechanisms for new or existing *frameworks*.

For advanced details about customizing your own *framework*, see the [Creating and Configuring Custom Frameworks](#) (on page 1941) section.

IDML

IDML is an abbreviation for Adobe InDesign Markup files.

Inline Element

An **inline element** is intended to be displayed in the same line of text as its siblings or the surrounding text. For instance, strong and emphasis in HTML are *inline elements*. It is distinct from a *block element*, which is visually separated from its siblings.

Java Archive

Java Archive (JAR) is an archive file format. *JAR* files are built on the ZIP file format and have the `.jar` file extension. Computer users can create or extract *JAR* files using the `jar` command or an archive tool.

Key Space

The concept of a **Key Space** in DITA refers to a set of all possible keys that can be used in a *DITA map* structure. A **Key Space** is established when a *root map* (on page 2682) defines a set of effective key bindings. When Oxygen XML Editor Eclipse plugin processes key references, it determines the effective binding of a given key to a resource in the context of the *specified root map* (on page 2353).

Keystore

A **Keystore** is an encrypted file that contains private keys and certificates. There are two types of *keystores* that are supported in Oxygen XML Editor Eclipse plugin:

- **Java Key Store (JKS)**
- **Public-Key Cryptography Standards version 12 (PKCS-12)**

Main CSS Style

The **Main CSS Style** refers to the selection in the top half of the **Styles** drop-down menu (on the toolbar) that makes it easy to quickly change the look of your documents as they appear in **Author** mode and the output without having to edit the CSS stylesheets. The *main CSS* applies to the whole document and you can also select one or more *alternate styles (on page 2676)* (listed in the bottom half of the drop-down menu) that behave like layers and are merged sequentially with the *main CSS style*.

For more information, see [Configuring and Managing Multiple CSS Styles for a Framework \(on page 1955\)](#).

Main File

A **Main File** typically refers to the root of an imported or included tree of modules and this support helps you simplify the configuration and development of XML projects. For more information, see the [Contextual Project Operations Using 'Main Files' Support \(on page 278\)](#) section.

Oxygen Publishing Template

Oxygen Publishing Template defines all the aspects related with the **look and feel(layout and styles)** for the **WebHelp Responsive** output.

The template is self-contained and packed as a ZIP archive making it easy to share with others. It represents the main method for customizing the *WebHelp Responsive* output.

Related Information:

[Publishing Template Package Contents for WebHelp Responsive Customizations \(on page 1359\)](#)

Perspective

In Oxygen XML Editor Eclipse plugin, a **perspective** refers to an interface layout geared towards a specific editing environment. Each *perspective* includes a unique set of interface objects, toolbars, views, and features. You can change the *perspective* by selecting the respective icon in the top-right corner of Oxygen XML Editor Eclipse plugin or by selecting the *perspective* from the **Window > Perspective > Open Perspective** menu.

The *perspectives* that are available in Oxygen XML Editor Eclipse plugin are:

-  **Editor** (*on page 234*) - The most commonly used *perspective* and it is used to edit XML documents.
-  **XSLT Debugger** (*on page 236*) - Used to detect problems in an XSLT transformation by executing the process step by step in a controlled environment.
-  **XQuery Debugger** (*on page 237*) - Used to detect problems in an XQuery transformation process by executing the process step by step in a controlled environment
-  **Database** (*on page 238*) - Used to browse and manage databases.

Plugin

In Oxygen XML Editor Eclipse plugin, a **plugin** is a component that adds extended functionality using a series of extension points and can be installed as an *add-on*. For more information, along with a full list of *add-ons* that are officially supported for Oxygen XML Editor Eclipse plugin, see [Oxygen XML Add-on Repositories](#).

Pretty-Print

Pretty-print refers to formatting and indenting the source code in **Text** mode to make the content easier to view and analyze. The formatting actions that are available in Oxygen XML Editor Eclipse plugin include:

-  **Format and Indent Element** - Available in the **Source** submenu of the contextual menu for the current element.
-  **Format and Indent** - Available on the toolbar for the entire current document.
-  **Format and Indent** - Available in the contextual menu of the **Text view** (*on page 1218*) and applies to all the content in that view.
-  **Format and Indent Files** - Available in the contextual menu of the **Project Explorer view** (*on page 269*) for one or more selected files.

QName

QName stands for "qualified name" and defines a valid identifier for elements and attributes. *QNames* are used as URI references to reference particular elements or attributes within XML documents.

Quick Assist

The **Quick Assist** feature gives you easy access to some of the most commonly used actions for the specific type of document you are editing. If one or more actions are available in the current context, they are accessible via a yellow bulb help (💡) placed at the current line in the stripe on the left side of the editor in **Text** mode. You can also invoke the quick assist menu by using the **Ctrl + 1** (**Meta 1** on macOS) keyboard shortcuts.

Quick Fix

The **Quick Fix** support in Oxygen XML Editor Eclipse plugin helps you resolve errors that appear in an XML document by offering proposals to fix problems such as missing required attributes or invalid elements. *Quick Fixes* are available in **Text** mode and **Author** mode and they can be presented and activated in several ways.

- When hovering over an area of text where a validation error or warning occurs, the *Quick Fix* proposals can be presented as links in a tooltip pop-up window.
- When hovering over an error or warning in **Author** mode, the *Quick Fix* proposals are presented in a small drop-down menu.
- If you place the cursor in the highlighted area where a validation error or warning occurs, a *Quick Fix* icon (🔧) is displayed in the stripe on the left side of the editor. Clicking that icon will allow you select from the available proposals.
- If you place the cursor in the highlighted area where a validation error or warning occurs, you can also access the *Quick Fix* menu by pressing **Ctrl + 1 (Command + 1 on macOS)** on your keyboard.

Oxygen XML Editor Eclipse plugin also provides support for [defining and customizing a library of *Quick Fixes* using the Schematron language \(on page 983\)](#).

Root Map

A **Root Map** (or main map) specifies a *DITA map* (on page 2678) that defines a hierarchical structure of submaps that are contained within the *root map*. Essentially, the *root map* defines a scope and provides the mechanism to allow your defined keys to be propagated throughout the entire map structure (this mechanism is also known as a *key space* (on page 2679)).

In Oxygen XML Editor Eclipse plugin, the **DITA Maps Manager** includes an [option on its toolbar where you can easily specify the *root map* \(on page 2341\)](#), but there are also several other ways to [select or change the *root map* \(on page 2353\)](#).

Space-Preserved Element

A **spaced-preserved element** refers to elements that require white spaces and line endings to be preserved (for example, DITA `<codeblock>` and `<pre>` elements).

Subject Scheme Map

A **Subject Scheme Map** allows you to create custom controlled attribute values and to manage metadata. *Subject scheme maps* use a key definition to define a collection of controlled values rather than a collection of topics. The highest level of map that uses the set of controlled values must reference the *subject scheme map* where those controlled values are defined.

A controlled value is a keyword that can be used as a value in a metadata attribute. For example, the `@audience` metadata attribute may take a value that identifies the user group associated with a particular content unit (for medical equipment, that might include *therapist*, *oncologist*, *surgeon*, *radiologist*, and so

on). In a *subject scheme map*, you can define a list of these audience values and you can then use these values to profile your content. For more information, see [Customizing Profiling Values with a Subject Scheme Map \(on page 2597\)](#).

Track Changes

The *Track Changes* feature allows you to review changes that you or other authors have made and then accept or reject them. You can also manage the visualization mode of the tracked changes, add comments to changes, and mark them as being done. These actions are easily accessible from contextual menus, the toolbar, or the **Review** view (on page 438).

For more information about this feature, see [Managing Tracked Changes \(on page 417\)](#).

WebHelp Output Directory

WebHelp_OUTPUT_DIR refers to the output directory where WebHelp transformation files will be generated.

The output directory can be specified using the **Output Directory** text field in the **Output** tab of the transformation scenario dialog box.

When running the WebHelp transformation from a command line, the output directory can be specified using the `-o` or `--output` option.

Working Set

A **Working Set** refers to a set of files that will be used for the scope of search and refactoring operations. Many of the search and refactoring wizards include a step where you can specify the scope for the operation and you can choose one or more *working sets* to restrict the scope to that specified set of files.

XML Catalog

An **XML Catalog** maps a system ID or a URI reference for a resource (stored either remotely or locally) to a local copy of the same resource. Whenever XML processing relies on external resources (such as referenced schemas and stylesheets), the use of an *XML Catalog* becomes a necessity when Internet access is not available or the connection is slow.

Oxygen XML Editor Eclipse plugin includes default global catalogs as well as default catalogs for each of the built-in *frameworks* (on page 2679), and you can also create your own. Oxygen XML Editor Eclipse plugin uses these *XML Catalogs* to resolve references for document validation and transformations. For more information, see [Working with XML Catalogs \(on page 594\)](#).
